INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	9%	45%	45%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	18%	55%	27%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	36%	36%	27%
Physical effort required	18%	36%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	27%	45%	27%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	10%	40%	25%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	50%	40%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	30%	60%
Physical effort required	10%	60%	30%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	60%	10%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting new codes 64582-84. These new codes represent implantation, revision/replacement, and removal of a hypoglossal nerve stimulator, previously reported using 64568-64570. The existing codes have been retained and now represent the same work when performed on the vagal nerve. Those services will predominantly by Neurosurgery and were not surveyed for this meeting as a

result of their changes being editorial. The Panel approved the CCA and the code is now being valued by the RUC. The new code will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted selection of 362 members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated in sleep medicine as their sub-specialty and are ***have also been trained through the mandatory process by the only company that currently manufactures this device, Inspire. Given that only Inspire trained physicians and facilities can perform this procedure at the time of survey, we did not feel it was appropriate or representative to survey sleep-medicine members who were not certified in these specific procedures.***

Recommendation (Work and Intra Time):

We are recommending a work RVU of **14.00 and 120 minutes of intra service time**, based on our survey's median results.

Time package selection: We have selected pre-time package 4 and post-time package 9B due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia and the patients typically have multiple comorbities and being very difficult to position and access during the procedure.

Pre-time Package 4 Difficult Patient/Difficult Procedure

Evaluation Time – We are recommending 40 minutes of evaluation time which is consistent with the pre-service package time, and our survey median.

Positioning Time – We are recommending 15 minutes of positioning time which is an increase of 12 minutes from the package time, but consistent with our survey median time and necessary for this procedure. Specifically, you must tape down the chest area to access the neck and utilize sleds and belts to secure them. There are two specific surgical sites and patients typically have a very large body habitus. The procedure requires that you have the ability to access them and position them in ergonomic fashion and requires an extended neck and chest access throughout the procedure.

Scrub, Dress, Wait Time – We are recommending 15 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 70 minutes, taking the lesser of surveyed time or the pre-service package time with increased time requested for the extensive positioning work required for these procedures.

Post-time Package 9B General Anesthesia or Complex Regional Block/Complex Procedure
Recommended time has been reduced to 20 minutes which is a decrease of 13 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 20 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey supports this, with 44 respondents indicating that a discharge management visit is performed when the patient is discharged within 24 hours which is typical. Based on these results, we have included a **half discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. Both of these visits were indicated as a level three office visit, 99213. During visit one the physician checks the wound and removes sutures, ensuring there is no infection.

Visit 1 - 99213:
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. Sutures are removed. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The patient and physician discuss the patients' current sleep history, including

snoring, cessation of breathing and restless sleep. The physician inquires about any concerning signs of sleep apnea, including daytime somnolence.

Visit 2 - 99213:
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The patient and physician discuss the patients' current sleep history, including snoring, cessation of breathing and restless sleep. The physician inquires about any concerning signs of sleep apnea, including daytime somnolence. The physician and the patient discuss further options for the treatment of sleep apnea given the absence of the hypoglossal nerve stimulator.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	2019 Medicare Utilization
23680	Open treatment of shoulder dislocation, with surgical or anatomical neck fracture, includes internal fixation, when performed	090	0.0506	13.15	120	361	2007-02	89

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64570 and 0468T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 83
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 83 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 27 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is 33% of 64570's previous volume which is what we estimate will be transferred over to the new hypoglass nerve code 64584.

Specialty Otolaryngology Frequency 27 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 69930

Meeting Date: January 20201

CPT Code	Long Descriptor	Global Period
64582	Open implantation of hypoglossal nerve neurostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array	090
CPT Code	**Long Descriptor**	**Global Period**
64583	Revision or replacement of hypoglossal nerve neurostimulator array and distal respiratory sensor electrode or electrode array, including connection to existing pulse generator	090
CPT Code	**Long Descriptor**	**Global Period**
64584	Removal of hypoglossal nerve neurostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
64582	A 46-year-old male with moderate to severe obstructive sleep apnea presents after failing positive airway pressure therapy. Examination shows base of tongue airway collapse without complete concentric collapse at the palate.
CPT Code	**Vignette**
64583	A 48-year-old male who underwent placement of a hypoglossal nerve stimulator develops a malfunctioning device. He undergoes replacement of the hypoglossal nerve neurostimulator electrode array, pulse generator, and distal respiratory sensor electrode or electrode array.
CPT Code	**Vignette**
64584	A 48-year-old male who underwent placement of a hypoglossal nerve stimulator develops intolerance to the system. He undergoes removal of the hypoglossal nerve neurostimulator electrode array, pulse generator, and distal respiratory sensor electrode or electrode array.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology and sleep medicine. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

These are new codes which represent procedures on the hypoglossal nerve only. Their volume will come out of existing codes which represented both vagal nerve and hypoglossal nerve procedures. Those codes are used as the reference. They are 64568, 64569, 64570.

3. Is this code(s) typically reported with an E/M service?
   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:
   N/A clinical staff time recommendations are identical to the prior code's PE inputs.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:
   N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
   During the pre-service clinical staff are completing pre-service diagnostic and referral forms, coordinating pre-surgery services including test results, scheduling space and equipment in the facility, providing pre-service education and obtaining consent from the patient, and completing pre-procedure phone calls and prescriptions.
   b. Service period (includes pre, intra and post):
   N/A
   c. Post-service period:
   During the post service period two post-operative visits are scheduled during which the staff assist with the suture removal, ensure the patient bring s all needed equipment and supplies with them, and assists the physician in the activation and utilization of the device.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
   N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
   N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

DESCRIPTION	Code	Unit	Item Qty	U p
pack, post-op incision care (suture)	**SA054**	**pack**		4
kit, suture removal		kit	1	
povidone soln (Betadine)		ml	10	
gauze, sterile 4in x 4in		item	2	
gloves, sterile		pair	1	
steri-strip (6 strip uou)		item	2	
swab-pad, alcohol		item	2	
tape, surgical paper 1in (Micropore)		inch	12	
tincture of benzoin, swab		item	1	

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EF008 Exam chair – office visit formula EQ170 Fiberoptic headlight – office visit formula

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

Clinical staff time remained unchanged except in the post period where post operative visit time went down.

Supplies were modified to remove unnecessary packs and add in only those items required, such as gloves. Supplies that were retained had quantities modified to reflect reduced numbers of visits.

Equipment remained unchanged, times modified in accordance with the office visit formula and reduced post operative visits.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Destruction of Intraosseous Basivertebral Nerve – Tab 14

In October 2020, the CPT Editorial Panel approved the addition of two codes to report thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance for the first two vertebral bodies (lumbar or sacral) and for each additional vertebral body (lumbar or sacral).

64628 ***Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; first two vertebral bodies, lumbar or sacral***
The RUC reviewed the survey results from 58 spine surgeons, physiatrists, and pain medicine physicians and determined that the survey median overestimated the work required to perform this service. After thorough discussion, the RUC recommends the survey 25th percentile work RVU of 8.25 to appropriately account for the physician work involved in this service. The RUC notes that the 25th percentile value results in a work intensity that closely aligns with the add-on code (0.085 and 0.081 IWPUT respectively). The RUC recommends: 56 minutes pre-service time (33 minutes evaluation, 10 minutes positioning, 13 minutes scrub/dress/wait time), 60 minutes intra-service time, and 20 minutes immediate post-service time, 0.5 99238 discharge visit and 1-99213 office visit.

The RUC noted that the survey 25th percentile value is appropriately bracketed by the two key reference service codes 22514 *Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; lumbar* (work RVU = 7.99 and 45 minutes intra-service time) and 22513 *Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; thoracic* (work RVU = 8.65 and 50 minutes intra-service time). The RUC concluded that CPT code 64628 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 8.25 for CPT code 64628.**

64629 ***Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; each additional vertebral body, lumbar or sacral (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 58 spine surgeons, physiatrists, and pain medicine physicians and determined that the survey 25th percentile work RVU of 4.87, intra-service and total time of 60 minutes, appropriately accounts for the physician work required to perform this add-on service. The RUC noted that the 25th percentile value results in a work intensity that closely aligns with the base code (0.081 and 0.085 IWPUT respectively).

The RUC also noted that there are several ZZZ codes with 60 minutes of intra-service time and similar work RVUs. Specifically, CPT code 61799 *Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); each additional cranial lesion, complex (List separately in addition to code for primary procedure)* (work RVU = 4.81 and 60 minutes intra-service time) and CPT code 63103 *Vertebral corpectomy (vertebral body resection), partial or complete, lateral extracavitary approach with decompression of spinal cord and/or nerve root(s) (eg, for tumor or*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

retropulsed bone fragments); thoracic or lumbar, each additional segment (List separately in addition to code for primary procedure) (work RVU = 4.82 and 60 minutes intra-service time) are spinal/cranial procedures with similar amount of physician work and identical intra-service times. For further support, the RUC compared CPT code 64629 to the two key reference service codes 22515 *Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)* (work RVU = 4.00 and 30 minutes intra-service time) and 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50 and 45 minutes intra-service time) and agreed that these codes appropriately bracket the survey code. The RUC concluded that CPT code 64629 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends a work RVU of 4.87 for CPT code 64629.**

Practice Expense
For CPT code 64628, the Practice Expense Subcommittee approved pre-service time for extensive use of clinical staff in the facility setting. The equipment inputs were modified to remove EQ168 *light, exam* and add EF031 *table, power*. For CPT code 64629, no direct practice expense inputs are recommended as the practice expense for the add-on code is already included in the base code. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

New Technology
CPT codes 64628 and 64629 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Nervous System **Extracranial Nerves, Peripheral Nerves, and Autonomic Nervous System** **Destruction by Neurolytic Agent (eg, Chemical, Thermal, Electrical or Radiofrequency), Chemodenervation** **Somatic Nerves**				
●64628	Q1	Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; first two vertebral bodies, lumbar or sacral (Use 64628 in conjunction with 64629)	010	8.25
✚●64629	Q2	each additional vertebral body, lumbar or sacral (List separately in addition to code for primary procedure) (Do not report 64628, 64629 in conjunction with 77003, 77012)	ZZZ	4.87

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64628 Tracking Number Original Specialty Recommended RVU: **9.75**
Presented Recommended RVU: **9.75**
Global Period: 010 Current Work RVU: **N/A** RUC Recommended RVU: **8.25**

CPT Descriptor: Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; first two vertebral bodies, lumbar or sacral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female with more than 6 months of chronic axial low back pain who failed a minimum of 6 months of traditional conservative therapies, including active physical therapy or chiropractic care, spinal injections and/or medications. An MRI demonstrates degenerative disc disease at L5-S1 with associated endplate changes consistent with Modic Type I in the L5 and S1 vertebral bodies.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 68% , In the ASC 28%, In the office 4%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 95% , Overnight stay-less than 24 hours 5% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review records and any pertinent imaging studies. Confirm (THE NEGATIVE) results of (the-REMOVE) diagnostic facet injections with patient. Communicate with other professionals, patient, and family, and obtain informed consent. Dress, scrub, and wait before the procedure. Prepare patient and needed equipment for the procedure. Position the patient on the X-ray table for appropriate fluoroscopic view. Prepare the skin and drape the ablation site.

Description of Intra-Service Work: An incision is made, and an introducer trocar is inserted with a mallet to access the vertebral body via a transpedicular approach. After breaching the posterior vertebral body with the trocar at the junction of the pedicle and vertebral body, a curved cannula assembly is utilized within the vertebral body and navigate towards the basivertebral nerve, which is located in the posterior 1/3 of the vertebral body. A straight channeling stylet is then utilized if needed to extend the channel to the midline location of the basivertebral nerve. The straight channeling stylet is then removed. Once accurate placement is confirmed, a bipolar probe is inserted into the posterior half of the vertebral body, connected to the radiofrequency generator, and radiofrequency energy is applied for 15 minutes to destroy the basivertebral nerve. The next vertebral body is accessed sequentially using the same technique with additional instrumentation required. Energy is applied for 15 minutes to destroy the basivertebral nerve in this adjacent vertebral body. At the completion of the procedure, all instruments are removed, and the incisions are closed.
Report 64628 for destruction of the intraosseous basivertebral nerve within two consecutive vertebral bodies (1 motion segment); report 64629 for each additional destruction of intraosseous basivertebral nerve within each additional vertebral body.

Description of Post-Service Work: After the procedure, observe the patient for any new and unexpected neurological deficits. Review the procedure and results (including written and telephone reports and orders) with the patient and other professionals. Schedule an office visit within the ten-day global period to monitor for complications, assessment of pain and pain relief, and documentation of functional outcome are included in the medical chart.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	22%	42%	36%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	19%	62%
Physical effort required	3%	25%	72%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	25%	66%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	5%	20%	50%	25%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making		15%	85%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	40%	55%
Physical effort required	15%	35%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	15%	85%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Codes 64628 and 64629 were established at the CPT Editorial Panel Meeting in October 2020 to report ablation of the interosseous basivertebral nerve. These new codes were then placed on the RUC New/Revised Level of Interest Form. Multiple societies responded with an interest in surveying.

64628 was given a global period of 010 days and 64629 was given a global period of ZZZ as an add-on code.

AAPM, AAPM&R, ASIPP, NASS, SIS, and ISASS conducted random samples of their members. In addition, the specialties requested permission from the RUC Research Subcommittee to additionally include trained physicians from a list provided by the device manufacturer Relievant Inc.

A total of 1364 survey requests were sent out, with 290 going to the targeted survey list provided by Relievant. A total of 58 non-financially conflicted surveys were completed.

The median experience rate for the surveyed procedure in the last 12 months was 2.

Survey Results

Pre-Service:

- Median Pre-Service Evaluation time=44 minutes
- Median Pre-Service Positioning time=10 minutes
- Median Pre-Service Scrub, Dress and Wait time=13 minutes

Intra-Service:

- Median Intra-service time=60 minutes

Immediate Post-Service:

- Median Immediate post-service time=20 minutes

Post-Service Visits:

- Median Facility Visits=.50 99238 (same day discharge)
- Median Non-Facility Visits=2 99213 (Level III Office/Outpatient E/M visits)

Total Survey Time: 212 minutes

Survey Work RVU

- 25th % Work RVU=8.25
- Median Work RVU=9.75
- 75th% Work RVU=17.23

Key Reference Services

Survey respondents choose CPT code 22514, Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; lumbar as the primary key reference code with 34 respondents choosing it as the KRS. CPT code 22513, Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; thoracic was the second key reference service, chosen by 21 of the survey respondents.

Recommended Time and Work RVU

A consensus panel of RUC advisors from the surveying specialties met and recommend the following time and work RVU for CPT code 64628.

Pre-Service Package 3 Straightforward Patient/Difficult Procedure:

- Median Pre-Service Evaluation time=33 minutes (standard package pre-service evaluation time)
- Median Pre-Service Positioning time=10 minutes (standard package pre-service positioning time, plus 7 minutes to account for time spent positioning patient prone; survey median time)
- Median Pre-Service Scrub, Dress and Wait time=13 minutes (standard package pre-service SDW time, minus 7 minutes to equal survey median time)

Intra-Service:

- Median Intra-service time=60 minutes

Immediate Post-Service Package 9A General Anesthesia or Regional Block/Straightforward Procedure):

- Median Immediate post-service time=20 minutes (standard package immediate post-service time minus 10 minutes to equal survey median time)

Post-Service Visits:

- Median Facility Visits=.50 99238 (same day discharge)
- Median Non-Facility Visits=1 99213 (Level III Office/Outpatient E/M visit). The consensus panel felt that 1 post-operative visit in the 10-day global period was more typical than 2, as indicated by the survey respondents. 1 post-operative visit is also consistent with the post-operative visits for key reference services 22514 and 22513

Total Survey Time: 178 minutes

Work RVU=9.75 (median survey work RVU).

The Consensus Panel felt the survey median work RVU of 9.75 to be an appropriate work RVU for 64628. 9.75 was the median work RVU from the survey which we believe is an accurate reflection of physician work and intensity as indicated by the survey respondents and the fact they have experience with the procedure. A work RVU of 9.75 has an IWPUT of .110 which is almost exactly equal to the KRS code 22514 IWPUT of .112 and the second KRS code of 22513 with an IWPUT of .114. Thus, a work RVU of 9.75 maintains relativity with the key comparison procedures as indicated by survey respondents. Our survey respondents ranked 64628 as more complex and intense than both 22513 and 22514 for all measures, with more than 50% of respondents indicating 64628 to be more complex for all components of the procedure

The Consensus Panel also compared 64628 to other 010 global periods. CPT code 31239, Nasal/sinus endoscopy, surgical; with dacryocystorhinostomy which was RUC valued in 2013, has the same intra-service time of 60 minutes, and similar post-operative visits of 0.5 99238 and a 99213 office visit, total time of 168 minutes and a work RUV of 9.04. The Panel believes 64628 to be slightly more intense in its work than this endoscopy procedure, but otherwise very similar in nature.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. As the base code, 64628 would be reported with 660X1, the add-on code when 64629 is performed. The October 2020 CPT Code Change Proposal estimated that 6462 would be reported approximately 11% of the time that 64628 is reported.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 22899

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pain Medicine How often? Sometimes

Specialty Physical Medicine and Rehabilitation How often? Sometimes

Specialty Interventional Pain How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 900
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated by consensus panel

Specialty Pain Medicine Frequency 200 Percentage 22.22 %

Specialty Physical Medicine and Rehabilitation Frequency 100 Percentage 11.11 %

Specialty Inteventional Pain Frequency 200 Percentage 22.22 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 800
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated by consensus panel

Specialty Pain Medicine Frequency 175 Percentage 21.87 %

Specialty Physical Medicine and Rehabilitation Frequency 175 Percentage 21.87 %

Specialty Interventional Pain Frequency 135 Percentage 16.87 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64629 Tracking Number Original Specialty Recommended RVU: **4.87**
Presented Recommended RVU: **4.87**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **4.87**

CPT Descriptor: Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; each additional vertebral body, lumbar or sacral (List separately in addition to code for primary procedure)
(Do not report 64628, 64629 in conjunction with 77003, 77012)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old female with more than 6 months of chronic axial low back pain who failed a minimum of 6 months of traditional conservative therapies, including active physical therapy or chiropractic care, spinal injections and/or medications. An MRI demonstrates degenerative disc disease at L5-S1 with associated endplate changes consistent with Modic Type I in the L5 and S1 vertebral bodies. Note: This is an add-on service. Only consider the additional work related to the primary procedure.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital , In the ASC , In the office

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day , Overnight stay-less than 24 hours , Overnight stay-more than 24 hours

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day

Description of Pre-Service Work: N/A

Description of Intra-Service Work: An incision is made, and an introducer trocar is inserted with a mallet to access the vertebral body via a transpedicular approach. After breaching the posterior vertebral body with the trocar at the junction of the pedicle and vertebral body, a curved cannula assembly is utilized within the vertebral body and navigate towards the basivertebral nerve, which is located in the posterior 1/3 of the vertebral body. A straight channeling stylet is then utilized if needed to extend the channel to the midline location of the basivertebral nerve. The straight channeling stylet is then removed. Once accurate placement is confirmed, a bipolar probe is inserted into the posterior half of the vertebral body, connected to the radiofrequency generator, and radiofrequency energy is applied for 15 minutes to destroy the basivertebral nerve. The next vertebral body is accessed sequentially using the same technique with additional instrumentation required. Energy is applied for 15 minutes to destroy the basivertebral nerve in this adjacent vertebral body. At the completion of the procedure, all instruments are removed, and the incisions are closed.
Report 64628 for destruction of the intraosseous basivertebral nerve within two consecutive vertebral bodies (1 motion segment); report 64629 for each additional destruction of intraosseous basivertebral nerve within each additional vertebral body.

Description of Post-Service Work: N/A

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status?

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
22515	ZZZ	4.00	**RUC Time**

CPT Descriptor Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)"

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
22552	ZZZ	6.50	**RUC Time**

CPT Descriptor Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
63048	ZZZ	3.87	**RUC Time**	128,927

CPT Descriptor 1 Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
34812	ZZZ	4.13	**RUC Time**	9,013

CPT Descriptor 2 Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
63103	ZZZ	4.82	**RUC Time**

CPT Descriptor Vertebral corpectomy (vertebral body resection), partial or complete, lateral extracavitary approach with decompression of spinal cord and/or nerve root(s) (eg, for tumor or retropulsed bone fragments); thoracic or lumbar, each additional segment (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 47 **% of respondents:** 81.0 **%**

Number of respondents who choose 2nd Key Reference Code: 2 **% of respondents:** 3.4 **%**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	20%	48%	32%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	27%	73%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	2%	18%	80%
Physical effort required	2%	25%	73%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	36%	59%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	0%	100%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	100%	0%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	100%	0%
Physical effort required	0%	100%	0%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	100%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Codes 64628 and 64629 were established at the CPT Editorial Panel Meeting in October 2020 to report ablation of the interosseous basivertebral nerve. These new codes were then placed on the RUC New/Revised Level of Interest Form. Multiple societies responded with an interest in surveying.

64628 was given a global period of 010 days and 64629 was given a global period of ZZZ as an add-on code.

AAPM, AAPM&R, ASIPP, NASS, SIS, and ISASS conducted random samples of their members. In addition, the specialties requested permission from the RUC Research Subcommittee to additionally include trained physicians from a list provided by the device manufacturer Relievant Inc.

A total of 1364 survey requests were sent out, with 290 going to the targeted survey list provided by Relievant. A total of 58 non-financially conflicted surveys were completed.

The median experience rate for the surveyed procedure in the last 12 months was 2.

Survey Results

Intra-Service:

- Median Intra-service time=60 minutes

Total Survey Time: 212 minutes

Survey Work RVU

- 25th % Work RVU=4.87
- Median Work RVU=7.00
- 75th% Work RVU=10.00

Key Reference Services

Survey respondents choose CPT code 22515, Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure) as the primary key reference code with 53 respondents (81%) choosing it as the KRS. Multiple other reference services were chosen by 2 respondents, but none was chosen by more than 2 additional respondents.

Recommended Time and Work RVU

A consensus panel of RUC advisors from the surveying specialties met and recommend the following time and work RVU for CPT code 64629

Intra-Service:

- Median Intra-service time=60 minutes

Total Survey Time: 60 minutes

Work RVU=4.87 (25th % survey work RVU).

The Consensus Panel felt the survey 25th % work RVU of 4.87 to be an appropriate work RVU for 64629. 4.87 was the 25th % work RVU from the survey which we believe is an accurate reflection of physician work and intensity as indicated by the survey respondents and the fact they have experience with the procedure. A work RVU of 4.87 maintains appropriate relativity with the base code of 64628 at the recommended work RVU of 9.75 as 64629 has no pre or post work included and should be approximately 50% of the base code work RVU. The Consensus Panel felt the survey median work RVU of 7.00 would be too high relative to 64628 and not represent an appropriate reduction in work RVU relative to the reduced total times.

The 25th % survey work RVU of 4.87 is also more appropriately relative to the work RVU for the KRS of 22515 at 4.00 and has a similar reduction in work RVU to the base codes for 22515 (22513 and 22513). Thus, a work RVU of 4.87 maintains appropriate relativity with the work RVUs for the family of Key Reference Services with an IWPUT considerably lower than KRS 22515 suggesting 4.87 falls on the lower end of the range of appropriate work RVU for 64629.

In addition, the Consensus Panel also compared 64629 to other ZZZ global period codes. There are several ZZZ codes with 60 minutes of intra-time and similar work RVUs. Specifically, CPT code 61799, CPT code 63103 and CPT code 22854. All three have been RUC surveyed, all are spinal/cranial procedures, and 61799 and 63103 having almost identical WRVUS. 22854 has a significantly higher RVW even with the same 60 minutes of intra-service time.

CPT CODE	DESCRIPTOR	WORK RVU	INTRA-SERVICE TIME	TOTAL TIME	IWPUT
22515	Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)	4.00	30	32	.132
61799	Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); each additional cranial lesion, complex (List separately in addition to code for primary procedure)	4.81	60	60	.080
63103	Vertebral corpectomy (vertebral body resection), partial or complete, lateral extracavitary approach with decompression of spinal cord and/or nerve root(s) (eg, for tumor or retropulsed bone fragments); thoracic or lumbar, each additional segment (List separately in addition to code for primary procedure)	4.82	60	60	.080
64629	**Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; each additional vertebral body, lumbar or sacral (List separately in addition to code for primary procedure)**	**4.87**	**60**	**60**	**.081**
22854	Insertion of intervertebral biomechanical device(s) (eg, synthetic cage, mesh) with integral anterior instrumentation for device anchoring (eg, screws, flanges), when performed, to vertebral corpectomy(ies) (vertebral body resection, partial or complete) defect, in conjunction with interbody arthrodesis, each contiguous defect (List separately in addition to code for primary procedure)	5.50	60	60	.092

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. As the add-on code, 64629 would be reported with 64628, the base code when performed. The October 2020 CPT Code Change Proposal estimated that 64629 would be reported approximately 11% of the time that 64628 is reported

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
64628	Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; first two vertebral bodies, lumbar or sacral	010
64629	Thermal destruction of intraosseous basivertebral nerve, inclusive of all imaging guidance; first two vertebral bodies, lumbar or sacral each additional vertebral body, lumbar or sacral (List separately in addition to code for primary procedure) (Do not report 64628, 64629 in conjunction with 77003, 77012)	ZZZ

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
64628	A 50-year-old female with more than 6 months of chronic axial low back pain who failed a minimum of 6 months of traditional conservative therapies, including active physical therapy or chiropractic care, spinal injections and/or medications. An MRI demonstrates degenerative disc disease at L5-S1 with associated endplate changes consistent with Modic Type I in the L5 and S1 vertebral bodies.
64629	A 50-year-old female with more than 6 months of chronic axial low back pain who failed a minimum of 6 months of traditional conservative therapies, including active physical therapy or chiropractic care, spinal injections and/or medications. An MRI demonstrates degenerative disc disease at L5-S1 with associated endplate changes consistent with Modic Type I in the L5 and S1 vertebral bodies. Note: This is an add-on service. Only consider the additional work related to the primary procedure.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our Committee Expert Panel reviewed the code descriptors and typical patients and developed consensus recommendations for clinical staff time, equipment, and supplies. The panel recommends standard 010 global facility inputs for 64628 with no additional time or equipment. The panel recommends standard ZZZ facility inputs of 0 for 64629

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   64628 KRS-22514: Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; lumbar

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

64629 KRS-22515: Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; each additional thoracic or lumbar vertebral body (List separately in addition to code for primary procedure)

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

   N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   Clinical staff explains where to come for the appointment, checks medications, runs through list of medical conditions, makes sure the patient is off anti-coagulation drugs, confirms if patient uses BP medications, walks the patient through the procedure, confirms whether a driver is available for a ride home and answers patient questions.

   b. Service period (includes pre, intra and post):

   Clinical staff will be available throughout the procedure to circulate and provide clean supplies and instruments, assist with equipment needs, and assist with maintaining patient's extremity position or repositioning.

   c. Post-service period:

   Standard clinical staff work during post-op office follow up visits

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

   N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

   N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

no

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EQ168	light, exam	1332.1952	0.003535282	36	36	36
EF031	table, power	5968.4775	0.015838707	36	36	36

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

The consensus panel recommends 30 minutes pre-service clinical staff inputs. The PE subcommittee has a standard of 0 minutes for pre-service clinical staff work for 010 global period codes such as

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

64628. 64628 however is not a typical 010 global period procedure. It is an extensive procedure, more similar to a typical 090-day global period procedure (which is assigned 60 minutes clinical pre-service time as a standard) than many more "minor" 010 global period procedures such as injections. 64628 is performed in a facility only, and under general anesthesia. It requires extensive clinical staff work in advance of the procedure to complete diagnostic and referral forms, completed pre-surgical checklists, schedule equipment for the facility, obtain consent and complete consent forms and phone calls including prescription setup/ordering. Clinical staff are essential in the pre-service period and are engaged extensively. 30 minutes of pre-service clinical staff time is an appropriate assignment for 64628 and matches the KRS 22514 pre-service clinical staff allocation. 22514, Kyphoplasty is similar in its setting and pre-service work requirements and the 30 minutes pre-service clinical staff time maintains that relativity appropriately.

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee (RUC)
Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: New Technology/ New Service*

January 2021

Dilation of Aqueous Outflow Canal – Tab 15

CPT codes 66174 and 66175 were identified through the New Technology/New Services List. In January 2020, the specialty societies submitted an action plan and the RUC recommended referral to the CPT Editorial Panel May 2020 meeting to possibly revise the descriptor and add exclusionary parentheticals for CPT 66174. In October 2020, the CPT Editorial Panel added a parenthetical to 66174 to restrict reporting this code in conjunction with CPT code 65820.

66174 ***Transluminal dilation of aqueous outflow canal; without retention of device or stent***
The RUC reviewed the survey results from 72 ophthalmologists and assessed the relativity of CPT codes 66174 and 66175; the RUC determined that the relativity of the 25th percentile survey results should be maintained. The RUC determined that the increment between the 25th percentile work RVU value for CPT code 66174 (work RVU = 10.28) and the survey 25th percentile work RVU value for CPT code 66175 (work RVU = 12.00) would yield an increment between these two codes of 1.72. The specialty society agreed that this increment appropriately represents the value between these two codes (representative of the retention of device or stent). This comparison results in a work RVU recommendation of 8.53 for CPT code 66174 with 173 minutes total time. The RUC recommends 13 minutes of pre-service evaluation time, 1 minute of pre-service positioning time, 6 minutes of pre-service scrub/dress/wait time, 20 minutes of intra-service time, 6 minutes of immediate post-service time, 0.5-99238 discharge visit, 1-99212 office visit, and 4-99213 office visits.

For additional support, the RUC also reviewed CPT code 66174 by isolating the same-day work and comparing it to other existing 000-day global codes. The RUC selected two 000-day global codes: CPT code 15273 *Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children* (work RVU = 3.50 and 20 minutes intra-service time) and CPT code 16035 *Escharotomy; initial incision* (work RVU = 3.74 and 20 minutes intra-service time). The RUC chose these values because they have intra-service times of 20 minutes (identical to the survey median intra-service time of 20 minutes). The RUC then added the total work RVU value of the 0.5-99238, 4-99213, and 1-99212 outpatient office visits (total work RVU = 5.00) to the selected bracket values. This methodology yields work RVU values of 8.50 for CPT code 15273 and 8.74 for CPT code 16035. This is a strong indication that the 8.53 work RVU recommendation for CPT code 66174 is appropriate when comparing to other services. **The RUC recommends a work RVU of 8.53 for CPT code 66174.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

66175 ***Transluminal dilation of aqueous outflow canal; with retention of device or stent***
The RUC reviewed the survey results from 49 ophthalmologists for CPT code 66175 and determined that it was appropriate to recommend a direct work RVU crosswalk to CPT code 67110 *Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)* (work RVU = 10.25, 30 minutes intra-service time, 196 minutes total time). The RUC recommends 13 minutes of pre-service evaluation time, 1 minute of pre-service positioning time, 6 minutes of pre-service scrub/dress/wait time, 30 minutes of intra-service time, 7 minutes of immediate post-service time, 0.5-99238 discharge visit, 1-99212 office visit, and 4-99213 office visits.

Additionally, the RUC compared the survey code to CPT code 66982 *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation* (work RVU = 10.25, 30 minutes of intra-service time, 175 minutes of total time) and noted that both codes have identical intra-service time and involve similar physician work, supporting the recommended work value of 10.25. **The RUC recommends a work RVU of 10.25 for CPT code 66175.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

RUC Database Flag
The RUC recommends to flag CPT code 66174 as "do not use to validate for physician work" since the RUC recommendation was not based on direct survey RVUs.

Practice Expense
For CPT codes 66174 and 66175, the Practice Expense Subcommittee approved the standard 090-day global period direct practice expense inputs. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

CPT Descriptor: Transluminal dilation of aqueous outflow canal; without retention of device or stent

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male presents with a five-year history of chronic open angle glaucoma with intraocular pressure uncontrolled in the right eye. Visual field testing of the right eye reveals progressive glaucomatous damage.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 22% , In the ASC 78%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and family and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications. Perform a surgical time out. Administer sub-Tenon, peribulbar, or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface. Position the operating microscope.

Description of Intra-Service Work: Corneal traction sutures are placed. The sclera is exposed through a 6 mm conjunctival incision at the desired surgical site. A limbal-based superficial scleral flap, approximately 4 mm in width and 4 mm in length, is made to a depth of one-third scleral thickness, or approximately 300 microns. A second, inner scleral flap is made directly under the superficial flap, approximately 0.5 mm anterior to the margin of the superficial flap, to a depth approximately 100 microns above the level of the ciliary body.

The inner scleral flap is progressively dissected anteriorly to the aqueous outflow canal (Schlemm canal), exposing Descemet membrane. The membrane is then excised at the anterior limit of the dissection to de-roof the canal and create a window. Both of the exposed ostia of the canal are dilated first with balanced salt solution and then viscoelastic. A paracentesis is performed.

A flexible microcatheter is inserted into the canal and advanced. The catheter is slightly withdrawn and additional viscoelastic injected when areas of resistance are encountered, then further advanced the entire extent of the canal (360 degrees. The microcatheter is then withdrawn while viscoelastic is simultaneously injected, dilating the canal for its entire extent.

Viscoelastic is aspirated from the anterior chamber with an irrigation/aspiration handpiece. The anterior chamber is reformed with balanced salt solution and the intraocular pressure adjusted to a physiologic range. The outer scleral flap and conjunctiva are separately sutured closed to seal the surgical site. The incisions are tested for leaks. The lid speculum is removed. Antibiotic ointment is placed on the eye as necessary. The eye is patched with a soft patch and a rigid shield.

Description of Post-Service Work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow

up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
54530	090	8.46	**RUC Time**	1,190

CPT Descriptor 1 Orchiectomy, radical, for tumor; inguinal approach

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
67904	090	7.97	**RUC Time**	54,853

CPT Descriptor 2 Repair of blepharoptosis; (tarso) levator resection or advancement, external approach

Other Reference CPT Code	Global	Work RVU	Time Source
67210	090	6.36	**RUC Time**

CPT Descriptor Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 26 **% of respondents:** 36.1 **%**

Number of respondents who choose 2nd Key Reference Code: 13 **% of respondents:** 18.0 **%**

Physical effort required	31%	62%	8%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	31%	54%	15%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66174, *Transluminal dilation of aqueous outflow canal; without retention of device or stent* and CPT 66175, *Transluminal dilation of aqueous outflow canal; with retention of device or stent* are 090-day global CPT codes describing non-penetrating surgical treatments for glaucoma. They were initially published in 2011 and have been reviewed periodically under the new technology screen. Both had very few claims until 2017, at which time CPT 66174 began doubling in volume while CPT 66175 experienced a significant reduction in claims.

The increase in 66174 utilization is because it is a newer glaucoma procedure that doesn't create an external conjunctival bleb, with its attendant long-term risks of scarring, failure, and infection. Therefore, this procedure is being done on some patients that would have had a full-thickness bleb-producing glaucoma procedure and on some patients with glaucoma as an alternative to multiple topical glaucoma medications, particularly when those

patients are undergoing cataract surgery. This also explains the performance of 66174 in conjunction with cataract surgery 60% of the time. The frequent reporting of 66174 with goniotomy, 65820 – 40% of the time – has been a source of concern for some time. It is not warranted because the work of 65820 is already included in 66174. The Academy advocated for a CCI edit to bundle the two procedures, and that went into effect as of July 1, 2020.

CPT 66175, which adds permanent stent placement to the dilation procedure, has dropped off dramatically in claims volume. Permanent stent placement was initially thought to result in greater and possibly longer-lasting pressure reduction, but differences have not proven to be as significant as anticipated, resulting in a shift in volume towards the shorter procedure.

Both codes were surveyed for the January 2021 meeting.

CPT 66174 and 66175 are in a section of CPT labeled "Anterior Sclera – Excision" with six other procedures. CPT 66130, *Excision of lesion, sclera*, is unrelated to any of the other codes in the section, which are all for treatment of glaucoma. The five other glaucoma procedures in the section (CPT 66150, 66155, 66160, 66170, and 66172) are a family of codes that describe various means of creating a fistula with a filtering bleb to reduce intraocular pressure. The surgical technique is markedly different from that of CPT 66174 and 66175, which increase outflow through the trabecular meshwork without creating a fistula or a bleb and do not include excision of sclera. The intraoperative physician work and postoperative management of CPT 66174 and 66175 differ because of the absence of the fistula and bleb, making them in a separate family from CPT 66150-66172.

A survey of CPT 66174 sent to a random sample of American Academy of Ophthalmology and American Glaucoma Society members had 72 respondents, with 97% indicating the vignette to be typical. The code's current work value is 12.85 RVU. The survey median WRVU was 12.35 and the 25th percentile was 10.28. The median IST was 20 minutes. The survey showed five 99213 postoperative visits.

The top key reference service, chosen by 36% of respondents, was CPT 66183, *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach*
(RUC 2013), with a WRVU of 13.20, an IST of 45 minutes, and five level 3 and three level 2 postoperative visits. The second reference service, chosen by 18% of respondents, was CPT 66184, *Revision of aqueous shunt to extraocular equatorial plate reservoir; without graft* (RUC 2014), with a WRVU of 9.58, an IST of 60 minutes, and four level 3 and three level 2 postoperative visits. Both have substantially longer ISTs than the surveyed code to create or revise a filtering conjunctival bleb and more postoperative visits to manage the bleb. Most of the intraservice work of the chosen reference codes, while on an open eye, is extraocular. In contrast, the surveyed code involves primarily intraocular work. Fifty-eight percent of respondents ranked the surveyed code as identical to the top reference service on overall intensity and complexity, with 34% ranking the surveyed code higher. The majority ranked the surveyed code (66174) higher than the top reference service on technical skill and were split on physical effort.

The expert panel of the AAO and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The panel agreed with the median IST of 20 minutes. This is a substantial reduction from the current value of 60 minutes and is related to increasing familiarity with the procedure and significant improvements in the instrumentation used to cannulate the outflow canal since introduction of the procedure.

The panel agreed with the surveyed number of postoperative visits but reduced the level of one of the postoperative visits from 99213 to 99212. The level 2 visit is done on the first postoperative day to check vision, pressure, incision integrity, and level of inflammation. These patients typically have unstable postoperative IOP due to their glaucoma and require frequent pressure monitoring. They also have significant and persistent postoperative inflammation related to intraoperative instrumentation of uveal tissue for 360 degrees, necessitating more frequent dilated examinations to monitor the retina for development of cystoid macular edema (CME). Early detection and treatment of CME, prior to reduced visual acuity, improves visual outcomes but requires a careful dilated exam. Dilated level 3 examinations are typical at 1, 2-3, 6-8, and 10-12 weeks. This duration of inflammation after surgery with the attendant risk of CME was not recognized at the time the

procedure was introduced and valued in 2010. This explains why the number of dilated examinations has increased from 2 to 4 even as the total number of postop visits has decreased from 6 to 5.

We chose pre-service package 1 (straightforward patient, straightforward procedure) and reduced the survey pre-evaluation time from 21 to 13 minutes to match the package. We reduced the survey positioning and scrub/dress/wait times from 5 and 9 minutes to the package times of 1 and 6 minutes respectively. We used the survey post-service time median of 6 minutes, which is less than the 18 minutes of post-service time package 7A (local anesthesia, straightforward procedure), and one-half of a 99238 for discharge day management. Total time for the procedure is 173 minutes, with an IST of 20 minutes.

We considered the survey 25th percentile work value of 10.28 and rejected it as too high, based on the significant reduction in IST found in the survey and an associated IWPUT of 0.239, creating an anomalous relationship with other intraocular procedures.

There are very few eligible crosswalks for a short-IST code with multiple postop visits. There are only six 090-day global CPT codes in the RUC database with ISTs between 16 and 24 minutes that have been reviewed in the last 10 years. One has a negative IWPUT and another has been flagged as not to be used to validate physician work. The remainder (CPT 22310, 26055, 26160, and 67914) have work values ranging from 3.11-3.75 RVU, well below the survey low value and any reasonable estimate of necessary physician work for an intraocular glaucoma procedure.

We considered a crosswalk to CPT 67210, *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (RUC 2010), with 6.36 WRVU, an IST of 15 minutes, and a total time of 106 minutes. CPT 66711, *Ciliary body destruction; cyclophotocoagulation, endoscopic, without concomitant removal of crystalline lens* (RUC 2019) is an even better match, with a 20-minute IST identical to that of the surveyed code and a much closer total time of 191 minutes. In 2019 the RUC recommended a work value of 6.36 RVU for CPT 66711, but this was reduced by CMS to 5.62 RVU. The work value of 6.36 is below the survey low value, and results in an IWPUT of 0.043, low for an intraocular procedure.

After considering reviewer comments and discussion at the pre-facilitation meeting, we also considered two additional incremental methods:

- Reduce our recommended value for CPT 66175, 10.25 WRVU, by the difference in the survey 25th percentile work values for CPT 66175 (12.00) and CPT 66174 (10.28). This results in a work of 8.53 WRVU for 66174. The associated IWPUT of 0.152 remains higher than the procedure's current IWPUT of 0.131.
- An IWPUT-matching method which acknowledges that although the procedure takes less time than when it was introduced, the intensity has not changed. The work value that matches the current IWPUT (0.131) is 8.11 RVU.

We ultimately settled on the latter method and a value of 8.11 WRVU as the most accurate way to value the procedure. This is below the survey 25th percentile value. The IWPUT (0.131) places the procedure in an appropriate intensity rank order with other intraocular procedures.

We recommend a work value of 8.11 WRVU for CPT 66174, with times of 20/20/6 and a total time of 173 minutes. Because of the non-traditional valuation methodology, we also recommend that CPT 66174 be flagged to not be used to validate physician work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) It is one option for patients with concurrent cataract and poorly controlled glaucoma.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3. CPT Code	Pre-	Intra-	Post-	Total Time	Work RVU	Global Period	% Billed Together
4. 66984	20	20	5	126	7.35	090	60.6%

Global Period: 090 Current Work RVU: **13.60** RUC Recommended RVU: **10.25**

CPT Descriptor: Transluminal dilation of aqueous outflow canal; with retention of device or stent

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male presents with a five-year history of chronic open angle glaucoma with intraocular pressure uncontrolled in the right eye. Visual field testing of the right eye reveals progressive glaucomatous damage.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 22% , In the ASC 78%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and family and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications. Perform a surgical time out. Administer sub-Tenon, peribulbar, or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface. Position the operating microscope.

Description of Intra-Service Work: Corneal traction sutures are placed. The sclera is exposed through a 6 mm conjunctival incision at the desired surgical site. A limbal-based superficial scleral flap, approximately 4 mm in width and 4 mm in length, is made to a depth of one-third scleral thickness, or approximately 300 microns. A second, inner scleral flap is made directly under the superficial flap, approximately 0.5 mm anterior to the margin of the superficial flap, to a depth approximately 100 microns above the level of the ciliary body.

The inner scleral flap is progressively dissected anteriorly to the aqueous outflow canal (Schlemm canal), exposing Descemet membrane. The membrane is then excised at the anterior limit of the dissection to de-roof the canal and create a window. Both of the exposed ostia of the canal are dilated first with balanced salt solution and then viscoelastic. A paracentesis is performed.

A flexible microcatheter is inserted into the canal and advanced. The catheter is slightly withdrawn and additional viscoelastic injected when areas of resistance are encountered, then further advanced the entire extent of the canal (360 degrees. With the microcatheter in place, a device (e.g., flexible stent, suture) is attached to the distal tip of the microcatheter. The microcatheter is then withdrawn while viscoelastic is simultaneously injected, dilating the canal and facilitating maintenance of the stent within the canal for its entire extent (360 degrees). Once the flexible microcatheter is removed, the stent remaining within the canal is tied at a tension which will facilitate aqueous flow through the trabecular meshwork.

Viscoelastic is aspirated from the anterior chamber with an irrigation/aspiration handpiece. The anterior chamber is reformed with balanced salt solution and the intraocular pressure adjusted to a physiologic range. The outer scleral flap and conjunctiva are separately sutured closed to seal the surgical site and cover the stent. The incisions are tested for leaks. The lid speculum is removed. Antibiotic ointment is placed on the eye as necessary. The eye is patched with a soft patch and a rigid shield.

Description of Post-Service Work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66174, *Transluminal dilation of aqueous outflow canal; without retention of device or stent* and CPT 66175, *Transluminal dilation of aqueous outflow canal; with retention of device or stent* are 090-day global CPT codes describing non-penetrating surgical treatments for glaucoma. They were initially published in 2011 and have been reviewed periodically under the new technology screen. Both had very few claims until 2017, at which time CPT 66174 began doubling in volume while CPT 66175 experienced a significant reduction in claims. This is discussed in detail in the SOR for CPT 66174.

As noted in the SOR for CPT 66174, both of these codes are in a family by themselves within the CPT section "Anterior Sclera – Excision" but do not actually describe a scleral excision procedure.

A survey of CPT 66175 sent to a random sample of American Academy of Ophthalmology and American Glaucoma Society members had 49 respondents, with 84% indicating the vignette to be typical. The code's current work value is 13.60 RVU. The survey median WRVU was 13.50 and the 25th percentile was 12.00. The median IST was 30 minutes. The survey showed five 99213 postoperative visits.

The top key reference service, chosen by 33% of respondents, was CPT 66183, *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach* (RUC 2013), with a WRVU of 13.20, an IST of 45 minutes, and five level 3 and three level 2 postoperative visits. The second reference service, chosen by 29% of respondents, was CPT 66179, *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (RUC 2014), with a WRVU of 14.00, an IST of 55 minutes, and five level 3 and three level 2 postoperative visits. Both have substantially longer ISTs than the surveyed code related to the number of postoperative visits necessary to manage a filtering bleb. Most of the intraservice work of the chosen reference codes, while on an open eye, is extraocular. In contrast, the surveyed code involves primarily intraocular work, increasing its complexity. The majority of respondents ranked the surveyed code as identical to both reference services on overall intensity and complexity and mental effort and judgment. The majority ranked the survey code higher than the top reference service on technical skill and physical effort and were split on overall psychological stress.

The expert panel of the AAO and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The panel agreed with the median IST of 30 minutes. This is less than half the current value of 68 minutes and is related to increasing familiarity with the procedure and improvements in the instrumentation, the surgical approach, and the stent used to cannulate the outflow canal since introduction of the procedure.

The panel agreed with the surveyed number of postoperative visits but reduced the level of one of the postoperative visits from 99213 to 99212. The level 2 visit is done on the first postoperative day to check vision, pressure, incision integrity, and level of inflammation. These patients typically have unstable postoperative IOP due to their glaucoma and require frequent pressure monitoring. They also have significant and persistent postoperative inflammation related to intraoperative instrumentation of uveal tissue for 360 degrees, necessitating more frequent dilated examinations to monitor for development of cystoid macular edema. This is discussed in detail in the SOR for CPT 66174. Dilated level 3 examinations are typical at 1, 2-3, 6-8, and 10-12 weeks postoperatively.

We chose pre-service package 1 (straightforward patient, straightforward procedure) and reduced the survey pre-evaluation time from 21 to 13 minutes to match the package. We reduced the survey positioning time from 5 minutes to the package time of 1 minute and maintained the survey scrub/dress/wait time of 6 minutes, matching the package time. We used the survey post-service time median of 7 minutes, which is less than the 18 minutes of post-service time package 7A (local anesthesia, straightforward procedure), and one-half of a 99238 for discharge day management. Total time for the procedure is 184 minutes, with an IST of 30 minutes.

There are only six 090-day global CPT codes in the RUC database with ISTs between 26 and 34 minutes that have been reviewed within 10 years. Most have much shorter total times and fewer postoperative visits than the surveyed code and work values below the survey's low value. The procedure with the closest work value to the survey's 25th percentile is CPT 66982, *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation* (RUC 2019) with 10.25 WRVU, an identical IST of 30 minutes and an almost identical IST of 175 minutes, 2 minutes shorter than that of the surveyed code.

We recommend a work value of 10.25 RVU for CPT 66175, with a crosswalk to CPT 66982, complex cataract surgery. The times are an excellent match. The IWPUT at this value, 0.158, is appropriately lower than that of complex cataract surgery (0.180) and is consistent with the intensity and complexity of a procedure on a patient with poorly controlled glaucoma requiring a high degree of technical skill cannulating Schlemm canal for 360

degrees without unroofing the trabecular meshwork. The IWPUT is similar to that of vitrectomy codes CPT 67042 and 67041 (0.160), placing CPT 66175 in appropriate rank order with other intraocular procedures. The recommended work value is below the survey 25th percentile of 12.00 WRVU and well below the current value of 13.60 WRVU.

We are aware that the work value of CPT 66982 is being reaffirmed at this meeting. Although it was reviewed in 2019, it is in a family with a new CPT code, 669X1, which has been surveyed for this meeting. If CPT 66982 is considered ineligible as a crosswalk due to this status, we will substitute as a crosswalk the same procedure that was used as a crosswalk to value CPT 66982 in 2019. That procedure is CPT 67110, *Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)* (RUC 2014), with 10.25 WRVU, an identical 30-minute IST, and a total time of 196 minutes. CPT 67110 involves intraocular gas injection. Although a complex intraocular procedure, it does not involve the sustained intraocular manipulations of either CPT 66982 or 66175 or the vitrectomy codes noted above (CPT 67041, 67042). CPT 67110 therefore appropriately has a lower IWPUT than the vitrectomy or cataract procedures and the surveyed code, CPT 66175, maintaining an appropriate rank order of complexity among intraocular procedures.

We recommend a work value of 10.25 WRVU for CPT 66175, with times of 20/30/7 and a total time of 184 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 400
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate based on RUC DB and recent growth.

Specialty Ophthalmology Frequency 400 Percentage 100.00 %

Specialty Frequency Percentage %

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
66174	Transluminal dilation of aqueous outflow canal; without retention of device or stent	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
66174	A 55-year-old male presents with a five-year history of chronic open angle glaucoma with intraocular pressure uncontrolled in the right eye. Visual field testing of the right eye reveals progressive glaucomatous damage.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. The consensus committee considered the survey data and PE details to determine clinical time. Additionally, applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   Reference Code is the Existing Code

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

   N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Transluminal dilation of aqueous outflow canal surgery is major glaucoma surgery with a 90-day global. Standard inputs are used during the pre-service period consistent with PEAC recommendations for 90-day global procedures.

   b. Service period (includes pre, intra and post):

This time accounts for the standard inputs of same day discharge management.

   c. Post-service period:

This time accounts for staff time during postoperative visits. Standard times were used based on the level of postoperative office visit as determined by the RUC-approved survey data for this code.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

Ophthalmology pack for dilated eye exams – utilized on visits requiring a dilated exam. Ophthalmology pack for non-dilated eye exams – utilized on non-dilated postoperative visits.

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

Exam lane: Standard office visit formula used. Screening lane: Standard office visit formula used.

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Category III Codes

January 2021

Cataract Removal with Drainage Device Insertion – Tab 16

The RUC identified CPT code 0191T via the Category III codes with High Utilization screen (2018 estimated Medicare utilization over 1,000). In January 2020, the RUC recommended that the specialty societies develop a coding application for Category I status. In October 2020, the CPT Editorial Panel replaced two Category III codes with two new codes to report extracapsular cataract removal with insertion of intraocular lens prosthesis and one Category III code to report insertion of anterior segment aqueous drainage device without concomitant cataract removal.

66989 ***Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more***
The RUC reviewed the survey results from 113 ophthalmologists and cataract and refractive surgeons for CPT code 66989 and determined that the survey 25th percentile work RVU of 12.13 appropriately accounts for the work required to perform this service. The RUC recommends 26 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 7 minutes of pre-service scrub/dress/wait time, 28 minutes of intra-service time, 8 minutes of immediate post-service time, 0.5-99238 discharge visit, 1-99212 office visit, and 3-99213 office visit.

The RUC notes that the recommended intra-service time of 28 minutes of intra-service time for CPT code 66989 two minutes less the intra-service time of 30 minutes associated with CPT code 66982 *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation*, while the intra-service time for CPT code 66991 is 5 minutes higher than the 20 minutes of intra-service time associated with code CPT 66984 *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation*. The RUC noted that this should not be the case, as the insertion of the intraocular lens prosthesis should take the same amount of time and be represented by the same relative work for both procedures. The RUC further noted that it is counterintuitive that 66989's intra-service time would be lower than 66982's intra-service time, as 66989 includes both complex cataract surgery and the insertion of the intraocular anterior segment aqueous drainage device. The specialty society explained that this is likely because the early adopters of this new technology service are highly skilled surgeons who perform these procedures quickly; as this

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

procedure diffuses into the wider population of ophthalmologic surgeons over the next few years, the intra-service time will likely rise above the intra-service time associated with codes 66982 and 66984 and will come in line for both CPT 66989 and 66991.

The RUC compared CPT code 66989 to key reference services CPT code 66183 *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach* (work RVU = 13.20, total time 257 minutes) and CPT code 66179 *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (work RVU = 14.00, total time 272 minutes) and determined that the difference between the survey 25th percentile work RVU value for 66989 and the work RVU value for 66982 appropriately represent the work associated with code 66989 and that this places 66989 in appropriate rank order with the two key reference services, both of which have higher total time and more intense physician work. **The RUC recommends a work RVU of 12.13 for CPT code 66989.**

66991 ***Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more***
The RUC reviewed the survey results from 114 ophthalmologists and cataract and refractive surgeons for CPT code 66991 and assessed the relativity of CPT code 66991 and CPT code 66984 *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation*. The RUC agreed with the specialty society that the difference in work between CPT code 66989 and CPT code 66991 is whether the cataract procedure is complex (CPT code 66989) or routine (CPT code 66991). Therefore, the RUC determined that it would be appropriate to use the increment between the 25th percentile work RVU value for CPT code 66989 and the current RUC-reviewed work RVU value for CPT code 66982 to build a work RVU recommendation for CPT code 66991. The RUC determined that the increment between the 25th percentile work RVU value for CPT code 66989 (work RVU = 12.13) and the current RUC-reviewed work RVU value for CPT code 66982 (work RVU = 10.25) would yield an increment between those two codes of 1.88. This comparison results in a work RVU recommendation of 9.23 for CPT code 66991. The RUC recommends 25 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 7 minutes of pre-service scrub/dress/wait time, 25 minutes of intra-service time, 8 minutes of immediate post-service time, 0.5-99238 discharge visit, 1-99212 office visit, 3-99213 office visit. **The RUC recommends a work RVU of 9.23 for CPT code 66991.**

Affirmation of RUC Recommendations
The RUC reviewed the specialty society's request to affirm the recent valuations for CPT codes 66982, 66984, 66987 and 66988. The specialty society noted that these codes are in the same family as CPT codes 66989 and 66991 but did not need to be resurveyed for the January 2021 RUC meeting as they had just been reviewed at the January 2019 RUC meeting and that there have been no changes in the typical physician work, patient population, technology, and site of service associated with these procedures. The RUC noted that it would be necessary to re-survey this entire family of codes in two years once the new procedures described by CPT codes 66989 and 66991 have diffused into the wider ophthalmology population. **The RUC recommends affirming the current work RVU of 10.25 for code 66982, 7.35 for code 66984, 13.15 for code 66987, and 10.25 for code 66988**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RUC Database Flag
The RUC recommends flagging CPT code 66991 as "do not use to validate for physician work" since the RUC used an incremental work RVU building block methodology for valuation.

Practice Expense
For CPT codes 66989 and 66991, the Practice Expense Subcommittee approved the standard 090-day global period direct practice expense inputs. For CPT codes 66982, 66984, 66987, and 66988, the Practice Expense Subcommittee affirmed the current direct practice expense inputs. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

New Technology
CPT codes 66989 and 66991 will be placed on the New Technology list and be re-reviewed by the RUC in two years (with CPT codes 66982, 66984, 66987, and 66988) to ensure correct valuation and utilization assumptions.

Peter Smith, MD
Chair, Specialty Society Relative Value Scale Update Committee
American Medical Association Plaza
330 N. Wabash Ave., Suite 39300
Chicago, IL 60611-5885

Dear Dr. Smith:

The American Academy of Ophthalmology is requesting that the RUC reaffirm the recent valuations for CPT codes 66982, 66984, 66987, and 66988. These procedures are in a family with two new codes, CPT 66989 and 66991, that are being presented at this meeting. The entire family of existing cataract codes was reviewed at the January 2019 RUC meeting. These codes do not need to be re-reviewed at this time because there have been no changes in the procedures: the typical physician work, patient population, technology, and site of service have not changed in many years, and certainly not since the last RUC valuation two years ago.

Additionally, although CPT 66987 and 66988 were new CPT codes in 2020, they are not new technology. These two codes are combinations of long-existing procedures - endocyclophotocoagulation (CPT 66711) plus cataract (CPT 66982 or 66984). They were created because CPT 66711 was being reported over 75% of the time with one of the cataract services.

As such, we will not be surveying nor recommending new values for CPT 66982, 66984, 66987, or 66988 at the January 2021 RUC meeting.

We are happy to discuss this further should you need additional information.

Sincerely,

David B. Glasser, M.D.
AAO RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:66989 Tracking Number S2 Original Specialty Recommended RVU: **12.13**
Presented Recommended RVU: **12.13**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **12.13**

CPT Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year-old man with a cortical cataract severe enough to no longer allow vision for reading who requires cataract removal and replacement with an intraocular lens. He has a history of use of systemic medications causing floppy iris syndrome and the intraoperative use of an iris retraction device is planned. In addition, his increased intraocular pressure is not well controlled on two topical medications so placement of an aqueous drainage device through an internal approach is planned at the same time.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 16% , In the ASC 82%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and family and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Perform a surgical time out. Administer sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface..

Description of Intra-Service Work: Insert a lid speculum. Position the microscope. Make a side-port incision 45 to 90 degrees away from the intended site of the surgical incision. Fill the anterior chamber with a viscoelastic. Create a temporal multiplanar limbal/corneal incision into the anterior chamber. Make four additional 1-mm incisions at the limbus in order to place iris hooks in a diamond pattern around the eye. One by one, insert the iris hooks into the incisions and manipulate to retract the iris. Reposition the iris hooks in the areas of loose zonules to better support the iris and the capsule during subsequent steps of cataract removal.

Enter the eye through the main incision with a sharp bent needle to open the anterior capsule, followed by forceps to fashion a circular opening in the anterior capsule of the cataract. Insert a cannula into the eye to perform hydrodissection by injecting balanced salt solution between the lens cortex and capsule, loosening the nuclear and cortical layers of the lens in the process, while maintaining the integrity of the capsule. Hydrodelineate as needed by injecting balanced salt solution between the lens cortex and nucleus. Inject additional viscoelastic into the anterior chamber of the eye prior to phacoemulsification. Check the function of the phacoemulsification handpiece and the machine settings. Remove bubbles by tapping the handpiece with irrigation on. Insert the phacoemulsification tip into the eye and a second instrument through the side port incision.

Using both hands as well as the foot actuated phaco pedal, carefully perform phacoemulsification with simultaneous aspiration of the lens nuclear material. Rotate and dis-assemble the lens to avoid inadvertent trauma to the cornea, lens capsule or iris. Add viscoelastic as needed to maintain a safe working space. Remove the phacoemulsification tip and the second instrument from the eye once all of the nuclear material has been removed. Introduce an irrigation and aspiration tip into the eye to aspirate the remainder of the cortical lens material. Then carefully vacuum and polish the interior surface of the thin lens capsule in an attempt to avoid future secondary membrane formation.

Assess the integrity of the capsule and zonules and determine how much additional support the capsular bag and intraocular lens (IOL) will require. Enlarge incisions and create scleral flaps as needed for the IOL and support system chosen. Insert and suture a capsular tension ring or segment as needed. While maintaining traction on the eye via the side port incision, insert the tip of the IOL injection device into the main incision and place the IOL in the eye. Once in the eye, allow the IOL to unfold without damage to the cornea. Properly position and center the IOL using a lens hook. Suture the IOL and/or capsular bag/zonular complex as needed. Remove the iris hooks one by one. Perform a peripheral iridectomy as necessary.

Deepen the anterior chamber with additional viscoelastic. Apply viscoelastic to the corneal surface, apply a goniolens, and locate collector channels to identify sites for drainage device insertion. Lift the patient's head off of the head rest and rotate 30 degrees away from the surgeon. Rotate the operating microscope 30 degrees toward the surgeon. Re-apply the goniolens and adjust the microscope to visualize the chamber angle and nasal trabecular meshwork. Insert the drainage device inserter through the main incision and across the anterior chamber towards the nasal chamber angle. Retract the protective sleeve. Position the drainage device at the trabecular meshwork and insert into Schlemm's canal. Release the device from the injector. Tap the tip of the device to seat it firmly. Observe for blood reflux. Remove the injector and deepen the chamber with additional viscoelastic as needed. Re-insert the injector, retract the protective sleeve, position and insert the second drainage device approximately 2 clock-hours from the first. Tap to seat firmly, observe for blood reflux, and remove the injector.

Reposition the head and microscope vertically. Irrigate excess viscoelastic from the surface of the cornea. Reposition the IOL. Aspirate viscoelastic from the anterior chamber with the irrigation/aspiration handpiece. Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Reform the eye with balanced salt solution and adjust the intraocular pressure to a physiologic range. Test the incisions for leaks and hydrate or suture any that leak. Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	6%	32%	41%	21%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	3%	41%	56%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	33%	67%
Physical effort required	3%	53%	43%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	32%	59%

2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	4%	22%	48%	26%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	26%	67%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	4%	19%	78%
Physical effort required	7%	44%	48%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	30%	63%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66989, *extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal)*

anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more is a new 090-day global CPT code combining complex cataract and IOL surgery with ab interno insertion of an aqueous drainage device for glaucoma. Use of these drainage devices is increasing in popularity because they offer the potential for pressure lowering without a full-thickness fistula and conjunctival bleb subject to scarring, infection, and failure due to over- or under-filtration.

This procedure has been reported since 2010 with CPT 0191T and CPT 66982. Claims volume for 0191T (57,829 in 2019) warranted creation of category I CPT codes combining cataract/IOL and drainage device procedures. Separate codes for device insertion with complex cataract/IOL surgery (66989) and standard cataract/IOL surgery (66991) were created. Both are being reviewed at this meeting.

Inadequate literature support and lack of FDA approval precluded creation of a category I CPT code for stand-alone drainage device insertion to replace 0191T, either as an add-on ZZZ or 090-day global. A new Category III code, 0671T, was created for the stand-alone procedure and is not being valued by the RUC at this time.

The entire family of cataract procedures, including CPT 66982, 66983, 66984, 66987, and 66988 was reviewed at the January 2019 RUC meeting. These codes do not need to be re-reviewed at this time because there have been no changes in the procedures: the typical physician work, patient population, technology, and site of service have not changed in many years, and certainly not since the last RUC valuation just two years ago.

Additionally, although CPT 66987 and 66988 were new CPT codes in 2020, they are not new technology. These two codes are combinations of long-existing procedures: endocyclophotocoagulation (CPT 66711) plus cataract (CPT 66982 or 66984). They were created by the Editorial Panel because CPT 66711 was being reported over 75% of the time with one of the cataract services.

We are therefore asking the RUC to reaffirm the values for CPT 66982, 66984, 66987, and 66988 that were determined two years ago.

For CPT 66989, a random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 113 respondents, 97% of whom found the vignette to be typical. The median WRVU was 13.90 and the 25th percentile was 12.13. The median IST was 28 minutes. The survey showed four 99213 postoperative visits. The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings.

The top key reference service, chosen by 30% of respondents, was CPT 66183, *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach* (RUC 2013), with a WRVU of 13.20, an IST of 45 minutes, and five level 3 and three level 2 postoperative visits. The second reference service, chosen by 24% of respondents, was CPT 66179, *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (RUC 2014), with a WRVU of 14.00, an IST of 55 minutes, and five level 3 and three level 2 postoperative visits. Both have substantially longer ISTs than the surveyed code related to the creation of a filtering conjunctival bleb, and a greater number of postoperative visits necessary to manage the bleb. The majority of respondents ranked the surveyed code as more or much more intense and complex on overall intensity and complexity and all submeasures compared to both key reference services with the exception of physical effort, where the majority ranked them identical. This is consistent with the surveyed code consisting of almost entirely intraocular work while a substantial portion of the reference code work, to create the conjunctival bleb, while on an open eye, is extraocular.

The panel noted that the median IST of 28 minutes for the combined procedure is 2 minutes shorter than the cataract procedure alone (CPT 66982). Surgeons who perform 66989 and 66991 were more likely to complete the survey than those who perform standalone cataract surgery but not the more complex combined procedures. These early adopters of the newer combined procedures are typically more skilled and experienced surgeons and are typically faster than the typical surgeon who performs cataract surgery alone and who would have responded to the cataract code survey in 2019. In addition, complex cataract surgery comprises a wide range of difficulties and times, with the “easier” 66982s being appropriate for use of the drainage device. This results in a false or

pseudo-inconsistency in the ISTs between these new combined codes and the standalone cataract surgery codes based upon the respondent profile. Surveying both the combined and standalone codes at this time would probably not resolve this anomaly because the new procedures have not yet diffused into the wider surgeon population.

We recognize that these codes will return for review in a few years under the New Technology screen, at which time the procedures will have diffused into a broader provider population. An array survey of the entire family, including the standalone cataract codes, should resolve this apparent anomaly once more surgeons are using it. Therefore, rather than discard the data and resurvey now, we accepted it as correct for the typical surgeon currently performing the procedure and proceeded with an attempt at valuation.

The panel agreed with the survey's 4 postoperative visits. We reduced one of the visits from a level 3 to a level 2. The level 2 visit is done on the first postoperative day to check vision, pressure, incision integrity, and level of inflammation. These patients typically have significantly greater than normal postoperative inflammation due to insertion of the device into uveal tissue and unstable IOP due to their glaucoma, as well as the potential for IOL dislocation and cystoid macular edema, necessitating more frequent dilated examinations in the postoperative period than stand-alone uncomplicated cataract surgery (CPT 66984). Dilated level 3 examinations are typical at 1, 2-4, and 6-10 weeks postoperatively because of the need for detailed examination of the posterior retina for macular edema, the peripheral retina for tears or detachments, and the peripheral intraocular lens implant for decentration and stability.

We chose pre-service package 3 (straightforward patient, difficult procedure) based on the comorbidity of poorly controlled glaucoma and the need for intraoperative repositioning requiring greater time for review and discussion in the preoperative area, and manipulation of sensitive uveal tissue requiring more profound local anesthesia with longer-lasting, slower-onset agents. These are typically complex, difficult to operate eyes with miotic pupils requiring a discussion of the multiple different options for lens fixation that may arise during surgery. This must also be reviewed by the physician and discussed with the patient to explain their effect on the potential length of the procedure and planned visual outcome.

We reduced the package pre-service evaluation time from 33 minutes to match the survey time of 26 minutes. We reduced the survey positioning time from 5 minutes to match the package time of 3 minutes, and reduced the package pre-service scrub, dress and wait time from 15 minutes to the survey time of 7 minutes. We used the survey post-service time median of 8 minutes, which is less than the 21 minutes of post-service time package 7B (local anesthesia, complex procedure), and one-half of a 99238 for discharge day management. Total time for the procedure is 176 minutes, with an IST of 28 minutes.

We originally considered recommending the survey's 25th percentile work value, 12.31 RVU, for CPT 66989. However, this resulted in a very high IWPUT of 0.258. After considering reviewer comments and discussion at prefacilitation, the panel decided that this was not a supportable recommendation.

As with most intraocular procedures with relatively short ISTs and multiple postop visits, there are few if any eligible crosswalks. There are only nine 090-day global codes in the RUC database with ISTs between 25 and 30 minutes that have been reviewed within 10 years. The closest to the survey value and times is the standalone complex cataract surgery procedure CPT 66982, *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation*. This was reviewed by the RUC in 2019 with a work value of 10.25 RVU, an IST of 30 minutes, and the same number and level of postoperative visits as the surveyed code. Because 66982 is up for reaffirmation at this meeting it is ineligible as a crosswalk. We also considered a crosswalk to the procedure used to crosswalk the value of CPT 66982 in 2019: CPT 67110, *Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)* (RUC 2015), with 10.25 WRVU, an IST of 30 minutes, and a total time of 196 minutes.

Logically there should be more work involved with the addition of the drainage device insertion despite the 2-minute shorter IST. Therefore, we considered other incremental and building block methods to value CPT 66989:

- Match the IWPUT to CPT 66982 (0.180), with a work value of 9.50 RVU;
- Apply the incremental value of the IST change at the IWPUT of CPT 66982, with a work value of 9.89 RVU

Both of these methods result in recommendations lower than the value of the standalone procedure, which the panel felt is even more paradoxical than a value equal to that of the base code.

We ultimately decided that a more accurate representation of physician work would be an incremental increase in WRVU equal to the difference in the survey 25th percentile work values between 66989 and 66991. This increment, 1.08 WRVU, was be added to our work value recommendation for 66991, 9.40 RVU, resulting in a recommendation of 10.48 WRVU for CPT 66989. This is a slightly greater work value than that of the standalone cataract procedure. This remains substantially below the survey 25th percentile value. It carries a high IWPUT, 0.199, but we are unable to devise any more accurate way to value the procedure until it has had time to diffuse into the broader population of ophthalmic surgeons.

We therefore recommend a work value of 10.48 WRVU for CPT 66989 (tracking number S2), with times of 36/28/8 and a total time of 176 minutes. We recommend that the procedure be flagged to not be used to value physician work and that it be placed on the New Technology list.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0191T and 66982

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 14000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology Frequency 14000 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,813
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate

Specialty Ophthalmology Frequency 6813 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Cataract removal/lens insertion

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 66982

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:66991 Tracking Number S6 Original Specialty Recommended RVU: **11.05**
Presented Recommended RVU: **9.40**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **9.23**

CPT Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 69-year-old woman with a posterior subcapsular cataract who is no longer able to drive requires cataract removal and replacement with an intraocular lens. In addition, her increased intraocular pressure is not well controlled so placement of an aqueous drainage device through an internal approach is planned for the same time.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 14% , In the ASC 84%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and family and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Perform a surgical time out. Administer sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface.

Description of Intra-Service Work: Insert a lid speculum. Position the microscope. Make a side-port incision 45 to 90 degrees away from the intended site of the surgical incision. Fill the anterior chamber with a viscoelastic. Create a temporal multiplanar limbal/corneal incision into the anterior chamber. Enter the eye through the main incision with a sharp bent needle to open the anterior capsule, followed by forceps to fashion a circular opening in the anterior capsule of the cataract. Insert a cannula into the eye to perform hydrodissection by injecting balanced salt solution between the lens cortex and capsule, loosening the nuclear and cortical layers of the lens in the process, while maintaining the integrity of the capsule. Hydrodelineate as needed by injecting fluid between the lens cortex and nucleus. Inject additional viscoelastic into the anterior chamber prior to phacoemulsification. Check the function of the phacoemulsification handpiece and the machine settings. Remove bubbles by tapping the handpiece with irrigation on. Insert the phacoemulsification tip into the eye and a second instrument through the side port incision. Using both hands and the foot actuated phaco pedal, carefully perform phacoemulsification with simultaneous aspiration of the lens nuclear material. Rotate and dis-assemble the lens to avoid inadvertent trauma to the cornea, lens capsule or iris. Add viscoelastic as needed to maintain a safe working space. Remove the phacoemulsification tip and second instrument from the eye. Introduce an irrigation and aspiration tip into the eye to aspirate the remainder of the cortical lens material. Then carefully vacuum and polish the interior surface of the thin lens capsule in an attempt to avoid future secondary membrane formation.

Adjust the size of the incision as needed to accommodate the intraocular lens (IOL). While maintaining traction on the eye via the side port incision, insert the tip of the IOL injection device into the main incision and place the IOL in the eye. Once in the eye, allow the IOL to unfold without damage to the cornea. Properly position and center the IOL into the capsular bag using a lens hook.

Deepen the anterior chamber with additional viscoelastic. Apply viscoelastic to the corneal surface, apply a goniolens, and locate collector channels to identify sites for drainage device insertion. Lift the patient's head off of the head rest and rotate 30 degrees away from the surgeon. Rotate the operating microscope 30 degrees toward the surgeon. Re-apply the goniolens and adjust the microscope to visualize the chamber angle and nasal trabecular meshwork. Insert the drainage device inserter through the main incision and across the anterior chamber towards the nasal chamber angle. Retract the protective sleeve. Position the drainage device at the trabecular meshwork and insert into Schlemm's canal. Release the device from the injector. Tap the tip of the device to seat it firmly. Observe for blood reflux. Remove the injector and deepen the chamber with additional viscoelastic as needed. Re-insert the injector, retract the protective sleeve, position and insert the second drainage device approximately 2 clock-hours from the first. Tap to seat firmly, observe for blood reflux, and remove the injector and gonio lens.

Reposition the head and microscope vertically. Irrigate excess viscoelastic from the surface of the cornea. Reposition the IOL. Aspirate viscoelastic from the anterior chamber with the irrigation/aspiration handpiece. Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Reform the eye with balanced salt solution and adjust the intraocular pressure to a physiologic range. Test the incisions for leaks and hydrate or suture any that leak. Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician..

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	7%	17%	51%	24%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	34%	61%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	24%	76%
Physical effort required	2%	41%	56%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	24%	63%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	13%	13%	47%	27%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	33%	53%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	13%	80%
Physical effort required	13%	33%	53%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	27%	53%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66991, *extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure),manual or mechanical technique(eg, irrigation and aspiration or phacoemulsification); with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more)* is a new 090-day global CPT code combining cataract and IOL surgery with ab interno insertion of an aqueous drainage device for glaucoma.

Use of these drainage devices is increasing in popularity because they offer the potential for pressure lowering without a full-thickness fistula and conjunctival bleb subject to scarring, infection, and failure due to over- or under-filtration.

This procedure has been reported since 2010 with CPT 0191T and CPT 66984, without a multiple procedure payment reduction. Claims volume for 0191T (57,829 in 2019) warranted creation of category I CPT codes combining cataract/IOL and drainage device procedures. Separate codes for device insertion with complex cataract/IOL surgery (66989) and standard cataract/IOL surgery (66991) were created. Both are being reviewed at this meeting.

Inadequate literature support and lack of FDA approval precluded creation of a category I CPT code for stand-alone drainage device insertion, either as an add-on ZZZ or 090-day global. A new Category III code, 0671T, was created for the stand-alone procedure and is not being valued by the RUC at this time.

As discussed in the SOR for CPT 66989, we are asking for reaffirmation of the values for CPT 66982, 66984, 66987, and 66988 that were determined at the January 2019 RUC meeting.

For CPT 66991, a random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 114 respondents, 99% of whom found the vignette to be typical. The median WRVU was 13.20 and the 25th percentile was 11.05. The median IST was 25 minutes. The survey showed one 99212 and three 99213 postoperative visits. The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings.

The top key reference service, chosen by 36% of respondents, was CPT 66183, *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach* (RUC 2013), with a WRVU of 13.20, an IST of 45 minutes, and five level 3 and three level 2 postoperative visits. The second reference service, chosen by 13% of respondents, was CPT 66179, *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (RUC 2014), with a WRVU of 14.00, an IST of 55 minutes, and five level 3 and three level 2 postoperative visits. Both have substantially longer ISTs than the surveyed code related to the creation of a filtering conjunctival bleb, and a greater number of postoperative visits necessary to manage the bleb. The majority of respondents ranked the surveyed code as more or much more intense and complex on overall intensity and complexity and all of the submeasures compared to both key reference services. This is consistent with the surveyed code consisting of almost entirely intraocular work while a substantial portion of the reference code work, to create the conjunctival bleb, while on an open eye, is extraocular.

The panel accepted the survey median IST of 25 minutes although a differential of only 5 minutes over the IST for the corresponding standalone cataract procedure (CPT 66984) seemed low given the additional steps required to insert the drainage device. As discussed in the SOR for CPT 66989, the panel attributes this to the increased experience and speed of the early adapters likely to perform this procedure and complete the survey compared with the much greater number of surgeons who to date perform standalone cataract surgery alone.

The panel agreed with the number and level of postoperative visits. A level 2 visit is done on the first postoperative day to check vision, pressure, incision integrity, and level of inflammation. These patients typically have unstable IOP due to their glaucoma and greater than normal postoperative inflammation and risk of cystoid macular edema due to insertion of the device into uveal tissue. This necessitates more frequent dilated examinations in the postoperative period than stand-alone uncomplicated cataract surgery (CPT 66984). Three dilated level 3 examinations are typical, one each at approximately 1, 2-4, and 8-10 weeks postoperatively. These 3 dilated examinations are required for detailed examination of the posterior retina for macular edema and the peripheral retina for tears or detachments. This is more additional level 3 postop visit compared to the standalone uncomplicated cataract procedure (CPT 66984).

We chose pre-service package 3 (straightforward patient, difficult procedure) as with CPT 66989 based on the comorbidity of poorly controlled glaucoma and the need for intraoperative repositioning requiring greater time for review and explanation in the preoperative area, and manipulation of sensitive uveal tissue requiring more

profound local anesthesia. We reduced the package pre-service evaluation time from 33 minutes to match the survey time of 25 minutes. We reduced the survey positioning time from 5 minutes to match the package time of 3 minutes, and reduced the package pre-service scrub, dress and wait time from 15 minutes to the survey time of 7 minutes. We used the survey post-service time median of 8 minutes, which is less than the 21 minutes of post-service time package 7B (local anesthesia, complex procedure), and one-half of a 99238 for discharge day management. Total time for the procedure is 172 minutes, with an IST of 25 minutes.

As with the other code in this tab (66989), we considered the survey's 25th percentile work value, 11.05 RVU. After considering the associated IWPUT of 0.246 as well as comments from reviewers and at pre-facilitation, we decided that this was not a supportable value.

There are only 4 recently reviewed 090-day global CPT codes in the RUC database with 25-minute ISTs that have been reviewed within the past 10 years (CPT 46946, 53854, 67916, and 67923). All of them carry fewer postop visits, lower total times, and significantly lower work values (4.50-5.93 RVU) than standalone cataract surgery. The two ophthalmic procedures are extraocular eyelid repairs.

We therefore turned to an incremental approach, considering the following options:

1. Add increment of one additional level 3 postop visit (1.30 WRVU) to work value of CPT 66984, no added work value for additional 5 minutes IST over standalone:
    a. Work value: 8.65 RVU
    b. Differential over CPT 66984: +1.30 RVU
    c. IWPUT: 0.168
2. Match IWPUT to corresponding standalone cataract procedure CPT 66984 (0.191):
    a. Work value: 9.66 RVU
    b. Differential over CPT 66984: +2.31 RVU
    c. IWPUT: 0.191
3. Add incremental work value of 5 minutes increased IST at IWPUT of CPT 66984 (0.191), plus value of additional level 3 postop visit (1.30 WRVU) to work value of CPT 66984:
    a. Work value: 9.60
    b. Differential over CPT 66984: +2.25 RVU
    c. IWPUT: 0.188

Because CPT 66984 is flagged as not to be used to value physician work, we applied the IWPUT of CPT 66982, which has no similar restriction, to the incremental approach in Options 2 and 3:

4. Match IWPUT to standalone complex cataract procedure CTP 66982 (0.180):
    a. Work value: 9.40 RVU
    b. Differential over CPT 66984: +2.05 RVU
    c. IWPUT: 0.180
5. Add incremental work value of 5 minutes increased IST at IWPUT of CPT 66982 (0.180), plus value of additional level 3 postop visit (1.30 WRVU) to work value of CPT 66984:
    a. Work value: 9.55 RVU
    b. Differential over CPT 66984: +2.20 RVU
    c. IWPUT: 0.186

While none of these options is ideal, Option 4, matching the IWPUT to the standalone complex cataract procedure CPT 66982, is the only one which uses survey times with no reliance on the value of CPT 66984. The panel feels that this is consistent with our valuation method for CPT 66989 in that it offers no premium for being faster than the typical surgeon. It also results in an IWPUT in line with that of the standalone procedure. As with CPT 66989, this code will be reviewed with the standalone procedures under a New Technology flag within a few years. An array survey at that time, once more surgeons are familiar with the procedure, should return more uniform data. In the meantime, the recommended value is as accurate an estimate of physician work as possible and avoids carrier pricing.

We recommend a work value of 9.40 WRVU for CPT 66991, with times of 35/25/8 and a total time of 172 minutes. We recommend that the procedure be flagged to not be used to value physician work and that it be placed on the New Technology list.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0191T and 66984

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 145000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology Frequency 145000 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 72,205 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology Frequency 72205 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Cataract removal/lens insertion

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 66984

FACILITY DIRECT PE INPUTS **CPTCODE(S):_66989___**
SPECIALTY SOCIETY(IES):__AAO, ASCRS_____
PRESENTER(S):_Ankoor Shah, David Glasser, Emily Jones, and Parag Parekh__

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
66989	Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with insertion of intraocular (eg, trabecular meshwork, supraciliary, suprachoroidal) anterior segment aqueous drainage device, without extraocular reservoir, internal approach, one or more	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
66989	A 74-year-old man with a cortical cataract severe enough to no longer allow vision for reading who requires cataract removal and replacement with an intraocular lens. He has a history of use of systemic medications causing floppy iris syndrome and the intraoperative use of an iris retraction device is planned. In addition, his increased intraocular pressure is not well controlled on two topical medications so placement of an aqueous drainage device through an internal approach is planned at the same time.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. The consensus committee considered the survey data and PE details to determine clinical time. Additionally, applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   Reference Code is 66982. This is the code for complex cataract surgery, but without placement of an aqueous drainage device.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Cataract surgery with placement of an aqueous drainage device is a major surgery with a 90-day global. Standard inputs are used during the pre-service period consistent with PEAC recommendations for 90-day global procedures.

   b. Service period (includes pre, intra and post):

This time accounts for the standard inputs of same day discharge management.

   c. Post-service period:

This time accounts for staff time during postoperative visits. Standard times were used based on the level of postoperative office visit as determined by the RUC-approved survey data for this code.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

Ophthalmology pack for dilated eye exams – utilized on visits requiring a dilated exam.

Ophthalmology pack for non-dilated eye exams – utilized on non-dilated postoperative visits.

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

Exam lane: Standard office visit formula used. Screening lane: Standard office visit formula used.

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More

January 2019

Cyclophotocoagulation Cataract Surgery – Tab 11

In October 2017, CPT codes 66711 and 66984 were identified as codes reported together 75% of the time or more. The RUC reviewed action plans to determine whether a code bundle solution should be developed for these services. In January 2018, the RUC recommended to refer to CPT to bundle 66711 with 66984 for CPT 2020. In May 2018, the CPT Editorial Panel revised three codes and created two new codes to differentiate cataract procedures performed with and without endoscopic cyclophotocoagulation.

66711 ***Ciliary body destruction; cyclophotocoagulation, endoscopic, without concomitant removal of crystalline lens***
The RUC reviewed the survey results from 40 ophthalmologists and determined to crosswalk the work RVU of 6.36 from key reference service code 67210 *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (work RVU = 6.36 and 15 minutes intra-service time) to CPT code 66711. The RUC conducted a thorough search of all other potential crosswalk codes and ran into a lack of potential crosswalk codes due to the lack of similarly intense major surgical procedures with a comparable amount of skin-to-skin time, OR time and amount of post-operative care. The RUC noted that the survey intra-service time decreased 10 minutes from the current time and that the only appropriate crosswalk for this intense intraocular service is CPT code 67210. The survey respondents indicated that 66711 is more intense and complex to perform than 67210 on all measures examined (mental effort/judgment, technical skill/physical effort and psychological stress). Additionally, both services use laser ablation of tissue, making it the most clinically relatable service for comparison.

The RUC recommends 25 minutes pre-service evaluation, 3 minutes pre-service positioning, 6 minutes pre-service scrub/dress/wait pre-service time, 20 minutes intra-service time, 10 minutes immediate post-time, half a discharge day management (99238), four 99213 office visits and one 99212 office visit. The first post-operative visit is a 99212 visit on the first day after surgery in which the physician performs an exam on an un-dilated eye, checking visual acuity, intraocular pressure, incision integrity, and level of inflammation. The remaining four post-operative visits are 99213 visits approximately 1 week, 2 weeks, 1 month and 6-8 weeks postoperatively, in which the physician performs an exam on a dilated eye, checking visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema. These exams must be performed on a dilated eye, as specified by practice guidelines, to check for macular edema and ensure that retinal detachment has not occurred. **The RUC recommends a work RVU of 6.36 for CPT code 66711.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Complex Cataract Removal

66982 ***Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation***

The RUC reviewed the survey results from 92 ophthalmologists and determined to crosswalk the work RVU of 10.25 from CPT code 67110 *Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)* (work RVU = 10.25 and 30 minutes intra-service time) to CPT code 66982. The RUC noted that the survey top key reference codes 67036 *Vitrectomy, mechanical, pars plana approach;* (work RVU = 12.13, IWPUT = 0.1075) and 65850 *Trabeculotomy ab externo* (work RVU = 11.39, IWPUT = 0.1109) have a much lower physician work intensity than the surveyed code and therefore it would be appropriate for the survey code to have a higher intra-service work per unit of time (IWPUT). The intensity of cataract surgery has not changed and the magnitude estimation in the survey data supports that the intensity of this service is high. All the intra-service time for cataract surgery is spent with both the physicians' hands inside the eye and both feet managing ultrasound and microscope foot pedals, where a slight misstep can lead to serious complications such as endophthalmitis or retinal detachment with permanent loss of vision, which contributes to the intensity of the procedure. The RUC conducted a thorough search of all other potential crosswalk codes and ran into a lack of potential crosswalk codes due to the lack of similarly intense major surgical procedures with a comparable amount of skin-to-skin time, OR time and amount of post-operative care. The RUC noted that the only appropriate crosswalk for this intense service is 67110. CPT code 66982 has less total time than 67110, but that is due to the difference in post-operative visits required for these services. Both CPT codes 66982 and 67110 require the same intra-service time of 30 minutes and CPT code 66982 is appropriately more intense than CPT code 67110. CPT code 67110 involves an injection of air into the vitreous to tamponade the retinal detachment and there is relativity less intraocular manipulation. Whereas, the intra-service work for 66982 includes work all performed inside the eye.

The RUC recommends 25 minutes evaluation, 3 minutes positioning, 7 minutes scrub/dress/wait pre-service time, 30 minutes intra-service time, 6 minutes immediate post-time, half a discharge day management (99238), three 99213 office visits and one 99212 office visit. The first post-operative visit is a 99212 visit on the first day after surgery in which the physician performs an exam on an un-dilated eye, checking visual acuity, intraocular pressure, incision integrity, and level of inflammation. The remaining three post-operative visits are 99213 visits approximately 1 week, 2-4 weeks, and 6-8 weeks postoperatively, in which the physician performs an exam on a dilated eye, checking visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments. These exams must be performed on a dilated eye, as specified by practice guidelines, to ensure that retinal detachment has not occurred. **The RUC recommends a work RVU of 10.25 for CPT code 66982.**

66987 ***Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with endoscopic cyclophotocoagulation***

The RUC reviewed the survey results from 31 ophthalmologists and determined a work RVU of 13.15 appropriately accounts for the work required to perform this service. The RUC conducted a thorough search of all other potential crosswalk codes and noted a lack of potential crosswalk codes due to the complete lack of similarly intense major surgical procedures with a comparable amount of skin-to-skin time, OR time

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

and amount of post-operative care. There are no available crosswalks to the physician work, time and intensity of this service. Therefore, the RUC used an increment approach by adding the RUC recommended difference of the standard cataract removal with endoscopic cyclophotocoagulation (CPT code 66988 RUC recommended work RVU = 10.25) compared to the standard cataract removal without endoscopic cyclophotocoagulation (CPT code 66984, RUC recommended work RVU = 7.35), which results in 2.90 (10.25 - 7.35 = 2.90). Therefore, adding the work of the endoscopic cyclophotocoagulation (2.90) to the RUC recommendation for CPT code 66982 complex cataract removal without endoscopic cyclophotocoagulation (RUC recommended work RVU = 10.25), (10.25 + 2.90 = 13.15) results in 13.15 work RVUs.

The RUC noted that the survey top key reference codes 66179 *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (work RVU = 14.00, 55 minutes intra-service time and IWPUT = 0.1156) and 65285 *Repair of laceration; cornea and/or sclera, perforating, with reposition or resection of uveal tissue* (work RVU = 15.36, 90 minutes intra-service time and IWPUT = 0.0743) have a much higher intra-service time and lower IWPUT than what would be appropriate for the much more intense surveyed code. The intensity of cataract surgery has not changed and the magnitude estimation in the survey data supports that the intensity of this service is high. All the intra-service time for cataract surgery is spent with both the physicians' hands inside the eye and both feet managing ultrasound and microscope foot pedals, where a slight misstep can lead to serious complications such as endophthalmitis or retinal detachment with permanent loss of vision, which contributes to the intensity of the procedure.

The RUC recommends 30 minutes pre-service evaluation, 3 minutes pre-service positioning, 10 minutes pre-service scrub/dress/wait time, 36 minutes intra-service time, 10 minutes immediate post-time, half a discharge day management (99238), five 99213 office visits and one 99212 office visit. The first post-operative visit is a 99212 visit on the first day after surgery in which the physician performs an exam on an un-dilated eye, checking visual acuity, intraocular pressure, incision integrity, and level of inflammation. The remaining five post-operative visits are 99213 visits approximately 1, 2, 3-4, 6-8, and 10-12 weeks postoperatively, in which the physician performs an exam on a dilated eye, to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments. These exams must be performed on a dilated eye, as specified by practice guidelines, to check for macular edema and ensure that retinal detachment has not occurred. **The RUC recommends a work RVU of 13.15 for CPT code 66987.**

Cataract Removal

66983 ***Intracapsular cataract extraction with insertion of intraocular lens prosthesis (1 stage procedure)***
This service is performed less than 150 times in the Medicare population and the specialty society, with the RUC's approval, did not attempt to survey this service. Based on the Medicare Provider Utilization and Payment Data: Physician and Other Supplier PUF CY2016 file, only one ophthalmologist reported this service more than 10 times. **The RUC recommends that this service be contractor priced.**

66984 ***Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation***
The RUC reviewed the survey results from 93 ophthalmologists and determined a work RVU of 7.35 appropriately accounts for the work required to perform this service. The RUC used an incremental approach by taking the value of similar service 67210 *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (work RVU = 6.36 and 15 minutes intra-service time, IWPUT = 0.1991) and added the intensity for 5 additional intra-service minutes associated with 66984 (20 minutes intra-service time). (5 minutes x 0.1991

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intensity of CPT code 67210 = 0.99, 6.36 + 0.99 = 7.35). The RUC conducted a thorough search of all other potential crosswalk codes and ran into a lack of potential crosswalk codes due to the complete lack of similarly intense major surgical procedures with a comparable amount of skin-to-skin time, OR time and amount of post-operative care. The RUC noted there are no distinct crosswalks to support the intensity of this service and the only appropriate code to reference with similar intensity is 67210. A minority of those surveyed, chose CPT code 67210 as a top key reference service and ranked the intensity and complexity of 66984 as somewhat more to much more than 67210. The specialty societies indicated that as an intraocular procedure, 66984 is much more intense and complex than 67210, which is an extraocular laser procedure with a contact lens placed on the eye.

The RUC noted that the survey top key reference codes 65850 *Trabeculotomy ab externo* (work RVU = 11.39, IWPUT = 0.1109) and 66184 *Revision of aqueous shunt to extraocular equatorial plate reservoir; without graft* (work RVU = 9.58, IWPUT = 0.0485) have a much lower IWPUT than what would be appropriate for the much more intense surveyed code. The intensity of cataract surgery has not changed and the magnitude estimation in the survey data supports that the intensity of this service is high. All the intra-service time for cataract surgery is spent with both the physicians' hands inside the eye and both feet managing ultrasound and microscope foot pedals, where a slight misstep can lead to serious complications such as endophthalmitis or retinal detachment with permanent loss of vision, which contribute to the intensity of the procedure.

The RUC recommends 13 minutes pre-service evaluation, 1 minutes pre-service positioning, 6 minutes pre-service scrub/dress/wait time, 20 minutes intra-service time, 5 minutes immediate post-service time, half a discharge day management (99238), two 99213 office visits and one 99212 office visit. The first post-operative visit is a 99212 visit on the first day after surgery in which the physician performs an exam on an un-dilated eye, checking visual acuity, intraocular pressure, incision integrity, and level of inflammation. The remaining two post-operative visits are 99213 visits approximately one week and one month postoperatively to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments. These exams must be performed on a dilated eye as specified by practice guidelines, to check for macular edema and ensure that retinal detachment has not occurred. **The RUC recommends a work RVU of 7.35 for CPT code 66984.**

66988 ***Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); with endoscopic cyclophotocoagulation***
The RUC reviewed the survey results from 31 ophthalmologists and determined to crosswalk the work RVU of 10.25 from CPT code 67110 *Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)* (work RVU = 10.25 and 30 minutes intra-service time) to this service. The RUC noted that the survey top key reference codes 66179 *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (work RVU = 14.00, 55 minutes intra-service time and IWPUT = 0.1156) and 65285 *Repair of laceration; cornea and/or sclera, perforating, with reposition or resection of uveal tissue* (work RVU = 15.36, 90 minutes intra-service time and IWPUT = 0.0743) have much higher intra-service time and lower IWPUT than what would be appropriate for the much more intense surveyed code. The intensity of cataract surgery has not changed and the magnitude estimation in the survey data supports that the intensity of this service is high. All the intra-service time for cataract surgery is spent with both the physicians' hands inside the eye and both feet managing ultrasound and microscope foot pedals, where a slight misstep can lead to serious complications such as endophthalmitis or retinal detachment with permanent loss of vision, which contributes to the intensity of the procedure. The RUC conducted a thorough search of all other potential crosswalk codes and ran into a lack of potential crosswalk codes due to the lack of similarly intense major surgical procedures with a comparable amount of skin-to-skin time, OR

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

time and amount of post-operative care. The RUC noted the only appropriate crosswalk for this intense service is 67110. CPT code 66988 has similar total time and the same intra-service time of 30 minutes. CPT code 66988 is appropriately more intense than CPT code 67110. CPT code 67110 involves an injection of air into the vitreous to tamponade the retinal detachment and there is relativity less intraocular manipulation. Whereas, the intra-service work for 66988 includes work all performed inside the eye.

The RUC recommends 25 minutes pre-service evaluation, 3 minutes pre-service positioning, 10 minutes pre-service scrub/dress/wait time, 30 minutes intra-service time, 7 minutes immediate post-time, half a discharge day management (99238), four 99213 office visits and one 99212 office visit. The first post-operative visit is a 99212 visit on the first day after surgery in which the physician performs an exam on an undilated eye, checking visual acuity, intraocular pressure, incision integrity, and level of inflammation. The remaining four post-operative visits are 99213 visits approximately 1, 2, 4, and 6-8 weeks postoperatively, in which the physician performs an exam on a dilated eye, to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments. These exams must be performed on a dilated eye, as specified by practice guidelines, to check for macular edema and ensure that retinal detachment has not occurred. **The RUC recommends a work RVU of 10.25 for CPT code 66988.**

Flag
The value for CPT codes 66984 and 66987 were established using a building block methodology, the RUC notes that they should be flagged as "**Do not use to validate for physician work."**

Practice Expense
The RUC recommends the standard 090-day global period direct practice expense inputs as submitted by the specialty society.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Eye and Ocular Adnexa**				
▲66711	I1	Ciliary body destruction; cyclophotocoagulation, endoscopic, without concomitant removal of crystalline lens (For endoscopic cyclophotocoagulation performed at same encounter as extracapsular cataract removal with intraocular lens insertion, see 66987, 66988) *(Do not report 66711 in conjunction with 66990)*	090	6.36

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:66711 Tracking Number I1 Original Specialty Recommended RVU: **7.40**
Presented Recommended RVU: **7.35**
Global Period: 090 Current Work RVU: **7.93** RUC Recommended RVU: **6.36**

CPT Descriptor: Ciliary body destruction; cyclophotocoagulation, endoscopic, without concomitant removal of crystalline lens

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old patient with a history of chronic glaucoma has progressive optic nerve damage and elevated intraocular pressure (IOP) that has not been controlled by medical therapy and a previous filtering operation. The patient is pseudo-phakic with a miotic pupil.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 35% , In the ASC 63%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Check adequacy of pupillary dilation. Perform a surgical time out. Administer sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface. Check the settings of the photocoagulation unit and function of the light pipe.

Description of Intra-Service Work: Insert a lid speculum to allow adequate visualization. Make a multiplanar temporal clear corneal incision into the anterior chamber. Inject a small amount of viscoelastic into the anterior chamber, over the pupil and lens to protect the cornea. Then inject viscoelastic under the iris root for 180°. Use viscodissection to carefully separate the iris adhesions to the lens capsule and IOL, to facilitate visualization of the ciliary body processes with the endoscope. Insert the endoscope/laser probe through the temporal incision viewing the nasal ciliary processes on the heads-up display across the bed from the operating microscope. Reinject viscoelastic to those areas that need additional release of adhesions under direct visualization with the endoscope. While periodically viewing the position of the handpieces through the operating microscope, and continually having the OR staff manually adjusting and orienting the focus of the image on the endocyclophotocoagulation display from the lightpipe/endoscope laser probe, coagulate the ciliary processes through the endoscope.

Move the endoscope slowly in an arc of 180° allowing treatment of each individual ciliary process for several seconds with an endpoint of shrinkage and whitening. Reposition the probe to slowly apply a second row of cyclophotocoagulation to the portion of the pars plicata immediately inferior to the ciliary processes and remove the probe. Make a second multiplanar corneal incision 90° away from the first. Insert the endoscope/laser probe through this second incision and treat the contralateral ciliary processes and pars plicata to complete treatment of 270° of the processes. After completion of laser therapy, remove the viscoelastic material from the anterior segment of the eye with an irrigation and aspiration handpiece, with careful attention to remove viscoelastic trapped behind the iris. Confirm that the IOL remains in proper position. Remove the iris hooks one by one. Perform a peripheral iridectomy as necessary.

Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Inject a corticosteroid drug into the anterior chamber and subconjunctival space. Reform the eye with balanced salt solution. Test the incisions for leaks. Suture

any incisions that leak. Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Immediate post-service work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

Postoperative visits: Patient is seen for a level 2 visit on day 1 to check visual acuity, intraocular pressure, incision integrity, and level of inflammation. The patient is seen again for dilated level 3 visits approximately 1 week, 2 weeks, 1 month, and 6-8 weeks postoperatively to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	12%	19%	50%	19%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	31%	62%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	6%	31%	62%
Physical effort required	0%	31%	69%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	6%	19%	75%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	17%	50%	33%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	67%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	33%	50%	17%
Physical effort required	50%	17%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	100%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66711, *Ciliary body destruction; cyclophotocoagulation, endoscopic, without concomitant removal of crystalline lens* is being revalued as part of the family of endoscopic ciliary ablation codes associated with new CPT codes 66987 and 66988, which describe combined cataract surgery/endoscopic ciliary ablation procedures. The new codes were created because endoscopic ciliary ablation is performed over 75% of the time with cataract surgery. CPT 66711 was last reviewed by the RUC in 2004.

A random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 40 respondents, 90% of whom found the vignette to be typical. The median WRVU was 9.01 and the 25th percentile was 7.85. The median IST was 20 minutes. The survey showed four 99213 and one 99212 postoperative visits. The current work value of 66711 is 7.93 WRVU, with an IST of 30 minutes and the same number and level of postoperative visits.

The top key reference service, chosen by 40% of respondents, was CPT 67210, *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (RUC 2010), with a WRVU of 6.36, an IST of 15 minutes, and three level 3 postoperative visits. The second reference service, chosen by 15% of respondents, was CPT 66185, *Revision of aqueous shunt to extraocular equatorial plate reservoir; with graft* (RUC 2014), with a WRVU of 10.58, an IST of 65 minutes, three level 2 and four level 3 postoperative visits. The respondents ranked the surveyed code as more intense and complex on all intensity and complexity measures compared to the top key reference service.

The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The panel agreed with the median IST of 20 minutes and the number and level of postoperative visits. A level 2 visit is done on the first postoperative day to check vision, pressure, incision integrity, and level of inflammation. Subsequent visits at 1, 2, 4, and 6-8 weeks are dilated level 3 visits. These patients typically have significant postoperative inflammation due to the ablation of the ciliary processes, necessitating frequent dilated examinations in the postoperative period to perform a detailed examination of the posterior retina for cystoid macular edema (CME). CME occurs more commonly in the presence of postoperative inflammation. The sooner CME is detected and treated, the lower the likelihood of permanent macular changes resulting in reduced visual acuity.

We chose pre-service package 3 (straightforward patient, difficult procedure) as these are typically complex, difficult to operate eyes with a history of multiple prior procedures and miotic pupils. We reduced the package pre-service evaluation time from 33 minutes to match the survey time of 25 minutes, reduced the survey positioning time from 5 minutes to match the package time of 3 minutes, and reduced the package pre-service scrub, dress and wait time from 15 minutes to the survey time of 6 minutes. This is an increase in pre-time of 9 minutes compared to the current value. The extra time in the preoperative are is necessary for the physician to review the patient's prior surgical interventions, which are typically multiple, including cataract surgery and one or more prior failed glaucoma procedures. There are also more options available than there were in 2004, when the code was last valued, for supporting an intraocular lens that may be found to be loose or may be dislocated intraoperatively. In the past, these lenses were typically left alone if they covered the visual axis or removed if badly dislocated, but now they are supported with one of a variety of rings or sutures. While the need to use these devices intraoperatively is not typical, a discussion of and re-emphasis of prior office discussions regarding their potential use is typical in the preoperative area.

We used the survey post-service time median of 10 minutes, which is less than the 21 minutes of post-service time package 7B (local anesthesia, complex procedure) and unchanged from the current value, and one-half of a 99238 for discharge day management. Total time for the procedure is 191 minutes, with an IST of 20 minutes. Despite the 10-minute decrease in IST, the total time remains almost identical due to recognition of the increased time spent reviewing the complex past history and explaining the procedure in the pre-operative area.

As with CPT 66984 in this family, we were unable to find adequate crosswalk codes for the 25th percentile work value. In the absence of a crosswalk, we initially chose a work value recommendation of 7.40 WRVU, below the 25th percentile, based on matching the IWPUT to the current value. The reviewers were concerned with this atypical methodology and recommended pre-facilitation.

As a result of pre-facilitation, we are now recommending a crosswalk to the work value of the top key reference service, CPT 67210, *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (RUC 2010), with 6.36 WRVU, an IST of 15 minutes, and total time of 106 minutes. While the IST

and total times don't match exactly, laser ablation of tissue is used in both CPT 67111 and our primary KRS, CPT 67210, making it a logical crosswalk from a clinical perspective. **Therefore, our recommended work value for CPT 66711 is 6.36 WRVU (IWPUT is 0.023), well below the survey's 25th percentile, with times of 34/20/10 minutes and a total time of 191 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) CPT 66711 is frequently billed in conjunction with 66982 or 66984, cataract surgery. New CPT codes have been established to capture the combined services, which should reduce the reporting of 66711 with other CPT codes.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4500
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. Estimation Only

CPT Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmentalstage; without endoscopic cyclophotocoagulation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old female presents with chronic angle closure glaucoma and posterior synechiae with fixed miotic pupil who has now developed a cataract. Cataract removal with IOL placement is recommended with iris hooks to open the small pupil.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 27% , In the ASC 72%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and family and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Perform a surgical time out. Administer topical, sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface.

Description of Intra-Service Work: : Insert a lid speculum. Position the microscope. Make a side-port incision 45 to 90 degrees away from the intended site of the surgical incision. Fill the anterior chamber with a viscoelastic. Create a temporal multiplanar limbal/corneal incision into the anterior chamber. Make four additional 1-mm incisions at the limbus in order to place iris hooks in a diamond pattern around the eye. One by one, insert the iris hooks into the incisions and manipulate to retract the iris. Reposition the iris hooks in the areas of loose zonules to better support the iris and the capsule during subsequent steps of cataract removal.

Enter the eye through the main incision with a sharp bent needle to open the anterior capsule, followed by forceps to fashion a circular opening in the anterior capsule of the cataract. Insert a cannula into the eye to perform hydrodissection by injecting balanced salt solution between the lens cortex and capsule, loosening the nuclear and cortical layers of the lens in the process, while maintaining the integrity of the capsule. Hydrodelineate as needed by injecting balanced salt solution between the lens cortex and nucleus. Inject additional viscoelastic into the anterior chamber of the eye prior to phacoemulsification. Check the function of the phacoemulsification handpiece and the machine settings. Remove bubbles by tapping the handpiece with irrigation on. Insert the phacoemulsification tip into the eye and a second instrument through the side port incision.

Using both hands as well as the foot actuated phaco pedal, carefully perform phacoemulsification with simultaneous aspiration of the lens nuclear material. Rotate and dis-assemble the lens to avoid inadvertent trauma to the cornea, lens capsule or iris. Add viscoelastic as needed to maintain a safe working space. Remove the phacoemulsification tip and the second instrument from the eye once all of the nuclear material has been removed. Introduce an irrigation and aspiration tip

into the eye to aspirate the remainder of the cortical lens material. Then carefully vacuum and polish the interior surface of the thin lens capsule in an attempt to avoid future secondary membrane formation.

Assess the integrity of the capsule and zonules and determine how much additional support the capsular bag and intraocular lens (IOL) will require. Enlarge incisions and create scleral flaps as needed for the IOL and support system chosen. Insert and suture a capsular tension ring or segment as needed. While maintaining traction on the eye via the side port incision, insert the tip of the IOL injection device into the main incision and place the IOL in the eye. Once in the eye, allow the IOL to unfold without damage to the cornea. Properly position and center the IOL using a lens hook. Suture the IOL and/or capsular bag/zonular complex as needed. Remove the viscoelastic material from the anterior segment of the eye with an irrigation and aspiration handpiece. Remove the iris hooks one by one. Perform a peripheral iridectomy as necessary.

Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Reform the eye with balanced salt solution and adjust the intraocular pressure to a physiologic range. Test the incisions for leaks. Suture any incisions that leak. Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Immediate post-service work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

Postoperative visits: Patient is seen for a level 2 visit on day 1 to check visual acuity, intraocular pressure, incision integrity, and level of inflammation. The patient is seen again for dilated level 3 visits approximately 1 week, 2-4 weeks, and 6-8 weeks postoperatively to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2019		
Presenter(s):	David B. Glasser, MD AAO, John T. McAllister, MD AAO, Parag Parekh, MD ASCRS		
Specialty Society(ies):	Ophthalmology		
CPT Code:	66982		
Sample Size:	1541	**Resp N:** 92	**Response:** 5.9 %
Description of Sample:	A random sample of members were pulled from the AAO, AGS and ASCRS databases.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
67036	090	12.13	**RUC Time**

CPT Descriptor Vitrectomy, mechanical, pars plana approach;

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
65850	090	11.39	**RUC Time**

CPT Descriptor Trabeculotomy ab externo

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
54437	090	11.50	**RUC Time**	51

CPT Descriptor 1 Repair of traumatic corporeal tear(s)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
53850	090	10.08	**RUC Time**	4,253

CPT Descriptor 2 Transurethral destruction of prostate tissue; by microwave thermotherapy

Other Reference CPT Code	Global	Work RVU	Time Source
67110	090	10.25	**RUC Time**

CPT Descriptor Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)n

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 19 **% of respondents:** 20.6 **%**

Number of respondents who choose 2nd Key Reference Code: 18 **% of respondents:** 19.5 **%**

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	21%	47%	32%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	53%	26%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	74%	26%
Physical effort required	5%	69%	26%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and	0%	53%	47%

judgment of physician • Estimated risk of malpractice suit with poor outcome	

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	28%	33%	28%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	33%	39%	28%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	28%	61%
Physical effort required	11%	61%	28%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	22%	39%	39%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66982, *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; without endoscopic cyclophotocoagulation* is being revalued as part of the family of cataract surgery codes associated with new CPT codes 66987 and 66988, which describe combined cataract surgery/endoscopic ciliary ablation procedures. The new codes were created because endoscopic ciliary ablation is performed over 75% of the time with cataract surgery. CPT 66982 was last valued by the RUC in 2012.

A random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 92 respondents, 91% of whom found the vignette to be typical. The median WRVU was 12.89 and the 25th percentile was 11.50. The median IST was 30 minutes. The survey showed four 99213 postoperative visits. The current work value of 66982 is 11.08 WRVU, with an IST of 33 minutes, two level 2 and two level 3 postoperative visits.

The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The key reference service comparisons proved problematic as only 21% of respondents chose the primary reference service, CPT 67036, *Vitrectomy, mechanical, pars plana approach* (RUC 2013), with a WRVU of 12.13, an IST of 50 minutes, and five level 3 postoperative visits. Only 20% of respondents chose CPT 65850, *Trabeculotomy ab externo* (RUC 2005), with 11.39 WRVU, an IST of 60 minutes, and five level 2 postoperative visits as a reference service. While respondents who ranked the intensity and complexity of the reference codes similar to that of the surveyed code, an almost equal number (17%) chose CPT 66179 *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (RUC 2015), with 14.00 WRVU, an IST of 55 minutes, and 8 postoperative visits. Respondents ranked CPT 66179, which has a similar IWPUT as the top 2 reference codes, as lower in intensity and complexity than the surveyed code. As with the survey for CPT 66984, the panel believes that the low percentage of respondents who chose each reference service reflect the dissimilarity between cataract surgery and other intraocular procedures, and that respondents picked reference codes based primarily on similarity to their chosen work value estimates. That they ranked CPT 66982 as more intense than CPT 66179 (aqueous shunt, IWPUT 0.1156) but similar in intensity to CPT 67036 (vitrectomy, IWPUT 0.108) and CPT 65850 (trabeculectomy, IWPUT 0.111) highlights the inconsistency between the intensity/complexity metrics and the actual intensities of the reference codes, making it problematic to use the key reference services to compare complexity in this survey.

The panel agreed with the median IST of 30 minutes and the survey findings of four postoperative visits. However, the panel felt that rather than four 99213 visits as supported by the survey, the first postoperative visit should be a level 2, which is typical of the work associated with an undilated examination to check vision, pressure, incision integrity, and inflammation. The subsequent postoperative visits at 1 week, 2-4 weeks, and 6-8 weeks are all dilated level 3 visits to assess IOL position and presence of macular edema and peripheral retinal tears or detachments in addition to the portions of the exam that can be performed without dilation (checking vision, intraocular pressure, and status of the anterior segment of the eye). The Academy's Preferred Practice Pattern recommends dilated examinations in the postoperative period, specifically to assess for macular edema. The largest professional liability insurer of ophthalmologists (OMIC) emphasizes the importance of dilated examinations to their insureds because in their claims database, the most common missed diagnosis leading to claims is retinal detachment due to failure to perform a dilated examination. An additional visit compared to CPT 66984 is necessary in these patients with more complex eyes and greater degrees of inflammation and risk of lens implant dislocation and retinal disease. The increase in one of the postoperative visits from level 2 to level 3 compared to the current value of the code is also supported by the survey and is consistent with the typical postoperative course.

We chose pre-service package 3 (straightforward patient, difficult procedure) as these are complex cases with multiple potential variants of the procedure that may be necessary as the procedure develops, and these need to be re-reviewed by the surgeon and discussed with the patient immediately prior to surgery in the preoperative area. We reduced the package pre-service evaluation time from 33 minutes to match the survey time of 25 minutes, reduced the survey positioning time from 5 minutes to match the package time of 3 minutes, and reduced the package pre-service scrub, dress and wait time from 15 minutes to the survey time of 7 minutes. This represents a 10-minute increase in pre-service time compared to the current value of the code, and is necessary because of the increased number of options for lens fixation that may arise during surgery and the need to discuss their potential effect on planned visual outcome. We used the survey post-service time median of 6 minutes, which is less than the 21 minutes of post-service time package 7B (local anesthesia, complex procedure) and a 4-minute decrease compared to the current value, and one-half of a 99238 for discharge day management. Total time for the procedure is 175 minutes, with an IST of 30 minutes.

Despite the 3-minute decrease in IST and 10-minute increase in total time, the panel felt that the overall work of the procedure was unchanged, and initially recommended maintaining the work value at 11.04 WRVU. The expert panel believes that cataract surgery has not decreased in intensity since last valued. It is almost entirely an intraocular procedure. Nearly all of the 30 minutes of IST is spent working inside the eye, where a miniscule error can result in a ruptured capsule with a dropped nucleus, leading to an increased risk of serious complications such as endophthalmitis or retinal detachment with permanent loss of vision. The lens capsule is less than 5 microns thick posteriorly. That thin, mobile membrane serves as the only barrier between an uncomplicated case and a complicated one. While those complications are uncommon, they are always only a few microns away and contribute to the technical skill requirements and intensity of the intraservice work. Cataract surgery has not become any less intense over the years and remains intense throughout the course of the procedure. If anything, the intensity of the work has increased over time as patient expectations for "perfect vision" after cataract surgery have become typical. However, there are no crosswalks to support this work value because of its high intensity. Further, the low number of respondents choosing each reference service and the inconsistency of their intensity rankings made use of the KRS problematic. The reviewers were concerned with these issues, and for that reason we sought pre-facilitation.

As a result of pre-facilitation, we have chosen a crosswalk to CPT 67110, *Repair of retinal detachment; by injection of air or other gas (eg, pneumatic retinopexy)* (RUC 2015), with 10.25 WRVU, 30 minutes IST and 196 minutes total time. Although somewhat shorter in total time due to fewer postoperative visits, the intraservice portion of CPT 66982 is of greater intensity than CPT 67110, making for a reasonable work value crosswalk. **We recommend a work value of 10.25 WRVU for CPT 66982, below the survey's 25th percentile value, crosswalked to CPT 67110, and with times of 35/30/6 and a total time of 175 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 245175
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation only

Specialty Ophthalmology Frequency 245175 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 163,451 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Ophthalmology Frequency 163451 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Cataract removal/lens insertion

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 66982

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:66987 Tracking Number I3 Original Specialty Recommended RVU: **13.50**
Presented Recommended RVU: **13.15**
Global Period: 090 Current Work RVU: **N/A** RUC Recommended RVU: **13.15**

CPT Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with endoscopic cyclophotocoagulation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old female with a history of visually significant cataract and chronic glaucoma and that is not controlled by current therapy. Combined cataract removal, intraocular lens implantation, and treatment of the ciliary processes with endoscopic cyclophotocoagulation to reduce aqueous production is recommended. Iris hooks are needed to open the small pupil.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 23% , In the ASC 77%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Check adequacy of pupillary dilation. Perform a surgical time out. Administer sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface. Check the settings of the photocoagulation unit and function of the light pipe.

Description of Intra-Service Work: Insert a lid speculum. Make a side-port incision remote from the anticipated surgical incision. Fill the anterior chamber with a viscoelastic. Create a temporal multiplanar limbal/corneal incision into the anterior chamber. Make four additional 1-mm incisions at the limbus in order to place iris hooks in a diamond pattern around the eye. One by one, insert the iris hooks into the incisions and manipulate to retract the iris. Reposition the iris hooks in the areas of loose zonules to better support the iris and the capsule during subsequent steps of cataract removal.

Use sharp bent needle and forceps to fashion an opening in the anterior capsule of the cataract. Perform hydrodissection by injecting fluid between the lens cortex and capsule, loosening the lens in the process. Hydrodelineate as needed by injecting fluid between the lens cortex and nucleus. Inject additional viscoelastic into the anterior chamber prior to phacoemulsification. Check the function of the phacoemulsification handpiece and the machine settings. Remove bubbles by tapping the handpiece with irrigation on. Insert the phacoemulsification tip into the eye. Perform phacoemulsification with simultaneous aspiration of the lens nuclear material. Rotate and dis-assemble the lens to avoid inadvertent trauma to the cornea, lens capsule or iris. Use the side-port incision to allow access for a second instrument to aid in the disassembly process. Remove the phacoemulsification tip from the eye once all of the nuclear material has been removed. Introduce an irrigation-aspiration tip into the eye to aspirate the remainder of the cortical lens material. Then carefully vacuum and polish the thin posterior lens capsule in an attempt to avoid future secondary membrane formation.

Assess the integrity of the capsule and zonules and determine how much additional support the capsular bag and intraocular lens (IOL) will require. Enlarge incisions and create scleral flaps as needed for the IOL and support system chosen. Insert

and suture a capsular tension ring or segment as needed. Place the IOL in the eye using an injection device. Once in the eye, position and center the lens properly using a lens hook. Suture the IOL and/or capsular bag/zonular complex as needed.

Re-inject a small amount of viscoelastic into the anterior chamber, over the pupil and lens to protect the cornea. Then inject viscoelastic under the iris root for 180° to facilitate visualization of the ciliary body processes with the endoscope. Insert the endoscope/laser probe through the temporal incision viewing the nasal ciliary processes on the heads-up display across the bed from the operating microscope. While periodically viewing the position of the handpieces through the operating microscope, and continually having the OR staff manually adjusting and orienting the focus of the image on the endocyclophotocoagulation display from the lightpipe probe, coagulate the ciliary processes through the endoscope with the endpoint of shrinkage and whitening. Move the endoscope slowly in an arc allowing treatment of each individual process over an arc of 180° and remove the probe. Make a second corneal incision 90° away from the first or enlarge the prior side-port incision if it is properly positioned. Insert the endoscope/laser probe through this second incision and treat the contralateral ciliary processes to complete treatment of 270° to 360° of the processes. After completion of laser therapy, remove the viscoelastic material from the anterior segment of the eye with an irrigation and aspiration handpiece, with careful attention to remove viscoelastic trapped behind the iris. Confirm that the IOL remains in the proper position. Remove the iris hooks one by one. Perform a peripheral iridectomy as necessary.

Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Inject a corticosteroid drug into the anterior chamber. Reform the eye with balanced salt solution. Test the incisions for leaks. Suture any incisions that leak. Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Immediate post-service work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

Postoperative visits: Patient is seen for a level 2 visit on day 1 to check visual acuity, intraocular pressure, incision integrity, and level of inflammation. The patient is seen again for dilated level 3 visits approximately 1, 2, 3-4, 6-8, and 10-12 weeks postoperatively to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	10%	20%	60%	10%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	50%	50%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	30%	70%
Physical effort required	10%	40%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	40%	60%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	25%	38%	37%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	13%	87%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	25%	75%
Physical effort required	0%	13%	87%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	13%	87%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66987, *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with endoscopic cyclophotocoagulation body destruction* is a new CPT code combining

complex cataract surgery and IOL surgery with endoscopic ciliary ablation for glaucoma because the latter procedure is performed over 75% of the time with cataract surgery. This procedure was previously reported with CPT 66982 and CPT 66711, and subject to the multiple procedure payment reduction.

A random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 31 respondents, 97% of whom found the vignette to be typical. The median WRVU was 14.88 and the 25th percentile was 13.50. The median IST was 36 minutes. The survey showed five 99213 and one 99212 postoperative visits.

The top key reference service, chosen by 32% of respondents, was CPT 66179, *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (RUC 2014), with a WRVU of 14.00, an IST of 55 minutes, and five level 3 and three level 2 postoperative visits. The second reference service, chosen by 26% of respondents, was CPT 65285, *Repair of laceration; cornea and/or sclera, perforating, with reposition or resection of uveal tissue* (RUC 2011), with a WRVU of 15.36, an IST of 90 minutes, and six level 3 and one level 2 postoperative visits. The respondents ranked the surveyed code as more intense and complex on all intensity and complexity measures compared to both key reference services.

The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The panel agreed with the median IST of 36 minutes and the number and level of postoperative visits. A level 2 visit is done on the first postoperative day to check vision, pressure, incision integrity, and level of inflammation. These patients typically have significantly greater than normal postoperative inflammation and unstable IOP due to the combined nature of the procedure with ciliary body ablation, as well as the potential for IOL dislocation, necessitating more frequent dilated examinations in the postoperative period than the standalone cataract (CPT 66982) or endocyclophotocoagulation (CPT 66711) procedures. Dilated level 3 examinations are typical at 1, 2, 3-4, 6-8, and 10-12 weeks postoperatively because of the need for detailed examination of the posterior retina for macular edema, the peripheral retina for tears or detachments, and the peripheral intraocular lens implant for decentration and stability.

We chose pre-service package 3 (straightforward patient, difficult procedure) as these are typically complex, difficult to operate eyes with miotic pupils. We reduced the package pre-service evaluation time from 33 minutes to match the survey time of 30 minutes, which is necessary to review the history and explain the multiple surgical options that may be taken during the procedure. We reduced the survey positioning time from 5 minutes to match the package time of 3 minutes, and reduced the package pre-service scrub, dress and wait time from 15 minutes to the survey time of 10 minutes. As with the standalone complex cataract procedure (CPT 66982), there are an increased number of options for lens fixation that may arise during surgery which must be reviewed by the physician and discussed with the patient to explain their potential effect on the expected length of the procedure and planned visual outcome. These patients also typically require a greater wait time after the anesthetic injection than cataract surgery or ciliary ablation cases done alone because the combined cases take longer and involve direct cauterization of sensitive uveal tissue, so longer acting drugs which take longer to take effect (e.g. bupivacaine) are typically employed. The physician typically does a personal check of the settings and function of the photocoagulation unit, monitor and light pipe prior to the incision. We used the survey post-service time median of 10 minutes, which is less than the 21 minutes of post-service time package 7B (local anesthesia, complex procedure), and one-half of a 99238 for discharge day management. Total time for the procedure is 239 minutes, with an IST of 36 minutes.

We were unable to find a high-quality crosswalk for the survey's 25th percentile work value of 13.50 WRVU. After pre-facilitation of the other codes in this family, we determined that a building block type method, based on the adding the difference in work value between CPT 66984 and CPT 66988 to the work value of CPT 66982, would most fairly and appropriately value 66987. The recommended work value of CPT 66984 is 7.35 WRVU and CPT 66988 is 10.25 WRVU. The difference of 2.90 WRVU represents the work of the added ciliary photoablation portion of the procedure. Adding this work value to the recommended value for complex cataract surgery alone (CPT 66982) yields a combined procedure work value of 13.15, slightly below the survey's 25th percentile. **We recommend a work value of 13.15 WRVU for CPT 66987, with times of 43/36/10 and a total time of 239 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Cataract removal/lens insertion

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 66982

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:66984 Tracking Number I5 Original Specialty Recommended RVU: **8.04**
Presented Recommended RVU: **7.41**
Global Period: 090 Current Work RVU: **8.52** RUC Recommended RVU: **7.35**

CPT Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old female complains of vision problems. Examination reveals that a cataract in her right eye has progressed to the point of visual impairment. She has difficulty reading and recently failed a driving test.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 24% , In the ASC 73%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 96% , Overnight stay-less than 24 hours 4% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Check adequacy of pupillary dilation. Perform a surgical time out. Administer topical, sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface.

Description of Intra-Service Work: : Insert a lid speculum. Position the microscope. Make a side-port incision 45 to 90 degrees away from the intended site of the surgical incision. Fill the anterior chamber with a viscoelastic. Create a temporal multiplanar limbal/corneal incision into the anterior chamber. Enter the eye through the main incision with a sharp bent needle to open the anterior capsule, followed by forceps to fashion a circular opening in the anterior capsule of the cataract. Insert a cannula into the eye to perform hydrodissection by injecting balanced salt solution between the lens cortex and capsule, loosening the nuclear and cortical layers of the lens in the process, while maintaining the integrity of the capsule. Hydrodelineate as needed by injecting fluid between the lens cortex and nucleus. Inject additional viscoelastic into the anterior chamber prior to phacoemulsification. Check the function of the phacoemulsification handpiece and the machine settings. Remove bubbles by tapping the handpiece with irrigation on. Insert the phacoemulsification tip into the eye and a second instrument through the side port incision. Using both hands and the foot actuated phaco pedal, carefully perform phacoemulsification with simultaneous aspiration of the lens nuclear material. Rotate and dis-assemble the lens to avoid inadvertent trauma to the cornea, lens capsule or iris. Add viscoelastic as needed to maintain a safe working space. Remove the phacoemulsification tip and second instrument from the eye. Introduce an irrigation and aspiration tip into the eye to aspirate the remainder of the cortical lens material. Then carefully vacuum and polish the interior surface of the thin lens capsule in an attempt to avoid future secondary membrane formation.

Adjust the size of the incision as needed to accommodate the intraocular lens (IOL). While maintaining traction on the eye via the side port incision, insert the tip of the IOL injection device into the main incision and place the IOL in the eye. Once in the eye, allow the IOL unfold without damage to the cornea. Properly position and center the IOL into the capsular bag using a lens hook.
Remove the viscoelastic material from the anterior segment of the eye with an irrigation and aspiration handpiece. Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Reform the eye with balanced salt solution and adjust the intraocular pressure to a physiologic range. Test the incisions for leaks. Suture any incisions that leak.

Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Immediate post-service work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

Postoperative visits: Patient is seen for a level 2 visit on day 1 to check visual acuity, intraocular pressure, incision integrity, and level of inflammation. The patient is seen again for dilated level 3 visits approximately 1 week and 1 month postoperatively to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments.

Technical skill required	17%	28%	55%
Physical effort required	50%	33%	16%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	39%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66984, *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), without endoscopic cyclophotocoagulation* is being revalued as part of the family of cataract surgery codes associated with new

CPT codes 66X01 and 66X02, which describe combined cataract surgery/endoscopic ciliary ablation procedures. The new codes were created because endoscopic ciliary ablation is performed over 75% of the time with cataract surgery. CPT 66984 was last valued by the RUC in 2012.

A random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 93 respondents, 99% of whom found the vignette to be typical. The median WRVU was 11.39 and the 25th percentile was 10.10. The median IST was 20 minutes.

The survey showed three 99213 postoperative visits. The current work value of 66984 is 8.52 WRVU, with an IST of 21 minutes, two level 2 and two level 3 postoperative visits.

The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The key reference service comparisons proved problematic as only 20% chose the primary reference service, CPT 65850, *Trabeculotomy ab externo* (RUC 2005), with a WRVU of 11.39, an IST of 60 minutes, and five level 2 postoperative visits. Only 19% of respondents chose CPT 66184, *Revision of aqueous shunt to extraocular equatorial plate reservoir; without graft* (RUC 2014), with 9.58 WRVU, 60 minutes IST, and 3 level 2 and 4 level 3 postop visits as a reference service. While respondents who ranked the intensity and complexity of the reference codes similar to that of the surveyed code, those who chose CPT 67210, *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (RUC 2010) as a reference ranked the surveyed code higher or much higher in intensity than the surveyed code. The wide distribution of choices among the RSL reflects the dissimilarity between cataract surgery and other intraocular procedures. The panel believes that the most popular RSL choices were made by respondents because their work values are close to the work values they selected by magnitude estimation for the surveyed code. The fact that respondents ranked CPT 66984 as more intense than CPT 67210 (IWPUT 0.199) but equal in intensity to CPT 65850 (IWPUT 0.111) and CPT 66184 (IWPUT 0.048) highlights the inconsistency between the intensity/complexity metrics and the actual intensities of the reference codes, making it problematic to use the key reference services to compare complexity in this survey.

The panel agreed with the survey median IST of 20 minutes (almost identical to the current value of 21 minutes) and the survey findings of three postoperative visits (one less than the current value). However, the panel felt that rather than three 99213 visits as supported by the survey, one 99212 and two 99213 visits more accurately reflected the work done in the postoperative period, with the level 2 visit representing the work associated with the typical one-day postop visit and the level 3 visits typical of the dilated exam performed at the second and final postop examinations. The subsequent examinations at approximately one week and one month need to include dilation to assess the macula in detail for presence of macular edema and the peripheral retina for tears or detachments. The Academy's Preferred Practice Pattern recommends dilated examinations in the postoperative period, specifically to assess for macular edema. The largest professional liability insurer of ophthalmologists (OMIC) emphasizes the importance of dilated examinations to their insureds because in their claims database, the most common missed diagnosis leading to claims is retinal detachment due to failure to perform a dilated examination

We chose pre-service package 1 (straightforward patient, straightforward procedure) with a total of 20 minutes, which is less than the survey median pre-service time of 35 minutes and 2 minutes less than the current pre-service time. We used the survey post-service time median of 5 minutes, which is less than the 18 minutes of post-service time package 7A (local anesthesia, straightforward procedure) and 2 minutes less than the current post-service time, and one-half of a 99238 for discharge day management. Total time for the procedure is 126 minutes, with an IST of 20 minutes.

We initially recommended a work value of 8.04, arrived at by a reverse building block method to subtract the work value of one less level 2 postoperative visit, as this is the only substantive change since the code was last surveyed.

As with CPT 66982, there are no crosswalks to support this work value because of its high intensity. As noted above, use of the KRS to support the intensity was problematic due to the low number choosing each reference service and the inconsistency of the intensity rankings. Nevertheless, respondents chose work values and times at a much higher IWPUT than the codes on the RSL. The expert panel believes that cataract surgery has not decreased in intensity since last valued. It is almost entirely an intraocular procedure. Nearly all of the 20 minutes of IST is spent working inside the eye, where a miniscule error can result in a ruptured capsule with a dropped nucleus, leading to an increased risk of serious complications such as endophthalmitis or retinal detachment with permanent loss of vision. The lens capsule is less than 5 microns thick posteriorly. That thin, mobile membrane serves as the only barrier between an uncomplicated case and a complicated one. While those complications are uncommon, they are always only a few microns away and contribute to the

technical skill requirements and intensity of the intraservice work. Cataract surgery has not become any less intense over the years and remains intense throughout the course of the procedure. If anything, the intensity of the work has increased over time as patient expectations for "perfect vision" after cataract surgery have become typical.

While there have been examples of the RUC using reverse building block in the past (CPT 52341-52346, cystoscopy, where hospital visit values were removed with a change in site of service in 2008), the reviewers for this code were uncomfortable with that methodology. We therefore sought pre-facilitation meeting to discuss the valuation methodology.

As a result of pre-facilitation, we have chosen to use a crosswalk to CPT 67210, *Destruction of localized lesion of retina (eg, macular edema, tumors), 1 or more sessions; photocoagulation* (RUC 2010), which has 6.36 WRVU, a 15-minute IST, a total time of 106 minutes, and an IWPUT of 0.199. While a minority of those surveyed chose CPT 67210 as a reference code, those that did choose it ranked the intensity and complexity of the cataract code as greater or much greater. As an intraocular procedure, CPT 66984 is more intense than CPT 67210, which is an extraocular laser procedure.

The surveyed IST for CPT 66984 is 5 minutes longer than the IST of CPT 67210. By taking the 5-minute increment in IST and multiplying it by the current IWPUT of CPT 66984 at the time it was surveyed (0.210), we calculated a recommended work value for CPT 66984 that is 1.05 WRVU greater than the work value of CPT 67210, or 7.41 WRVU. **Therefore, our recommended work value for 66984 is 7.41 WRVU, well below the survey's 25th percentile, with times of 20/20/5 minutes and a total time of 126 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2,618,000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation only

Specialty Ophthalmology Frequency 2618000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,745,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation based on RUC database

Specialty Ophthalmology Frequency 1745000 Percentage 100.00 %

SUMMARY OF RECOMMENDATION

CPT Code:66988 Tracking Number I6 Original Specialty Recommended RVU: **11.08**
Presented Recommended RVU: **10.25**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **10.25**

CPT Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); with endoscopic cyclophotocoagulation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male with a history of visually significant cataract and chronic glaucoma and that is not controlled by current therapy. Combined cataract removal, intraocular lens implantation and treatment of the ciliary processes to reduce aqueous production is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 26% , In the ASC 74%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record and preoperative diagnostic testing. Discuss the planned procedure with the patient and obtain informed consent. Identify and mark the eye for surgery. Write preoperative orders for medications and pupillary dilation. Check adequacy of pupillary dilation. Perform a surgical time out. Administer sub-Tenon or retrobulbar anesthetic. Reposition the patient. Prep and drape the ocular surface. Check the settings of the photocoagulation unit and function of the light pipe.

Description of Intra-Service Work: Insert a lid speculum. Position the microscope. Make a side-port incision away from the intended site of the surgical incision. Fill the anterior chamber with a viscoelastic. Create a temporal multiplanar limbal/corneal incision into the anterior chamber. Use sharp bent needle and forceps to fashion an opening in the anterior capsule of the cataract. Perform hydrodissection by injecting fluid between the lens cortex and capsule, loosening the lens in the process. Hydrodelineate as needed by injecting fluid between the lens cortex and nucleus. Inject additional viscoelastic into the anterior chamber prior to phacoemulsification. Check the function of the phacoemulsification handpiece and the machine settings. Remove bubbles by tapping the handpiece with irrigation on. Insert the phacoemulsification tip into the eye. Perform phacoemulsification with simultaneous aspiration of the lens nuclear material. Rotate and dis-assemble the lens to avoid inadvertent trauma to the cornea, lens capsule or iris. Use the side-port incision to allow access for a second instrument to aid in the disassembly process. Remove the phacoemulsification tip from the eye. Introduce an irrigation-aspiration tip into the eye to aspirate the remainder of the cortical lens material. Then carefully vacuum and polish the thin posterior lens capsule in an attempt to avoid future secondary membrane formation.

Adjust the size of the incision as needed to accommodate the intraocular lens (IOL). Place the IOL in the eye using an injection device. Once in the eye, properly position and center the IOL using a lens hook.

Re-inject a small amount of viscoelastic into the anterior chamber, over the pupil and lens to protect the cornea. Then inject viscoelastic under the iris root for 180° to facilitate visualization of the ciliary body processes with the endoscope. Insert the endoscope/laser probe through the temporal incision viewing the nasal ciliary processes on the heads-up display across the bed from the operating microscope. While periodically viewing the position of the handpieces through the operating microscope, and continually having the OR staff manually adjusting and orienting the focus of the image on the endocyclophotocoagulation display from the lightpipe probe, coagulate the ciliary processes through the endoscope with

the endpoint of shrinkage and whitening. Move the endoscope slowly in an arc allowing treatment of each individual process over an arc of 180° and remove the probe. Make a second corneal incision 90° away from the first or enlarge the prior side-port incision if it is properly positioned. Insert the endoscope/laser probe through this second incision and treat the contralateral ciliary processes to complete treatment of 270° to 360° of the processes. After completion of laser therapy, remove the viscoelastic material from the anterior segment of the eye with an irrigation and aspiration handpiece, with careful attention to remove viscoelastic trapped behind the iris. Confirm that the IOL remains in the proper position. Remove the iris hooks one by one. Perform a peripheral iridectomy as necessary.

Inject a miotic drug into the anterior chamber to produce pupillary miosis as needed. Inject a corticosteroid drug into the anterior chamber. Reform the eye with balanced salt solution. Test the incisions for leaks. Suture any incisions that leak. Remove the lid speculum. Place an antibiotic ointment on the eye as necessary. Place a soft patch and a rigid shield on the operative eye.

Description of Post-Service Work: Immediate post-service work: Write post-operative orders and prescriptions for post-operative medications. Complete an operative report. Discuss the surgical procedure and post op instructions with the patient and family. Necessary follow up testing and exams as well as medications, activity and restrictions are reviewed. Communicate with the referring physician.

Postoperative visits: Patient is seen for a level 2 visit on day 1 to check visual acuity, intraocular pressure, incision integrity, and level of inflammation. The patient is seen again for dilated level 3 visits approximately 1, 2, 4, and 6-8 weeks postoperatively to check visual acuity, intraocular pressure, incision integrity, corneal clarity, level of inflammation, and detailed examination of the central retina for cystoid macular edema and peripheral retina for tears or detachments.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 66988, *Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); with endoscopic* cyclophotocoagulation is a new CPT code combining cataract and IOL surgery with endoscopic ciliary ablation for glaucoma because the latter procedure is performed over 75% of

the time with cataract surgery. This procedure was previously reported with CPT 66984 and CPT 66711, and subject to the multiple procedure payment reduction.

A random survey of American Academy of Ophthalmology, American Society of Cataract and Refractive Surgeons, and American Glaucoma Society members had 31 respondents, 97% of whom found the vignette to be typical. The median WRVU was 13.95 and the 25th percentile was 11.08. The median IST was 30 minutes. The survey showed five 99213 postoperative visits. The top key reference service, chosen by 26% of respondents, was CPT 66179, *Aqueous shunt to extraocular equatorial plate reservoir, external approach; without graft* (RUC 2014), with a WRVU of 14.00, an IST of 55 minutes, and five level 3 and three level 2 postoperative visits. The second reference service, chosen by 19% of respondents, was CPT 65285, *Repair of laceration; cornea and/or sclera, perforating, with reposition or resection of uveal tissue* (RUC 2011), with a WRVU of 15.36, an IST of 90 minutes, and six level 3 and one level 2 postoperative visits. The respondents ranked the surveyed code as similar or more intense and complex on the intensity and complexity measures compared to the key reference services.

The expert panel of the AAO, ASCRS, and AGS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The panel agreed with the median IST of 30 minutes and 5 postoperative visits. These patients typically have significantly greater than normal postoperative inflammation and unstable IOP due to the ciliary body ablation, necessitating frequent dilated examinations in the postoperative period to check for macular edema and peripheral retinal tears or detachments. However, the panel felt that rather than five 99213 visits as supported by the survey, the first postoperative visit should be a level 2, which is typical of the work associated with an undilated examination to check vision, pressure, incision integrity, and inflammation. As with the standalone ciliary photoablation procedure (CPT 67111), the subsequent postoperative visits at 1, 2, 4 and 6-8 weeks are all dilated level 3 visits to assess IOL position and presence of macular edema and peripheral retinal tears or detachments in addition to the portions of the exam that can be performed without dilation (checking vision, intraocular pressure, and status of the anterior segment of the eye).

We chose pre-service package 3 (straightforward patient, difficult procedure) as these are complex combined cases. We reduced the package pre-service evaluation time from 33 minutes to match the survey time of 25 minutes, which is necessary to review the prior history and explain the multiple surgical options that may be taken during the procedure. There is a risk of dislocating the lens implant during the ciliary ablation portion of the procedure, and the options to fixate the lens should that occur and its implications for planned outcome must be reviewed with the patient. We reduced the survey positioning time from 5 minutes to match the package time of 3 minutes, and reduced the package pre-service scrub, dress and wait time from 15 minutes to the survey time of 10 minutes. These patients typically require a greater wait time after the anesthetic injection than cataract surgery or ciliary ablation cases done alone because the combined cases take longer and involve direct cauterization of sensitive uveal tissue, so longer acting drugs which take longer to take effect (e.g. bupivacaine) are typically employed. The physician typically does a personal check of the settings and function of the photocoagulation unit and monitor and function of the light pipe prior to the incision. We used the survey post-service time median of 7 minutes, which is less than the 21 minutes of post-service time package 7B (local anesthesia, complex procedure), and one-half of a 99238 for discharge day management. Total time for the procedure is 202 minutes, with an IST of 30 minutes.

We were unable to find an adequate crosswalk for our initial recommendation of the survey's 25th percentile work value of 11.08. After pre-facilitation, we concluded that a crosswalk to CPT 67110, *Repair of retinal*

detachment; by injection of air or other gas (eg, pneumatic retinopexy) (RUC 2015), with 10.25 WRVU, 30 minutes IST and 196 minutes total time was appropriate. CPT 669871 has 1 less postoperative visit but more pre-time, and a greater portion of the procedure involves high-intensity intraocular manipulations compared to CPT 67110. **Therefore, we are recommending a work value for CPT 66988 of 10.25 WRVU, below the survey's 25th percentile, with times of 38/30/7 and a total time of 202 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 12000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Ophthalmology Frequency 12000 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation Only

Specialty Ophthalmology Frequency 8000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Cataract removal/lens insertion

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 66984

CPT Code: 66711
Specialty Society: American Academy of Ophthalmology

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Ciliary body destruction; cyclophotocoagulation, endoscopic, without concomitant removal of crystalline lens

Global Period: 090 Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we queried other physicians who have the appropriate expertise for this code. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: **N/A**

3. Is this code(s) typically billed with an E/M service? **No**

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: **N/A**

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: **N/A**

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: **N/A**

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. **N/A**

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

    Exam lane: Standard office visit formula used.
    Screening lane: Standard office visit formula used.

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**

13. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**

14. Please include an explanation of each line item:

    15 – Standard facility time input for completing pre-service diagnostic and referral forms
    16 – Standard facility time input for coordinating pre-surgery services
    17 – Standard facility time input for scheduling space and equipment in the facility
    18 – Standard facility time input for providing pre-service education/obtaining consent
    19 – Standard facility time input for completing pre-procedure phone calls and prescription
    74 – Standard facility time input for discharge day management
    88 – Typical number of 99212 post-op visits as demonstrated by RUC-approved survey
    89 – Typical number of 99213 post-op visits as demonstrated by RUC-approved survey
    102 – Ophthalmology visit pack with dilation for 99213 post-op visits
    103 – Ophthalmology visit pack without dilation for 99212 post-op visits

CPT Code: 66982
Specialty Society: American Academy of Ophthalmology

CPT Code: 66987
Specialty Society: American Academy of Ophthalmology

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1-stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification), complex, requiring devices or techniques not generally used in routine cataract surgery (eg, iris expansion device, suture support for intraocular lens, or primary posterior capsulorrhexis) or performed on patients in the amblyogenic developmental stage; with endoscopic cyclophotocoagulation

Global Period: 090 Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we queried other physicians who have the appropriate expertise for this code. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: **This new code will represent when the current 66711 and 66982 are performed together. 66711 is the primary reference, but both 66711 and 66982 are listed in parallel on the excel sheet for reference.**

3. Is this code(s) typically billed with an E/M service? **No.**

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: **N/A**

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: **There is no current total cost for a combined code. However, the proposed total cost is marginally higher than either of the two individual current codes, exclusively because when the two codes are done in combination, there is typically one extra post-operative visit, as demonstrated by the RUC-approved survey.**

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: **N/A**

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. **N/A**

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

    Exam lane: Standard office visit formula used.
    Screening lane: Standard office visit formula used.

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**

13. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**

14. Please include an explanation of each line item:

    15 – Standard facility time input for completing pre-service diagnostic and referral forms
    16 – Standard facility time input for coordinating pre-surgery services
    17 – Standard facility time input for scheduling space and equipment in the facility
    18 – Standard facility time input for providing pre-service education/obtaining consent
    19 – Standard facility time input for completing pre-procedure phone calls and prescription
    74 – Standard facility time input for discharge day management
    88 – Typical number of 99212 post-op visits as demonstrated by RUC-approved survey
    89 – Typical number of 99213 post-op visits as demonstrated by RUC-approved survey
    102 – Ophthalmology visit pack with dilation for 99213 post-op visits
    103 – Ophthalmology visit pack without dilation for 99212 post-op visits

CPT Code: 66984
Specialty Society: American Academy of Ophthalmology

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation

Global Period: 090 Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we queried other physicians who have the appropriate expertise for this code. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: **Existing code used as reference.**

3. Is this code(s) typically billed with an E/M service? **No**

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: **N/A**

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: **N/A**

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: **N/A**

8. If you wish to identify a new staff type, please include a very specific staff description, a salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov. **N/A**

9. If you wish to include a supply that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

10. If you wish to include an equipment item that is not on the list please provide a paid invoice. Identify and explain the invoice here: **N/A**

11. List all the equipment included in your recommendation and the equipment formula chosen (see document titled "Calculating equipment time"). If you have selected "other formula" for any of the equipment please explain here:

    Exam lane: Standard office visit formula used.
    Screening lane: Standard office visit formula used.

12. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail please include here: **N/A**

13. If there is any other item on your spreadsheet that needs further explanation please include here: **N/A**

14. Please include an explanation of each line item:

    15 – Standard facility time input for completing pre-service diagnostic and referral forms
    16 – Standard facility time input for coordinating pre-surgery services
    17 – Standard facility time input for scheduling space and equipment in the facility
    18 – Standard facility time input for providing pre-service education/obtaining consent
    19 – Standard facility time input for completing pre-procedure phone calls and prescription
    74 – Standard facility time input for discharge day management
    88 – Typical number of 99212 post-op visits as demonstrated by RUC-approved survey
    89 – Typical number of 99213 post-op visits as demonstrated by RUC-approved survey
    102 – Ophthalmology visit pack with dilation for 99213 post-op visits
    103 – Ophthalmology visit pack without dilation for 99212 post-op visits

CPT Code: 66988
Specialty Society: American Academy of Ophthalmology

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation (SoR)
Facility Direct Practice Expense (PE) Inputs

CPT Long Descriptor: Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); with endoscopic cyclophotocoagulation

Global Period: 090 Meeting Date: January 2019

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally, we queried other physicians who have the appropriate expertise for this code. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is not new, you must use the current direct PE inputs as your reference code. You can provide one additional reference code if you are required to use the current direct PE inputs. Provide an explanation for the selection of reference code(s) here: **This new code will represent when the current 66711 and 66984 are performed together. 66711 is the primary reference, but both 66711 and 66984 are listed in parallel on the excel sheet for reference.**

3. Is this code(s) typically billed with an E/M service? **No.**

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time: **N/A**

5. If you are requesting an increase over the current total cost for clinical staff time (This does not include minutes to assist physician and the number of post-op visits, as they are directly related to physician work), total cost of supplies, and/or total cost of equipment you must provide compelling evidence: **There is no current total cost for a combined code. The total cost of this proposed code does not exceed that of 66711.**

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and listed in tab 2, please explain the difference here: **N/A**

7. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities: **N/A**

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Lacrimal Canaliculus Drug Eluting Implant Insertion – Tab 17

In October 2020, the CPT Editorial Panel replaced CPT Category III code 0356T with a new CPT Category I code to report the insertion of a drug eluting implant into the lacrimal canaliculus.

68841 ***Insertion of drug-eluting implant, including punctal dilation, when performed, into lacrimal canaliculus, each***
The RUC reviewed the survey results from 32 ophthalmologists for CPT code 68841 and agreed with the recommended direct work RVU crosswalk to CPT code 65205 *Removal of foreign body, external eye; conjunctival superficial* (work RVU = 0.49, 3 minutes of intra-service time, and 11 minutes total time) as it has identical intra-service time and an almost identical IWPUT. The RUC recommends 5 minutes of pre-service evaluation time, 1 minute of pre-service positioning time, 1 minute of pre-service scrub/dress/wait time, 3 minutes of intra-service time, 2 minutes of immediate post-service time, and 12 minutes total time for code 68841. The RUC recommended work RVU of 0.49 is lower than the survey 25th percentile work RVU of 0.74. The RUC agreed with the recommended work value of 0.49 using code 65205 as a direct work RVU crosswalk because both codes involve identical intra-service time and similar physician work and with the specialty society's explanation that the 3 minutes of intra-service time and nature of this procedure warrant a direct work RVU crosswalk lower than the survey 25th percentile value.

CPT code 68841 describes placement of a drug delivery device through an intact punctum into the lacrimal canaliculus. CPT code 68841 is typically performed in a facility in conjunction with intraocular surgery, typically cataract surgery (CPT codes 66982 and 66984) to deliver an extended-release dose of corticosteroid to treat postoperative inflammation. The device is a drug formulation that dissolves over the course of about a month. However, it can be placed in the office setting during the post-operative period if there is an unexpected degree of inflammation or the patient has trouble administering eyedrops. It can also be used off-label for treatment of non-surgical ocular inflammatory disease. The specialty societies noted that they expect utilization to increase in the office setting once implants containing medications for treatment of glaucoma or other non-surgical diseases are approved and introduced.

CPT code 68841 will be performed as a standalone code as implants containing other medications are introduced or as off-label treatment of non-surgical inflammation. The specialty societies noted that is why this is designated as a 000-day global service. The RUC agreed, noting that it would be subject to the multiple procedure reduction when applicable. The specialty societies confirmed that the only currently approved drug is used in conjunction with an intraocular surgical procedure and may be placed during surgery or in the office during the 1-day post-operative visit. As additional drugs are approved, these will likely be performed on the same day as an office visit. The specialty societies noted, and the RUC confirmed that the pre- and post-service times are much less than the established packages accounting for any overlap.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared CPT code 68841 to the top two key reference services, CPT code 65222 *Removal of foreign body, external eye; corneal, with slit lamp* (work RVU = 0.84, 7 minutes of intra-service time, 15 minutes total time) and CPT code 65800 *Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous* (work RVU = 1.53, 5 minutes of intra-service time, and 28 minutes of total time) and noted that the time and intensity of work of these procedures indicates an appropriate rank order for the recommended work RVU and total time for CPT code 68841. by CPT code 65205. For additional support, the RUC referenced CPT code 68200 *Subconjunctival injection* (work RVU = 0.49 and 11 minutes total time). **The RUC recommends a work RVU of 0.49 for CPT code 68841**.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Practice Expense
The Practice Expense Subcommittee recognized that if CPT code 68841 is done independently, the clinical staff time would be extensive; however, 68841 is typically done with cataract surgery, so the specialty chose to use minimal clinical staff time. Also, any duplication in the service period due to placement typically on postoperative day one from cataract surgery has been eliminated. **The RUC recommends the direct practice expense units as submitted by the specialty societies.**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:68841 Tracking Number T1 Original Specialty Recommended RVU: **0.49**
Presented Recommended RVU: **0.49**
Global Period: 000 Current Work RVU: **N/A** RUC Recommended RVU: **0.49**

CPT Descriptor: Insertion of drug-eluting implant, including punctal dilation, when performed, into lacrimal canaliculus, each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old female presents for cataract removal. a drug-eluting implant is placed in conjunction with the cataract removal.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the patient record. Discuss the planned procedure with the patient and family and obtain informed consent. Identify the position and patency of the lacrimal punctum. Reposition the patient and lower lid to expose the punctum. Administer topical anesthetic.

Description of Intra-Service Work: Insert a punctal dilator and advance into the canaliculus, dilating the punctum, then remove. Dry the punctum and surrounding tissue with a cotton-tipped applicator. Grasp the drug-eluting implant with forceps and insert through the punctum into the canaliculus. Bury the tip of the implant below the surface of the punctal opening.

Description of Post-Service Work: Complete an operative report. Discuss the procedure with the patient and family. Follow up exams as well as medications, activity and restrictions are reviewed.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
65222	000	0.84	**Other**

CPT Descriptor Removal of foreign body, external eye; corneal, with slit lamp

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
65800	000	1.53	**RUC Time**

CPT Descriptor Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
29540	000	0.39	**RUC Time**	213,060

CPT Descriptor 1 Strapping; ankle and/or foot

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
51702	000	0.50	**RUC Time**	234,004

CPT Descriptor 2 Insertion of temporary indwelling bladder catheter; simple (eg, Foley)

Other Reference CPT Code	Global	Work RVU	Time Source
65205	000	0.49	**RUC Time**

CPT Descriptor Removal of foreign body, external eye; conjunctival superficial

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 10 **% of respondents:** 31.2 **%**

Number of respondents who choose 2nd Key Reference Code: 6 **% of respondents:** 18.7 **%**

TIME ESTIMATES (Median)

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	20%	40%	30%	10%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	40%	30%	30%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	70%	30%
Physical effort required	10%	70%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and	40%	50%	10%

judgment of physician • Estimated risk of malpractice suit with poor outcome	

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	33%	0%	50%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	33%	33%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	67%	33%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	50%	33%	17%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

CPT 68841, *Insertion of drug-eluting implant, including punctal dilation, when performed, into lacrimal canaliculus, each* is a new 000-day global CPT code for placement of drug-eluting canalicular implants that can replace or supplement topical eyedrop administration.

This procedure was previously reported with CPT 0356T. There is no claims data available because at this time the only FDA-approved drug for this procedure, a dexamethasone-eluting implant, was introduced to the market in the third quarter of 2020. The procedure is typically performed in a facility in conjunction with cataract surgery (CPT 66982, 66984) or another intraocular procedure at this time. However, it can be placed in the office during the postoperative period if there is an unexpected degree of inflammation or the patient experiences difficulty administering eyedrops. It can also be used off-label for treatment of non-surgical ocular inflammatory

disease. We expect additional office utilization once implants containing medications for treatment of glaucoma or other non-surgical diseases are approved and introduced.

There are two other codes in the "Lacrimal System: Repair" section of CPT that might be considered in the same family as CPT 68841: CPT 68760 and 68761. The other codes in this section of CPT (68700-68750, 68770) are not remotely related in terms of the details of the surgical procedures and diseases they treat despite their listing in the same section of CPT. They are therefore not in the same family of procedures.

CPT 68760 and 68761 differ significantly from CPT 68841 in a number of essential characteristics. First, CPT 68841 is typically performed in a facility, while CPT 68760 and 68761 are performed in the office 86.8% and 96.7% of the time, respectively. Second, 68841 describes placement of a drug delivery device through an intact punctum into the lacrimal canaliculus, while the two existing procedures describe closure of the punctum. Third, they are used in different circumstances for different clinical indications.

CPT 68841 is used in conjunction with intraocular surgery, typically cataract removal, to deliver an extended release dose of corticosteroid to treat postoperative inflammation. The device is a drug formulation that dissolves over the course of about a month. CPT 68760 and 68761 are not typically used in conjunction with any other surgical procedure and are not drug delivery systems. They are typically reported with an office visit and are done to close the punctum to treat ocular surface disease due to dry eye.

For the above reasons, both CPT 68760 and 68761 are in a separate family from CPT 68841 and are not being reviewed at this time.

A survey of 68841 sent to a random sample of American Academy of Ophthalmology and American Society of Cataract and Refractive Surgery members had 32 respondents, 88% of whom found the vignette to be typical. The median WRVU was 0.83 and the 25th percentile was 0.74. The median IST was 3 minutes. The expert panel of the AAO and ASCRS, which is familiar with the procedure and the RUC process, reviewed the survey findings. The procedure is very new, the drug having been introduced in the third quarter of 2020. Although there was an adequate service performance rate, some respondents may still have been on the initial learning curve at the time of the survey.

The top key reference service, chosen by 31% of respondents, was CPT 65222, *Removal of foreign body, external eye; corneal, with slit lamp* (RUC 2011), with a WRVU of 0.84, an IST of 7 minutes, and a total time of 15 minutes. The second reference service, chosen by 19% of respondents, was CPT 65800, *Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous* (RUC 2012), with a WRVU of 1.53, an IST of 5 minutes, and a total time of 28 minutes. While 40% of respondents ranked the surveyed code identical on the overall intensity and complexity measure, 40% ranked it somewhat or much more complex than the top reference service. The majority ranked the codes identical on the submeasures. The majority ranked the surveyed code higher than the second reference service on overall intensity and complexity and physical effort, ranking them identical on the technical skill submeasure. These rankings were paradoxical in that respondents found the surveyed code more complex than a high-IWPUT intraocular procedure, yet similar in complexity to a lower-IWPUT extraocular procedure. Only 6 respondents chose the intraocular procedure as a reference, and they may have been among those early in their learning curve with the new procedure.

The panel agreed with the survey median IST of 3 minutes. We considered valuing 68841 as an add-on ZZZ procedure with no pre- or post-service time. However, the procedure will be done as a standalone as implants containing other medications are introduced or as off-label treatment of non-surgical inflammation. Therefore, we are valuing the code as a 000-day global. There will be an opportunity to revisit utilization patterns when it is reviewed under the New Technology screen.

Pre-service package 1 is appropriate for a procedure typically performed in a facility. Because CPT 68841 is currently performed in conjunction with intraocular surgery, times would be expected to be shorter than the package times. Survey respondents appeared to recognize this, perhaps because the vignette states that the procedure is done in conjunction with cataract removal.

We used the survey pre-service evaluation time of 5 minutes, substantially lower than the package time of 13 minutes. Five minutes is necessary to discuss the aspects of the procedure that are separate from the associated intraocular surgery, obtain a separate informed consent, and identify the location and patency of the lacrimal punctum in the preoperative area. All of this is distinct from and in addition to the work associated with the concurrent intraocular procedure.

We reduced the survey positioning time of 2 minutes to match the package time of 1 minute. Positioning time in addition to that of the associated procedure is required because the drug-eluting implant is placed after the intraocular procedure's intra-service work is completed. After the drapes and lid speculum are removed, which is part of the intraocular procedure, the head must be repositioned to center the lacrimal punctum in the microscope field of view. The lid must then be everted and angled to make the lacrimal punctum accessible. This occurs after conclusion of the intraocular procedure and is separate from the positioning performed at the beginning of the intraocular procedure. We allocated 1 minute for positioning, consistent with the package time and less than the survey value of 2 minutes.

We reduced the 2-minute survey scrub/dress/wait time to 1 minute. This time is required to allow administration and onset of topical anesthesia prior to implant insertion. It is consistent with the detailed breakdown of pre-service package 1. As with the positioning, this too occurs after the conclusion of, and is in addition to the scrub/dress/wait time for the associated intraocular procedure.

The survey immediate postoperative time of 2 minutes is needed to complete the portion of the operative report unique to the implant insertion and to discuss symptoms of implant extrusion.

The pre-, intra-, and post- times for the procedure are 7/3/2, with a total time of 12 minutes.

We recommend a work value for CPT 68841 of 0.49 WRVU, below the survey 25th percentile, with a crosswalk to CPT 65205, *Removal of foreign body, external eye; conjunctival superficial* (RUC 2017). The crosswalk code has an identical IST of 3 minutes and a total time of 11 minutes, within 1 minute of the surveyed code. The IWPUT at this work value is almost identical to that of the crosswalk code, though we recognize that IWPUTs are unreliable for such brief procedures. The recommended value is further supported by CPT 68200, *Subconjunctival injection of medication or other substance into Tenon's capsule* (RUC 2011) with 0.49 WRVU, an IST of 5 minutes, and a total time of 11 minutes.

The panel also considered a crosswalk to CPT 67820, *Correction of trichiasis; epilation, by forceps only* (RUC 2016), with 0.32 WRVU, an IST of 5 minutes, and a total time of 11 minutes. The panel felt that the work, intensity, and precision of inserting an implant through the punctum in an eye with a fresh surgical incision is better represented by the crosswalk to a foreign body removal or a subconjunctival injection.

We recommend a work value of 0.49 WRVU for CPT 68841, with times of 7/3/2 and a total time of 12 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☒ Other reason (please explain) The only currently approved drug is used in conjunction with an intraocular surgical procedure, and may be placed during surgery or in the office during the 1-day postoperative visit. As additional drugs are approved, these will likely be performed on the same day as an office visit.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3.	CPT Code	Pre-	Intra-	Post-	Total Time	Work RVU	Global Period
4.	66982	35	30	6	175	10.25	090
5.	66984	20	20	5	126	7.35	090

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0356T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology Frequency 100000 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 45,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate.

Specialty Ophthalmology Frequency 45000 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Eye procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 66984

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
68841	Insertion of drug-eluting implant, including punctal dilation, when performed, into lacrimal canaliculus, each	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
68841	A 67-year-old female presents for cataract removal. a drug-eluting implant is placed in conjunction with the cataract removal.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. The consensus committee considered the survey data and PE details to determine clinical time. Additionally, applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   First Reference Code 65222 Removal of corneal foreign body – this was chosen based on the survey results indicating this as the top reference code
   Second Reference Code 68761 Closure of lacrimal punctum by plug, each – this was chosen based on the similarity of the procedure. The major difference between this code and 68841, is that a device to block the punctum is inserted vs a drug eluting agent that is placed through the punctum into the canaliculus.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   No

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   CPT 0356T has no claims data thus the answers below are anticipated:
   Ophthalmology.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Presume 5% done in the non-facility setting and 95% will be done in the facility setting.
Dominant provider should be the same in both settings – ophthalmology.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

No

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

The clinical staff time if done independently would be extensive; however, since this is typically done with cataract surgery we have chosen to use minimal clinical staff time. Furthermore, reductions beyond those levels have been made where appropriate.
CA001 – This time is used to complete pre-service referral forms. Because this additional drug approval for the actual implant that is inserted this is additional time beyond what would be included for cataract surgery and not duplicative. The standard times have been used.
CA004 – This is to provide pre-service education and consent. Despite being done with cataract surgery, the procedure and associated risks and benefits are different and still require additional discussion. The standard times have been used.
CA002, CA003, and CA005 Have been reduced from 3 minutes to 0 minutes.

   b. Service period (includes pre, intra and post):

Duplication due to placement typically on postoperative day one from cataract surgery has been eliminated.
CA013 – Staff would prepare the room and supplies for the procedure. This requires instrumentation and setup beyond a cataract postoperative visit, thus the standard time of 2 minutes in completed.

   c. Post-service period:

CA024 – The room and equipment are cleaned. The full allotment of standard time is included because both a punctal dilator and 45-degree forceps that are used need to be scrubs, cleaned, repacked, and sterilized. These are instruments not used on a postoperative cataract surgery visit.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

CA035 – Review of instructions specific to this device are performed. These are risks separate from cataract surgery and include discussion of care of the eyelid, need to evaluate for extrusion of device, etc. This has been reduced from the standard time of 2 minutes to 1 minute.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A. Typically the physician performs the procedure and staff help with setup, cleanup, post procedure counselling etc.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

SB024 – Sterile Gloves, required for the procedure performed by the physician. Sterile gloves required due to recent cataract surgery and potential for infecting the eye through recent incisions
SG081 – Cotton tip applicators – these are required above and beyond a normal postoperative visit to facilitate eversion of the eyelids for placement of the implant.
SJ043 – Povidone swabsticks – needed for sterility for the above-mentioned reasons.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

SH058 – Proparacaine – required for anesthesia.

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

19. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):
    N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

    N/A

21. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:
    EL006 – Screening lane is used for the duration of setup, procedure, cleaning, and counselling post procedure. Standard formulas applied.

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:
    N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

23. If this is a PE only code please select a crosswalk based on a similar specialty mix:
    N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made

during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

68841	A 67-year-old female presents for cataract removal. a drug-eluting implant is placed in conjunction with the cataract removal.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The Academy convenes a consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. The consensus committee considered the survey data and PE details to determine clinical time. Additionally, applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on whether or not any changes were needed for the existing supplies and equipment.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   First Reference Code 65222 Removal of corneal foreign body – this was chosen based on the survey results indicating this as the top reference code
   Second Reference Code 68761 Closure of lacrimal punctum by plug, each – this was chosen based on the similarity of the procedure. The major difference between this code and 68841, is that a device to block the punctum is inserted vs a drug eluting agent that is placed through the punctum into the canaliculus

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

The clinical staff time if done independently would be extensive; however, since this is typically done with cataract surgery we have chosen to use minimal clinical staff time. Furthermore, reductions beyond those levels have been made where appropriate. CA001 – This time is used to complete pre-service referral forms. Because this additional drug approval for the actual implant that is inserted this is additional time beyond what would be included for cataract surgery and not duplicative. The standard times have been used. CA003 – This service is typically at the facility and requires additional time to ensure drug to be implanted are ordered for placement in the facility setting. This is reduced further from the standard 3 minutes to 1 minute. CA004 – This is to provide pre-service education and consent. Despite being done with cataract surgery, the procedure and associated risks and benefits are different and still require additional discussion. The standard times have been used. CA002 and CA005 Have been reduced from 3 minutes to 0 minutes.

   b. Service period (includes pre, intra and post):

None.

   c. Post-service period:

None.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if

available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

None in the facility setting

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

None in the facility setting.

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Transcutaneous Passive Implant-Temporal Bone – Tab 18

In October 2020, the CPT Editorial replaced two codes for mastoidectomy with new codes for magnetic transcutaneous attachment to external speech processor. Additional revisions and codes were added to differentiate implantation, removal, and replacement of the implants.

69714 ***Implantation, osseointegrated implant, skull; with percutaneous attachment to external speech processor***
The RUC reviewed the survey results from 73 physicians and determined that a work RVU of 8.69 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 40 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and two office visit(s) (2x 99213).

The RUC recommends a direct work RVU crosswalk to CPT code 52400 *Cystourethroscopy with incision, fulguration, or resection of congenital posterior urethral valves, or congenital obstructive hypertrophic mucosal folds* (work RVU= 8.69, intra-service time of 40 minutes and 197.5 minutes of total time) and noted that both codes have identical intra-service time, similar total time, and should be valued identically. The RUC agreed that due to the lack of 090-day global codes with 40 minutes of intra-service time, CPT code 52400 is an appropriate crosswalk for the work value, resulting in a work intensity that closely aligns with the revision/replacement of implant code 69717 (0.110 and 0.100 IWPUT respectively). The RUC agreed that code 52400 and the survey code have similar intra-service and total times and should be valued identically, below the survey's 25th percentile. **The RUC recommends an interim work RVU of 8.69 for CPT code 69714.**

69716 ***Implantation, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor***
The RUC reviewed the survey results from 67 physicians and determined that a work RVU of 9.77 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 32 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to MPC code 50590 *Lithotripsy, extracorporeal shock wave* (work RVU= 9.77, intra-service time of 60, immediate post service time of 15 minutes and total time of 207 minutes) and noted that both codes have identical intra-service time, identical post-service time and similar total time, and should be valued identically. The RUC agreed that an IWPUT of 0.100 is appropriate and that the recommended work value of 9.77 places the survey code well within the relativity of the family.

Additionally, the RUC agreed that the work value of 9.77 for code 69716 is appropriately bracketed by codes 43180 *Esophagoscopy, rigid, transoral with diverticulectomy of hypopharynx or cervical esophagus (eg, Zenker's diverticulum), with cricopharyngeal myotomy, includes use of telescope or operating microscope and repair, when performed* (work RVU = 9.03 and total time of 201 minutes) and 57240 *Anterior*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed (work RVU = 10.08 and total time of 211 minutes), further supporting a recommended work RVU of 9.77 for code 69716. **The RUC recommends an interim work RVU of 9.77 for CPT code 69716.**

69717 ***Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor***
The RUC reviewed the survey results from 64 physicians and determined that a work RVU of 8.80 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and two office visit(s) (2x 99213).

The RUC recommends a direct work RVU crosswalk to CPT code 27829 *Open treatment of distal tibiofibular joint (syndesmosis) disruption, includes internal fixation, when performed* (work RVU= 8.80 and intra-service time of 45 minutes) to appropriately account for the physician work involved in this service. The RUC agreed that code 27829 is an appropriate crosswalk, the recommended work value of 8.80 for the survey code results in an IWPUT of 0.100. Additionally, the RUC agreed that the survey code should be valued identically to code 27829 because both services have identical intra-service time. **The RUC recommends an interim work RVU of 8.80 for CPT code 69717.**

69719 ***Revision/replacement (including removal of existing device), osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor***
The RUC reviewed the survey results from 59 physicians and determined that the work RVU of 9.77 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 60 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to MPC code 50590 *Lithotripsy, extracorporeal shock wave* (work RVU = 9.77, intra-service time of 60 minutes and total time of 207 minutes). The RUC agreed that the crosswalk to MPC code 50590 and recommended work value of 9.77 appropriately accounts for the physician work involved in this service because both codes have identical intra-service time, identical post-service time and similar total time. The RUC agreed that an IWPUT of 0.099 is appropriate and that the recommended work value of 9.77 places the survey code well within the relativity of the family.

Additionally, the RUC agreed that the work value of 9.77 for code 69719 is appropriately bracketed by codes 43180 *Esophagoscopy, rigid, transoral with diverticulectomy of hypopharynx or cervical esophagus (eg, Zenker's diverticulum), with cricopharyngeal myotomy, includes use of telescope or operating microscope and repair, when performed* (work RVU = 9.03 and total time of 201 minutes) and 57240 *Anterior colporrhaphy, repair of cystocele with or without repair of urethrocele, including cystourethroscopy, when performed* (work RVU = 10.08 and total time of 211 minutes), further warranting a recommended work RVU of 9.77 for code 69719. **The RUC recommends an interim work RVU of 9.77 for CPT code 69719.**

69726 ***Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor***
CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey results from 66 physicians and determined that the work RVU of 5.93 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 32 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 30 minutes of intra-service time, and 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and one office visit(s) (1x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to code 53852 *Transurethral destruction of prostate tissue; by radiofrequency thermotherapy* (work RVU = 5.93, intra-service time of 30 minutes and total time of 142 minutes). The RUC agreed that the work value of 5.93 appropriately accounts for the physician work involved in this service. The RUC noted that the survey code and crosswalk code 53852 have identical intra-service time and similar total time. The RUC agreed that an IWPUT of 0.088 is appropriate and that the recommended work value of 5.93 places the survey code well within the relativity of the entire family. Additionally, the RUC agreed that the recommended work value of 5.93 is appropriate because this (removal) service has a lower intensity, in comparison to the implantation and revision/replacement services in the family. **The RUC recommends an interim work RVU of 5.93 for CPT code 69726.**

69727 ***Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor***
The RUC reviewed the survey results from 59 physicians and determined that the work RVU of 7.13 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 33 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 45 minutes of intra-service time, 15 minutes of immediate post-service time, ½ discharge day management (99238), one office visit(s) (1x 99212), and one office visit(s) (1x 99213).

After thorough discussion, the RUC recommends a direct work RVU crosswalk to code 37718 *Ligation, division, and stripping, short saphenous vein* (work RVU = 7.13, intra-service time of 45 minutes and total time of 178 minutes). The RUC agreed that the crosswalk to code 37718 and recommended value of 7.13 appropriately accounts for the physician work involved in this service because the survey code and crosswalk code have identical intra-service time and similar total time. The RUC agreed that an IWPUT of 0.085 is appropriate and is like (removal) code 69726 (IWPUT = 0.088) in the family, therefore the recommended work value of 7.13 places the survey code well within the relativity of the entire family. Additionally, the RUC agreed that the recommended work value of 7.13 is appropriate because this (removal) service has a lower intensity, in comparison to the implantation and revision/replacement services in the family.

The RUC agreed that the recommended work value of 7.13 is appropriately bracketed by codes 15823 *Blepharoplasty, upper eyelid; with excessive skin weighting down lid* (work RVU = 6.81, intra-service time of 45 minutes and total time of 161 minutes) and 67904 *Repair of blepharoptosis; (tarso) levator resection or advancement, external approach* (work RVU = 7.97, intra-service time of 45 minutes and total time of 185 minutes). **The RUC recommends an interim work RVU of 7.13 for CPT code 69727.**

Resurvey for April 2021 RUC Meeting
In January 2021, the RUC reviewed these services and determined that they need to be interim and resurveyed for the April 2021 RUC meeting with a revised Reference Service List (RSL) to encompass a larger range of relative values, specifically relative values on the lower end of the spectrum. Additionally, there was concern from the specialty that survey respondents may not have fully understood the new removal codes based on the anomalous intra-service time response for code 69726 which was less than all other codes in the family.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The Practice Expense Subcommittee replaced one SA053 *pack, post-op incision care (suture and staple)* with one SA054 *pack, post-op incision care (suture)*. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Auditory System** **Middle Ear** **Osseointegrated Implants** The following codes are for implantation of an osseointegrated implant into the skull. These devices treat hearing loss through surgical placement of an abutment or device into the skull that facilitates transduction of acoustic energy to be received by the better-hearing inner ear or both inner ears when the implant is coupled to a speech processor and vibratory element. This coupling may occur in a percutaneous or a transcutaneous fashion. Other reparative middle ear and mastoid procedures (69501-69676) may be performed for different indications and may be reported separately when performed.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69714 Tracking Number Original Specialty Recommended RVU: **11.00**
Presented Recommended RVU: **8.69**
Global Period: 090 Current Work RVU: **14.45** RUC Recommended RVU: **8.69**

CPT Descriptor: Implantation, osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old male suffers from chronic otitis media resulting in otorrhea and mixed hearing loss. He is unalbe to wear traditional hearing aids. Implantation of an osseointegrated bone anchored device with a percutaneous attachment to an external speech processor is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 49% , In the ASC 49%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection to the pericranium. A dissection is performed and the pericranium is incised and dissected away from the cranial bone to expose an area for implant placement. A pilot guide hole through the cranium is drilled, and the deep portion of the guide hole is instrumented to ascertain the possible presence of dural contact and lack of sigmoid sinus exposure. Depending on this deep instrumentation, the pilot hole is possibly deepened. The final guide hole is then widened with spiral drilling to achieve a larger opening to receive the implant. The implanted fixture is installed in the cranial bone to very specific torque settings. This implanted fixture is then secured to the transcutaneous abutment. The overlying flap and surrounding soft tissues are thinned to a maximal thickness to allow for transcutaneous attachment to the processor. A separate incision is made in the overlying skin of the flap to allow the percutaneous abutment to extend through the soft tissue flap. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion. A small bolster is created immediately surrounding the abutment and a locking cap is fixed to the abutment to keep the bolster in place and with appropriate pressure.

Description of Post-Service Work: The prepped area of the recipient site is cleaned. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	14%	36%	36%	14%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	29%	50%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	21%	36%	43%
Physical effort required	29%	36%	36%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	24%	43%	36%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	21%	50%	14%	14%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	14%	64%	21%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	21%	36%	43%
Physical effort required	31%	54%	16%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	42%	50%	8%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #2

We recognize that KRS code 2, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked "Do not use to value physician work" in the RUC database. The RUC database further states the following rationale: "The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU." We do not agree that simply because the 75th percentile was approved in valuing this service, that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of **8.69 and 40 minutes of intra service time**, based on a crosswalk to CPT 52400. This is below the survey's 25th percentile.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that three post-operative office visits are typically conducted after the procedure. Two level three office visits, 99213; and one level two office visit, 99212.

Post op visit 1: 99213

The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	Top_Specialty	2019 Medicare Utilization
46707	Repair of anorectal fistula with plug (eg, porcine small intestine submucosa [SIS])	090	0.06	6.39	40	187	2009-04	COLORECTAL SURGERY (PROCTOLOGY)	39

	hypertrophic mucosal folds								

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 279
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 279 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 93 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current 2019 volume indicated by the RUC database for this code is 993 cases, however, we anticipate the majority of this volume (94% or so) will transfer to the new X codes.

Specialty Otolaryngology Frequency 93 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 69714

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69716 Tracking Number Original Specialty Recommended RVU: **12.00**
Presented Recommended RVU: **9.77**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **9.77**

CPT Descriptor: Implantation, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old male with left mixed hearing loss seeks intervention for improved quality of life at work and socially. Placement of a magnetic transcutaneous bone anchored heraing device is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 49% , In the ASC 49%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and a subpericranial pocket for the implant coil and magnet are created. The area for the transducer is then identified using the template and marked on the outer table of the skull in the region of the sinodural angle. Surgical guide and fixation holes are then drilled taking care not to penetrate the sigmoid sinus or the dura overlying the temporal lobe of the brain. This area is measured for appropriate depth to accommodate the fixation screw. The skull overlying the sinodural angle is then drilled to create a well in the bone to accommodate the transducer device, again staying just superficial to the dura and sigmoid sinus. The entire device including the coil, magnet, and transducer portions are then placed. The device is then fixed to the skull using the fixation screw to a specific torque setting. The thickness of the flap overlying the magnet and coil portion of the device is then carefully measure and precisely trimmed to a specific thickness to allow for transcutaneous transmission. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	8%	0%	58%	17%	17%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	58%	34%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	8%	42%	50%
Physical effort required	0%	75%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	42%	33%	25%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	33%	33%	33%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	50%	33%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	17%	50%	33%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #2

We recognize that KRS code 2, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked "Do not use to value physician work" in the RUC database. The RUC database further states the following rationale: "The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU." We do not agree that simply because the 75th percentile was approved in valuing this service that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of **9.77 and 60 minutes of intra service time**, based on a crosswalk to CPT 50590. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 32 minutes of evaluation time which is 1 minute less than the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 45 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Regarding post-operative visits, our survey respondents indicated that two post-operative visits were needed, two 99213 visits. Our expert panel agreed.

Post op visit 1: 99213

The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2979
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the 2019 volume for 69714 in the AMA RUC database

Specialty Otolaryngology Frequency 2979 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 900
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe the majority (94% or so) of existing volume for the predecessor code 69714 will move to this new code. Volume for 69714 in 2019 was 993 cases.

Specialty Otolarngology Frequency 900 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69717 Tracking Number Original Specialty Recommended RVU: **11.48**
Presented Recommended RVU: **8.80**
Global Period: 090 Current Work RVU: **15.43** RUC Recommended RVU: **8.80**

CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 16-year-old female with chronic otitis media and conductive hearing loss who previously received a percutaneous bone anchored implant has chronic inflammation at the abutment site that has been unresponsive to medical therapy. The device is removed and a new device is placed at a different site.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 48% , In the ASC 50%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential post-surgical skin breakdown and implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed implant recipient site is precisely measured and then marked using the implant template. The location of the implant transducer is marked using a hypodermic needle inserted down to the bone with marking ink, such as Methylene blue. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection to the pericranium. A subpericranial dissection is performed and the previous implant abutment is removed. The cranial bone surrounding the osseointegrated titanium fixture in the patient's skull is drilled around the implant. The fixture is removed. The wound is thoroughly inspected for the cause of the patient's original complication related to the implant. The area for the new placement of the implant is then identified, templated, and marked on the outer table of the skull. A dissection is performed and the pericranium is incised and dissected away from the cranial bone to expose an area for implant placement. A new pilot guide hole through the cranium is drilled, and the deep portion of the guide hole is instrumented to ascertain the possible presence of dural contact and lack of sigmoid sinus exposure. Depending on this deep instrumentation, the pilot hole is possibly deepened. The final guide hole is then widened with spiral drilling to achieve a larger opening to receive the implant. The implanted fixture is installed in the cranial bone to very specific torque settings. This implanted fixture is then secured to the transcutaneous abutment. The overlying flap and surrounding soft tissues are thinned to a maximal

thickness to allow for transcutaneous attachment to the processor. A separate incision is made in the overlying skin of the flap to allow the percutaneous abutment to extend through the soft tissue flap. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion. A small bolster is created immediately surrounding the abutment and a locking cap is fixed to the abutment to keep the small abutment bolster in place and with appropriate pressure.

Description of Post-Service Work: he prepped area of the recipient site is cleaned. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
15260	090	11.64	**RUC Time**

CPT Descriptor Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; 20 sq cm or less

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
15120	090	10.15	**RUC Time**

CPT Descriptor Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children (except 15050)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
67904	090	7.97	**RUC Time**	54,853

CPT Descriptor 1 Repair of blepharoptosis; (tarso) levator resection or advancement, external approach

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
26615	090	7.07	**RUC Time**	1,057,533

CPT Descriptor 2 Open treatment of metacarpal fracture, single, includes internal fixation, when performed, each bone

Other Reference CPT Code	Global	Work RVU	Time Source
66183	090	13.20	**RUC Time**

CPT Descriptor Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 9 **% of respondents:** 14.0 **%**

Number of respondents who choose 2nd Key Reference Code: 9 **% of respondents:** 14.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 69717	Top Key Reference CPT Code: 15260	2nd Key Reference CPT Code: **15120**

Physical effort required	44%	33%	22%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	33%	33%	33%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **8.80 and 45 minutes of intra service time**, based on a crosswalk to CPT 27829. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that three post-operative office visits are typically conducted after the procedure. Three level three office visits, 99213. Our expert panel agreed that three visits are necessary, but amended them to two level three visits (99213) and one level two office visit (99212) consistent with code 69714.

Post op visit 1: 99213
The mastoid dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability is assessed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The small abutment bolster and associated locking cap device are removed. The sutures are removed. The area around the percutaneous abutment is vigorously cleaned and possibly debrided. The wound is again inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 3: 99212
The patient's convalescence to that point is reviewed. The wounds are inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69717

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 18
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 18 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current 2019 volume indicated by the RUC database for this code is 68, however, we esitmate that only about 7% of existing cases will be reported in the future by the percutaneous codes. We anticipate that the remainder of the volume will transition to the new transcutaneous codes.

Specialty Otolaryngology Frequency 6 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 69717

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69719 Tracking Number Original Specialty Recommended RVU: **12.00**
Presented Recommended RVU: **9.77**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **9.77**

CPT Descriptor: Revision/replacement (including removal of existing device), osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female with right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed and a new device is placed at a different site.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 47% , In the ASC 51%, In the office 2%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Review the CT scan to ensure that there is adequate bone quality and quantity in the area of implantation to support a successful implantation. Perform a current physical exam paying special attention to the patient's skin condition and skin thickness in the area of the actuator and coil to avoid potential repeat post-surgical skin breakdown, pain, and possible implant extrusion. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed insertion site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the proposed NEW implant recipient site is precisely measured and then marked using the implant template. The incision is injected with local anesthetic

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is removed. The wound is thoroughly inspect for the cause of the patient's original complication related to the implant. A subpericranial pocket for the implant coil and magnet are created. The area for the new placement of the transducer is then identified using the template and marked on the outer table of the skull. Surgical guide and fixation holes are then drilled taking care not to penetrate the dura overlying the temporal lobe of the brain. This area is measured for appropriate depth to accommodate the fixation screw. The skull is then drilled to create a well in the bone to accommodate the transducer device, again staying just superficial to the dura. The entire device including the coil, magnet, and transducer portions are then placed. The device is then fixed to the skull using the fixation screw to a specific torque setting. The thickness of the flap overlying the magnet and coil portion of the device is then carefully measure and precisely trimmed to a specific thickness to allow for transcutaneous transmission. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	38%	12%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	63%	37%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	13%	88%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	13%	75%	13%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	57%	14%	29%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	57%	43%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	57%	43%
Physical effort required	0%	71%	30%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	29%	43%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Note re: Key Reference Code #1

We recognize that KRS code 1, 31610, was selected as a KRS for this code, and some others in this family of codes by survey respondents. That code is marked "Do not use to value physician work" in the RUC database. The RUC database further states the following rationale: "The RUC recommends to flag CPT codes 31605 and 31610 as do not use for validation of work as 31605 physician time and work recommendations are based on only the 20 survey respondents who performed this service in the past 12 months and 31610 recommendation was based on the survey 75th percentile work RVU." We do not agree that simply because the 75th percentile was approved in valuing this service that it should be viewed as unreliable as a comparison to other services, and therefore, we included it in our RSL as a recently valued, and familiar service that our members would understand.

Recommendation (Work and Intra Time):

We are recommending a work RVU of 9.77 **and 60 minutes of intra service time**, based on a crosswalk to CPT 50590. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. Two level three office visits, 99213.

Post op visit 1: 99213

The dressing is removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. Flap viability overlying the coil is assessed. The sutures are removed. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. Antibiotic ointment is placed on the surgical wound.

Post op visit 2: 99213
The patient's convalescence to that point is reviewed. The wound is inspected and palpated for full incisional healing prior to fitting the sound processor. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Long term care, strategies to maximize function, and expected outcomes are discussed in detail. Counseling regarding the device, its function, and signs and symptoms of trouble with the device are discussed with the patient and family.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	Top_Specialty	2019 Medicare Utilization
25607	Open treatment of distal radial extra-articular fracture or epiphyseal separation, with internal fixation	090	0.0523	9.56	60	275	2006-02	ORTHOPEDIC SURGERY	9419

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 27
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare volume cited below

Specialty Otolaryngology Frequency 27 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 9 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Industry data indicates that approximately .5-1% of cases of 69716 will be revised, we estimate 900 cases per year of 69716, and 9 is 1% of that volume.

Specialty Otolaryngology Frequency 9 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69726 Tracking Number Original Specialty Recommended RVU: **10.00**
Presented Recommended RVU: **5.93**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **5.93**

CPT Descriptor: Removal, osseointegrated implant, skull; with percutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old female with a right mixed hearing loss had previous placement of a percutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed without replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 33% , In the ASC 36%, In the office 30%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam paying special attention to the patient's skin condition adequacy for closure following implant removal. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed removal site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the incision is marked in the region of the previous incision. The incision is injected with local anesthetic.

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is exposed. The cranial bone surrounding the osseo-integrated titanium fixture in the patient's skull is drilled around the implant. The wound is thoroughly inspected for the cause of the patient's original complication related to the implant. The wound is irrigated and hemostasis is obtained. The wound where the external abutment of the implant is debrided then closed followed by closure of the linear incision anterior to the implant site in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other

complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The incisions and wound are inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	7%	31%	48%	14%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	31%	41%	28%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	45%	31%	24%
Physical effort required	34%	38%	27%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	44%	48%	6%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	63%	38%	0%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	26%	63%	13%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	63%	38%	0%
Physical effort required	50%	50%	0%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	38%	62%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **5.93 and 30 minutes of intra service time**, based on a crosswalk to CPT 53852. This is below our survey's 25th percentile RVW and utilizes our survey's median intra-service time.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 32 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 45 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. One level three office visit, 99213; and one level two office visit, 99212. Our expert panel agreed.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The incisions and wound are inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare data below.

Specialty Otolaryngology Frequency 3 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 1% of future 69714 volume will have to be removed. The 2019 volume of 69714 was 993 cases, which we anticipate will drop approximately 94% to 93 cases going forward. One percent of 93 is .93, or one case per year.

Specialty Otolaryngology Frequency 1 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:69727 Tracking Number Original Specialty Recommended RVU: **10.98**
Presented Recommended RVU: **7.13**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **7.13**

CPT Descriptor: Removal, osseointegrated implant, skull; with magnetic transcutaneous attachment to external speech processor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male with right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant which worked well, but has now become infected. The device is removed without replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 46% , In the ASC 51%, In the office 3%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patient and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam paying special attention to the patient's skin condition adequacy for closure following implant removal. Reconcile medications and allergies. Address NPO status and timing. Discuss preoperative home medications and postoperative prescriptions and check the prescription drug monitoring database, discuss. Plan the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common and serious complications. There is confirmation of site of proposed removal site, and a detailed description is given of the postoperative changes in wound and incision and the expected cosmetic and functional results. Review and obtain informed consent. Verify that all required instruments and supplies are available. Following induction of anesthesia, the patient is positioned and prepped for the procedure. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The postauricular hair is shaved and the incision is marked

Description of Intra-Service Work: An incision is performed followed by a meticulous dissection through the pericranium. A subpericranial dissection is performed and the previous implant is exposed. The cranial bone surrounding the osseo-integrated titanium transducer and the respective fixture screws in the patient's skull is drilled out to free the implant. The wound is thoroughly inspected for the cause of the patient's original complication related to the implant. The wound is irrigated and hemostasis is obtained. The wound is closed in a layered fashion.

Description of Post-Service Work: The prepped areas of the respective donor and recipient sites are cleaned. A dressing is applied to the donor site. A compression dressing is fashioned and is wrapped around the head to compress the recipient site. The patient is observed during emergence from anesthesia. Dictation and postoperative orders are performed. Discharge medications are reconciled and prescriptions are written. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team. Communication with the referring physician is then performed. There is a discussion with the family regarding the procedure and findings. The patient is then seen after emergence from general anesthesia to check the patient's neurologic status, wound for signs of hematoma, or other complications. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review the written postoperative instructions.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	38%	38%	23%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	15%	46%	39%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	46%	15%	38%
Physical effort required	38%	38%	23%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	31%	46%	23%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	38%	50%	13%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	25%	50%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	38%	50%	12%
Physical effort required	38%	50%	12%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	63%	38%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting the revision of two existing codes, 69714 and 69717, as well as the addition of four new codes 69716-727. These new codes represent implantation, revision/replacement, and removal of a transcutaneous and percutaneous osseointegrated implants, respectively. The

Panel approved the CCA and the code is now being valued by the RUC. The new codes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 533 members from the AAO-HNS, the American Neurotology Society, and the AOS (American Otological Society).

Recommendation (Work and Intra Time):

We are recommending a work RVU of **7.13 and 45 minutes of intra service time**, based on a crosswalk to CPT 37718. This is below our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3 Straightforward Patient/Difficult Procedure

Evaluation Time – We are recommending 33 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is 7 minutes less than the survey median time, but consistent with the preservice package.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is 5 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 46 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A General Anesthesia or Complex Regional Block/ Straightforward Procedure
Recommended time has been reduced to 15 minutes which is a decrease of 15 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 15 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey did not indicate that this was typical, however, it is the RUC standard for 090 global services when performed in the hospital, so we have included **.5 discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. One level three office visit, 99213 and one level two office visit, 99212.Our expert panel agreed.

Post op visit 1: 99213
The mastoid dressing is removed. The sutures are removed. The patient's convalescence to that point is reviewed and discussed. The neurological status is assessed. The wound is inspected and palpated. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Antibiotic ointment is placed on the wound. Patient and family questions and concerns are addressed. Ongoing care is reiterated.

Post op visit 2: 99212
The patient's convalescence to that point is reviewed. The wound is again inspected and palpated to insure full healing. The middle ear is inspected. Tuning forks are utilized to evaluate the patients hearing. Patient and family questions and concerns are addressed. Ongoing care is reiterated. A discussion occurs regarding different hearing options now that the previous osseointegrated implant has been removed and not replaced.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69714

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 27
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the estimated Medicare volume cited below.

Specialty Otolaryngology Frequency 27 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 9 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Industry data estimates .5-1% of 69716 cases will have to be removed. We estimated 900 cases per year of 69716, and 1% of that is 9.

Specialty Otolaryngology Frequency 9 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31070

SS Rec Summary

ISSUE: Transcutaneous Passive Implant Temporal Bone (BAHA)

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
69714	A 56-year-old male suffers from chronic otitis media resulting in otorrhea and mixed hearing loss. He is unable to wear traditional hearing aids. Implantation of an osseointegrated bone anchored device with a percutaneous attachment to an external speech processor is performed.
CPT Code	**Vignette**
69716	A 48-year-old male with a left mixed hearing loss seeks intervention for improved quality of life at work and socially. Placement of a magnetic transcutaneous bone anchored hearing device is performed.
CPT Code	**Vignette**

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

69717	A 16-year-old female with chronic otitis media and conductive hearing loss who previously received a percutaneous bone anchored implant has chronic inflammation at the abutment site that has been unresponsive to medical therapy. The device is removed and a new device is placed at a different site.
CPT Code	**Vignette**
69719	A 59-year-old female with a right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed and a new device is placed at a different site.
CPT Code	**Vignette**
69726	A 59-year-old female with a right mixed hearing loss had previous placement of a percutaneous bone anchored implant. It worked well, but she has developed discomfort at the device site. The device is removed without replacement.
CPT Code	**Vignette**
69727	A 62-year-old male with a right mixed hearing loss previously had placement of a magnetic transcutaneous bone anchored implant which worked well, but has now become infected. The device is removed without replacement.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology, sleep medicine, and otology. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   Existing codes 69714 and 69717 were utilized as comparison codes for all new codes in the family.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence*

guidelines) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

During the pre-service clinical staff are completing pre-service diagnostic and referral forms, coordinating pre-surgery services including test results, scheduling space and equipment in the facility, providing pre-service education and obtaining consent from the patient, and completing pre-procedure phone calls and prescriptions.

   b. Service period (includes pre, intra and post):

During the service period the clinical staff assist with a half discharge management visit for the patient. This includes post-procedure care instructions. They also clean the instruments used during each post operative visit.

   c. Post-service period:

During post operative visits the patient is checked in via front-desk staff. Clinical staff collects vitals from the patient. An exam chair/table and light are required with paper covering for the exam furniture. A postoperative wound kit for removal of sutures/staples is required. The clinical staff assists the physician with removal of the sutures.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

DESCRIPTION	Code	Unit	Item Qty	Unit price
pack, minimum multi-specialty visit	**SA048**	**pack**		**4.0507**
paper, exam table		foot	7	
gloves, non-sterile		pair	2	
gown, patient		item	1	
pillow case		item	1	
cover, thermometer probe		item	1	

DESCRIPTION	Code	Unit	Item Qty	Unit price
pack, cleaning, surgical instruments	**SA043**	**pack**	1	**10.7922**
gloves, non-sterile		pair	2	
gown, staff, impervious		item	1

autoclave bag		item	1	
autoclave tape		yd	0.33	
enzymatic detergent		oz	1	
cleaning brush, instruments		item	1	

DESCRIPTION	Code	Unit
pack, post-op incision care (suture)	**SA054**	**pack**
kit, suture removal		kit
povidone soln (Betadine)		ml
gauze, sterile 4in x 4in		item
gloves, sterile		pair
steri-strip (6 strip uou)		item
swab-pad, alcohol		item
tape, surgical paper 1in (Micropore)		inch
tincture of benzoin, swab		item

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EQ234 suction and pressure cabinet, ENT (SMR)
EQ183 microscope, operating
EQ170 light, fiberoptic headlight w-source
EF008 chair with headrest, exam, reclining

The office visit formula was used for all these pieces of equipment.

EQ137 basic instrument pack

The instrument pack formula was used for this item.

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is

reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

Clinical staff time in the preservice period remains unchanged for all codes in the family. All codes have cleaning time added in the intra service time period to allocate time to cleaning the instruments used at each post op visit. Post-operative time has changed, commensurate with the survey data and recommended post op visits. Two codes (64714/64717) have 3 post op visits and the rest of the family has 2 post op visits.

Some supplies were reduced commensurate with reducing the post-operative visits per our survey data. Additionally, we added a minimum multi-specialty pack for each post op visit and reduced individual, unnecessary line items. We also added a basic instrument pack and cleaning pack for the instruments which will be used at each post op visit. The items include a tuning fork, Frasier tip suctions, and ear curettes. We removed the suture/staple pack and replaced it with just a suture pack.

Equipment times were reduced based on less office visits and lower overall office visit post time. The instrument pack formula was used for the new instrument pack and cleaning time was accounted for.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Trabecular Bone Score (TBS) – Tab 19

In October 2020, the CPT Editorial Panel created four new CPT codes to describe trabecular bone score (TBS) analysis. CPT codes 77090 and 77091 involve only technical work. The specialty noted that TBS can be performed synchronously with a dual-energy X-ray absorptiometry (DXA) or if a patient had a prior DXA within a clinically relevant amount of time. In addition, TBS analysis for bone micro architecture can also be performed on a previous appropriately acquired CT scanogram or other appropriate imaging study, avoiding the need for the patient to undergo additional imaging. TBS can also be a stand-alone service with imaging acquired independently of a DXA scan or separate imaging scan; that is the reason the service was created as an XXX base code instead of an add-on service. TBS is an independent variable for assessing a patient's osteoporatic risk and fracture risk.

77089 ***Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual X-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk***
The RUC reviewed the survey results from 33 diagnostic radiologists and recommends the survey 25th percentile work RVU of 0.20 for CPT code 77089. The RUC recommends 2 minutes of pre-service time, 5 minutes of intra-service time and 2 minutes of post-service time. The specialty noted that the physician work performed by the radiologist is identical for services 77089 and 77092 and that the sole distinction between these two services is related to practice expense.

The specialty noted that for most of the physician time, the interpreting physician is assessing the images provided, assessing the areas of the target analysis and then reviewing that data in comparison to other clinical information. Both DXA and TBS involve an extensive clinical questionnaire because the data cannot be assessed in the absence of appropriate clinical history, medication review and the patient's prior pertinent studies. Both for DXA and TBS, if the patient has prior fractures in the areas of analysis that would be a feedback in which the interpreting physician would need to associate or analyze a different area within that bone, because it would be possible to get spurious or incorrect data.

To justify a value of 0.20, the RUC compared the survey code to 2nd key reference code 77081 *Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)* (work RVU= 0.20, intra-service time of 5 minutes, total time of 9 minutes) and noted that both services typically involve an identical amount of time and physician work for the radiologist performing the service. The RUC also compared the survey code to MPC code 74019 *Radiologic examination, abdomen; 2 views* (work RVU= 0.23, intra-service time of 4 minutes, total time of 6 minutes) and noted that the MPC code, with three minutes less of total time, is a slightly more intense service to perform. **The RUC recommends a work RVU of 0.20 for CPT code 77089.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

77092 ***Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified health care professional***
The RUC reviewed the survey results from 33 diagnostic radiologists and recommends the survey median work RVU of 0.20 for CPT code 77092. The RUC recommends 2 minutes of pre-service time, 5 minutes of intra-service time and 2 minutes of post-service time. The specialty noted that the physician work performed by the radiologist is identical for services 77089 and 77092 and that the sole distinction between these two services is related to practice expense.

The specialty noted that, for this service, the interpreting physician is assessing the images provided and then assessing the areas of the target analysis and then reviewing that data in comparison to other clinical information. Both DXA and TBS involve an extensive clinical questionnaire because the data cannot be assessed in the absence of appropriate clinical history, medication review and the patient's prior pertinent studies. For both DXA and TBS, if the patient has prior fractures in the areas of analysis that would be a feedback in which the interpreting physician would have to associate or analyze a different area within that bone, because it would be possible to get spurious or incorrect data.

To justify a value of 0.20, the RUC compared the survey code to 2nd key reference code 77081 *Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)* (work RVU= 0.20, intra-service time of 5 minutes, total time of 9 minutes) and noted that both services typically involve an identical amount of time and physician work for the radiologist performing the service. The RUC also compared the survey code to MPC code 74019 *Radiologic examination, abdomen; 2 views* (work RVU= 0.23, intra-service time of 4 minutes, total time of 6 minutes) and noted that the MPC code, with three minutes less of total time, is a slightly more intense service to perform. **The RUC recommends a work RVU of 0.20 for CPT code 77092.**

Practice Expense
The Practice Expense Subcommittee reviewed the proposed direct practice expense inputs and agreed they were appropriate, as proposed by the specialty. The specialty explained that CPT code 77089 describes the complete TBS service when the TBS software is installed on the imaging equipment, including physician review and interpretation of the TBS report. CPT code 77090 is used to report when data is extracted from the imaging equipment and sent elsewhere for TBS analysis. CPT code 77091 is used when only TBS is performed, and CPT code 77092 captures the physician review and interpretation of TBS. CPT codes 77090 and 77091 are technical work only. The Subcommittee agreed that it would be warranted to include a per encounter software licensing fee for the TBS software for CPT codes 77089 and 77091. The software is currently sold "per click" or per scan. As this is a per-patient, single-use item, it is appropriately included as a supply item and not an equipment item, which is typically accounted for by minutes used. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

New Technology/New Service
The RUC recommends that CPT codes 77089-77092 be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:77089 Tracking Number V1 Original Specialty Recommended RVU: **0.20**
Presented Recommended RVU: **0.20**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **0.20**

CPT Descriptor: Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 69-year-old female who had a previous bone density study, which demonstrated osteopenia.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the order and reason for the examination and any pertinent clinical history, including the patient's clinical information sheet. Review any prior TBS or DXA studies or other relevant studies to determine appropriate site.

Description of Intra-Service Work: Verify that the previously acquired images (e.g. DXA, etc.) are appropriate for TBS analysis, including quality control and no exclusion of anatomy or artifact. Open the images in the TBS software, separate from PACS, and verify that images have transferred appropriately. Identify the appropriate population reference control. Review images to determine region to be included in calculations. Interpret the TBS data and compare to established norms, including risk analysis to determine if fracture risk (FRAX) analysis, reported separately, is indicated. Compare the results to previous studies. Compare the reported values to population standards. Transfer TBS images to PACS. Dictate report.

Description of Post-Service Work: Review, edit, and sign the final report. Communicate results to the referring provider or the patient.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the October 2020 CPT Editorial Panel meeting, four new codes (CPT codes 77089, 77090, 77091, and 77092) were created for Trabecular Bone Score (TBS) analysis. The code descriptions can be seen in the table

below. As CPT codes 77090 and 77091 involve only technical work, the American College of Radiology (ACR) surveyed CPT codes 77089 and 77092 for the January 2021 RUC meeting and convened an expert panel of physicians familiar with this service to review the survey data.

CPT Code	Descriptor
77089	Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk *(Do not report 77089 in conjunction with 77090, 77091, 77092)*
77090	Trabecular bone score (TBS), structural condition of the bone microarchitecture; technical preparation and transmission of data for analysis to be performed elsewhere *(Do not report 77090, 77091, 77092 in conjunction with 77089)*
77091	Trabecular bone score (TBS), structural condition of the bone microarchitecture; technical calculation only *(Do not report 77090, 77091, 77092 in conjunction with 77089)*
77092	Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional *(Do not report 77090, 77091, 77092 in conjunction with 77089)*

TBS is a measurement of the structural condition of the bone microarchitecture. It is strongly correlated with 3D bone microarchitecture parameters such as the structure model index, the number of trabeculae and their connectivity and negatively with the space between trabeculae. A high TBS value means that microarchitecture bone is dense, well connected with little spaces between trabeculae and fairly homogenously distributed. Conversely, a low TBS value means that the microarchitecture of bone is incomplete and poorly connected with wide spaces between trabeculae and heterogeneously distributed. TBS predicts the risk of major osteoporotic fracture independently of bone mineral density (BMD) and clinical risk factors. The TBS score helps physicians better classify patients for risk of fracture and subsequently help guide decisions about the course of care for the patient.

The TBS software can reside directly on a DXA or X-ray machine or the necessary data can be exported from the DXA machine to an imaging workstation, enabling the TBS analysis to be performed separately from image acquisition, either on site or at another location. Additionally, TBS can be performed retrospectively provided that appropriate gray-scale data exists for export and analysis.

For the TBS code family, CPT code 77089 describes the complete TBS service when the TBS software is installed on the imaging equipment, including physician review and interpretation of the TBS report. CPT code 77090 is used to report when data is extracted from the imaging equipment and sent elsewhere for TBS analysis. CPT code 77091 is used when only TBS is performed, and CPT code 77092 captures the physician review and interpretation of TBS. 77090 and 77091 are technical work only. It is important to understand that, from the perspective of physician work, 77089 and 77092 are the same.

Below is a table of the DXA codes, which would most often be performed with the TBS services as a reference.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT	RUC Meeting Date
77080	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine)	0.20	2	5	2	9	0.022	October 2013

77081	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)	0.20	2	5	2	9	0.022	January 2018
77089	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk**	**0.20**	**2**	**5**	**2**	**9**	**0.022**	**January 2021**
77092	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional**	**0.20**	**2**	**5**	**2**	**9**	**0.022**	**January 2021**
77085	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine), including vertebral fracture assessment	0.30	3	8	3	14	0.021	October 2013
77086	Vertebral fracture assessment via dual-energy X-ray absorptiometry (DXA)	0.17	2	5	2	9	0.016	October 2013

Survey Process

The ACR surveyed a random sample of 1,596 of its membership who indicated that they perform procedures in the modalities of gynecologic radiation oncology, mammography, women's imaging, musculoskeletal, and interventional radiology. The ACR also surveyed a random sample of 1,596 of all of its membership. Additionally, the ACR surveyed 182 individuals from the vendor MediMaps. This is a total of 3,374 individuals who were surveyed.

Work RVU and Time Recommendations

The expert panel recommends the survey 25th percentile value at 0.20 work RVU and survey median times of 2 minutes pre-service, 5 minutes intra-service, and 2 minutes post-service.

Key Reference Services

Approximately two thirds of the survey respondents chose one of the top two key reference services, both of which are DXA codes, which have similar work and patient populations compared to the surveyed code, 77089. Our recommended work RVU of 0.20 compares favorably to the most commonly chosen key reference service, CPT code 77085 *(Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine), including vertebral fracture assessment),* as this exam is performed on a similar patient population and requires similar physician work.

The second key reference service code, 77081 *(Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)),* supports the recommendation by providing a relative upper bound on work compared to the times indicated by the surveyed physicians.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT
77081	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)	0.20	2	5	2	9	0.022
77089	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk**	**0.20**	**2**	**5**	**2**	**9**	**0.022**
77085	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine), including vertebral fracture assessment	0.30	3	8	3	14	0.021

MPC Codes

Our recommendation for CPT code 77089 compares favorably to the following MPC codes depicted in the table below. Specifically, the value recommendation has slightly higher intra-service and total times, but the same or lower work RVU compared to these MPC codes.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT
92567	Tympanometry (impedance testing)	0.20	1	4	1	6	0.039
77089	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation**	**0.20**	**2**	**5**	**2**	**9**	**0.022**

	and report on fracture risk						
74019	Radiologic examination, abdomen; 2 views	0.23	1	4	1	6	0.046
72081	Radiologic examination, spine, entire thoracic and lumbar, including skull, cervical and sacral spine if performed (eg, scoliosis evaluation); one view	0.26	1	5	1	7	0.043

Summary:

In summary, our expert panel recommends the 25th survey percentile at 0.20 work RVU with survey median times of 2 minutes pre-service, 5 minutes intra-service, and 2 minutes post-service. The recommended value compares favorably with the key reference services, 77085 and 77081, and maintains relativity within the RBRVS.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This is a new code.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 380000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This service described by CPT code 77089 is estimated to be provided 380,000 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 91200 Percentage 24.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 380,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 77089 is estimated to be provided 380,000 times nationally in a one-year period to Medicare patients.

Specialty Diagnostic Radiology Frequency 91200 Percentage 24.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 77081

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:77092 Tracking Number V4 Original Specialty Recommended RVU: **0.20**
Presented Recommended RVU: **0.20**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **0.20**

CPT Descriptor: Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old female with antecedent of breast cancer treated with anti-aromatase.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review the order and reason for the examination and any pertinent clinical history, including the patient's clinical information sheet. Review any prior TBS or DXA studies or other relevant studies to determine appropriate site.

Description of Intra-Service Work: Verify that the previously acquired images (e.g. DXA, etc.) are appropriate for TBS analysis, including quality control and no exclusion of anatomy or artifact. Open the images in the TBS software, separate from PACS, and verify that images have transferred appropriately. Identify the appropriate population reference control. Review images to determine region to be included in calculations. Interpret the TBS data and compare to established norms, including risk analysis to determine if fracture risk (FRAX) analysis, reported separately, is indicated. Compare the results to previous studies. Compare the reported values to population standards. Transfer TBS images to PACS. Dictate report.

Description of Post-Service Work: Review, edit, and sign the final report. Communicate results to the referring provider or the patient.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

At the October 2020 CPT Editorial Panel meeting, four new codes (CPT codes 77089, 77090, 77091, and 77092) were created to describe Trabecular Bone Score (TBS) analysis. The code descriptions can be seen in

the table below. As CPT codes 77090 and 77091 involve only technical work, the American College of Radiology (ACR) surveyed CPT codes 77089 and 77092 for the January 2021 RUC meeting and convened an expert panel of physicians familiar with this service to review the survey data.

CPT Code	Descriptor
77089	Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk *(Do not report 77089 in conjunction with 77090, 77091, 77092)*
77090	Trabecular bone score (TBS), structural condition of the bone microarchitecture; technical preparation and transmission of data for analysis to be performed elsewhere *(Do not report 77090, 77091, 77092 in conjunction with 77089)*
77091	Trabecular bone score (TBS), structural condition of the bone microarchitecture; technical calculation only *(Do not report 77090, 77091, 77092 in conjunction with 77089)*
77092	Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional *(Do not report 77090, 77091, 77092 in conjunction with 77089)*

TBS is a measurement of the structural condition of the bone microarchitecture. It is strongly correlated with 3D bone microarchitecture parameters such as the structure model index, the number of trabeculae and their connectivity and negatively with the space between trabeculae. A high TBS value means that microarchitecture bone is dense, well connected with little spaces between trabeculae and fairly homogenously distributed. Conversely, a low TBS value means that the microarchitecture of bone is incomplete and poorly connected with wide spaces between trabeculae and heterogeneously distributed. TBS predicts the risk of major osteoporotic fracture independently of bone mineral density (BMD) and clinical risk factors. The TBS score helps physicians better classify patients for risk of fracture and subsequently help guide decisions about the course of care for the patient.

The TBS software can reside directly on a DXA or X-ray machine or the necessary data can be exported from the DXA machine to an imaging workstation, enabling the TBS analysis to be performed separately from image acquisition, either on site or at another location. Additionally, TBS can be performed retrospectively provided that appropriate gray-scale data exists for export and analysis.

For the TBS code family, CPT code 77089 describes the complete TBS service when the TBS software is installed on the imaging equipment, including physician review and interpretation of the TBS report. CPT code 77090 is used to report when data is extracted from the imaging equipment and sent elsewhere for TBS analysis. CPT code 77091 is used when only TBS is performed, and CPT code 77092 captures the physician review and interpretation of TBS. 77090 and 77091 are technical work only. It is important to understand that, from the perspective of physician work, 77089 and 77092 are the same.

Below is a table of the DXA codes, which would most often be performed with the TBS services as a reference.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT	RUC Meeting Date
77080	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine)	0.20	2	5	2	9	0.022	October 2013

77081	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)	0.20	2	5	2	9	0.022	January 2018
77089	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk**	**0.20**	**2**	**5**	**2**	**9**	**0.022**	**January 2021**
77092	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional**	**0.20**	**2**	**5**	**2**	**9**	**0.022**	**January 2021**
77085	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine), including vertebral fracture assessment	0.30	3	8	3	14	0.021	October 2013
77086	Vertebral fracture assessment via dual-energy X-ray absorptiometry (DXA)	0.17	2	5	2	9	0.016	October 2013

Survey Process

The ACR surveyed a random sample of 1,596 of its membership who indicated that they perform procedures in the modalities of gynecologic radiation oncology, mammography, women's imaging, musculoskeletal, and interventional radiology. The ACR also surveyed a random sample of 1,596 of all of its membership. Additionally, the ACR surveyed 182 individuals from the vendor MediMaps. This is a total of 3,374 individuals who were surveyed.

Work RVU and Time Recommendations

The expert panel recommends the 25th survey percentile value at 0.20 work RVU with survey median times of 2 minutes pre-service, 5 minutes intra-service, and 2 minutes post-service.

Key Reference Services

Approximately two thirds of the survey respondents chose one of the top two key reference services, both of which are DXA codes, which have similar work and patient populations compared to the surveyed code, 77092. Our recommended work RVU of 0.20 compares favorably to the most commonly chosen key reference service, CPT code 77085 *(Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine), including vertebral fracture assessment),* as this exam is performed on a similar patient population and requires similar physician work.

The second key reference service code, 77081 *(Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)),* supports the recommendation by providing a relative upper bound on work compared to the times indicated by the surveyed physicians.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT
77081	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel)	0.20	2	5	2	9	0.022
77092	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional**	**0.20**	**2**	**5**	**2**	**9**	**0.022**
77085	Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; axial skeleton (eg, hips, pelvis, spine), including vertebral fracture assessment	0.30	3	8	3	14	0.021

MPC Codes

Our recommendation for CPT code 77092 compares favorably to the MPC codes as depicted in the table below. Specifically, the value recommendation has slightly higher intra-service and total times, but the same or lower work RVU compared to these MPC codes.

CPT Code	Descriptor	Work RVU	Pre	Intra	Post	Total Time	IWPUT
92567	Tympanometry (impedance testing)	0.20	1	4	1	6	0.039
77092	**Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare**	**0.20**	**2**	**5**	**2**	**9**	**0.022**

	professional						
74019	Radiologic examination, abdomen; 2 views	0.23	1	4	1	6	0.046
72081	Radiologic examination, spine, entire thoracic and lumbar, including skull, cervical and sacral spine if performed (eg, scoliosis evaluation); one view	0.26	1	5	1	7	0.043

Summary:

In summary, our expert panel recommends the 25th survey percentile value at 0.20 work RVU with survey median times of 2 minutes pre-service, 5 minutes intra-service, and 2 minutes post-service. The recommended value compares favorably with the key reference services, 77085 and 77081, and maintains relativity within the RBRVS.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This is a new code.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 20000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This service described by CPT code 77092 is estimated to be provided 20,000 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 4800 Percentage 24.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 20,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The service described by CPT code 77092 is estimated to be provided 20,000 times nationally in a one-year period to Medicare patients.

Specialty Diagnostic Radiology Frequency 4800 Percentage 24.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Imaging

BETOS Sub-classification:
Standard imaging

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 77081

NONFACILITY DIRECT PE INPUTS **CPT CODE(S): 77089, 77090, 77091, 77092**

SPECIALTY SOCIETY: ACR

PRESENTER(S): Kurt A. Schoppe, MD; Lauren Golding, MD; Andy Moriarity, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
77089	Trabecular bone score (TBS), structural condition of the bone microarchitecture; using dual x-ray absorptiometry (DXA) or other imaging data on gray-scale variogram, calculation, with interpretation and report on fracture risk (Do not report 77089 in conjunction with 77090, 77091, 77092)	XXX
77090	Trabecular bone score (TBS), structural condition of the bone microarchitecture; technical preparation and transmission of data for analysis to be performed elsewhere (Do not report 77090, 77091, 77092 in conjunction with 77089)	XXX
77091	Trabecular bone score (TBS), structural condition of the bone microarchitecture; technical calculation only (Do not report 77090, 77091, 77092 in conjunction with 77089)	XXX
77092	Trabecular bone score (TBS), structural condition of the bone microarchitecture; interpretation and report on fracture risk only, by other qualified healthcare professional (Do not report 77090, 77091, 77092 in conjunction with 77089)	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
77089	A 69-year-old female who had a previous bone density study, which demonstrated osteopenia.
77090	A 54-year-old postmenopausal female with current tobacco use, a family history of osteoporosis, and a suspicion of Type II diabetes.
77091	A 75-year-old male with bilateral knee osteoarthritis and a history of use of corticosteroids.
77092	A 60-year-old female with antecedent of breast cancer treated with anti-aromatase.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The American College of Radiology convened a panel that included a number of experts familiar with this service to evaluate the direct practice expense inputs for Trabecular Bone Score (TBS).

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   These is a new code family and does not have existing inputs. We have included CPT code 77081 *(Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular*

skeleton (peripheral) (eg, radius, wrist, heel)) as a reference code as TBS is commonly performed with (or uses) DXA scans.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   N/A

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   To note: As these are new codes, the specialty is using CPT code 77081 *(Dual-energy X-ray absorptiometry (DXA), bone density study, 1 or more sites; appendicular skeleton (peripheral) (eg, radius, wrist, heel))* as a reference as TBS is commonly performed with (or uses) DXA scans.

   According to the RUC database in the non-facility (Global & 26), Internal Medicine is the dominant specialty at 28.7%. The subsequent specialties are as follows: Diagnostic Radiology (23.8%), Endocrinology (15.2%), Rheumatology (10%), Family Medicine (8.9%), etc. Internal Medicine remains the dominant specialty in the Global as well.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   This is a new code family. There are no existing inputs.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

   N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

   This is a new code family. There are no existing inputs.

9. Please provide a brief description of the clinical staff work for the following:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

a. Pre-Service period:

77090: The technologist sends the DXA scan image files offsite for external analysis.

77089 and 77090: The radiologic technologist provides pre-service education and obtains consent from the patient. The technologist explains the TBS procedure to patient before it is performed, informs the patient that this procedure is an add-on to DXA, and explains that this is a bone quality test calculated by the software based on the patient's images. The technologist explains how they measure quality (internal bone structure), what additional information that the physician may receive and that this may affect treatment decisions following the physician's interpretation of results.

b. Service period (includes pre, intra and post):

77089 and 77091: The technologist prepares and manipulates the images for physician interpretation. The technologist QC's the images in PACS and checks all images. In addition, the technologist may review the examination with the interpreting physician. The technologist scans the exam documents into PACS and completes the exam in the RIS system to populate images into the work queue.

c. Post-service period:

N/A

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

77089 and 77091: The technologist prepares and manipulates the images for physician interpretation. The technologist QC's the images in PACS and checks all images. In addition, the technologist may review the examination with the interpreting physician. The technologist scans the exam documents into PACS and completes the exam in the RIS system to populate images into the work queue.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

TBS iNsight Software: This software is required in order to appropriately perform the TBS procedures. This software uses spatial statistics to calculate the TBS from the gray-scale variograms from DXA or other imaging data such as an X-ray or projected CT image. The technologist prepares and manipulates the images for physician interpretation. The TBS report is then reviewed and interpreted by the physician to determine the bone quality and risk of future fracture and help guide decisions about the course of care for the patient.

This is a recent 2020 invoice for the TBS iNsight Software. This software is currently sold "per click" or per scan. As this is a single-use item, we have included this as a supply item and not an equipment item, which is typically accounted for by minutes used. The invoice depicts that this is a TBS iNsight 1-year License and covers a total of 100 scans. The total unit price for the license is $2,500; therefore, we are estimating the cost to be $25 per patient (or scan).

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

19. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No.

20. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

Technologist PACS Workstation (ED050) =PACS formula
Professional PACS Workstation (ED053) = Sum of half of pre-service physician time and full intra-service physician time

21. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee (RUC)
Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any **Vendor or Company** that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS-Other – Utilization over 20,000

January 2021

Pathology Clinical Consult – Tab 20

The Relativity Assessment Workgroup identified CPT code 80500 via the CMS/Other source codes with the Medicare utilization over 20,000 screen. In October 2019, the RUC referred this issue to the CPT Editorial Panel to define this service more specifically as the current descriptor is vague. In October 2020, the CPT Editorial Panel replaced two codes with four new codes to report pathology clinical consultation and creation of guidelines to select and document the appropriate level of service.

Compelling Evidence
These services are exactly work neutral based on the utilization assumptions for the to be deleted codes, 80500 and 80502, to the new services. However, to account for any fluctuations and recognizing change in these services since CMS valued them, the specialty societies provided compelling evidence. The specialty society indicated that incorrect assumptions were made in the previous valuation of this service, physician work has changed due to technology advances and the patient population has changed. These services were valued via an unknown CMS crosswalk method over 30 years ago. This represents a flawed valuation assumption methodology. This code is a CMS/Other source code and has never been RUC surveyed or reviewed by the RUC. In the last 30 years, there has been an explosive growth in the number and complexity of laboratory tests, development of new drugs, and increased numbers of patients living with chronic diseases. Consequently, the role of the consulting pathologist to investigate and explain these issues has similarly grown and become more complex. Patients are frequently more complex with several chronic conditions and on multiple drugs. Disease classification systems are now more complex requiring integration of several patient and laboratory parameters including molecular studies. The quantity of data that needs to be assessed and incorporated into a comprehensive meaningful report is extensive. Additionally, transplant and pre-transplant consultations are more complex. With this growth, the spectrum of complex interpretations and consultations has also widened. As a result of these trends, there is greater demand for a written order and written report by the pathologist.

With respect to the explosive growth of laboratory tests and changes in population, molecular diagnostic testing has dramatically increased, which makes it difficult for ordering physicians to keep pace with the indications for and interpretations of the tests. In addition to an increase in molecular diagnostic testing, the number and complexity of laboratory testing has increased. Similarly, there is tremendous variability in the naming and abbreviations for test names, which can make selecting the appropriate test even more difficult. With so many test options available, there is an increased risk of an ordering physician selecting the wrong or unnecessary test which may delay making a diagnosis, impose risks on the patient, and impose other costs. To avoid this scenario, the necessity to consult a clinical pathologist before choosing which laboratory tests to order has increased.

The RUC determined that compelling evidence has been met that this service was previously valued based on a flawed methodology, the physician work has changed due to technology advances and the patient population has changed.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

A CMS representative questioned if the pathologist work in these services is more like a standard consultation service based on the description of work provided. The description of work has elements similar to the non-pathology consultation services, such as pre-service work for review of medical records and post-service work to confer findings with the clinical team. The Chair of the Research Subcommittee indicated that this question did come to the Research Subcommittee and the specialties indicated the difference was that because these services are not a direct patient to pathologist face-to-face encounter, but rather a provider to the pathologist encounter regarding a patient, the activities as they described them occurred in one continuous sitting. In other words, a provider calls the pathologists and he or she at that moment is looking through the previous studies, the history, providing the recommendation and then it all was one single intra-service encounter.

A CMS representative also questioned, that in the medical decision making (MDM) grid, to bump up to another level is the assessment requiring an independent historian. In the office visit MDM table, the independent historian could be a caregiver. Since none of that is described in the description of physician work, what is the relevance here for medical decision making for the pathologist? The specialty society indicated that the definition of independent witness here could be anyone, including a nurse. When a pathologist calls to get independent information, they may call and talk to a nurse and that would qualify as an independent historian.

80503 ***Pathology clinical consultation; for a clinical problem with limited review of patient's history and medical records and straightforward medical decision making. When using time for code selection, 5-20 minutes of total time is spent on the date of the consultation.***
The RUC reviewed the survey results from 53 pathologists and determined that the survey 25th percentile work RVU of 0.50 appropriately accounts for the work required to perform this service. The RUC recommends 15 minutes intra-service time. The RUC agreed that work per unit of time (WPUT) is stable across this family of services and comparable to other XXX codes with this amount of physician time.

The RUC compared CPT code 80503 to the top two key reference services, CPT code 85060 *Blood smear, peripheral, interpretation by physician with written report* (work RVU = 0.45 and 12 minutes intra-service time) and 88305 *Level IV Surgical Pathology* (work RVU = 0.75 and 25 minutes intra-service time), which appropriately bracket the recommended physician work and time for this service.

For additional support, the RUC referenced MPC code 99407 *Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes* (work RVU = 0.50 and 15 minutes total time) and code 99422 *Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 11-20 minutes* (work RVU = 0.50 and 15 minutes total time), which require the exact same physician work and time. **The RUC recommends a work RVU of 0.50 for CPT code 80503.**

80504 ***Pathology clinical consultation; for a moderately complex clinical problem, with review of patient's history and medical records and moderate level of medical decision making. When using time for code selection, 21-40 minutes of total time is spent on the date of the consultation.***
The RUC reviewed the survey results from 54 pathologists and determined that the survey 25th percentile work RVU of 0.91 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes intra-service time. The RUC agreed that work per unit of time (WPUT) is stable across this family of services and comparable to other XXX codes with this amount of physician time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared CPT code 80504 to the top two key reference services, CPT 88321 *Consultation and report on referred slides prepared elsewhere* (work RVU = 1.63 and 50 minutes intra-service time) and 85390 *Fibrinolysins or coagulopathy screen, interpretation and report* (work RVU = 0.75 and 20 minutes intra-service time), which appropriately bracket the recommended physician work and time for this service.

For additional support, the RUC referenced MPC codes 92012 *Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; intermediate, established patient* (work RVU = 0.92 and 25 minutes total time) and 99202 *Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using time for code selection, 15-29 minutes of total time is spent on the date of the encounter* (work RVU = 0.93 and 20 minutes total time), which require similar physician work and time. **The RUC recommends a work RVU of 0.91 for CPT code 80504.**

80505 ***Pathology clinical consultation; for a highly complex clinical problem, with comprehensive review of patient's history and medical records and high level of medical decision making. When using time for code selection, 41-60 minutes of total time is spent on the date of the consultation.***
The RUC reviewed the survey results from 54 pathologists and determined that the survey 25th percentile work RVU of 1.80 appropriately accounts for the work required to perform this service. The RUC recommends 54 minutes intra-service time. The RUC agreed that work per unit of time (WPUT) is stable across this family of service and comparable to other XXX codes with this amount of physician time.

The RUC compared CPT code 80505 to the top two key reference services, 88325 *Consultation, comprehensive, with review of records and specimens, with report on referred material* (work RVU = 2.85 and 90 minutes intra-service time) and 88321 *Consultation and report on referred slides prepared elsewhere* (work RVU = 1.63 and 50 minutes intra-service time), which appropriately bracket the recommended physician work and time for this service.

For additional support, the RUC referenced MPC codes 92004 *Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits* (work RVU = 1.82 and 40 minutes total time) and 94002 *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day* (work RVU = 1.99 and 60 minutes total time) and 36456 *Partial exchange transfusion, blood, plasma or crystalloid necessitating the skill of a physician or other qualified health care professional, newborn*, (work RVU = 2.00 and 60 minutes total time), all which require similar physician work and time. **The RUC recommends a work RVU of 1.80 for CPT code 80505.**

80506 ***Pathology clinical consultation; prolonged service, each additional 30 minutes (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 49 pathologists and determined that the survey 25th percentile work RVU of 0.80 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes intra-service time. The RUC agreed that work per unit of time (WPUT) is stable across this family of service and comparable to other XXX codes with this amount of physician time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared CPT code 80506 to the top two key reference services, 88189 *Flow cytometry, interpretation; 16 or more markers* (work RVU = 1.70 and 36 minutes intra-service time) and 88356 *Morphometric analysis; nerve* (work RVU = 2.80 and 90 minutes intra-service time, both which require more physician work, time and intensity that the surveyed code.

For additional support, the RUC referenced MPC ZZZ codes 36476 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)* (work RVU = 2.65 and 30 minutes total time), 51797 *Voiding pressure studies, intra-abdominal (ie, rectal, gastric, intraperitoneal) (List separately in addition to code for primary procedure)* (work RVU = 0.80 and 15 minutes total time) and 15003 *Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, trunk, arms, legs; each additional 100 sq cm, or part thereof, or each additional 1% of body area of infants and children (List separately in addition to code for primary procedure)* (work RVU = 0.80 and 16 minutes total time). **The RUC recommends a work RVU of 0.80 for CPT code 80506.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The Practice Expense Subcommittee agreed that there is compelling evidence that the practice expense has changed due to this service being previously valued based on a flawed methodology, technology advances and change in the patient population (as specified in the compelling evidence that physician work has changed). The PE Subcommittee removed the equipment item ED021 *computer, desktop, w-monitor*, as it is not specifically dedicated to the procedure. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Pathology and Laboratory **Pathology Clinical Consultations ~~(Clinical Pathology)~~** Physician review of pathology and laboratory findings is frequently performed in the course of providing care to patients. Review of pathology and laboratory test results occurs in conjunction with the provision of an evaluation and management (E/M) service. Considered part of the non-face-to-face time activities associated with the overall E/M service, the review of the pathology and laboratory results is not a separately reportable service. Communicating results to the patient/family/caregiver of independent interpretation of results (not separately reported) may constitute an E/M service.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Pathology clinical consultation services codes (80503, 80504, 80505, 80506) describe physician pathology services provided at the request of another physician or other qualified health care professional at the same or another facility or institution.

A ~~clinical~~ pathology clinical consultation is a service, including a written report, rendered by the pathologist in response to a request (eg, written request, electronic request, phone request or face-to-face request) from a physician or other qualified health care professional that relates to clinical assessment or evaluation of ~~in relation~~ pathology and laboratory findings or other relevant clinical or diagnostic information, ~~to a test result(s)~~ requiring additional medical interpretive judgment. Reporting of ~~a test result(s)~~ pathology and laboratory findings or other relevant clinical or diagnostic information, without medical interpretive judgment is not considered a ~~clinical~~ pathology clinical consultation.

~~Reporting of a test result(s), without medical interpretive judgment is not considered a clinical pathology consultation.~~

The pathology clinical consultation services (80503, 80504, 80505, 80506) may be reported when the following criteria have been met:

- The pathologist renders a pathology clinical consultation at the request of a physician or other qualified healthcare professional (QHP) at the same or another institution.
- The pathology clinical consultation request is in relation to pathology and laboratory findings or other relevant clinical or diagnostic information (eg, radiology findings or operative/procedural notes) requiring additional medical interpretative judgment.

A pathologist may also render a pathology clinical consultation when mandated by federal or state regulation (eg, Clinical Laboratory Improvement Amendments [CLIA]).

Instruction for Selecting a Level of Pathology Clinical Consultation Services

The appropriate level of pathology clinical consultation services may be based on either

the total time for pathology clinical consultation services performed on the date of the consultation;

or

the level of the medical decision making as defined for each service

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code	Level of MDM (Based on 2 out of 3 Elements of MDM)	Elements of Medical Decision Making Number and Complexity of Problems Addressed	Elements of Medical Decision Making Amount and/or Complexity of Data to be Reviewed and Analyzed * - Each unique test, order, or document contributes to the combination of 2 or combination of 3 in Category 1 below. Time

Time alone may be used to select the appropriate code level for the pathology clinical consultation services codes (ie, 80503, 80504, 80505). When time is used to select the appropriate level for pathology clinical consultation codes, time is defined by the service descriptions. When prolonged time occurs, the add-on code (80506) may be reported. The appropriate time should be documented in the medical record when it is used as the basis for code selection.

Total time on the date of the consultation (pathology clinical consultation services): For coding purposes, time for these services is the total time on the date of the consultation. It includes time personally spent by the consultant on the day of the consultation (includes time in activities that require the consultant and does not include time in activities normally performed by clinical staff).

Consultant time includes the following activities, when performed:

- review of available medical history including presenting complaint, signs and symptoms, personal and family history

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

- review of results of tests
- review of all relevant past and current laboratory, pathology, and clinical findings
- arriving at a tentative conclusion/differential diagnosis
- comparison with previous study reports including radiographic reports, images as applicable, and results of other clinical testing
- ordering or recommending additional or follow-up testing
- referring and communicating with other health care professionals (not separately reported)
- counseling and educating the clinician or other qualified health care professional
- documenting clinical consultation report in the electronic or other health record

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 45-year-old female presents with abnormal pap smear. Clinicopathologic correlation of abnormal pap-smear with previous pap smears and/or gynecologic biopsies is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 62%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The pathologist is consulted by a provider on a patient. The pathologist reviews the clinical history in the patient’s medical record(s), which may include but is not limited to the history of present and past illness, medical/surgical history, imaging data, medication lists, transfusion history, social history and travel history. The patient’s medical record is reviewed focusing on recent and relevant remote clinical and diagnostic findings. All applicable diagnostic material, slides, primary analytical data are retrieved/unarchived for the pathologist’s examination and review. The pathologist assesses the relevant results or findings to include, but not limited to, hematology, coagulation, chemistry, microbiology, molecular and genetic studies, and/or any peripheral blood smear(s), cytopathologic, and histopathologic preparation(s). The pathologist integrates all data and information for clinical correlation and medical decision making, with documentation of the service in the medical record. The pathologist may also discuss case findings with requesting provider and/or clinical team (by phone, face to face, or virtually), including recommendations for additional testing and further clinical evaluation. When using time for code selection, 5-20 minutes of total time is spent on the date of the consultation.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
85060	XXX	0.45	**RUC Time**

CPT Descriptor Blood smear, peripheral, interpretation by physician with written report

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
88305	XXX	0.75	**RUC Time**

CPT Descriptor Level IV - Surgical pathology

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99407	XXX	0.50	**RUC Time**	83,194

CPT Descriptor 1 Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99281	XXX	0.48	**RUC Time**	67,730

CPT Descriptor 2 Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: A problem focused history; A problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor.

Other Reference CPT Code	Global	Work RVU	Time Source
99422	XXX	0.50	**RUC Time**

CPT Descriptor Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 11-20 minutes

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 20 **% of respondents:** 37.7 **%**

Number of respondents who choose 2nd Key Reference Code: 7 **% of respondents:** 13.2 **%**

TIME ESTIMATES (Median)

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	10%	60%	30%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	60%	35%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	16%	74%	10%
Physical effort required	30%	65%	5%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	55%	40%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	43%	43%	14%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	86%	14%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	57%	29%
Physical effort required	0%	71%	29%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	57%	43%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Clinical pathology consultation services were identified for review by the AMA RUC's Relativity Assessment Workgroup during the October 2019 RUC meeting. As part of the review of the 80500-80502 code family, the CAP reviewed Medicare claims utilization data and observed that there may be confusion regarding proper reporting of these services or miscoding. The RUC agreed with the CAP's request to refer the code family to CPT to develop proper CPT instruction and a proposal for code structure refinement for the October 2020 CPT Editorial Panel meeting. To clarify appropriate use of the clinical pathology services, the CPT Editorial Panel approved the deletion of CPT codes 80500 and 80502

and the creation of four new pathology clinical consultation CPT codes for valuation by the RUC at the January 2021 RUC meeting.

Pathology Clinical Consultations
Physician review of pathology and laboratory findings is frequently performed in the course of providing care to patients. Review of pathology and laboratory test results occurs in conjunction with the provision of an evaluation and management (E/M) service. Considered part of the non-face-to-face time activities associated with the overall E/M service, the review of the pathology and laboratory results is not a separately reportable service.

Pathology clinical consultation services (80503, 80504, 80505, 80506) describe physician pathology clinical consultation services provided at the request of another physician or qualified health care professional at the same or another facility or institution.

A pathology clinical consultation is a service, including a written report, rendered by the pathologist in response to a request (eg, written request, electronic request, phone request or face-to-face request) from a physician or other qualified health care professional that relates to clinical assessment or evaluation of pathology and laboratory findings or other relevant clinical or diagnostic information, requiring additional medical interpretive judgment. Reporting of pathology and laboratory findings or other relevant clinical or diagnostic information, without medical interpretive judgment, is not considered a pathology clinical consultation.

The pathology clinical consultation services (80503, 80504, 80505, 80506) may be reported when the following criteria have been met:

- The pathologist renders a pathology clinical consultation at the request of a physician or qualified healthcare professional (QHP) at the same or another institution.
- The pathology clinical consultation request is in relation to pathology and laboratory findings or other relevant clinical or diagnostic information requiring additional medical interpretative judgment.

A pathologist may also render a pathology clinical consultation when mandated by federal or state regulation (eg, Clinical Laboratory Improvement Amendments [CLIA]). For example, CLIA 88 requires that at a minimum of all Pap test results interpreted as high grade squamous intraepithelial lesion (HSIL), adenocarcinoma or other malignant neoplasms be correlated with subsequent or previous histologic biopsies. Additionally, if a patient has a current HSIL (cervical intraepithelial neoplasia (CIN 2 and above) with prior negative pap test, CLIA 88 requires all gynecologic cytology slides over the last five years to be reviewed for that patient.

Instruction for Selecting a Level of Pathology Clinical Consultation Services
The appropriate level of pathology clinical consultation services may be based on either the total time for pathology clinical consultation services performed on the date of the consultation; or the level of the medical decision making as defined for each service.

Guidelines for Pathology Clinical Consultation Services
Select the appropriate level of pathology clinical consultation services based on the following:

1. The total time for pathology clinical consultation services performed on the date of the consultation; or
2. The level of the medical decision making as defined for each service.

Compelling Evidence:
The CAP's expert panel believes that the RUC's compelling evidence standards have been met for the following reasons:

Evidence that incorrect assumptions were made in the previous valuation of the service
There is evidence that incorrect assumptions were made in the previous valuation of this service. This service was valued through an unknown CMS crosswalk method about 25 years ago. This represents a flawed valuation assumption mechanism or methodology. This code is a CMS/Other source code and has never been RUC surveyed or reviewed by the RUC.

Evidence that technology has changed physician work (ie, diffusion of technology) and the patient population has changed
Over the past 25 years since these services were valued by CMS, there has been an explosive growth in the number and complexity laboratory tests, development of new drugs, and the increased numbers of patients living with chronic diseases. Some reasons for these increases are as follows:

- Relative to 25 years ago, hospitals now have a more varied and diverse population with new diseases that need to be looked for (eg. malaria, microfilaria, etc.).
- The presence of new diseases or more prevalent diseases with hematologic manifestations/findings (eg. babesia, anaplasmosis/ehrlichiosis, COVID, therapy-related myeloid disorders from more cancer patients

receiving chemotherapy, new medications leading to more hematologic disorders, typically cytopenias, more illegal drugs such as levamisole-tainted cocaine leading to neutropenia or other cytopenias).
- Coagulation has new tests and many new anticoagulants that make interpreting coagulation tests much more difficult.
- Toxicology has many new drugs and metabolites to detect and often needs to detected (ie., many patients do multiple drugs).
- For smear reviews, patient hospitalizations seem to be more complex with more health issues and longer hospital stays, on average.

Consequently, the role of the consulting pathologist to investigate and explain these issues has similarly grown. Patients are frequently more complex with several chronic conditions and on multiple drugs. Disease classification systems are now more complex requiring integration of several patient and laboratory parameters including molecular studies. The quantity of data that needs to be assessed and incorporated into a comprehensive meaningful report is extensive. Additionally, transplant and pre transplant consultations are more complex. With this growth, the spectrum of complex interpretations and consultations has also widened. As a result of all of these trends, there is greater demand for a written order and written report by the pathologist.

With respect to the aforementioned explosive growth of laboratory tests and changes in population, molecular diagnostic testing has dramatically increased, which makes it difficult for physicians to keep pace with the indications for and interpretations of the tests. In addition to an increase in molecular diagnostic testing, the number and complexity of laboratory testing has increased. Similarly, there is tremendous variability in the naming and abbreviations for test names, which can make selecting the appropriate test even more difficult. With so many test options available, there is an increased risk of a physician selecting the wrong or unnecessary test which may delay making a diagnosis, impose risks on the patient, and impose other costs. To avoid this scenario, the necessity to consult a clinical pathologist before choosing which laboratory tests to order has increased.

Documentation in the peer-reviewed literature or other reliable data that there have been changes in physician work:

Survey Process and Results – 80503

In preparation for the January 2021 RUC meeting, the College of American Pathologists (CAP) determined that there is no pre-service or post-service physician work involved in this service and that the standard pathology survey instrument needed editing to exclude pre- and post-service work questions. Additionally, because clinical pathology consultations are specialized pathologists' work, a change in the survey instrument's intra-service work description was needed. The RUC's Research Subcommittee approved all the changes to the survey instrument.

The CAP conducted a physician work survey of 3,500 randomly selected active members, resulting in 53 respondents. Survey respondents (62%) agreed that the vignette represented the typical patient. The survey results are below:

80503, N=53	Intra-Service and Total Time	Physician Work RVU
Low	4	0.25
25th Percentile	10	0.50
Median	15	0.75
75th Percentile	18	0.90
High	32	1.70

The survey instrument contained 25 reference codes for respondents to choose from to depict the most similar pathology service to 80503. The reference service list physician work RVUs ranged from 0.24 to 3.60.

The Key Reference Service codes were:
First 85060 - Blood smear, peripheral, interpretation by physician with written report (Work RVU = 0.45, 12 minutes intra and total time) 38%
Secondary 88305 – Level IV – Surgical pathology (Work RVU = 0.75, 25 minutes intra and total time) 13%

Note that 58% of the respondents chose a reference code with a work RVU greater than the recommended work RVU of 0.50 for 80503.

Expert Panel Review and Opinion:
The survey results for CPT code 80503 were reviewed by an expert panel consisting of CAP's Economic Affairs Committee physician members, including several experts who perform the service. The expert panel considered the total work, time, intensity, and complexity of the typical patient case, and agreed that the 25th percentile work value of 0.50 with a median time of 15 minutes is the appropriate value for the code based on the survey results, intra-service time, comparison to key reference services, IWPUT, and the relative value of other codes on the physician fee schedule. In addition, it is important to note that the AMA's billed together data of the number of unique occurrences (same day, same patient, same provider), is typically once for code 80500.

Recommendation:
The CAP recommends a physician work RVU of 0.50 for CPT code 80503 with 15 minutes of intra-service and total time. The expert panel believes that our survey supports our recommendation for this new CPT code service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 80500

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Sometimes

Specialty Clinical Laboratory How often? Rarely

Specialty Other How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 87992
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumption that 100% of the current volume of CPT code 80500 will go to this code and 2019 RUC database Medicare volume represents about 25% of the total payer volume.

Specialty Pathology Frequency 73385 Percentage 83.39 %

Specialty Clinical Laboratory Frequency 13709 Percentage 15.57 %

Specialty Other Frequency 898 Percentage 1.02 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 21,998 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumption that 100% of the current volume of CPT code 80500 will go to this code, 2019 RUC database Medicare volume used.

Specialty Pathology Frequency 18346 Percentage 83.39 %

Specialty Clinical Laboratory Frequency 3427 Percentage 15.57 %

Specialty Other Frequency 224 Percentage 1.01 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Specialist

BETOS Sub-classification Level II:
Pathology

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number N/A

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 80500

SUMMARY OF RECOMMENDATION

CPT Code:80504 Tracking Number Original Specialty Recommended RVU: **0.91**
Presented Recommended RVU: **0.91**
Global Period: XXX Current Work RVU: **N/A** RUC Recommended RVU: **0.91**

CPT Descriptor: Pathology clinical consultation; for a moderately complex clinical problem, with review of patient's history and medical records and moderate level of medical decision making. When using time for code selection, 21-40 minutes of total time is spent on the date of the consultation.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old female with new onset leukocytosis. Pathology clinical consultation is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The pathologist is consulted by a provider on a patient. The pathologist reviews the clinical history in the patient's medical record(s), which may include but is not limited to the history of present and past illness, medical/surgical history, imaging data, medication lists, transfusion history, social history and travel history. The patient's medical record is reviewed focusing on recent and relevant remote clinical and diagnostic findings. All applicable diagnostic material, slides, primary analytical data are retrieved/unarchived for the pathologist's examination and review. The pathologist assesses the relevant results or findings to include, but not limited to, hematology, coagulation, chemistry, microbiology, molecular and genetic studies, and/or any peripheral blood smear(s), cytopathologic, and histopathologic preparation(s). The pathologist integrates all data and information for clinical correlation and medical decision making, with documentation of the service in the medical record. The pathologist may also discuss case findings with requesting provider and/or clinical team (by phone, face to face, or virtually), including recommendations for additional testing and further clinical evaluation. When using time for code selection, 21-40 minutes of total time is spent on the date of the consultation.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	75%	25%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	75%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	92%	8%
Physical effort required	0%	83%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and	0%	67%	33%

judgment of physician • Estimated risk of malpractice suit with poor outcome					

2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	14%	86%	0%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	29%	57%	14%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	33%	67%	0%
Physical effort required	28%	71%	0%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	57%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

See below

Clinical pathology consultation services were identified for review by the AMA RUC's Relativity Assessment Workgroup during the October 2019 RUC meeting. As part of the review of the 80500-80502 code family, the CAP reviewed Medicare claims utilization data and observed that there may be confusion regarding proper reporting of these services or miscoding. The RUC agreed with the CAP's request to refer the code family to CPT to develop proper CPT instruction and a proposal for code structure refinement for the October 2020 CPT Editorial Panel meeting. To clarify appropriate use of the clinical pathology services, the CPT Editorial Panel approved the deletion of CPT codes 80500 and 80502 and the creation of four new pathology clinical consultation CPT codes for valuation by the RUC at the January 2021 RUC meeting.

Pathology Clinical Consultations
Physician review of pathology and laboratory findings is frequently performed in the course of providing care to patients. Review of pathology and laboratory test results occurs in conjunction with the provision of an evaluation and management (E/M) service. Considered part of the non-face-to-face time activities associated with the overall E/M service, the review of the pathology and laboratory results is not a separately reportable service.

Pathology clinical consultation services (80503, 80504, 88505, 88506) describe physician pathology clinical consultation services provided at the request of another physician or qualified health care professional at the same or another facility or institution.

A pathology clinical consultation is a service, including a written report, rendered by the pathologist in response to a request (eg, written request, electronic request, phone request or face-to-face request) from a physician or other qualified health care professional that relates to clinical assessment or evaluation of pathology and laboratory findings or other relevant clinical or diagnostic information, requiring additional medical interpretive judgment. Reporting of pathology and laboratory findings or other relevant clinical or diagnostic information, without medical interpretive judgment, is not considered a pathology clinical consultation.

The pathology clinical consultation services (80503, 80504, 88505, 88506) may be reported when the following criteria have been met:

- The pathologist renders a pathology clinical consultation at the request of a physician or qualified healthcare professional (QHP) at the same or another institution.
- The pathology clinical consultation request is in relation to pathology and laboratory findings or other relevant clinical or diagnostic information requiring additional medical interpretative judgment.

A pathologist may also render a pathology clinical consultation when mandated by federal or state regulation (eg, Clinical Laboratory Improvement Amendments [CLIA]). For example, CLIA 88 requires that at a minimum of all Pap test results interpreted as high grade squamous intraepithelial lesion (HSIL), adenocarcinoma or other malignant neoplasms be correlated with subsequent or previous histologic biopsies. Additionally, if a patient has a current HSIL (cervical intraepithelial neoplasia (CIN 2 and above) with prior negative pap test, CLIA 88 requires all gynecologic cytology slides over the last five years to be reviewed for that patient.

Instruction for Selecting a Level of Pathology Clinical Consultation Services
The appropriate level of pathology clinical consultation services may be based on either
the total time for pathology clinical consultation services performed on the date of the consultation; or the level of the medical decision making as defined for each service.

Guidelines for Pathology Clinical Consultation Services
Select the appropriate level of pathology clinical consultation services based on the following:

1. The total time for pathology clinical consultation services performed on the date of the consultation; or
2. The level of the medical decision making as defined for each service.

Compelling Evidence:
The CAP's expert panel believes that the RUC's compelling evidence standards have been met for the following reasons:

Evidence that incorrect assumptions were made in the previous valuation of the service
There is evidence that incorrect assumptions were made in the previous valuation of this service. This service was valued through an unknown CMS crosswalk method about 25 years ago. This represents a flawed valuation assumption mechanism or methodology. This code is a CMS/Other source code and has never been RUC surveyed or reviewed by the RUC.

Evidence that technology has changed physician work (ie, diffusion of technology) and the patient population has changed
Over the past 25 years since these services were valued by CMS, there has been an explosive growth in the number and complexity laboratory tests, development of new drugs, and the increased numbers of patients living with chronic diseases. Some reasons for these increases are as follows:

- Relative to 25 years ago, hospitals now have a more varied and diverse population with new diseases that need to be looked for (eg. malaria, microfilaria, etc.).

- The presence of new diseases or more prevalent diseases with hematologic manifestations/findings (eg. babesia, anaplasmosis/ehrlichiosis, COVID, therapy-related myeloid disorders from more cancer patients receiving chemotherapy, new medications leading to more hematologic disorders, typically cytopenias, more illegal drugs such as levamisole-tainted cocaine leading to neutropenia or other cytopenias).
- Coagulation has new tests and many new anticoagulants that make interpreting coagulation tests much more difficult.
- Toxicology has many new drugs and metabolites to detect and often needs to detected (ie., many patients do multiple drugs).
- For smear reviews, patient hospitalizations seem to be more complex with more health issues and longer hospital stays, on average.

Consequently, the role of the consulting pathologist to investigate and explain these issues has similarly grown. Patients are frequently more complex with several chronic conditions and on multiple drugs. Disease classification systems are now more complex requiring integration of several patient and laboratory parameters including molecular studies. The quantity of data that needs to be assessed and incorporated into a comprehensive meaningful report is extensive. Additionally, transplant and pre transplant consultations are more complex. With this growth, the spectrum of complex interpretations and consultations has also widened. As a result of all of these trends, there is greater demand for a written order and written report by the pathologist.

With respect to the aforementioned explosive growth of laboratory tests and changes in population, molecular diagnostic testing has dramatically increased, which makes it difficult for physicians to keep pace with the indications for and interpretations of the tests. In addition to an increase in molecular diagnostic testing, the number and complexity of laboratory testing has increased. Similarly, there is tremendous variability in the naming and abbreviations for test names, which can make selecting the appropriate test even more difficult. With so many test options available, there is an increased risk of a physician selecting the wrong or unnecessary test which may delay making a diagnosis, impose risks on the patient, and impose other costs. To avoid this scenario, the necessity to consult a clinical pathologist before choosing which laboratory tests to order has increased.

Documentation in the peer-reviewed literature or other reliable data that there have been changes in physician work:

Survey Process and Results – 88504

In preparation for the January 2021 RUC meeting, the College of American Pathologists (CAP) determined that there is no pre-service or post-service physician work involved in this service and that the standard pathology survey instrument needed editing to exclude pre- and post-service work questions. Additionally, because clinical pathology consultations are specialized pathologists' work, a change in the survey instrument's intra-service work description was needed. The RUC's Research Subcommittee approved all the changes to the survey instrument.

The CAP conducted a physician work survey of 3,500 randomly selected active members, resulting in 54 respondents. Survey respondents (78%) agreed that the vignette represented the typical patient. The survey results are below:

88504, N=54	Intra-Service and Total Time	Physician Work RVU
Low	18	0.50
25th Percentile	30	0.91
Median	30	1.50
75th Percentile	35	1.80
High	60	7.75

The survey instrument contained 25 reference codes for respondents to choose from to depict the most similar pathology service to 88504. The reference service list physician work RVUs ranged from 0.24 to 3.60.

The Key Reference Service codes were:
First 88321 - Consultation and report on referred slides prepared elsewhere (Work RVU = 1.63, 50 minutes intra and total time) 24%
Secondary 85390 Fibrinolysins or coagulopathy screen, interpretation and report (Work RVU = 0.75, 20 minutes intra and total time) 13%
Note that 70% of the respondents chose a reference code with a work RVU greater than the recommended work RVU of 0.91 for 88504.

Expert Panel Review and Opinion:
The survey results for CPT code 88504 were reviewed by an expert panel consisting of CAP's Economic Affairs Committee physician members, including several experts who perform the service. The expert panel considered the total work, time, intensity, and complexity of the typical patient case, and agreed that the 25th percentile work value of 0.91 with a median time of 30 minutes is the appropriate value for the code based on the survey results, intra-service time, comparison to key reference services, IWPUT, and the relative value of other codes on the physician fee schedule. In addition, it is important to note that the AMA's billed together data of the number of unique occurrences (same day, same patient, same provider), is typically once for codes 80500 and 80502.

Recommendation:
The CAP recommends a physician work RVU of 0.91 for CPT code 88504 with 30 minutes of intra-service and total time. The expert panel believes that our survey supports our recommendation for this new CPT code service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 80502

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Sometimes

Specialty Clinical Laboratory How often? Rarely

Specialty Other How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 41965
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumption that 80% of the current volume of CPT code 80502 will go to this code and 2019 RUC database Medicare volume represents about 25% of the total payer volume.

Specialty Pathology Frequency 35032 Percentage 83.47 %

Specialty Clinical Laboratory Frequency 6078 Percentage 14.48 %

Specialty Other Frequency 915 Percentage 2.18 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 10,491 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumption that 80% of the current Medicare volume of CPT code 80502 will go to this code, 2019 RUC database Medicare volume used.

Specialty Pathology Frequency 8758 Percentage 83.48 %

Specialty Clinical Laboratory Frequency 1504 Percentage 14.33 %

Specialty Other Frequency 229 Percentage 2.18 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Specialist

BETOS Sub-classification Level II:
Pathology

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number N/A

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 80502

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:80505 Tracking Number Original Specialty Recommended RVU: **1.80**
Presented Recommended RVU: **1.80**
Global Period: XXX Current Work RVU: **N/A** RUC Recommended RVU: **1.80**

CPT Descriptor: Pathology clinical consultation; for a highly complex clinical problem, with comprehensive review of patient's history and medical records and high level of medical decision making. When using time for code selection, 41-60 minutes of total time is spent on the date of the consultation.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 41-year-old female with acute thrombocytopenia and anemia. Pathology clinical consultation is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The pathologist is consulted by a provider on a patient. The pathologist reviews the clinical history in the patient's medical record(s), which may include but is not limited to the history of present and past illness, medical/surgical history, imaging data, medication lists, transfusion history, social history and travel history. The patient's medical record is reviewed focusing on recent and relevant remote clinical and diagnostic findings. All applicable diagnostic material, slides, primary analytical data are retrieved/unarchived for the pathologist's examination and review. The pathologist assesses the relevant results or findings to include, but not limited to, hematology, coagulation, chemistry, microbiology, molecular and genetic studies, and/or any peripheral blood smear(s), cytopathologic, and histopathologic preparation(s). The pathologist integrates all data and information for clinical correlation and medical decision making, with documentation of the service in the medical record. The pathologist may also discuss case findings with requesting provider and/or clinical team (by phone, face to face, or virtually), including recommendations for additional testing and further clinical evaluation. When using time for code selection, 41-60 minutes of total time is spent on the date of the consultation.

Description of Post-Service Work: N/A

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	14%	71%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Clinical pathology consultation services were identified for review by the AMA RUC's Relativity Assessment Workgroup during the October 2019 RUC meeting. As part of the review of the 80500-80502 code family, the CAP reviewed Medicare claims utilization data and observed that there may be confusion regarding proper reporting of these services or miscoding. The RUC agreed with the CAP's request to refer the code family to CPT to develop proper CPT instruction and a proposal for code structure refinement for the October 2020 CPT Editorial Panel meeting. To clarify appropriate use of the clinical pathology services, the CPT Editorial Panel approved the deletion of CPT codes 80500 and 80502 and the creation of four new pathology clinical consultation CPT codes for valuation by the RUC at the January 2021 RUC meeting.

Pathology Clinical Consultations

Physician review of pathology and laboratory findings is frequently performed in the course of providing care to patients. Review of pathology and laboratory test results occurs in conjunction with the provision of an evaluation and management (E/M) service. Considered part of the non-face-to-face time activities associated with the overall E/M service, the review of the pathology and laboratory results is not a separately reportable service.

Pathology clinical consultation services (80503, 8006, 80505, 80506) describe physician pathology clinical consultation services provided at the request of another physician or qualified health care professional at the same or another facility or institution.

A pathology clinical consultation is a service, including a written report, rendered by the pathologist in response to a request (eg, written request, electronic request, phone request or face-to-face request) from a physician or other qualified health care professional that relates to clinical assessment or evaluation of pathology and laboratory findings or other relevant clinical or diagnostic information, requiring additional medical interpretive judgment. Reporting of pathology and laboratory findings or other relevant clinical or diagnostic information, without medical interpretive judgment, is not considered a pathology clinical consultation.

The pathology clinical consultation services (80503, 80504, 80505, 80506) may be reported when the following criteria have been met:

- The pathologist renders a pathology clinical consultation at the request of a physician or qualified healthcare professional (QHP) at the same or another institution.
- The pathology clinical consultation request is in relation to pathology and laboratory findings or other relevant clinical or diagnostic information requiring additional medical interpretative judgment.

A pathologist may also render a pathology clinical consultation when mandated by federal or state regulation (eg, Clinical Laboratory Improvement Amendments [CLIA]). For example, CLIA 88 requires that at a minimum of all Pap test results interpreted as high grade squamous intraepithelial lesion (HSIL), adenocarcinoma or other malignant neoplasms be correlated with subsequent or previous histologic biopsies. Additionally, if a patient has a current HSIL (cervical intraepithelial neoplasia (CIN 2 and above) with prior negative pap test, CLIA 88 requires all gynecologic cytology slides over the last five years to be reviewed for that patient.

Instruction for Selecting a Level of Pathology Clinical Consultation Services

The appropriate level of pathology clinical consultation services may be based on either
the total time for pathology clinical consultation services performed on the date of the consultation; or the level of the medical decision making as defined for each service.

Guidelines for Pathology Clinical Consultation Services

Select the appropriate level of pathology clinical consultation services based on the following:

1. The total time for pathology clinical consultation services performed on the date of the consultation; or
2. The level of the medical decision making as defined for each service.

Compelling Evidence:

The CAP's expert panel believes that the RUC's compelling evidence standards have been met for the following reasons:

Evidence that incorrect assumptions were made in the previous valuation of the service

There is evidence that incorrect assumptions were made in the previous valuation of this service. This service was valued through an unknown CMS crosswalk method about 25 years ago. This represents a flawed valuation assumption mechanism or methodology. This code is a CMS/Other source code and has never been RUC surveyed or reviewed by the RUC.

Evidence that technology has changed physician work (ie, diffusion of technology) and the patient population has changed

Over the past 25 years since these services were valued by CMS, there has been an explosive growth in the number and complexity laboratory tests, development of new drugs, and the increased numbers of patients living with chronic diseases. Some reasons for these increases are as follows:

- Relative to 25 years ago, hospitals now have a more varied and diverse population with new diseases that need to be looked for (eg. malaria, microfilaria, etc.).
- The presence of new diseases or more prevalent diseases with hematologic manifestations/findings (eg. babesia, anaplasmosis/ehrlichiosis, COVID, therapy-related myeloid disorders from more cancer patients receiving chemotherapy, new medications leading to more hematologic disorders, typically cytopenias, more illegal drugs such as levamisole-tainted cocaine leading to neutropenia or other cytopenias).
- Coagulation has new tests and many new anticoagulants that make interpreting coagulation tests much more difficult.
- Toxicology has many new drugs and metabolites to detect and often needs to detected (ie., many patients do multiple drugs).
- For smear reviews, patient hospitalizations seem to be more complex with more health issues and longer hospital stays, on average.

Consequently, the role of the consulting pathologist to investigate and explain these issues has similarly grown. Patients are frequently more complex with several chronic conditions and on multiple drugs. Disease classification systems are now more complex requiring integration of several patient and laboratory parameters including molecular studies. The quantity of data that needs to be assessed and incorporated into a comprehensive meaningful report is extensive. Additionally, transplant and pre transplant consultations are more complex. With this growth, the spectrum of complex interpretations and consultations has also widened. As a result of all of these trends, there is greater demand for a written order and written report by the pathologist.

With respect to the aforementioned explosive growth of laboratory tests and changes in population, molecular diagnostic testing has dramatically increased, which makes it difficult for physicians to keep pace with the indications for and interpretations of the tests. In addition to an increase in molecular diagnostic testing, the number and complexity of laboratory testing has increased. Similarly, there is tremendous variability in the naming and abbreviations for test names, which can make selecting the appropriate test even more difficult. With so many test options available, there is an increased risk of a physician selecting the wrong or unnecessary test which may delay making a diagnosis, impose risks on the patient, and impose other costs. To avoid this scenario, the necessity to consult a clinical pathologist before choosing which laboratory tests to order has increased.

Documentation in the peer-reviewed literature or other reliable data that there have been changes in physician work:

Survey Process and Results – 80505

In preparation for the January 2021 RUC meeting, the College of American Pathologists (CAP) determined that there is no pre-service or post-service physician work involved in this service and that the standard pathology survey instrument needed editing to exclude pre- and post-service work questions. Additionally, because clinical pathology consultations are specialized pathologists' work, a change in the survey instrument's intra-service work description was needed. The RUC's Research Subcommittee approved all the changes to the survey instrument.

The CAP conducted a physician work survey of 3,500 randomly selected active members, resulting in 54 respondents. Survey respondents (78%) agreed that the vignette represented the typical patient. The survey results are below:

80505, N=54	Intra-Service and Total Time	Physician Work RVU
Low	15	0.75
25th Percentile	50	1.80
Median	54	2.84

75th Percentile	60	2.90
High	75	6.00

The survey instrument contained 25 reference codes for respondents to choose from to depict the most similar pathology service to 80505. The reference service list physician work RVUs ranged from 0.24 to 3.60.

The Key Reference Service codes were:
First 88325 - Consultation, comprehensive, with review of records and specimens, with report on referred material (Work RVU = 2.85, 90 minutes intra and total time) 46%
Secondary 88321 – Consultation and report on referred slides prepared elsewhere (Work RVU = 1.63, 50 minutes intra and total time) 13%

Note that 57% of the respondents chose a reference code with a work RVU greater than the recommended work RVU of 1.80 for 80505.

Expert Panel Review and Opinion:
The survey results for CPT code 80505 were reviewed by an expert panel consisting of CAP's Economic Affairs Committee physician members, including several experts who perform the service. The expert panel considered the total work, time, intensity, and complexity of the typical patient case, and agreed that the 25th percentile work value of 1.80 with a median time of 54 minutes is the appropriate value for the code based on the survey results, intra-service time, comparison to key reference services, IWPUT, and the relative value of other codes on the physician fee schedule. In addition, it is important to note that the AMA's billed together data of the number of unique occurrences (same day, same patient, same provider), is typically once for codes 80500 and 80502.

Recommendation:
The CAP recommends a physician work RVU of 1.80 for CPT code 80505 with 54 minutes of intra-service and total time. The expert panel believes that our survey supports our recommendation for this new CPT code service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 80502

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Sometimes

Specialty Clinical Laboratory How often? Rarely

Specialty Other How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 10491
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumption that 20% of the current volume of CPT code 80502 will go to this code and 2019 RUC database Medicare volume represents about 25% of the total payer volume.

Specialty Pathology Frequency 8758 Percentage 83.48 %

Specialty Clinical Laboratory Frequency 1504 Percentage 14.33 %

Specialty Other Frequency 229 Percentage 2.18 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,622
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumption that 20% of the current volume of CPT code 80502 will go to this code using 2019 RUC database Medicare volume.

Specialty Pathology Frequency 2190 Percentage 83.49 %

Specialty Clinical Laboratory Frequency 376 Percentage 14.33 %

Specialty Other Frequency 57 Percentage 2.17 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Specialist

BETOS Sub-classification Level II:
Pathology

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number N/A

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 80502

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	13%	50%	38%
Physical effort required	13%	75%	13%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	25%	38%	38%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	33%	50%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	50%	50%
Physical effort required	0%	83%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	33%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Clinical pathology consultation services were identified for review by the AMA RUC's Relativity Assessment Workgroup during the October 2019 RUC meeting. As part of the review of the 80500-80502 code family, the CAP reviewed Medicare claims utilization data and observed that there may be confusion regarding proper reporting of these services

or miscoding. The RUC agreed with the CAP's request to refer the code family to CPT to develop proper CPT instruction and a proposal for code structure refinement for the October 2020 CPT Editorial Panel meeting. To clarify appropriate use of the clinical pathology services, the CPT Editorial Panel approved the deletion of CPT codes 80500 and 80502 and the creation of four new pathology clinical consultation CPT codes for valuation by the RUC at the January 2021 RUC meeting.

Pathology Clinical Consultations
Physician review of pathology and laboratory findings is frequently performed in the course of providing care to patients. Review of pathology and laboratory test results occurs in conjunction with the provision of an evaluation and management (E/M) service. Considered part of the non-face-to-face time activities associated with the overall E/M service, the review of the pathology and laboratory results is not a separately reportable service.

Pathology clinical consultation services (80503, 80504, 80505, 80506) describe physician pathology clinical consultation services provided at the request of another physician or qualified health care professional at the same or another facility or institution.

A pathology clinical consultation is a service, including a written report, rendered by the pathologist in response to a request (eg, written request, electronic request, phone request or face-to-face request) from a physician or other qualified health care professional that relates to clinical assessment or evaluation of pathology and laboratory findings or other relevant clinical or diagnostic information, requiring additional medical interpretive judgment. Reporting of pathology and laboratory findings or other relevant clinical or diagnostic information, without medical interpretive judgment, is not considered a pathology clinical consultation.

The pathology clinical consultation services (80503, 80504, 80505, 80506) may be reported when the following criteria have been met:

- The pathologist renders a pathology clinical consultation at the request of a physician or qualified healthcare professional (QHP) at the same or another institution.
- The pathology clinical consultation request is in relation to pathology and laboratory findings or other relevant clinical or diagnostic information requiring additional medical interpretative judgment.

A pathologist may also render a pathology clinical consultation when mandated by federal or state regulation (eg, Clinical Laboratory Improvement Amendments [CLIA]). For example, CLIA 88 requires that at a minimum of all Pap test results interpreted as high grade squamous intraepithelial lesion (HSIL), adenocarcinoma or other malignant neoplasms be correlated with subsequent or previous histologic biopsies. Additionally, if a patient has a current HSIL (cervical intraepithelial neoplasia (CIN 2 and above) with prior negative pap test, CLIA 88 requires all gynecologic cytology slides over the last five years to be reviewed for that patient.

Instruction for Selecting a Level of Pathology Clinical Consultation Services
The appropriate level of pathology clinical consultation services may be based on either
the total time for pathology clinical consultation services performed on the date of the consultation; or the level of the medical decision making as defined for each service.

Guidelines for Pathology Clinical Consultation Services
Select the appropriate level of pathology clinical consultation services based on the following:

1. The total time for pathology clinical consultation services performed on the date of the consultation; or
2. The level of the medical decision making as defined for each service.

Compelling Evidence:
The CAP's expert panel believes that the RUC's compelling evidence standards have been met for the following reasons:

Evidence that incorrect assumptions were made in the previous valuation of the service
There is evidence that incorrect assumptions were made in the previous valuation of this service. This service was valued through an unknown CMS crosswalk method about 25 years ago. This represents a flawed valuation assumption mechanism or methodology. This code is a CMS/Other source code and has never been RUC surveyed or reviewed by the RUC.

Evidence that technology has changed physician work (ie, diffusion of technology) and the patient population has changed
Over the past 25 years since these services were valued by CMS, there has been an explosive growth in the number and complexity laboratory tests, development of new drugs, and the increased numbers of patients living with chronic diseases. Some reasons for these increases are as follows:

- Relative to 25 years ago, hospitals now have a more varied and diverse population with new diseases that need to be looked for (eg. malaria, microfilaria, etc.).
- The presence of new diseases or more prevalent diseases with hematologic manifestations/findings (eg. babesia, anaplasmosis/ehrlichiosis, COVID, therapy-related myeloid disorders from more cancer patients receiving chemotherapy, new medications leading to more hematologic disorders, typically cytopenias, more illegal drugs such as levamisole-tainted cocaine leading to neutropenia or other cytopenias).
- Coagulation has new tests and many new anticoagulants that make interpreting coagulation tests much more difficult.
- Toxicology has many new drugs and metabolites to detect and often needs to detected (ie., many patients do multiple drugs).
- For smear reviews, patient hospitalizations seem to be more complex with more health issues and longer hospital stays, on average.

Consequently, the role of the consulting pathologist to investigate and explain these issues has similarly grown. Patients are frequently more complex with several chronic conditions and on multiple drugs. Disease classification systems are now more complex requiring integration of several patient and laboratory parameters including molecular studies. The quantity of data that needs to be assessed and incorporated into a comprehensive meaningful report is extensive. Additionally, transplant and pre transplant consultations are more complex. With this growth, the spectrum of complex interpretations and consultations has also widened. As a result of all of these trends, there is greater demand for a written order and written report by the pathologist.

With respect to the aforementioned explosive growth of laboratory tests and changes in population, molecular diagnostic testing has dramatically increased, which makes it difficult for physicians to keep pace with the indications for and interpretations of the tests. In addition to an increase in molecular diagnostic testing, the number and complexity of laboratory testing has increased. Similarly, there is tremendous variability in the naming and abbreviations for test names, which can make selecting the appropriate test even more difficult. With so many test options available, there is an increased risk of a physician selecting the wrong or unnecessary test which may delay making a diagnosis, impose risks on the patient, and impose other costs. To avoid this scenario, the necessity to consult a clinical pathologist before choosing which laboratory tests to order has increased.

Documentation in the peer-reviewed literature or other reliable data that there have been changes in physician work:

Survey Process and Results – 80506

In preparation for the January 2021 RUC meeting, the College of American Pathologists (CAP) determined that there is no pre-service or post-service physician work involved in this service and that the standard pathology survey instrument needed editing to exclude pre- and post-service work questions. Additionally, because clinical pathology consultations are specialized pathologists' work, a change in the survey instrument's intra-service work description was needed. The RUC's Research Subcommittee approved all the changes to the survey instrument.

The CAP conducted a physician work survey of 3,500 randomly selected active members, resulting in 58 respondents. Survey respondents (71%) agreed that the vignette represented the typical patient. The survey results are below:

80506, N=49	Intra-Service and Total Time	Physician Work RVU
Low	12	0.25
25th Percentile	27	0.80
Median	30	1.50

75th Percentile	60	2.00
High	120	3.60

The survey instrument contained 25 reference codes for respondents to choose from to depict the most similar pathology service to 80506. The reference service list physician work RVUs ranged from 0.24 to 3.60.

The Key Reference Service codes were:
First 88189 - Flow cytometry, interpretation; 16 or more markers (Work RVU = 1.70, 36 minutes intra and total time) 16%
Secondary 88356 – Morphometric analysis; nerve (Work RVU = 2.80, 90 minutes intra and total time) 12%
Note that 73% of the respondents chose a reference code with a work RVU greater than the recommended work RVU of 0.80 for 80506.

Expert Panel Review and Opinion:
The survey results for CPT code 80506 were reviewed by an expert panel consisting of CAP's Economic Affairs Committee physician members, including several experts who perform the service. The expert panel considered the total work, time, intensity, and complexity of the typical patient case, and agreed that the 25th percentile work value of 0.80 with a median time of 30 minutes is the appropriate value for the code based on the survey results, intra-service time, comparison to key reference services, IWPUT, and the relative value of other codes on the physician fee schedule. In addition, it is important to note that the AMA's billed together data of the number of unique occurrences (same day, same patient, same provider), is typically once for codes 80500 and 80502.

Recommendation:
The CAP recommends a physician work RVU of 0.80 for CPT code 80506 with 30 minutes of intra-service and total time. The expert panel believes that our survey supports our recommendation for this new CPT code service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Not reported in the past

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Sometimes

Specialty Clinical Laboratory How often? Rarely

Specialty Other How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 1049
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 10% of the estimated volume for 80505, (10% of current volume of 80502), using 2019 RUC Database volume.

Specialty Pathology Frequency 876 Percentage 83.50 %

Specialty Clinical Pathology Frequency 150 Percentage 14.29 %

Specialty Other Frequency 23 Percentage 2.19 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 262
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 10% of the estimated volume for 80505 (10% of current volume of 80502), using 2019 RUC Database volume.

Specialty Pathology Frequency 219 Percentage 83.58 %

Specialty Clinical Laboratory Frequency 38 Percentage 14.50 %

Specialty Other Frequency 6 Percentage 2.29 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Evaluation Management

BETOS Sub-classification:
Specialist

BETOS Sub-classification Level II:
Pathology

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number N/A

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 80502

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
80503	45-year-old female presents with abnormal pap smear. Clinicopathologic correlation of abnormal pap-smear with previous pap smears and/or gynecologic biopsies is performed.
80504	A 45-year-old female with new onset leukocytosis. Pathology clinical consultation is requested.
80505	A 41-year-old female with acute thrombocytopenia and anemia. Pathology clinical consultation is requested.
80506	Assessment of patient with complex toxicology results. Pathology clinical consultation is requested.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The CAP recommends no direct practice expense inputs in the facility setting at this time.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   N/A

3. Is this code(s) typically reported with an E/M service?

   N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   The CAP recommends no direct practice expense inputs in the facility setting at this time.

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:
   The CAP recommends no direct practice expense inputs in the facility setting at this time.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:
   N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:
   The CAP recommends no direct practice expense inputs in the facility setting at this time.
   b. Service period (includes pre, intra and post):
   The CAP recommends no direct practice expense inputs in the facility setting at this time.
   c. Post-service period:
   The CAP recommends no direct practice expense inputs in the facility setting at this time.
8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
   The CAP recommends no direct practice expense inputs in the facility setting at this time.

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
   N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
    N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

N/A

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A consensus panel consisting of RUC advisors and subject matter experts met via multiple conference calls to review the survey data and existing PE inputs to develop the final recommendations presented in the PE worksheet.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   (Reference) CPT code 88323 - Consultation and report on referred material requiring preparation of slides

(Current inputs included on PE spreadsheet) CPT code 80500 - Clinical pathology consultation; limited, without review of patient's history and medical records
(Current inputs included on PE spreadsheet) CPT code 80502 - Clinical pathology consultation; comprehensive, for a complex diagnostic problem, with review of patient's history and medical records

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   These codes are not reported with an E/M service and are most often reported in the facility setting.

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   Pathology provides this service 83 percent of the time. Moreover, pathologists and clinical laboratories provide virtually 100 percent of this service. Pathology is also the dominant provider for this global service. The vast majority of these services are performed in the facility setting.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

   The CAP's expert panel believes that the RUC's compelling evidence standards have been met for the following reasons:

   Evidence that incorrect assumptions were made in the previous valuation of the service
   There is evidence that incorrect assumptions were made in the previous valuation of this service. This service was valued through an unknown CMS crosswalk method about 25 years ago. This represents a flawed valuation assumption mechanism or methodology. This code is a CMS/Other source code and has never been RUC surveyed or reviewed by the RUC.

   Evidence that technology has changed physician work (ie, diffusion of technology) and the patient population has changed
   Over the past 25 years since these services were valued by CMS, there has been an explosive growth in the number and complexity of laboratory tests, development of new drugs, and the increased numbers of patients living with chronic diseases. Some reasons for these increases are as follows:
   - Relative to 25 years ago, hospitals now have a more varied and diverse population with new diseases that need to be looked for (eg. malaria, microfilaria, etc.).

- The presence of new diseases or more prevalent diseases with hematologic manifestations/findings (eg. babesia, anaplasmosis/ehrlichiosis, COVID, therapy-related myeloid disorders from more cancer patients receiving chemotherapy, new medications leading to more hematologic disorders, typically cytopenias, more illegal drugs such as levamisole-tainted cocaine leading to neutropenia or other cytopenias).
- Coagulation has new tests and many new anticoagulants that make interpreting coagulation tests much more difficult.
- Toxicology has many new drugs and metabolites to detect and often needs to detected (ie., many patients do multiple drugs).
- For smear reviews, patient hospitalizations seem to be more complex with more health issues and longer hospital stays, on average.

Consequently, tthe role of the consulting pathologist to investigate and explain these issues has similarly grown. Patients are more frequently more complex with several chronic conditions and on multiple drugs. Disease classification systems are now more complex requiring integration of several patient and laboratory parameters including molecular studies. The quantity of data that needs to be assessed and incorporated into a comprehensive meaningful report is extensive. Additionally, transplant and pre transplant consultations are more complex. With this growth, the spectrum of complex interpretations and consultations has also widened. As a result of all of these trends, there is greater demand for a written order and written report by the pathologist.

With respect to the aforementioned explosive growth of laboratory tests and changes in population, molecular diagnostic testing has dramatically increased, which makes it difficult for physicians to keep pace with the indications for and interpretations of the tests. In addition to an increase in molecular diagnostic testing, the number and complexity of laboratory testing has increased. Similarly, there is tremendous variability in the naming and abbreviations for test names, which can make selecting the appropriate test even more difficult. With so many test options available, there is an increased risk of a physician selecting the wrong or unnecessary test which may delay making a diagnosis, impose risks on the patient, and impose other costs. To avoid this scenario, the necessity to consult a clinical pathologist before choosing which laboratory tests to order has increased.

Documentation in the peer-reviewed literature or other reliable data that there have been changes in physician work:

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

N/A

   b. Service period (includes pre, intra and post):

5 minutes: Preservice of service period. Manage pre-evaluation activities

4 minutes; Preservice of service period. Accession and enter information

3 minutes: Post Service Service period. File specimen, supplies, and other materials

   c. Post-service period:

N/A

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

5 minutes: Preservice of service period. Manage pre-evaluation activities: Clinical staff work done at this time is the compiling of patient data for the pathologist. Patient data can come from inside and/or outside of the physician's office and need to be integrated into the analyses performed by the pathologist. Additionally, data can come from other departmental areas and other specialists. Such data includes but is not limited to patient medical history records, retrieval of patient specimen slides, laboratory data, images, and printed/copied material. Electronic Health Records (EHR) and Laboratory Information Systems (LIS) are referenced as well. Data is often presented in graphical form which can be accessed via imaging software or may be printable for the pathologist.

4 minutes; Preservice of service period. Accession and enter information; The patient case is accessioned; multiple existing forms of data will need to be identified and incorporated into this accession.

3 minutes: Post Service Service period. File specimen, supplies, and other materials; Clinical staff files reports and slides and refills supplies and other materials used in the analysis

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
    N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
    N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
    N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
    N/A

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.
    N/A

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
    N/A

19. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):
    N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?

c. Does the computer include code specific software that is typically used to provide the service(s)?

A. Yes, the computer houses and/or accesses all the data and information that is integral to the pathologist's analyses.
B. During the time period when the pathologist is conducting his or her analysis, the computer is used exclusively by the pathologist; that is, no one else can use the computer when the pathologist is using it.
C. Yes. The computer contains the LIS suite of programs that allow for the analysis of laboratory data, retrieval of files and imaging data, images of laboratory data, such as graphical representations, and whole slide imaging as applicable to the office.

21. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

The CAP recommends the "Other" equipment formula for ED021 computer, desktop, w-monitor.
The CAP recommends the "Other" equipment formula EP024 microscope, compound.
ED021 and EP024 are used exclusively by the pathologist during the entire service and therefore the pathologist uses ED021 and EP024 during the entire duration of the service. The CAP used total median physician time from the work survey.

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

23. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is

reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Colon Capsule Endoscopy – Tab 21

In October 2020, the CPT Editorial Panel replaced one Category III code with a new Category I code to report gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report. Codes 91110 and 91111 were added as part of the family to be surveyed for the January 2021 RUC meeting.

91110 ***Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report***
The RUC reviewed the survey results from 104 gastroenterologists and agreed that the survey 25th percentile work RVU of 2.24 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 5 minutes of pre-service time, 40 minutes of intra-service time, and 10 minutes of immediate post-service time. During the intra-service period, which is intraluminal imaging of the esophagus through ileum, 70,000 images are captured. Specifically, the physician reviews the images with the localization software activated to input the esophagogastric junction, pylorus, and ileocecal valve locations. The physician scans the study and keys annotated anatomic landmarks (e.g., esophagogastric junction, duodenum, ileocecal valve, hepatic flexure, splenic flexure), permitting identification of potentially positive findings and determination of gastric and small bowel emptying times. Once the landmarks are determined, all images are viewed. When the physician identifies an abnormality, a thumbnail is created. Key findings or abnormalities are noted, and localization is determined by passage of time or by capsule localization software. The RUC agreed the intensity relativity is appropriate and that the recommended work value of 2.24 places the survey code well within the relativity of the family.

The RUC compared the survey code to the top key reference code 74262 *Computed tomographic (CT) colonography, diagnostic, including image postprocessing; with contrast material(s) including non-contrast images, if performed* (work RVU= 2.50, intra-service time of 45 minutes and total time of 57 minutes) and noted that both codes have similar intra-service time and similar total time and should be valued similarly. Code 74262 has five additional minutes of intra-service time and two additional minutes of total time, which accounts for the higher work value. In addition, most of the survey respondents that selected the top key reference code had indicated either that the survey code has similar or more intensity (100% of those survey respondents that selected the top key reference code also rated the survey code identical to much more intense/complex), justifying similar IWPUTs and WPUTs for both services. Additionally, the RUC compared the survey code to code 75557 *Cardiac magnetic resonance imaging for morphology and function without contrast material;* (work RVU= 2.35, intra-service time of 40 minutes, and total time of 60 minutes) and noted that both codes require identical intra-service time and very similar total time however, code 75557 has 5 more minutes of total time, supporting the work value for the survey code at the survey 25th percentile of 2.24. **The RUC recommends a work RVU of 2.24 for CPT code 91110.**

91111 ***Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report***
The RUC reviewed the survey results from 56 gastroenterologists and agreed that the current value of 1.00, which is below the survey 25th percentile, accurately reflects the typical physician work necessary to perform this service. The RUC recommends 5 minutes of pre-service time, 15 minutes of intra-service time, and 5 minutes of immediate post-service time. During the intra-service period, which is intraluminal imaging of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the esophagus, 15,000 images are captured. Specifically, the physician reviews the images and scans the entire study and annotated keys anatomic landmarks. Once the landmarks have been determined, all images are viewed by the physician. When an abnormality is identified, a thumbnail is created. The physician notes and records key findings or abnormalities on a localization drawing that may also be used to guide subsequent management of the patient. Localization is determined by passage of time or by capsule localization software. The RUC agreed that the intensity relativity is appropriate and that the recommended current work value of 1.00 places the survey code well within the relativity of the family.

The RUC compared the survey code to code 70470 *Computed tomography, head or brain; without contrast material, followed by contrast material(s) and further sections* (work RVU= 1.27, pre-service time of 5 minutes, intra-service time of 15 minutes and post-service time of 4 minutes) and agreed that both codes have identical pre-service time, identical intra-service time, similar total time, and should be valued similarly. Code 70470 however, has one minute less of total time, supporting the recommended current value of 1.00 for the survey code. Additionally, the RUC compared the survey code to code 76391 *Magnetic resonance (eg, vibration) elastography* (work RVU= 1.10, pre-service time of 5 minutes, intra-service time of 15 minutes, and post-service time of 5 minutes) and MPC code 95819 *Electroencephalogram (EEG); including recording awake and asleep (*work RVU = 1.08, pre-service time of 5 minutes, intra-service time of 15 minutes, and post-service time of 6 minutes). **The RUC recommends a work RVU of 1.00 for CPT code 91111.**

91113 ***Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report***
The RUC reviewed the survey results from 58 gastroenterologists and agreed that the survey 25th percentile work RVU of 2.41 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 5 minutes of pre-service time, 45 minutes of intra-service time, and 10 minutes of immediate post-service time. During the intra-service period, which is intraluminal imaging of the colon, 100,000 images are captured, reviewed and annotated. Specifically, the physician reviews the images with the localization software activated to input the esophagogastric junction, pylorus, and ileocecal valve locations. The physician scans the study and keys annotated anatomic landmarks (e.g., esophagogastric junction, first gastric image, first duodenal image, ileocecal valve, first cecal image, hepatic flexure, splenic flexure, and last rectal image), permitting identification of potentially positive findings and determination of gastric, small bowel and colonic transit times. Once the landmarks are identified, all images are then viewed with the two different (front and back) capsule cameras. This is in effect reviewing two capsule studies, one from the forward view camera and one from the trailing view camera. When the physician identifies an abnormality, it is measured, and a thumbnail is created. Images or abnormalities that are noted on the two different viewing cameras must be carefully analyzed and reconciled to determine if they represent two distinct pathologies or the same pathology from two different vantage points. This is critically important to avoid false positive findings. Localization is then determined by passage of time or by capsule localization software. The RUC agreed that intensity relativity is appropriate and that the recommended work value of 2.41 places the survey code well within the relativity of the family.

The RUC compared the survey code to the top key reference code 74262 *Computed tomographic (CT) colonography, diagnostic, including image postprocessing; with contrast material(s) including non-contrast images, if performed* (work RVU = 2.50, pre-service time of 5 minutes, intra-service time of 45 minutes, and post-service time of 7 minutes) and noted that both codes have identical pre-service time, identical intra-service time, similar total time, and should be valued similarly. Most survey respondents (61%) who selected code 74262, rated the survey code more intense/complex, further supporting the survey 25th percentile work value of 2.41. Additionally, the RUC compared the survey code to MPC code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU= 2.40, intra-service time of 39 minutes, and total time of 57 minutes) and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

noted that the survey code requires slightly more physician work and intra-service time and is therefore valued appropriately. **The RUC recommends a work RVU of 2.41 for CPT code 91113.**

New Technology/New Service
The RUC recommends that CPT code 91113 be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Practice Expense
The Practice Expense Subcommittee accepted the two new supplies 1 *PillCam® COLON 2 capsule* and *sensor sleeves* for code 91113 and removed SK087 *water, distilled*. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

Subject: Revised RVU recommendation for code 91113 - Tab 21

Dear Dr. Smith,

Based on feedback received during the RUC Pre-Facilitation #1 meeting on the evening of January 5 from our reviewers and the committee members, the American College of Gastroenterology (ACG), American Gastroenterological Association (AGA), and the American Society for Gastroenterology (ASGE) wish to revise our physician work recommendation for CPT code 91113 (*Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report*).

Code 91113 is a new CPT code proposed by industry and approved at the October 2020 CPT Editorial Panel meeting to convert Category III code 0355T for colon capsule endoscopy to Category I. The ACG, AGA, and ASGE conducted a survey for the January 2021 RUC meeting and received 58 responses. Because the median experience for 91113 was 0, we provided a data breakdown in the Survey Summary Spreadsheet of those who reported performing the procedure in the past 12 months vs those who did not. Members of RUC Pre-facilitation #1 advised us also to provide the data breakdown for those who had performed the procedure in the past 5 years since the number of those who performed the procedure in the past 12 months did not meet the RUC's minimum survey response. There are 35 participants who reported performing 91113 in the past 5 years. ***Based on data from this cohort of experienced providers, we recommend a physician work RVU of 2.48 which is equal to the 25th percentile of their survey data.***

We also revised the intra-service and post-service physician work descriptions for 91113 as recommended by our reviewers to place the work of measuring abnormalities in the intra-service work description. The following changes are reflected in the revised SOR for 91113:

> **Intra-service:** The physician reviews the images with the localization software activated to input the esophagogastric junction, pylorus, and ileocecal valve locations. The physician scans the study and keys annotated anatomic landmarks (eg, esophagogastric junction, first

gastric image, first duodenal image, ileocecal valve, first cecal image, hepatic flexure, splenic flexure, and last rectal image), permitting identification of potentially positive findings and determination of gastric, small bowel and colonic transit times. Once the landmarks are determined, all images are then viewed with the two different capsule cameras (front and back). This is in effect reviewing two capsule studies, one from the forward view camera and one from the trailing view camera. When the physician identifies an abnormality, it is measured and a thumbnail is created. Key findings or abnormalities are noted. Images or abnormalities noted on the two different viewing cameras must be carefully analyzed and reconciled to determine if they represent two distinct pathologies or the same pathology from two different vantage points. This is critically important to avoid false positive findings. Localization is determined by passage of time or by capsule localization software.

Post-service: After all images are reviewed and an interpretation is formulated, the physician prepares a report. The findings are communicated to the patient~~, any abnormalities that are found are measured and communicated to the patient~~ and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

Attached please find the revised Summary of Recommendations form for 91113 and the revised Survey Summary Spreadsheet for Tab 21.

We look forward to discussing Tab 21 with the RUC at the January 2021 meeting.

Sincerely,

R. Bruce Cameron, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:91110 Tracking Number Original Specialty Recommended RVU: **2.24**
Presented Recommended RVU: **2.24**
Global Period: XXX Current Work RVU: **2.49** RUC Recommended RVU: **2.24**

CPT Descriptor: Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old patient with recurrent, obscure gastrointestinal bleeding not diagnosed by other imaging and endoscopic procedures is referred for evaluation. Wireless capsule endoscopy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient is assessed for possible contraindications such as presence of pacemaker, active bowel obstruction, or swallowing disorder. The patient is educated about the nature of the procedure, why it is being performed, and possible complications and is instructed on how to prepare for the procedure (eg, fasting and wearing the proper clothing).

Description of Intra-Service Work: The physician reviews the images with the localization software activated to input the esophagogastric junction, pylorus, and ileocecal valve locations. The physician scans the study and keys annotated anatomic landmarks (eg, esophagogastric junction, duodenum, ileocecal valve, hepatic flexure, splenic flexure), permitting identification of potentially positive findings and determination of gastric and small bowel emptying times. Once the landmarks are determined, all images are viewed. When the physician identifies an abnormality, a ôthumbnailö is created. Key findings or abnormalities are noted. Localization is determined by passage of time or by capsule localization software.

Description of Post-Service Work: After all images are reviewed and an interpretation is formulated, the physician prepares a report. The findings are communicated to the patient, and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2021
Presenter(s):	R. Bruce Cameron, MD, ACG Shivan Mehta, MD, AGA Patricia Garcia, MD, AGA Seth A. Gross, MD, ASGE Vivek Kaul, MD, ASGE
Specialty Society(ies):	American College of Gastroenterology, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy
CPT Code:	91110
Sample Size:	3416 **Resp N:** 104
Description of Sample:	With permission from the Research Subcommittee we conducted a targeted survey using data from the vendor on physicians who have performed colon capsule endoscopy. Originally, we understood the list would contain contact information for 520 physicians; however, the list we recived contained 449 physicians. We also conducted a random sample of 3000 of our societies' memberships; however, once the list was cross-checked with the email address in the industry list for duplicates and bad email addresses had been removed, the random sample was 2,967.

Technical skill required	4%	76%	20%
Physical effort required	0%	76%	24%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	52%	48%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel accepted a proposal from industry (Medtronic) presented at the October 2020 CPT Editorial Panel meeting to convert Category III code 0355T for colon capsule endoscopy to Category I. Colon capsule endoscopy is related to two other Category I CPT codes, capsule endoscopy of the small bowel (91110) and the esophagus (91111), which were last reviewed together by the RUC in January 2016. Codes 91110 and 91111 were surveyed with new CPT code 91113 by the ACG, AGA and ASGE.

The Research Subcommittee approved our proposed survey methodology to use both a targeted survey and random sample due to low performance cited by the applicant in the CPT application for colon capsule endoscopy (91113). The Research Subcommittee also provided input on our reference service list.

The ACG, AGA, and ASGE conducted a survey of existing CPT codes 91110 and 91111 and new CPT code 91113 for presentation at the January 2021 RUC meeting.

91110 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

91111 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

91113 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report

Our multi-specialty consensus panel reviewed the survey data for codes 91110, 91111 and 91113, comparing the data and work RVUs (wRVUs) to the current data for similar XXX-day global codes that were recently approved by the RUC.

91110 – Discussion and Recommendation

Code 91110 is an existing code that was last reviewed by the RUC in January 2016. The ACG, AGA, and ASGE conducted a survey for the January 2021 RUC meeting and received 104 responses (79 from the random sample and 25 from the targeted survey of the industry list).

We recommend a **wRVU of 2.24**. This value is equal to the 25th percentile of the combined survey data.

Pre-time Package XXX is appropriate with 5 minutes of evaluation time, reflecting the current pre-service time.

Pre-service evaluation time: 5 minutes
Pre-service positioning time: 0 minutes
Pre-service scrub, dress, wait time: 0 minutes

Post-time Package XXX is appropriate with of 10 minutes of immediate post-service time, reflecting the survey median.

Intra-service time of 40 minutes is appropriate, reflecting the survey median.

Key Reference Services

Two reference services were selected more often than others: 74262 and 91112. However, code 74262 (*Computed tomographic (CT) colonography, diagnostic, including image postprocessing; with contrast material(s) including non-contrast images, if performed*) was selected most often (28/104).

Comparison to other recently RUC-reviewed codes with 40 minutes intra-service time:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 91110

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 98103

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2019 volume (32,701) * 3 = 98,103

Specialty Gastroenterology Frequency 92000 Percentage 93.77 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 32,701 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2019 volume

Specialty Gastroenterology Frequency 30500 Percentage 93.26 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 91110

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:91111 Tracking Number Original Specialty Recommended RVU: **1.00**
Presented Recommended RVU: **1.00**
Global Period: XXX Current Work RVU: **1.00** RUC Recommended RVU: **1.00**

CPT Descriptor: Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old patient with cirrhosis and compromised liver function is referred for screening for esophageal varices. Wireless capsule endoscopy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient is assessed for possible contraindications, such as presence of pacemaker, active bowel obstruction, or swallowing disorder. The patient is educated about the nature of the procedure, why it is being performed, and possible complications and is instructed on how to prepare for the procedure (eg, fasting and wearing the proper clothing).

Description of Intra-Service Work: The physician reviews the images and scans the entire study and annotated keys anatomic landmarks (eg, esophagogastric junction). Once the landmarks have been determined, all images are viewed. When an abnormality is identified, a ôthumbnailö is created. The physician notes and records key findings or abnormalities on a localization drawing that may also be used to guide subsequent management of the patient. Localization is determined by passage of time or by capsule localization software.

Description of Post-Service Work: After all images are reviewed and an interpretation is formulated, the physician prepares a report. The findings are communicated to the patient, and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2021
Presenter(s):	R. Bruce Cameron, MD, ACG Shivan Mehta, MD, AGA Patricia Garcia, MD, AGA Seth A. Gross, MD, ASGE Vivek Kaul, MD, ASGE
Specialty Society(ies):	American College of Gastroenterology, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy
CPT Code:	91111
Sample Size:	3416 **Resp N:** 56
Description of Sample:	With permission from the Research Subcommittee we conducted a targeted survey using data from the vendor on physicians who have performed colon capsule endoscopy. Originally, we understood the list would contain contact information for 520 physicians; however, the list we recived contained 449 physicians. We also conducted a random sample of 3000 of our societies' memberships; however, once the list was cross-checked with the email address in the industry list for duplicates and bad email addresses had been removed, the random sample was 2,967.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	25%	25%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel accepted a proposal from industry (Medtronic) presented at the October 2020 CPT Editorial Panel meeting to convert Category III code 0355T for colon capsule endoscopy to Category I. Colon capsule endoscopy is related to two other Category I CPT codes, capsule endoscopy of the small bowel (91110) and the esophagus (91111), which were last reviewed together by the RUC in January 2016. Codes 91110 and 91111 were surveyed with new CPT code 91113 by the ACG, AGA and ASGE.

The Research Subcommittee approved our proposed survey methodology to use both a targeted survey and random sample due to low performance cited by the applicant in the CPT application for colon capsule endoscopy (91113). The Research Subcommittee also provided input on our reference service list.

The ACG, AGA, and ASGE conducted a survey of existing CPT codes 91110 and 91111 and new CPT code 91113 for presentation at the January 2021 RUC meeting.

91110 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

91111 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

91113 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report

Our multi-specialty consensus panel reviewed the survey data for codes 91110, 91111 and 91113, comparing the data and work RVUs (wRVUs) to the current data for similar XXX-day global codes that were recently approved by the RUC.

91111 – Discussion and Recommendation

Code 91111 is an existing code that was last reviewed by the RUC in January 2016. The ACG, AGA, and ASGE conducted a survey for the January 2021 RUC meeting and received 56 responses (39 from the random sample and 17 from the targeted survey of the industry list).

We recommend a **wRVU of 1.00**. This value is equal to the current wRVU for 91111. The survey 25th percentile of the combined survey data is 1.11 wRVUs; however, we found no change in procedure, patient population or other compelling evidence requirement that would support an increase in wRVUs for 91111.

Pre-time Package XXX is appropriate with 5 minutes of evaluation time, reflecting the current pre-service time.

Pre-service evaluation time: 5 minutes
Pre-service positioning time: 0 minutes
Pre-service scrub, dress, wait time: 0 minutes

Post-time Package XXX is appropriate with of 5 minutes of immediate post-service time, reflecting the current post-service time.

Intra-service time of 15 minutes is appropriate, reflecting the survey median.

Key Reference Services

Two reference services were selected more often than others: 91112 and 74250. However, code 91112 (*Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report*) was selected most often (9/56).

Comparison to other recently RUC-reviewed codes with 15 minutes intra-service time:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 91111

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 438
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2019 volume (146) * 3 = 438

Specialty Gastroenterology Frequency 386 Percentage 88.12 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 146
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2019 volume = 146

Specialty Gastroenterology Frequency 129 Percentage 88.35 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 91111

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:91113 Tracking Number Original Specialty Recommended RVU: **2.41**
Presented Recommended RVU: **2.48**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **2.41**

CPT Descriptor: Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year old female who is referred for a diagnostic optical colonoscopy. The patient completes an effective bowel preparation regimen but due to angulation and fixation of colonic loops or difficult colonic anatomy, colonoscopy is not able to be completed. The patient is referred for colon capsule endoscopy to complete visualization of the colon.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The patient is assessed for possible contraindications such as presence of pacemaker, active bowel obstruction, or swallowing disorder. The patient is educated about the nature of the procedure, why it is being performed, and possible complications. Patient is instructed on how to prepare for the procedure (eg, fasting and wearing the proper clothing) as well as the complicated nature of the preparation which involves portions to be taken at home and portions to be taken upon arrival at the clinical site.

Description of Intra-Service Work: The physician reviews the images with the localization software activated to input the esophagogastric junction, pylorus, and ileocecal valve locations. The physician scans the study and keys annotated anatomic landmarks (eg, esophagogastric junction, first gastric image, first duodenal image, ileocecal valve, first cecal image, hepatic flexure, splenic flexure, and last rectal image), permitting identification of potentially positive findings and determination of gastric, small bowel and colonic transit times. Once the landmarks are determined, all images are then viewed with the two different capsule cameras (front and back). This is in effect reviewing two capsule studies, one from the forward view camera and one from the trailing view camera. When the physician identifies an abnormality it is measured and a thumbnail is created. Key findings or abnormalities are noted. Images or abnormalities noted on the two different viewing cameras must be carefully analyzed and reconciled to determine if they represent two distinct pathologies or the same pathology from two different vantage points. This is critically important to avoid false positive findings. Localization is determined by passage of time or by capsule localization software.

Description of Post-Service Work: After all images are reviewed and an interpretation is formulated, the physician prepares a report. The findings are communicated to the patient and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2021
Presenter(s):	R. Bruce Cameron, MD, ACG Shivan Mehta, MD, AGA Patricia Garcia, MD, AGA Seth A. Gross, MD, ASGE Vivek Kaul, MD, ASGE
Specialty Society(ies):	American College of Gastroenterology, American Gastroenterological Association, American Society for Gastrointestinal Endoscopy
CPT Code:	91113
Sample Size:	3416 **Resp N:** 58
Description of Sample:	With permission from the Research Subcommittee we conducted a targeted survey using data from the vendor on physicians who have performed colon capsule endoscopy. Originally, we understood the list would contain contact information for 520 physicians; however, the list we recived contained 449 physicians. We also conducted a random sample of 3000 of our societies' memberships; however, once the list was cross-checked with the email address in the industry list for duplicates and bad email addresses had been removed, the random sample was 2,967.

99235	XXX	3.24	**RUC Time**

CPT Descriptor Observation or inpatient hospital care, for the evaluation and management of a patient including admission and discharge on the same date, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually the presenting problem(s) requiring admission are of moderate severity. Typically, 50 minutes are spent at the bedside and on the patient's hospital floor or unit.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

CPT Descriptor 1 Domiciliary or rest home visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are

provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Typically, 45 minutes are spent with the patient and/or family or caregiver.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**

Overall intensity/complexity	0%	4%	35%	39%	22%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	30%	61%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	44%	56%
Physical effort required	0%	48%	52%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	4%	39%	57%

2nd Key Reference Code

	Much Less	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	7%	40%	13%	40%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	20%	27%	53%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	47%	53%
Physical effort required	27%	40%	33%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	33%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The CPT Editorial Panel accepted a proposal from industry (Medtronic) presented at the October 2020 CPT Editorial Panel meeting to convert Category III code 0355T for colon capsule endoscopy to Category I. Colon capsule endoscopy is related to two other Category I CPT codes, capsule endoscopy of the small bowel (91110) and the esophagus (91111), which were last reviewed together by the RUC in January 2016. Codes 91110 and 91111 were surveyed with new CPT code 91113 by the ACG, AGA and ASGE.

The Research Subcommittee approved our proposed survey methodology to use both a targeted survey and random sample due to low performance cited by the applicant in the CPT application for colon capsule endoscopy (91113). The Research Subcommittee also provided input on our reference service list.

The ACG, AGA, and ASGE conducted a survey of existing CPT codes 91110 and 91111 and new CPT code 91113 for presentation at the January 2021 RUC meeting.

91110 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

91111 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

91113 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report

Our multi-specialty consensus panel reviewed the survey data for codes 91110, 91111 and 91113, comparing the data and work RVUs (wRVUs) to the current data for similar XXX-day global codes that were recently approved by the RUC.

NOTE: Highlighted language below has been updated from the original SOR submission.

91113 – Discussion and Recommendation

Code 91113 is a new CPT code approved at the October 2020 CPT Editorial Panel meeting to convert Category III code 0355T for colon capsule endoscopy to Category I. The ACG, AGA, and ASGE conducted a survey for the January 2021 RUC meeting and received 58 responses (40 from the random sample and 18 from the targeted survey of the industry list). Because the median experience for 91113 was 0, we provided a data breakdown in the Survey Summary Spreadsheet on those who reported performing the procedure in the past 12 months vs those who did not. Additionally, the Pre-facilitation committee advised us to provide the data breakdown for those who had performed the procedure in the past 5 years since the number of those who performed the procedure in the past 12 months did not meet the RUC's minimum survey response. There are 35 participants who reported performing 91113 in the past 5 years.

REC	9111X	XXX	Gastrointestinal tract imaging, intral		0.048	0.041			2.48			60	5					45			10					

We recommend a **wRVU of 2.48**. This value is equal to the 25th percentile of the survey data of the survey participants who reported having performed the procedure in the past 5 years.

Pre-time Package XXX is appropriate with 5 minutes of evaluation time, consistent with other capsule endoscopy codes 91110 and 91111.

Pre-service evaluation time: 5 minutes
Pre-service positioning time: 0 minutes
Pre-service scrub, dress, wait time: 0 minutes

Post-time Package XXX is appropriate with of 10 minutes of immediate post-service time, reflecting the survey median.

Intra-service time of 45 minutes is appropriate, reflecting the survey median.

Key Reference Services
Two reference services were selected more often than others: 74262 and 99235. However, code 74262 (*Computed tomographic (CT) colonography, diagnostic, including image postprocessing; with contrast material(s) including non-contrast images, if performed*) was selected most often (22/58).

Comparison to other recently RUC-reviewed codes with 45 minutes intra-service time:

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0355T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 316
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. According to the company's Category I CPT application for colon capsule endoscopy, "From June 2017 - June 2018, 316 colon capsule endoscopy procedures have been documented as completed."

Specialty Gastroenterology Frequency 316 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 105
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate one third of the volume will be provided to Medicare patients.

Specialty Gastroenterology Frequency 105 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Tests

BETOS Sub-classification:
Other tests

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 91110

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Code	Long Descriptor	Global Period
91110	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report	XXX
91111	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report	XXX
91113	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
91110	A 70-year-old patient with recurrent, obscure gastrointestinal bleeding not diagnosed by other imaging and endoscopic procedures is referred for evaluation. Wireless capsule endoscopy is performed.
91111	A 65-year-old patient with cirrhosis and compromised liver function is referred for screening for esophageal varices. Wireless capsule endoscopy is performed.
91113	A 60-year old female who is referred for a diagnostic optical colonoscopy. The patient completes an effective bowel preparation regimen but due to angulation and fixation of colonic loops or difficult colonic anatomy, colonoscopy is not able to be completed. The patient is referred for colon capsule endoscopy to complete visualization of the colon.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The ACG, AGA and ASGE convened an RVS expert panel of the surveying specialty societies to review practice expense data for codes 91110, 91111 and 91113. The panel included both sub-specialists and generalists from within the specialties of a variety of settings across the United States. They also received input from practice managers and clinical staff familiar with the direct expense inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   Current CPT codes 91110 and 91111 were compared to their current PE inputs. New CPT code 91113 was compared to 91110.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   Codes 91110 and 91111 are not typically reported with an E/M. Code 91113 is a new code, but we do not expect it will typically be reported with an E/M.

Code 91110 is billed together with an office E/M code 2.6% of the time.
Code 91111 is billed together with an office E/M code 0% of the time.
Code 91113 is a new code with no billed together data yet.

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

Gastroenterology is the dominant specialty for code 91110 in the nonfacilty, reporting it 93.1% of the time. The dominant provider in the nonfacility, gastroenterology, is the same as for the global.

Gastroenterology is the dominant specialty for code 91111 in the nonfacility, reporting it 83.3% of the time. The dominant provider in the nonfacility, gastroenterology, is the same as for the global.

Code 91113 is a new code and has no data yet, but we expect gastroenterology will be the dominant specialty in the nonfacility and the same for the global.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

91110 Pre-Service Clinical Labor Activities = RN/LPN/MTA
No time above the PE Subcommittee standards for clinical activities is being requested

91110 Intra-Service Clinical Labor Activities = RN/LPN/MTA

- 3 minutes to provide education and consent activities, including what to expect during the procedure, what to do (and avoid doing) after leaving the office (e.g., every 15 minutes verify the Data Recorder lights is blinking twice per second, after eight hours or when you see the camera capsule in the toilet after a bowel movement, whichever comes first, remove the patches and the recorder from your body, pack them in a bag and follow your doctor's instructions for returning the equipment). For an example of educational instructions, see the Mayo Clinic's Patient Care and Instructions for small bowel capsule endoscopy https://www.mayoclinic.org/tests-procedures/capsule-endoscopy/about/pac-20393366 (CA011)
- 10 minutes to prepare room, equipment, data recorder, sensors, and workstation (CA013)
- 6 minutes to connect the equipment, fit belt to patient, put data recorder on patient, sync capsule to each sensor on belt (CA016)
- 4 minutes to assist patient with capsule ingestion and observe patient to ensure no complications (e.g., not in airway, Zenker's diverticulum, caught in esophageal stricture) (CA021)
- 6 minutes to disconnect belt, recorder, and sensor array and clean room and equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

91110 Post-Service Clinical Labor Activities = RN/LPN/MTA
Note that the RUC database reflects the CMS files which have CA032 in the post-service period for the capsule endoscopy codes 91110 and 91111 rather than the post-service of the service period.

91111 Pre-Service Clinical Labor Activities = RN/LPN/MTA
No time above the PE Subcommittee standards for clinical activities is being requested

91111 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to provide education and consent activities (CA011)
- 10 minutes to prepare room, equipment, data recorder, sensors, and workstation (CA013)
- 9 minutes to prepare and position patient (CA016)
    - 6 minutes to connect the equipment, fit belt, put data recorder on patient, sync capsule to each sensor
    - 3 minutes to position patient (assist patient onto table lying down on right side and then into a sitting position after the capsule is swallowed)
- 8 minutes to give patient 100c water to drink (1 min), observe swallow capsule and take one sip every 30 seconds (7 min), assist patient to sit upright and take another sip of water and wait 30 seconds (CA021)
- 6 minutes to disconnect belt, recorder, and sensor array and clean room and equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

91111 Post-Service Clinical Labor Activities = RN/LPN/MTA
Note that the RUC database reflects the CMS files which have CA032 in the post-service period for the capsule endoscopy codes 91110 and 91111 rather than the post-service of the service period.

91113 Pre-Service Clinical Labor Activities = RN/LPN/MTA
No time above the PE Subcommittee standards for clinical activities is being requested

91113 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 9 minutes to provide education and consent activities. See Attachment A (GCC PillCam Colon Packet- post ingestion instructions) for an example of educational instruction.
    - 1 minute to obtain consent
    - 5 minutes to provide education to understand prompts on digital recorder and what to do
    - 3 minutes to go over on-site bowel preparation
- 10 minutes to prepare room, equipment, data recorder, sensors, and workstation (CA013)
- 6 minutes to prepare and position patient, including connect the equipment, fit belt to patient, put data recorder on patient, sync capsule to each sensor on belt (CA016)
- 10 minutes to assist patient with capsule ingestion, observe patient to ensure no complication, and observe patient over 60 minutes post ingestion (CA021)
    - 2 minutes to assist patient with capsule ingestion

  - 2 minutes to observe patient immediately following ingestion to ensure no complications
  - 6 minutes to check on the patient at 10-minute intervals over a 60-minute period post-ingestion (1-minute check-in every 10 minutes over 60 minutes = 6 minutes)
    - Staff spend 1 minute with the patient during each of the 6 check-ins reviewing recorder prompts and using the real-time reader to localize the capsule location to confirm that the capsule exits the stomach.
- 6 minutes to disconnect belt, recorder, and sensor array and clean room and equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

91113 Post-Service Clinical Labor Activities = RN/LPN/MTA
No time is being requested.

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

91111
The capsule download time for the recording for ES029 was unintentionally omitted from 91111 and we ask the RUC to add it which will increase the aggregate current cost for equipment. The recording time for 91111 is 30 minutes.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

*Please note: If a supply has a purchase price of $100 or more please bold the item name and CMS code.			91110 Proposed Inputs		91111 Prop Inputs	
Meeting Date: January 2016 Tab: 44 Specialty: ACG, AGA, ASGE	CMS Code	Staff Type	Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report		Gastrointestina imaging, intralu (eg, capsu endoscopy esophagus v interpretation report	
LOCATION			Non Fac	Facility	Non Fac	Fa
GLOBAL PERIOD: XXX						
Other Clinical Activity: observe patient to ensure no complications (not in airway, zinker's diverticulum or caught in esophageal stricture)	L037D	RN/LPN/MTA	2			
Other Clinical Activity: position patient (assist patient onto table lying down on right side and then into a sitting position after the capsule is swallowed)					3	
Other Clinical Activity: Give pt 100c water to drink (1 min), observe swallow pillcam and take one sip every 30 seconds (7 min), assist patient to sit upright and take another sip of water and wait 30 seconds					8	
Post-Service						
Monitor pt. following moderate sedation						
Other clinical activity: disconnect belt, recorder and sensor array			3		3	
POST-SERVICE Period						
Start: Patient leaves office/facility						
Conduct phone calls/call in prescriptions	L037D	RN/LPN/MTA				
Other Clinical Activity: *recharge batteries, initiate data download to workstation, create image archive*	L037D	RN/LPN/MTA	4		4	

Other Clinical Activity: observe patient to ensure no complications (not in airway, Zenker's diverticulum or caught in esophageal stricture) was rolled into CA021 as part of the clinical staff's performance of the procedure.

Other Clinical Activity: position patient (assist patient onto table lying down on right side and then into a sitting position after the capsule is swallowed) was rolled into CA016 as part of prepare and positioning patient activity.

Other Clinical Activity: disconnect belt, recorder and sensor array was rolled into CA024 as part of cleaning the equipment.

Other Clinical Activity: recharge batteries, initiate data download to workstation, create image archive was rolled into CA032. Note that the RUC database reflects the CMS files that has the CA032 in the post-service period for these codes rather than the post-service of the service period.

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

CA010 for 91110 and 91111 was 3 minutes prior to CMS increasing clinical activity to 5 minutes for calendar year 2018.

For codes 91110, 91111 and 91113, at least 4 vital signs are taken prior to beginning the procedure to ensure the patient is healthy enough to undergo the capsule endoscopy procedure. Vital signs taken prior to the procedure include patient's temperature, heart rate, respiratory rate, and blood pressure and may include additional vital signs.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

91110, 91111 and 91113 Pre-Service Clinical Labor Activities = RN/LPN/MTA
- 5 minutes to complete pre-service diagnostic & referral forms (CA001)
- 3 minutes to provide follow-up phone calls & prescriptions (CA005)

   b. Service period (includes pre, intra and post):

91110 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to provide education and consent activities (CA011)
- 10 minutes to prepare room, equipment and supplies (CA013)
- 6 minutes to prepare and position patient (CA016)
- 4 minutes to perform procedure/service not related to physician work (CA021)
- 6 minutes to clean room/equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

91111 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 3 minutes to provide education and consent activities (CA011)
- 10 minutes to prepare room, equipment, supplies (CA013)
- 9 minutes to prepare and position patient (CA016)
- 8 minutes to perform procedure/service not related to physician work time (CA021)
- 6 minutes to clean room/equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

91113 Intra-Service Clinical Labor Activities = RN/LPN/MTA
- 9 minutes to provide education and consent activities
- 10 minutes to prepare room, equipment, supplies (CA013)
- 6 minutes to prepare and position patient (CA016)
- 10 minutes to perform procedure/service not related to physician work time (CA021)
- 6 minutes to clean room/equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

   c. Post-service period:

91110, 91111 and 91113 Post-Service Clinical Labor Activities = RN/LPN/MTA

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Note that the RUC database reflects the CMS files that has the CA032 in the post-service period for these codes rather than the post-service of the service period.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

91110 Intra-Service Clinical Labor Activities = RN/LPN/MTA

- 3 minutes to provide education and consent activities, including what to expect during the procedure, what to do (and avoid doing) after leaving the office (e.g., every 15 minutes verify the Data Recorder lights is blinking twice per second; after eight hours or when you see the camera capsule in the toilet after a bowel movement, whichever comes first, remove the patches and the recorder from your body, pack them in a bag and follow your doctor's instructions for returning the equipment). For an example of educational instructions, see the Mayo Clinic's Patient Care and Instructions for small bowel capsule endoscopy https://www.mayoclinic.org/tests-procedures/capsule-endoscopy/about/pac-20393366 (CA011)
- 10 minutes to prepare room, equipment, data recorder, sensors, and workstation (CA013)
- 6 minutes to connect the equipment, fit belt to patient, put data recorder on patient, sync capsule to each sensor on belt (CA016)
- 4 minutes to assist patient with capsule ingestion and observe patient to ensure no complications (CA021)
- 6 minutes to disconnect belt, recorder, and sensor array and clean room and equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

91111 Intra-Service Clinical Labor Activities = RN/LPN/MTA

- 3 minutes to provide education and consent activities (CA011)
- 10 minutes to prepare room, equipment, data recorder, sensors, and workstation (CA013)
- 9 minutes to prepare and position patient (CA016)
    - 6 minutes to connect the equipment, fit belt, put data recorder on patient, sync capsule to each sensor
    - 3 minutes to position patient (assist patient onto table lying down on right side and then into a sitting position after the capsule is swallowed)
- 8 minutes to give patient 100c water to drink (1 min), observe swallow capsule and take one sip every 30 seconds (7 min), assist patient to sit upright and take another sip of water and wait 30 seconds (CA021)
- 6 minutes to disconnect belt, recorder, and sensor array and clean room and equipment (CA024)

- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

91113 Intra-Service Clinical Labor Activities = RN/LPN/MTA

- 9 minutes to provide education and consent activities. See Attachment A (GCC PillCam Colon Packet- post ingestion instructions) for an example of educational instruction.
    - 1 minute to obtain consent
    - 5 minutes to provide education to understand prompts on digital recorder
    - 3 minutes to go over on-site bowel preparation
- 10 minutes to prepare room, equipment, data recorder, sensors, and workstation (CA013)
- 6 minutes to prepare and position patient, including connect the equipment, fit belt to patient, put data recorder on patient, sync capsule to each sensor on belt (CA016)
- 10 minutes to assist patient with capsule ingestion, observe patient to ensure no complication, and observe patient over 60 minutes post ingestion (CA021)
    - 2 minutes to assist patient with capsule ingestion
    - 2 minutes to observe patient immediately following ingestion to ensure no complications
    - 6 minutes to check on the patient at 10-minute intervals over a 60-minute period post-ingestion (1-minute check-in every 10 minutes over 60 minutes = 6 minutes)
        - Staff spend 1 minute with the patient during each of the 6 check-ins reviewing recorder prompts and using the real-time reader to localize the capsule location to confirm that the capsule exits the stomach.
- 6 minutes to disconnect belt, recorder, and sensor array and clean room and equipment (CA024)
- 4 minutes to recharge batteries, initiate data download to workstation and create image archive (CA032)

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

Not applicable. Staff work time is independent and separate from physician work time.

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

Not applicable

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

Not applicable

INVOICES

14. ☒ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

Code 91113 requires a colon capsule. Invoices for the PillCam® COLON 2 capsule accompany the submission for Tab 21. Please see the "Tab 21 – invoice summary" Excel document.

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

Pack, minimum multi-specialty visit - SA048; unit price = $4.05 - paper, exam table = 7 feet - gloves, non-sterile = 2 pair - gown, patient = 1 item - pillowcase = 1 item - cover, thermometer probe = 1 item

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

Not applicable

19. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

Not applicable

20. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EF023 – exam table = Default EQ146 – kit, capsule endoscopy recorder = Other Formula ES029 – video system, capsule endoscopy (software, computer, monitor, printer) = Other Formula **91110 Equipment Formula for EQ146 (capsule endoscopy recorder kit)**

The equipment formula approved by the RUC at the January 2016 RUC meeting (tab 44) for EQ146 included 10 minutes to prepare the room, equipment and supplies, 6 minutes to position to the patient connect the equipment, apply sensor array, fit belt, put data recorder on patient, sync capsule to each sensor, 2 minutes to observe capsule ingestion to ensure no complications, and 3 minutes to disconnect the belt, recorder and sensor array plus 480 minutes recording time for the capsule endoscopy and 80 minutes for the images to download to the computer and be processed by the software.

The equipment formula we are currently submitting for approval is:
CA013 + CA016 + 480 minutes recording time of the small bowel capsule + 80 minutes for the images to download to the computer and be processed by the software

The formula above reflects the time the capsule is in use during the preparation of equipment and supplies (CA013), during preparation of the patient when the capsule is synced to each sensor on the belt and the equipment is connected (CA016), the time the capsule is recording post-ingestion and the time for image download and processing.

91111 Equipment Formula for EQ146 (capsule endoscopy recorder kit)
The equipment formula approved by the RUC at the January 2016 RUC meeting (tab 44) for EQ146 included 10 minutes to prepare the room, equipment and supplies, 6 minutes to position to the patient connect the equipment, apply sensor array, fit belt, put data recorder on patient, sync capsule to each sensor and 3 minutes to disconnect the belt, recorder and sensor array plus 15 minutes for images to download to the computer. **However, the 30 minutes of recording time for the capsule is missing and we ask the RUC to include it in our current submission**.

The equipment formula we are currently submitting for approval is:
CA013 + CA016 + 30 minutes of recording time for the esophagus capsule + 15 minutes for the images to download to the computer and be processed by the software.

The formula above reflects the time the capsule is in use during the preparation of equipment and supplies (CA013), during preparation of the patient when the capsule is synced to each sensor on the belt and the equipment is connected (CA016), the time the capsule is recording post-ingestion and the time for image download and processing.

91113 Equipment Formula for EQ146 (capsule endoscopy recorder kit)
CA013 + CA016 + 600 minutes recording time of the small bowel capsule + 80 minutes for the images to download to the computer and be processed by the software

The formula above reflects the time the capsule is in use during the preparation of equipment and supplies (CA013), during the preparation of the patient when the capsule is synced to each sensor on the belt and the equipment is connected (CA016), the time the capsule is recording post-ingestion and the time for image download and processing.

91110 Equipment Formula for ES029 (capsule endoscopy video system)
The equipment formula approved by the RUC at the January 2016 RUC meeting (tab 44) for ES029 included 10 minutes to prepare the room, equipment and supplies, 4 minutes to recharge batteries,

initiate data download to workstation, create image archive and 80 minutes for the images to download to the computer and be processed by the software.

The equipment formula we are currently submitting for approval is:
CA013 + CA038 + 80 minutes for the images to download to the computer and be processed by the software

91111 Equipment Formula for ES029 (capsule endoscopy video system)
The equipment formula approved by the RUC at the January 2016 RUC meeting (tab 44) for ES029 included 10 minutes to prepare the room, equipment and supplies, 4 minutes to recharge batteries, initiate data download to workstation, create image archive and 15 minutes for the images to download to the computer and be processed by the software.

The equipment formula we are currently submitting for approval is:
CA013 + CA038 + 15 minutes for the images to download to the computer and be processed by the software

91113 Equipment Formula for ES029 (capsule endoscopy video system)
The equipment formula we are currently submitting for approval is:
CA013 + CA038 + 80 minutes for the images to download to the computer and be processed by the software

21. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

22. If this is a PE only code please select a crosswalk based on a similar specialty mix:

91110 = 91110
91111 = 91111

December 11, 2020

Scott Manaker, MD, PhD
RUC Practice Expense Subcommittee Chair
AMA Department of Physician Payment Policy and Systems
330 North Wabash, Office 45-372
Chicago, IL 60611

Subject: PE for Tab 21 - 91110, 91111 and 91113

Dear Dr. Manaker,

The American College of Gastroenterology (ACG), American Gastroenterological Association (AGA), and the American Society for Gastroenterology (ASGE) is not submitting facility practice expense recommendations for 91110, 91111 and 91113 as these codes are not performed in the facility setting:

91110 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with interpretation and report

91111 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus with interpretation and report

91113 Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), colon, with interpretation and report

We look forward to discussing practice expense for Tab 21 with the Practice Expense Subcommittee at the January 2021 meeting.

Sincerely,

R. Bruce Cameron, MD
RUC Advisor
American College of Gastroenterology

Shivan Mehta, MD

American Society for Gastrointestinal Endoscopy

AMA/Specialty Society RVS Update Committee Summary of Recommendations
**** High Volume Growth****

January 2021

Cardiac Ablation – Tab 22

The RUC identified CPT code 93656 with Medicare utilization over 10,000 that have increased by at least 100% from 2014 through 2019e. In January 2020, the RUC recommended to refer this issue to the CPT Editorial Panel in May 2020 for revision and bundling. Technology and clinical practice have changed since these codes were developed in 2011. Based on the billed together data for these and related codes, the specialty societies recommended referral to CPT to update code descriptors and likely bundle services now commonly performed together, such as 3D mapping. In October 2020, the CPT Editorial Panel revised one code (93653) to bundle with 3D mapping and to include "induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus," and another (93656) to add 3D mapping and "left atrial pacing and recording from coronary sinus or left atrium" and "intracardiac echocardiography including imaging supervision and interpretation" to their descriptors.

Rationale for Interim Recommendation
The specialties submitted a letter to the CPT Editorial Panel on December 14, 2020 requesting for the coding changes for these services to be rescinded for CPT 2022; however, as this request will not be considered until after the January 2021 RUC meeting and January 2021 is the last RUC meeting of the CPT 2022 cycle, the specialties have made a separate request to the RUC for the RUC's recommendations for these services to be interim.

During the presentation to the RUC, the specialties noted that despite the inclusion of comprehensive changes to the CPT introductory language, their multispecialty advisory committee believed that many of the survey respondents did not realize that the codes had been revised. The specialties noted that they inferred that this occurred because respondents may not have read the updated code descriptors thoroughly and that a contributing factor may be that the CPT code numbers did not change. Given respondents' familiarity with the existing code numbers, and their current ability to separately report the newly bundled services, the specialties asserted that there is a strong possibility that many of the survey participants based their assumptions on the current reporting rules where several services are separately reportable. The RUC discussed whether the survey respondents were confused by the change in reporting rules for this family of services. Although several RUC members did note that the survey physician times for 93654 seemed to be potentially incongruent with 93653 and 93656, the RUC noted that it was unclear whether most of the survey respondents understood the coding changes. **The RUC recommends for these services to be valued as interim and that these services will be resurveyed and reviewed at the April 2021 RUC meeting.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93653 ***Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry***
The RUC reviewed the survey results from 74 cardiac electrophysiologists and recommends the survey median work RVU of 18.49 for CPT code 93653. The RUC recommends 40 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 125 minutes of intra-service time and 30 minutes of immediate post-service time. The RUC noted that CPT code 93653 was revised to now bundle the physician work of CPT codes 93613 *Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)* and 93621 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with left atrial pacing and recording from coronary sinus or left atrium (List separately in addition to code for primary procedure)*, which previously were separately reported add-on services.

To justify a value of 18.49, the RUC compared the survey code to top key reference code 93580 *Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant* (work RVU= 17.97, intra-service time of 120 minutes, total time of 210 minutes) and noted that the survey code involves 5 more minutes of intra-service time and that 89 percent of the survey respondents that selected the top key reference code had also indicated that the survey code is a more intense and complex procedure to perform. The RUC also compared the survey code to CPT code 93590 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve* (work RVU= 21.70, intra-service of 135 minutes, total time of 223 minutes) and noted that the reference code involves 10 more minutes of intra-service time and total time and is a somewhat more intense service to perform, supporting a somewhat lower value for the survey code. The specialty noted and the RUC concurred that there are very few major surgical procedures that are 000-day or XXX to use as reference codes to compare to the survey code. **The RUC recommends an interim work RVU of 18.49 for CPT code 93653.**

93654 ***Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of ventricular tachycardia or focus of ventricular ectopy including left ventricular pacing and recording, when performed***
The RUC reviewed survey results from 73 cardiac electrophysiologists and agreed that the survey respondents, with a 25th percentile work value of 20.00, narrowly overvalued the physician work involved in performing this service. The RUC recommends maintaining the current value of 19.75 for CPT code 93654. The RUC recommends 40 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 20 minutes of pre-service scrub/dress/wait time, 240 minutes of intra-service time and 33 minutes of immediate post-service time.

To justify a work value of 19.75, the RUC compared the survey code to top key reference code 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU= 24.39, intra-service time of 180 minutes, total time of 270 minutes) and noted that the survey code involves 40 more minutes of intra-service time and 66 more minutes of total time. The specialty noted that the survey times for this service relative to the other services in this tab, which were all surveyed on the same survey instrument, made them think the survey respondents may not have considered the bundling of 3D mapping for the services in this tab. CPT code 93654 previously included 3D mapping, whereas the other services in the tab are newly having that work bundled in. The specialty noted and the RUC concurred that there are very few

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

major surgical procedures that are 000-day or XXX to use as reference codes to compare to this survey code. **The RUC recommends an interim work RVU of 19.75 for CPT code 93654.**

93655 ***Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia (List separately in addition to code for primary procedure)***
The RUC reviewed survey results from 74 cardiac electrophysiologists and agreed that the survey respondents, with a 25th percentile work value of 8.00, overvalued the physician work involved in performing this service. The RUC determined that a direct work RVU crosswalk to CPT code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)* (work RVU= 6.50, intra-service and total time of 60 minutes) would be appropriate, as both add-on services typically involve an identical amount of time and physician work intensity to perform. The RUC recommends 60 minutes of intra-service time for CPT code 93655

CPT codes 93653, 93654 and 93656 are the three base codes that add-on code 93655 will be reported with. All three of these base codes will have the work of 3D mapping bundled in. The RUC noted that 93655 is most often an add-on code reported with 93656 (83% of the time per 2018 Medicare 5% file).

To further support a work value of 6.50, the RUC compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 7.00, intra-service and total time of 60 minutes) and noted that both services have identical times, whereas the reference service is a slightly more intense procedure to perform. **The RUC recommends an interim work RVU of 6.50 for CPT code 93655.**

93656 ***Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and His bundle recording, when performed***
The RUC reviewed the survey results from 73 cardiac electrophysiologists and recommends the survey 25th percentile work RVU of 20.00 for CPT code 93656. The RUC recommends 40 minutes of pre-service evaluation, 3 minutes of pre-service positioning, 20 minutes of pre-service scrub/dress/wait time, 210 minutes of intra-service time and 33 minutes of immediate post-service time. The RUC noted that CPT code 93656 was revised to now bundle the physician work of CPT codes 93613 *Intracardiac electrophysiologic 3-dimensional mapping (List separately in addition to code for primary procedure)* and 93662 *Intracardiac echocardiography during therapeutic/diagnostic intervention, including imaging supervision and interpretation (List separately in addition to code for primary procedure)*, which previously were separately reported add-on services.

To justify a value of 20.00, the RUC compared the survey code to 2nd key reference code 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU= 24.39, intra-service time of 180 minutes, total time of 270 minutes) and noted that the survey code involves 30 more minutes of intra-service time and 36 more minutes of total time. The RUC also compared the survey code to

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT code 33978 *Removal of ventricular assist device; extracorporeal, biventricular* (work RVU= 25.00, intra-service time of 200, total time of 355) and noted that although the survey code involves 10 more minutes of intra-service time, the reference code includes 49 more minutes of total time, justifying a lower valuation for the survey code. The specialty noted and the RUC concurred that there are very few major surgical procedures that are 000-day or XXX to use as reference codes to compare to this survey code. **The RUC recommends an interim work RVU of 20.00 for CPT code 93656.**

93657 ***Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation (List separately in addition to code for primary procedure)***
The RUC reviewed survey results from 74 cardiac electrophysiologists and agreed that the survey respondents, with a 25th percentile work value of 8.00, overvalued the physician work involved in performing this service. The RUC determined that a direct work RVU crosswalk to CPT code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)* (work RVU= 6.50, intra-service and total time of 60 minutes) would be appropriate, as both add-on services typically involve an identical amount of time and physician work intensity to perform. The RUC recommends 60 minutes of intra-service time.

To further support a work value of 6.50, the RUC compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 7.00, intra-service and total time of 60 minutes) and noted that both services have identical times, whereas the reference service is a slightly more intense procedure to perform. **The RUC recommends an interim work RVU of 6.50 for CPT code 93657.**

Practice Expense
No direct practice expense inputs are recommended for CPT codes 93653-93657 as they are facility-only services.

Bundled Add-on Services for Next LOI
A RUC member noted that even though the work of add-on services 93613, 93621 and 93662 are being bundled into CPT codes 93653 and/or 93656, these add-on codes are being retained as they may also be reported with other CPT codes. However, these services are each typically reported with either 93653 or 93656 in the 2018 Medicare billed together data. These services will be added to the LOI along with 93653-93657 for the April 2020 RUC meeting.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

330 N. Wabash Avenue, Suite 39300
Chicago, IL 60611-5585

RE: October 2020 CPT Tab 61/January 2021 RUC Tab 22

Dear Dr. Synovec:

As the RUC and CPT Advisors for the Heart Rhythm Society and the American College of Cardiology, we request that the CPT Executive Committee rescind the Panel's October 2020 decision to revise codes 93653, 93654 and 93656 describing electrophysiology study with cardiac ablation services. The societies are struggling to develop work RVU recommendations and believe additional time would facilitate accurate work estimation.

Two of the five codes in the family include newly bundled work (93653, 93656). A third code was revised to move the bundled service into the primary code (93654). Our RUC expert panel was surprised to see the magnitude of change reported in the work survey data, especially for codes where additional elements are newly bundled. Following a number of conversations among staff and advisors, we have no confidence in the survey data that we received.

Despite the inclusion of comprehensive materials, we believe that our survey respondents did not realize that the codes had been revised. We infer that this occurred because respondents may not have read the updated code descriptors thoroughly. A contributing factor may be that the code numbers did not change. Given respondents' familiarity with the existing code numbers, and their current ability to separately bill for the newly bundled services, we think that the survey participants based their assumptions on current billing rules.

Were this not the last meeting of the CPT cycle, we would submit to the RUC the survey data and a letter with a plan to resurvey, explaining our concerns and items we plan to take up with the Research Subcommittee to obtain a more accurate response. However, since this is the last meeting in the cycle that approach is not possible. We intend to recommend interim values to the RUC at the January meeting and seek to modify elements of the survey and/or related survey materials to make these bundling changes clearer to respondents.

Unfortunately, there is no guarantee CMS would accommodate any updated recommendations from the April RUC meeting for 2022 rulemaking. Thus, our request to rescind the October outcome of Tab 61. Because we think some of the difficulty stemmed from use of the same code number for the newly

bundled codes, we request CPT delay publication of these codes until 2023, allowing us to execute the resurvey without introducing uncertainty from CMS. We have already raised several possible modifications with RUC staff, including utilizing "dummy" codes for the survey to prompt respondents to think of the items under review as new codes.

It is not necessarily part of our request that new code numbers be assigned to these services. We understand a process already exists to consider whether new code numbers are needed and that the code change application did not indicate a need for new numbers. Using the above-mentioned tactic of "dummy" codes in the RUC survey would accomplish the same thing from a work valuation perspective. This exercise could become a test case for something the RUC may want to standardize, for future bundled services, and may also warrant a separate rethinking of when new codes are assigned.

Thank you for your consideration of this request. Please contact society staff if additional information would be helpful for you and the Executive Committee, or if there are other solutions we should explore.

Sincerely,

JoEllyn Moore, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93653 Tracking Number Y1 Original Specialty Recommended RVU: **18.49**
Presented Recommended RVU: **18.49**
Global Period: 000 Current Work RVU: **14.75** RUC Recommended RVU: **18.49**

CPT Descriptor: Comprehensive electrophysiologic evaluation including with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium, and his bundle recording, when performed treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry
(Do not report 93653 in conjunction with 93600, 93602, 93603, 93610, 93612, 93613, 93618, 93619, 93620, 93621, 93642, 93654, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old female has recurrent palpitations. an event monitor has documented supraventricular tachycardia (svt). a comprehensive electrophysiologic evaluation with catheter ablation is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and supraventricular tachycardia ablation are explained to the patient. Management of antiarrhythmic medications is communicated to the patient. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. Informed consent is obtained. The patient is evaluated on the day of the procedure with a history and physical examination. Preprocedure laboratory testing is reviewed as well as current medications and changes in health status.

Description of Intra-Service Work: Direct current cardioversion/defibrillation and electrophysiology (EP) testing/ablation equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Local analgesia is administered along with anesthesia appropriate to the patient including moderate sedation. Venous access is obtained. Arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle may be obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. Pacing and sensing is performed in the right atrium, left atrium, and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at arrhythmia induction are performed via maneuvers that include burst pacing and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple atrial and ventricular sites.

Once the SVT is induced, pacing maneuvers are performed to elucidate the mechanism of the tachycardia. A combination of diagnostic maneuvers is performed and a high definition anatomical map of the chamber(s) of interest is generated. Voltage and electrical activation in the arrhythmia and/or in sinus rhythm is performed to identify normal activation, location of scar, and mechanism of the arrhythmia. Catheter ablation may then be performed. An ablation catheter is maneuvered from the sites of vascular access to the appropriate cardiac location to facilitate delivery of ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer mapping system to assist in identifying the arrhythmia circuit, localizing the origin (for focal arrhythmias) or the critical isthmus (reentrant arrhythmias). The 3D mapping system is calibrated, and recordings are made during sinus rhythm (to identify normal activation and location of scar) and during each distinct arrhythmia. The physician then analyzes the computer-generated map, ensuring that electrograms are annotated correctly and that the display parameters are correct for the specific arrhythmia being mapped. Based upon the data from the 3D mapping system, endocardial electrograms, surface ECG and the response of the SVT to pacing maneuvers, the ablation catheter is advanced to the point of earliest activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Radiofrequency (or cryo) ablation is then performed. If initial mapping in one chamber does not lead to complete identification of the essential arrhythmia circuit (either based on analysis of the map or based on incomplete ablation result, then the mapping catheter(s) is/are moved into another cardiac chamber and an additional 3D map is generated to aid in diagnosis; this is repeated until the arrhythmia mechanism is fully characterized and ablation is deemed completely successful. A final report that includes the mapping procedure and findings is prepared.

To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures. Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed. Sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family, and postprocedure assessments are performed.

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	15%	23%	62%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified

that CPT 93653 (SVT ablation) should have services bundled into it before the codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: **93653**, 93654, 93655, 93656, 93657. As indicated in the summary spreadsheet, revised 93653 is now a more comprehensive, bundled service that includes the work of 3D mapping (93613) and left atrial pacing/recording (93621).

The ACC and HRS randomly surveyed cardiac electrophysiologists, as designated by membership rolls, on the newly created codes and entire family. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 36% of respondents. 89% of the respondents indicated that 93653 was more complex. The second reference code was 33340 for percutaneous transcatheter closure of left atrial appendage with endocardial implant. It was selected by approximately 18% of respondents. About 85% of the respondents indicated that 93653 was more intense/complex overall.

Survey Concerns

In reviewing the survey data to develop work recommendations, the expert panel quickly developed doubts about the validity of the survey results for the newly bundled services, 93653 and 93656. In both instances, intraservice procedure times dropped significantly, despite the inclusion of the newly bundled elements. After deliberation, the expert panel concluded that we do not believe survey respondents thoroughly understood that 3D mapping and left atrial pacing were now inherent to 93653. This is despite language in the survey invitation and coding changes document (both attached).

We believe this may have occurred for two reasons. One is that despite providing information about the elements of the revised code, survey respondents still saw the same code number, 93653, and may have incorrectly believed the code descriptor was unchanged. The second reason is that when we compared the newly revised codes to code 93654 which did not undergo any revisions, that service came back with an identical intraservice procedure time and quite consistent work RVUs.

We can certainly think of reasons—mostly changes in technology and broader service dispersion—that intraservice times would decline somewhat after nearly a decade. However, the magnitude of the change does not comport with our professional experience. And these doubts are compounded by the absence of change in 93654, making us think something did not register for survey respondents.

Therefore, as part of this package of recommendations, we are also recommending the ultimate RUC value recommendations be made on an interim basis with a plan to resurvey these codes for the April RUC meeting. We have already developed several survey tool changes for which we will seek Research Subcommittee approval, attempting to more actively prompt survey respondents to incorporate the new elements of the bundled service. One such tactic is to use a "dummy" code so they do not immediately perceive familiarity with the code descriptor. Another is to include a redline version of the code descriptor in the survey itself. Yet another is to more explicitly inform respondents in the invitation which elements have been bundled.

Since this is the last meeting of the 2022 CPT cycle, we have separately requested the CPT Editorial Panel withhold publication of these codes until 2023. (attached) We do not know the outcome of that request and are preparing to resurvey regardless. However, as noted in that letter, it is uncertain whether CMS would accommodate late information from the April RUC meeting. Delaying publication of the revised codes is the surest way to avoid the possibility that inaccurate work RVUs are deployed in the 2022 fee schedule. Finally, we fully recognize that we may undertake this effort and still end up with similar results, but we believe the effort is worthwhile given our concerns with this initial survey data.

Recommendation

Therefore, for code 93653 the **societies recommend, <u>as an interim value</u>, the survey median RVW of 18.49 with 63 minutes preservice time from package 4, 125 minutes intraservice time from the survey median, and 30 minutes postservice time with 3 minutes removed from package 9B**. This aligns closely with the KRS 93580 in terms of IWPUT, WPUT, total time, and intraservice time. Survey respondents felt 93580 was less complex and had a shorter preservice time than 93652. This recommendation also produces a work RVU savings from the current, component-coded services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93653, 93613, 93621

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 63642
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twicethe Medicare-based claims volume.

Specialty Cardiac electrophysiology Frequency 50022 Percentage 78.59 %

Specialty Cardiology Frequency 11902 Percentage 18.70 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 31,821 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019e Medicare-based claims.

Specialty Cardiac electrophysiology Frequency 25009 Percentage 78.59 %

Specialty Cardiology Frequency 5951 Percentage 18.70 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93653

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording, and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording,left atrial pacing and recording from coronary sinus or left atrium, and His bundle recording, when performed; with treatment of ventricular tachycardia or focus of ventricular ectopy including left ventricular pacing and recording, when performed
(Do not report 93654 in conjunction with 93279-93284, 93286-93289, 93600-93603, 93609, 93610, 93612, 93613, 93618-93620, 93622, 93642, 93653, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old male with a history of new york heart association class iii heart failure due to ischemic dilated cardiomyopathy (ef 25%) and prior myocardial infarction presents with recurrent implantable cardioverter-defibrillator (icd) therapies for drug-refractory ventricular tachycardia.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Transthoracic echocardiography and, if necessary, transesophageal echocardiography are obtained prior to the procedure to rule out left ventricular thrombus and to assess the aortic arch for presence of atherometous plaques. The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and ventricular tachycardia ablation are explained to the patient and the patient's family. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory testing, medications, and changes in heath are reviewed. Informed consent is obtained.

Description of Intra-Service Work: Direct current cardioversion/defibrillation, electrophysiology (EP), and ablation equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Three-dimensional mapping equipment is tested and confirmed to be functioning normally. Local analgesia is administered. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed and/or transiently deactivated at the start of the case so as to minimize adverse consequences resulting from electromagnetic interference from radiofrequency current application.

Venous access is obtained. Arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle is obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. An intracardiac echo probe is placed via a femoral venous access approach. The intracardiac echo is used in conjunction with the three-dimensional mapping system to create a three-dimensional shell of the right or left ventricle, including the aortic root, aortic valve leaflets, coronary sinus, and mitral valve annulus. Papillary muscles are also recorded in the three-dimensional anatomical ultrasound map. Pacing and sensing is performed in the right atrium and right ventricle. His bundle recording is obtained. Refractory periods are

measured. Attempts at ventricular tachycardia induction are performed via burst pacing, decremental pacing, and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple ventricular sites.
To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Once an arrhythmia is induced, pacing maneuvers are performed to elucidate the mechanism of the ventricular tachycardia. During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer mapping system to assist in identifying the arrhythmia circuit, localizing the origin (for focal arrhythmias) or the critical isthmus (reentrant arrhythmias). The 3D mapping system is calibrated, and recordings are made during sinus rhythm (to identify normal activation and location of scar) and during each distinct arrhythmia. The physician then analyzes the computer-generated map, ensuring that electrograms are annotated correctly and that the display parameters are correct for the specific arrhythmia being mapped. Based upon the data from the 3D mapping system, endocardial electrograms, surface ECG and the response of the SVT to pacing maneuvers, the ablation catheter is advanced to the point of earliest activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Radiofrequency (or cryo) ablation is then performed. If initial mapping in one chamber does not lead to complete identification of the essential arrhythmia circuit (either based on analysis of the map or based on incomplete ablation result, then the mapping catheter(s) is/are moved into another cardiac chamber and an additional 3D map is generated to aid in diagnosis; this is repeated until the arrhythmia mechanism is fully characterized and ablation is deemed completely successful. Occasionally mapping of the epicardial surface of the heart is necessary. A final report that includes the mapping procedure and findings is prepared.
The electrical activation sequence is mapped with the three-dimensional electroanatomical mapping system and activation timing is superimposed upon the three-dimensional echo image previously obtained. Anticoagulation is administered once catheters have been placed on the left side of the heart. Once the ventricular tachycardia circuit is localized, a catheter is moved to the appropriate location or region of abnormal myocardium to deliver ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue. Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures.

Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are repeated following a 30-minute period following the conclusion of the final ablation lesion. Anticoagulation is reversed. Sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed to an active configuration with rates reprogrammed as necessary to treat any remaining arrhythmias.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family, and postprocedure assessments are performed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the

codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653 and 93656, and were tasked in surveying the other codes in the family: 93654, 93655, and 93657.

The ACC and HRS randomly surveyed cardia electrophysiologists, as designated by membership rolls, on the newly created codes. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. This is the last of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 93581 for percutaneous transcatheter closure of a congenital ventricular septal defect. It was selected by approximately 40% of respondents. 96% of the respondents indicated that 93654 was more complex. The second reference code was 93580 for percutaneous transcatheter closure of congenital interatrial communication. It was selected by approximately 38% of respondents. About 97% of the respondents indicated that 93654 was more intense/complex overall.

Survey Concerns

In reviewing the survey data to develop work recommendations, the expert panel quickly developed doubts about the validity of the survey results for the newly bundled services, 93653 and 93656. In both instances, intraservice procedure times dropped significantly, despite the inclusion of the newly bundled elements. After deliberation, the expert panel concluded that we do not believe survey respondents thoroughly understood that 3D mapping and left atrial pacing were now inherent to 93653. This is despite language in the survey invitation and coding changes document (both attached).

We believe this may have occurred for two reasons. One is that despite providing information about the elements of the revised code, survey respondents still saw the same code number, 93653, and may have incorrectly believed the code descriptor was unchanged. The second reason is that when we compared the newly revised codes to code 93654 which did not undergo any revisions, that service came back with an identical intraservice procedure time and quite consistent work RVUs.

We can certainly think of reasons—mostly changes in technology and broader service dispersion—that intraservice times would decline somewhat after nearly a decade. However, the magnitude of the change does not comport with our professional experience. And these doubts are compounded by the absence of change in 93654, making us think something did not register for survey respondents.

Therefore, as part of this package of recommendations, we are also recommending the ultimate RUC value recommendations be made on an interim basis with a plan to resurvey these codes for the April RUC meeting. We have already developed several survey tool changes we for which we will seek Research Subcommittee approval, attempting to more actively prompt survey respondents to incorporate the new elements of the bundled service. One such tactic is to use a "dummy" code so they do not immediately perceive familiarity with the code descriptor. Another is to include a redline version of the code descriptor in the survey itself. Yet another is to more explicitly inform respondents in the invitation which elements have been bundled.

Since this is the last meeting of the 2022 CPT cycle, we have separately requested the CPT Editorial Panel withhold publication of these codes until 2023. (attached) We do not know the outcome of that request and are preparing to resurvey regardless. However, as noted in that letter, it is uncertain whether CMS would accommodate late information from the April RUC meeting. Delaying publication of the revised codes is the surest way to avoid the possibility that inaccurate work RVUs are deployed in the 2022 fee schedule. Finally, we fully recognize that we may undertake this effort and still end up with similar results, but we believe the effort is worthwhile given our concerns with this initial survey data.

Recommendation

Therefore, for code 93654 the **societies recommend, <u>as an interim value</u>, the current work RVU of 19.75 with 63 minutes preservice time from package 4, 240 minutes intraservice time from the survey median, and 33 minutes postservice time from Post Service Package 9B**. This value builds some increment from 93653 that accounts for longer time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93654

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 15500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is about twice as likely as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 11935 Percentage 77.00 %

Specialty Cardiology Frequency 3147 Percentage 20.30 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,750
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019 eMedicare based claims.

Specialty Cardiac electrophysiology Frequency 5968 Percentage 77.00 %

Specialty Cardiology Frequency 1573 Percentage 20.29 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:93655 Tracking Number Y3 Original Specialty Recommended RVU: **8.00**
Presented Recommended RVU: **8.00**
Global Period: ZZZ Current Work RVU: **7.50** RUC Recommended RVU: **6.50**

CPT Descriptor: Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia
(List separately in addition to code for primary procedure)
(Use 93655 in conjunction with 93653, 93654, 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old female has undergone successful ablation of her atrial supraventricular tachycardia (SVT) focus (reported separately). Attempts to re-induce that arrhythmia reveal an additional atrial focus (also reported separately). A decision is made to ablate this additional focus following its discovery.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed. Diagnostic and ablative electrophysiology (EP) catheters are in cardiac chambers. During the course of the post-ablation electrophysiologic evaluation, a second (or greater) arrhythmia is identified. For example, if the primary tachycardia ablated was atrioventricular (AV) nodal reentrant tachycardia and during post ablation testing, an atrial tachycardia, atrial flutter, or accessory pathway with orthotropic reentry tachycardia is identified, this would be considered a separate mechanism of tachycardia. Pacing maneuvers are performed to define the mechanism(s) of the new tachycardia(s). Mapping is performed to define the optimal ablation site or sites that are distinct from the initial ablation site(s). Catheter ablation of this distinct mechanism of tachycardia is performed at its origin. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer-assisted mapping system to localize the arrhythmia origin. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

To record left atrial activity, femoral venous access site is already prepared for related procedure. Achieve central venous access, place a sheath in the femoral vein using standard percutaneous techniques, changing to subclavian or jugular access if that fails. Introduce the catheter into the sheath and advance into the right atrium where the ostium of the coronary sinus

is engaged. Advance the catheter into the coronary sinus. Use the multielectrode catheter to record electrical activity from the left atrium and, at times, pace the left atrium to attempt arrhythmia induction. Reposition the catheter as necessary throughout the course of the cardiac electrophysiology procedure to optimize recordings and pacing thresholds. At the conclusion of the procedure, remove the catheter. Include a description of this additional work and catheter use and associated findings in the procedure report.

Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, or damage to cardiac or vascular structures. Following the ablation portion of the procedure, repeat electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst, and premature pacing maneuvers. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the tachycardia demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the tachycardia is rendered durably suppressed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the

codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653 and 93656, and were tasked in surveying the other codes in the family: 93654, **93655,** and 93657.

The ACC and HRS randomly surveyed cardia electrophysiologists, as designated by membership rolls, on the newly created codes. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. This is the last of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 33257 for operative tissue ablation and reconstructive of atria. It was selected by approximately 23% of respondents. 76% of the respondents indicated that 93655 was more complex. The second reference code was 93609 for intraventricular and/or intra-atrial mapping of tachycardia. It was selected by approximately 20% of respondents. About 67% of the respondents indicated that 93655 was more intense/complex overall.

Survey Concerns

In reviewing the survey data to develop work recommendations, the expert panel quickly developed doubts about the validity of the survey results for the newly bundled services, 93653 and 93656. In both instances, intraservice procedure times dropped significantly, despite the inclusion of the newly bundled elements. After deliberation, the expert panel concluded that we do not believe survey respondents thoroughly understood that 3D mapping and left atrial pacing were now inherent to 93653. This is despite language in the survey invitation and coding changes document (both attached).

We believe this may have occurred for two reasons. One is that despite providing information about the elements of the revised code, survey respondents still saw the same code number, 93653, and may have incorrectly believed the code descriptor was unchanged. The second reason is that when we compared the newly revised codes to code 93654 which did not undergo any revisions, that service came back with an identical intraservice procedure time and quite consistent work RVUs.

We can certainly think of reasons—mostly changes in technology and broader service dispersion—that intraservice times would decline somewhat after nearly a decade. However, the magnitude of the change does not comport with our professional experience. And these doubts are compounded by the absence of change in 93654, making us think something did not register for survey respondents.

Therefore, as part of this package of recommendations, we are also recommending the ultimate RUC value recommendations be made on an interim basis with a plan to resurvey these codes for the April RUC meeting. We have already developed several survey tool changes we for which we will seek Research Subcommittee approval, attempting to more actively prompt survey respondents to incorporate the new elements of the bundled service. One such tactic is to use a "dummy" code so they do not immediately perceive familiarity with the code descriptor. Another is to include a redline version of the code descriptor in the survey itself. Yet another is to more explicitly inform respondents in the invitation which elements have been bundled.

Since this is the last meeting of the 2022 CPT cycle, we have separately requested the CPT Editorial Panel withhold publication of these codes until 2023. (attached) We do not know the outcome of that request and are preparing to resurvey regardless. However, as noted in that letter, it is uncertain whether CMS would accommodate late information from the April RUC meeting. Delaying publication of the revised codes is the surest way to avoid the possibility that inaccurate work RVUs are deployed in the 2022 fee schedule. Finally, we fully recognize that we may undertake this effort and still end up with similar results, but we believe the effort is worthwhile given our concerns with this initial survey data.

Recommendation

While this code descriptor did not change, its use as an additional ablation with a new base code that includes 3D mapping and left-atrial pacing, changing the service. The same 3D mapping and left-atrial pacing elements that were bundled into 93653 should now typically be considered to be included into this service, since those elements occur throughout the additional ablation. Therefore, for code 93655 the **societies recommend, <u>on an interim basis,</u> the survey 25th-percentile RVW of 8.00 with 60 minutes intraservice time**. This is sensibly below the KRS, which is an open surgical procedure. This value also brings the IWPUT for 93655 in nearly identical alignment with that of 93653, as well as 93653 KRS 93580. This value can also be supported by comparison to another transcatheter cardiac service, 93592 that describes the work of placing an additional occlusion device to close a paravalvular leak.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Descriptor: Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation, including intracardiac electrophysiologic 3-dimensional mapping, intracardiac echocardiography including imaging supervision and interpretation, induction or attempted induction of an arrhythmia including left or right atrial pacing/recording, right ventricular pacing/recording, and his bundle recording, when performed
(Do not report 93656 in conjunction with 93279, 93280, 93281, 93282, 93283, 93284, 93286, 93287, 93288, 93289, 93462, 93600, 93602, 93603, 93610, 93612, 93613, 93618, 93619, 93620, 93621, 93653, 93654, 93662)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old male with a history of hypertension has recurrent atrial fibrillation. despite rate and rhythm control with antiarrhythmic drugs, he remains symptomatic. a comprehensive electrophysiologic evaluation with transeptal catheterization and catheter ablation by pulmonary vein isolation for atrial fibrillation is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: A three-dimensional imaging study such as cardiac magnetic resonance imaging (MRI) or computed tomography (CT) scanning may be obtained prior to the procedure to assess atrial size and for pulmonary vein anatomic variants. The procedure and the risks, benefits, and alternatives associated with electrophysiology testing and atrial fibrillation ablation are explained to the patient and the patient's family. Management of antiarrhythmic medications is communicated to the patient. Arrangements are made for the X-ray technician, electrophysiology laboratory technician, and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory, medications, and change in health status are reviewed with careful attention to the degree of anticoagulation. Informed consent is obtained.

Description of Intra-Service Work: Direct current cardioversion/defibrillation, electrophysiology (EP), and ablative equipment is confirmed to be present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Local analgesia is administered. Venous access is obtained. Arterial access to monitor blood pressure and to retrograde aortic access to the left ventricle may be obtained. By means of the venous access sites, multi-electrode catheters are positioned in specific cardiac chambers. An intracardiac echocardiographic probe is advanced into the heart and imaging of the heart and pericardium is performed: specific structures visualized include: right atrium, tricuspid valve, right ventricle, left atrium, aortic valve, left ventricle, pulmonary veins (left upper, left lower, right upper, right lower), pericardium, superior vena cava, coronary sinus. Intracardiac echocardiography may be used to guide catheter manipulation, guide transseptal puncture, provide visualization of catheter contact during mapping and ablation, and observe for complications throughout the procedure. The intracardiac echo catheter may be placed into the left atrium or right ventricle for additional imaging planes. One or two transseptal catheterizations are performed to achieve access and facilitate placement of both a circular mapping catheter and an ablation catheter in the left atrium.

Additional anticoagulation is administered. Level of anticoagulation is monitored throughout the procedure and additional anticoagulation is administered as needed. Conduction intervals and refractory periods are measured and arrhythmia induction attempted. His bundle recording and ventricular pacing and sensing are performed. A mapping catheter is passed into the left atrium and pulmonary vein conduction is assessed and recorded. Selective venography of the pulmonary veins may be performed to define anatomy. A high definition 3D anatomical map of the chamber(s) of interest is generated. Voltage and relative electrical activation in the arrhythmia and/or sinus may be performed to identify normal activation, location of scar, and mechanism of arrhythmia. Importation, segmentation, and/or registration to the three dimensional map of a MRI/CT scan may be performed. High output pacing is performed to prevent and/or monitor for phrenic nerve damage during ablation. Catheter ablation is then performed to achieve pulmonary vein isolation. Point lesions or balloon administered lesions encircling the pulmonary vein region are created that guided by anatomical mapping and electrical signals provided by a circular mapping catheter. Pulmonary vein isolation, as measured by the circular mapping catheter as well as loss of tissue voltage and tissue pacing capture are the measured endpoints.

During the course of an electrophysiology procedure, an arrhythmia is induced that requires use of advanced 3D computer-assisted mapping system to localize the arrhythmia origin. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

Throughout the ablation the patient is monitored hemodynamic compromise due to cardiac perforation, - or tachyarrhythmias, embolic phenomena, thrombus formation, or damage to cardiac or vascular structures, including meticulous monitoring for lesion delivery within the pulmonary vein or close to the esophagus. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation. These are again repeated following a 30-minute waiting period following the conclusion of the final ablation lesion. If the pulmonary veins demonstrate recovery of conduction, then repeat mapping and ablation are performed as described above. These steps are repeated until the pulmonary veins are rendered durably isolated. Once electrophysiology testing and ablation are completed, anticoagulation is reversed. Post procedure, sheaths are removed, appropriate hemostasis is achieved, and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family and a postprocedure assessment is performed.

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the

codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653 and **93656** and were tasked in surveying the other codes in the family: 93654, 93655, and 93657.

The ACC and HRS randomly surveyed cardia electrophysiologists, as designated by membership rolls, on the newly created codes. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. This is the last of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 36% of respondents. 92% of the respondents indicated that 93656 was more complex. The second reference code was 93581 for percutaneous transcatheter closure of a congenital ventricular septal defect with implant. It was selected by approximately 32% of respondents. About 92% of the respondents indicated that 93656 was more intense/complex overall.

Survey Concerns

In reviewing the survey data to develop work recommendations, the expert panel quickly developed doubts about the validity of the survey results for the newly bundled services, 93653 and 93656. In both instances, intraservice procedure times dropped significantly, despite the inclusion of the newly bundled elements. After deliberation, the expert panel concluded that we do not believe survey respondents thoroughly understood that 3D mapping and left atrial pacing were now inherent to 93653. This is despite language in the survey invitation and coding changes document (both attached).

We believe this may have occurred for two reasons. One is that despite providing information about the elements of the revised code, survey respondents still saw the same code number, 93653, and may have incorrectly believed the code descriptor was unchanged. The second reason is that when we compared the newly revised codes to code 93654 which did not undergo any revisions, that service came back with an identical intraservice procedure time and quite consistent work RVUs.

We can certainly think of reasons—mostly changes in technology and broader service dispersion—that intraservice times would decline somewhat after nearly a decade. However, the magnitude of the change does not comport with our professional experience. And these doubts are compounded by the absence of change in 93654, making us think something did not register for survey respondents.

Therefore, as part of this package of recommendations, we are also recommending the ultimate RUC value recommendations be made on an interim basis with a plan to resurvey these codes for the April RUC meeting. We have already developed several survey tool changes we for which we will seek Research Subcommittee approval, attempting to more actively prompt survey respondents to incorporate the new elements of the bundled service. One such tactic is to use a "dummy" code so they do not immediately perceive familiarity with the code descriptor. Another is to include a redline version of the code descriptor in the survey itself. Yet another is to more explicitly inform respondents in the invitation which elements have been bundled.

Since this is the last meeting of the 2022 CPT cycle, we have separately requested the CPT Editorial Panel withhold publication of these codes until 2023. (attached) We do not know the outcome of that request and are preparing to resurvey regardless. However, as noted in that letter, it is uncertain whether CMS would accommodate late information from the April RUC meeting. Delaying publication of the revised codes is the surest way to avoid the possibility that inaccurate work RVUs are deployed in the 2022 fee schedule. Finally, we fully recognize that we may undertake this effort and still end up with similar results, but we believe the effort is worthwhile given our concerns with this initial survey data.

Recommendation

Therefore, for code 93656 the **societies recommend, <u>on an interim basis</u>, the survey median RVW of 24.20 with 63 minutes preservice time from package 4, 210 minutes intraservice time from the survey median, and 33 minutes postservice time from package 9B**. These recommendations compare reasonably well with second KRS 93581 that has 30 minutes shorter intraservice time and 36 minutes shorter total time, though survey respondents who selected 93581 nearly universally said 93656 is more intense/complex. This recommendation also produces a work RVU savings from the current, component-coded services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93656

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed for atrial fibrillation. Diagnostic and ablation catheters are present in cardiac chambers. Pulmonary vein isolation has been accomplished. An intracardiac echocardiographic probe has been advanced into the heart and imaging of the heart and pericardium is performed. Intracardiac echocardiography may be used to guide catheter manipulation, guide transseptal puncture, guide catheter manipulation and observe for complications throughout the procedure. Due to the presence of non-pulmonary vein sources of atrial fibrillation, additional non-pulmonary vein ablation lesions are created. These additional ablation lesions may contain any or all of the following: 1) Regions of fractionated potentials are mapped and ablated outside the pulmonary vein area. 2) linear lesions are created along the roof, mitral isthmus, or septal aspect of the left atrium. 3) Non-pulmonary vein focal sources of atrial fibrillation induction are induced, localized, and ablated. These locations may include areas of the left atrium, right atrium, superior vena cava, or coronary sinus. During the delivery of ablation energy, continuous monitoring for hemodynamic instability, arrhythmias, embolic events, and injury to the esophagus is performed.

During the course of these additional ablation lesions, an advanced 3D computer-assisted mapping system is used to facilitate identification of sites to target for catheter ablation as well as to record sites of lesions to allow the operator to create linear lesions. The mapping system is placed in the cardiac chamber of interest using standard percutaneous techniques. The system is calibrated, and recordings are made during sinus rhythm to identify normal activation and location of scar during each distinct tachycardia. The computer-generated map is displayed, modifications are made in the computer parameters and display, and the tachycardia origin is identified. The ablation catheter is moved to the point of early activation, localized by the mapping system, to identify a mid-diastolic potential, Kent potential, and/or similar paced maps. When a reentrant circuit is identified, entrainment mapping studies are performed and evaluated to confirm the catheter location is within the reentrant circuit. Additional mappings are made to confirm arrhythmia origin and to study additional arrhythmias at the conclusion of the procedure. A final report that includes the mapping procedure and findings is prepared.

Appropriate post ablation attempts at reeducation and observation for 30-minutes are performed. Following restoration of sinus rhythm, conduction intervals are measured and arrhythmia induction is re-attempted over a 30-minute period following the last ablation lesion. If the target site demonstrates recovery or incomplete suppression, then repeat mapping and ablation are performed as described above. These steps are repeated until the target site is rendered durably suppressed or the line demonstrates durable conduction block.

Description of Post-Service Work:

SURVEY DATA

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	5%	32%	18%	45%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	45%	55%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	32%	68%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	32%	59%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	39%	46%	7%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	15%	39%	46%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	46%	54%
Physical effort required	0%	58%	42%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	62%	30%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

When the Relativity Assessment Workgroup identified CPT code 93656 (atrial fibrillation ablation) due to its rapid increase in growth, the ACC and HRS reviewed the code and determined that certain work should be bundled into the existing code due to their being billed together more than 75% of the time. With continued review of 93656 and the related the volume data, the societies also identified that CPT 93653 (SVT ablation) should have services bundled into it before the

codes are re-surveyed for upcoming RUC valuation. As a result, in October 2020, the ACC and HRS presented a code change application to the CPT Editorial Panel on codes: 93653, 93654, 93655, 93656, **93657.**

The ACC and HRS randomly surveyed cardia electrophysiologists, as designated by membership rolls, on the newly created codes. The 000- and ZZZ-global day survey was completed by physicians who have experience with the service. This is the last of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 33257 for operative tissue ablation and reconstruction of atria. It was selected by approximately 30% of respondents. 64% of the respondents indicated that 93657 was more complex. The second reference code was 33419 for transcatheter mitral valve repair. It was selected by approximately 18% of respondents. About 54% of the respondents indicated that 93657 was more intense/complex overall.

Survey Concerns

In reviewing the survey data to develop work recommendations, the expert panel quickly developed doubts about the validity of the survey results for the newly bundled services, 93653 and 93656. In both instances, intraservice procedure times dropped significantly, despite the inclusion of the newly bundled elements. After deliberation, the expert panel concluded that we do not believe survey respondents thoroughly understood that 3D mapping and left atrial pacing were now inherent to 93653. This is despite language in the survey invitation and coding changes document (both attached).

We believe this may have occurred for two reasons. One is that despite providing information about the elements of the revised code, survey respondents still saw the same code number, 93653, and may have incorrectly believed the code descriptor was unchanged. The second reason is that when we compared the newly revised codes to code 93654 which did not undergo any revisions, that service came back with an identical intraservice procedure time and quite consistent work RVUs.

We can certainly think of reasons—mostly changes in technology and broader service dispersion—that intraservice times would decline somewhat after nearly a decade. However, the magnitude of the change does not comport with our professional experience. And these doubts are compounded by the absence of change in 93654, making us think something did not register for survey respondents.

Therefore, as part of this package of recommendations, we are also recommending the ultimate RUC value recommendations be made on an interim basis with a plan to resurvey these codes for the April RUC meeting. We have already developed several survey tool changes we for which we will seek Research Subcommittee approval, attempting to more actively prompt survey respondents to incorporate the new elements of the bundled service. One such tactic is to use a "dummy" code so they do not immediately perceive familiarity with the code descriptor. Another is to include a redline version of the code descriptor in the survey itself. Yet another is to more explicitly inform respondents in the invitation which elements have been bundled.

Since this is the last meeting of the 2022 CPT cycle, we have separately requested the CPT Editorial Panel withhold publication of these codes until 2023. (attached) We do not know the outcome of that request and are preparing to resurvey regardless. However, as noted in that letter, it is uncertain whether CMS would accommodate late information from the April RUC meeting. Delaying publication of the revised codes is the surest way to avoid the possibility that inaccurate work RVUs are deployed in the 2022 fee schedule. Finally, we fully recognize that we may undertake this effort and still end up with similar results, but we believe the effort is worthwhile given our concerns with this initial survey data.

Recommendation

While this code descriptor did not change, its use as an additional ablation with a new base code that includes 3D mapping and intracardiac echo, changing the service. The same 3D mapping and intracardiac echo elements that were bundled into 93656 should now typically be considered to be included into this service, since those elements occur throughout the additional ablation. Therefore, for code 93657 the **societies recommend, <u>on an interim basis,</u> the survey 25th-percentile RVW of 8.00 with 60 minutes intraservice time**. This is sensibly below the KRS, which is an open surgical procedure. This value also brings the IWPUT for 93657 in near that of 93656, as well as 93656 KRS 93580. This value can also be supported by comparison to another transcatheter cardiac service, 93592 that describes the work of placing an additional occlusion device to close a paravalvular leak.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93657, 93613, 93662

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiac Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 43919
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure is twice much as Medicare based claims.

Specialty Cardiac electrophysiology Frequency 36000 Percentage 81.96 %

Specialty Cardiology Frequency 8000 Percentage 18.21 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 21,959 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Figure reflects 2019e Medicare based claims.

Specialty Cardiac electrophysiology Frequency 18000 Percentage 81.97 %

Specialty Cardiology Frequency 4000 Percentage 18.21 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93657

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Outpatient Pulmonary Rehabilitation Services – Tab 23

In September 2020, the CPT Editorial Panel created two new codes to report physician or other qualified healthcare professional services for outpatient pulmonary rehabilitation, with and without continuous oximetry monitoring (per session). The specialty societies indicated they expect the two new codes to replace G0424 *Pulmonary rehabilitation, including exercise (includes monitoring), one hour, per session, up to two sessions per day.*

Compelling Evidence
CMS HCPCS code G0424 *Pulmonary rehabilitation, including exercise (includes monitoring), one hour, per session, up to two sessions per day* (work RVU = 0.28) was created in 2010, prior to publication of the detailed joint medical specialty Outpatient Pulmonary Rehabilitation (OPR) clinical guidelines in 2013. There is now a new definition of pulmonary rehabilitation, which states that pulmonary rehabilitation is a comprehensive intervention based on a thorough patient assessment, followed by patient tailored therapies that include but are not limited to exercise training, education and behavioral change to improve the physical and psychological condition of people with chronic respiratory disease and to promote the long-term adherence to health enhancing behaviors. Pulmonary Rehabilitation is now recognized as a core component of management of chronic obstructive pulmonary disease (COPD), and particularly focusing on health behavior change for this chronically ill population. However, patients with other advanced lung diseases can also participate in pulmonary rehabilitation.

In 2010, a survey was not conducted on the dominant performing specialty, Pulmonary Medicine. Therefore, the specialty societies presented, and the RUC agreed that compelling evidence is met due to incorrect assumptions/flawed methodology of the CMS/Other valuation, the code was not surveyed by pulmonary medicine physicians and the joint society clinical guidelines outline details were not captured nor valued in G0424. Additionally, there is documentation in peer-reviewed medical literature that there has been a change in the physician work due to both changes in technique, the updated guidelines and change in patient population to predominantly COPD patients.

94625 ***Physician or other qualified health care professional services for outpatient pulmonary rehabilitation; without continuous oximetry monitoring (per session)***
The RUC reviewed the survey results of 39 pulmonologists and determined that the survey 25th percentile work RVU of 0.55 appropriately accounts for the work required to perform this service. The RUC recommends 2 minutes pre-service evaluation time, 9 minutes intra-service time and 10 minutes immediate post-service time. The RUC agreed with the specialty societies to decrease the intra-service time from the survey respondents' time of 15 minutes to 9 minutes.

The typical patient for 94625 is significantly more stable and less sick than the typical patient of 94626. The new CPT codes are different than G0424 as they are used per session and only once per day. The typical pulmonary rehabilitation program for a patient is a total of 36 sessions. CMS limits that to 72 sessions lifetime. These occur several days a week, typically two or three days per week spanning a total of two or three

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

months. The patients typically have sessions which last 90 minutes or more with exercise rotations each being 10 to 20 minutes each with time in between for an assessment of dyspnea as well as obtaining vital signs. The patients are in the office setting and are typically not in a group setting. The physician or qualified health provider is available and typically interacts with either the respiratory therapist (RT) or both the RT and the patient during and post- session. These patients typically need modifications to the plan to achieve success. The physician is not typically scheduled for other activities, such as Evaluation and Management (E/M) visits, while filling the role of the supervising physician. They may be performing administrative tasks or other non-face-to-face tasks but must be immediately available throughout the session.

In summary, the widely varying times that a physician participates in each session challenged the survey participants as it required them to consider the total times that are typical for all the sessions and then divide by the number of sessions to come up with a typical average session. Therefore, the specialty societies recommended revised times of 2 minutes pre-service evaluation time, 9 minutes intra-service time and 10 minutes immediate post-service time. The 9 minutes of intra-service time is the survey 25th percentile since this is clearly a more stable population than those receiving 94626 and would involve less physician involvement during their exercise period.

The RUC compared CPT code 94625 to the top key reference services, code 99497 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate* (work RVU = 1.50 and 30 minutes intra-service time) and 99238 *Hospital discharge day management; 30 minutes or less* (work RVU = 1.28 and 20 minutes of intra-service time). The RUC noted that the surveyed code requires much less physician time and work to perform, thus is appropriately valued lower.

For additional support, the RUC referenced MPC code 99407 *Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes* (work RVU = 0.50 and 15 minutes total time) and code 99422 *Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 11-20 minutes* (work RVU = 0.50 and 15 minutes total time), which require similar physician work and time. **The RUC recommends a work RVU of 0.55 for CPT code 94625.**

94626 *Physician or other qualified health care professional services for outpatient pulmonary rehabilitation; with continuous oximetry monitoring (per session)*
The RUC reviewed the survey results of 39 pulmonologists and determined that the survey 25th percentile work RVU of 0.69 appropriately accounts for the work required to perform this service. The RUC recommends 2 minutes pre-service evaluation time, 14 minutes intra-service time and 10 minutes immediate post-service time.

The specialty society indicated that the patient population for 94626 will require oxygen at the onset. This is a patient population with advanced respiratory failure, who are already on oxygen, who will desaturate with exercise probably needing anywhere from four to six liters of oxygen per minute. These patients may have significant supraventricular arrhythmias, a-fibrillation with rapid ventricular response, non-sustained ventricular tachycardia or syncope in addition to their COPD exacerbations. Those are all significantly more likely and more common in the 94626 population, and much less common in the 94625 population, which is why the intra-service time is higher for 94626.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared CPT code 94626 to the top key reference service, code 94621 *Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings* (work RVU = 1.42, 30 minutes intra-service time and 50 minutes total time), noting that the surveyed code requires less physician work and time to perform. The RUC compared the surveyed code to the second top key reference code 99231 *Subsequent hospital care, per day…Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit* (work RVU = 0.76, 10 minutes of intra-service time and 20 minutes total time), noting both require similar physician work and time to perform.

For additional support, the RUC referenced MPC code 95251 *Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; analysis, interpretation and report* (work RVU = 0.70, 15 minutes intra-service time and 20 minutes total time) and code 94617 *Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry; with electrocardiographic recording(s)* (work RVU = 0.70, 10 minutes intra-service time and 26 minutes total time), which require almost identical physician work and time. **The RUC recommends a work RVU of 0.69 for CPT code 94626.**

CMS questioned and the specialty societies confirmed that any expected adverse reactions are included in the valuation for these codes since an E/M service would not be reported on the same date of service. Therefore, there will not be an issue if there are any edits to the E/M codes in the near future.

G Code Deletion
The RUC requests that CMS delete G0424, as these services could be reported by 94625 and 94626.

Practice Expense
The Practice Expense Subcommittee accepted the compelling evidence that the following have changed for these services: the dominant provider, the clinical guidelines, the technology/technique and patient population as outlined in the compelling evidence for work valuation above. The Practice Expense Subcommittee made a modification to the type of paper to SK057 *paper, laser printing (each sheet)*. The Subcommittee noted the specialties' use of L042B *Respiratory Therapist* for its clinical staff inputs. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

New Technology/New Services
CPT codes 94625 and 94626 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:94625 Tracking Number Z1 Original Specialty Recommended RVU: **0.55**
Presented Recommended RVU: **0.55**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **0.55**

CPT Descriptor: Physician or other qualified health care professional services for outpatient pulmonary rehabilitation; without continuous oximetry monitoring (per session).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old male with severe chronic obstructive pulmonary disease is enrolled in a pulmonary rehabilitation program without oximetry monitoring 45 days after hospitalization for an exacerbation.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: The physician reviews the patient with COPD or other chronic respiratory disease with significant symptoms of dyspnea in the pulmonary rehabilitation facility. Initial evaluation of patient at the start of the rehabilitation program includes physician review of outside medical records, focusing on cardiopulmonary history and any limitations to exercise. This includes review of relevant comorbidities such as significant cardiac disease and review of prior cardiac testing (electrocardiogram, echocardiogram, or stress testing), cognitive impairment, or orthopedic/musculoskeletal/rheumatologic disorders or fall risk that may be limitations to exercise. The physician must also perform a detailed review of pulmonary history including prior diagnostic testing such as pulmonary function testing, 6-minute walk testing, imaging including chest x-rays or chest CT scans, medication regimen, and oxygen therapy. Initial evaluation would also include assessing symptoms with validated instruments such as the Modified Medical Research Council scale for dyspnea or the COPD Assessment Test and reviewing results with the patient. For subsequent visits, the physician reviews the patient's recent medical records including any new relevant cardiopulmonary diagnostic testing, if performed, and reviewing past pulmonary rehabilitation sessions as documented by the respiratory therapist.

Description of Intra-Service Work: A review of systems is performed and key information from the patient's medical records is reviewed and confirmed with the patient. The physician reviews the current vital signs including the SpO2 at rest and during exercise and compares them with previous readings. The physician decides whether the patient is fit to participate in the pulmonary rehabilitation program, and whether the patient will require monitoring during the exercise & strengthening portion of the program. The physician is required to be immediately available during the exercise session, and the physician will perform face-to-face evaluation of the patient for any acute issues arising including oxygen desaturations beyond baseline, tachypnea or respiratory distress, tachycardia, hypertension or hypotension, or symptoms of acute illness such as developing acute exacerbation of COPD.

Description of Post-Service Work: The physician reviews the progress of every patient regularly with the respiratory therapists or other staff, and the physician uses this information to update the individualized exercise prescription at least every 30 days, and confirm the patient is benefitting from the program and continues to be medically appropriate for rehabilitation. The physician will decide with the therapists which other elements the patient's individualized program should include, such as the decision to repeat or train on devices for inhaled medications or training on airway clearance. If acute issues required face-to-face evaluation in the intra-service time, then communication by phone and/or written report with the referring physician, primary care provider, or relevant specialists would be developed after the visit.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2021		
Presenter(s):	Amy Ahasic, MD, (CHEST), Katina Nicolacakis, MD (ATS), Robert DeMarco, MD (CHEST), Alan Plummer, MD, (ATS)

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	20%	60%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The AMA CPT panel created two new codes for outpatient pulmonary (OPR) rehabilitation services at the September 2020 CPT meeting. One code describes when pulse oximetry is performed during the session, 94626, while the other CPT code describes the same service without monitoring of pulse oximetry, 94625. The CPT panel approved the same vignette for each service, this recognizes that the same patient can have the OPR services at a site of their choice, based on the

protocols of the different rehabilitation facility (following the society guidelines), the resources of oximetry can be identified and tracked with the reporting of one of the two new CPT codes. Of note, CMS created G0424 in 2010, 10+ years ago. However, there are differences in the G code description as well as the development of detailed OPR guidelines from the medical specialties. The societies believe these are new codes and services not previously described.

Compelling Evidence, if required:

Since the G0424 codes does exist with utilization, we are also providing our compelling evidence arguments in case the RUC feels it necessary. In short, the G code was created prior to publication of the detailed joint medical specialty OPR guidelines in 2013 and updated. No RUC survey was performed by the dominant performing specialty, Pulmonary Medicine, therefore we believe we meet the two below RUC compelling evidence arguments, as the G code is a CMS/Other values code not surveyed by pulmonary medicine physicians and the joint society guidelines outline details not captured nor valued in the G code.

"Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:

- a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values or CMS/Other source codes;

Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in physician work due to one or more of the following:

- knowledge"

Survey Results & ATS/CHEST Recommendations:
94625

A joint ATS and CHEST RVS panel (ATS/CHEST) reviewed and discussed the survey results. The ATS/CHEST panel was pleased that there were 39 responses to the survey request. This service is provided by subgroups of our larger medical specialties. The survey performance rate median of 10 studies per year among the 39 respondents is an understandable rate given this is a low volume service among our varying membership. The sample drawn from our memberships included all members of the pulmonary rehabilitation assemblies if available from each society, and a random pull of the general membership. These two groups were loaded into Qualtrics and then 90% of that group were surveyed to produce the required RUC random component to the survey pool. Surveying only members of the assemblies would not have given us enough of a pool to reach the required completed surveys. We did extend the survey past our original close date by 6 days and send urgent reminders to those surveyed, stating that we had not yet reached the required minimum, in order to finally reach the RUC minimum. We did receive more than usual number of responses that resources were limited due to COVID surges. In the end we were pleased on our revised deadline to have obtained 39 completed surveys.

Time Discussion:
The ATS/CHEST panel reviewed and discussed at length the pre, intra and post service survey median times of 10, 15 and 10 minutes. The discussion revolved around how to account for the significant times that are not typical in all sessions but are typical for the first session or any subsequent session(s) when the patient has an event or set back requiring re-evaluation and changes to the OPR plan for that patient. It was noted that these patients are of our sicker population as evidenced that our survey patient vignette was typical 82% of the time. Physicians are always on site and available to the respiratory therapist during each session. We would point out that they are not present at each patient session, however there is discussion with the therapist post each session. The first few sessions are time intensive for the physician as they develop and refine the session program for the Respiratory Therapist to follow. The RVS panel experts stated that often these initial and reevaluation can take upwards of 1 to 2 hours. It also was noted by the experts who run these programs that intervention most often occurs as post work to the session. While only the initial is frontloaded with pre time. Therefore, the expert panel considered that 60 minutes divided by 36 sessions would amount to 2 minutes of pre time for each session. The expert panel believes that the survey respondents had a difficult time defining how much time to allocate to the pre and the post for this reason, the expert panel believes an adjustment of the pre time is necessary and is recommending a pre time of 2 minutes as calculated and stated above.

In summary, the widely varying times that a physician participates in each session challenged the survey participant, as well as the experts, to consider the total times that are typical for all the sessions and then divide by the number of

sessions to come up with a typical average session. We believe our expert panel understood this best and therefore are recommending a revised survey time of 2 minutes of pre time, with the 25th percentage of 9 minutes (after discussion with facilitation) of intra time and 10 minutes of post time for each session.

Work Discussion:
We compared 94625 to the reference code CPT 99497 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate) RVW 1.50 (5-30-10);* while we believe these procedures are comparable, we believe the work for 94625 would require less time and less work than 99497. The ATS/CHEST panel also compared 94625 to the second key reference code CPT 99238 (*Hospital discharge day management; 30 minutes or less) with an RVW of 1.28 (8-20-10)* and believes this procedure's work and times would be higher and require more time than the survey code.

In summary, we are recommending an RVW of 0.55 for 94625 which is our 25th percentile survey, with a pre-service time 2 minutes, intra-service time 9 minutes and post-service time 10 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) G0424

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Medicne How often? Sometimes

Specialty Internal Medicine How often? Sometimes

Specialty Neurology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 23223
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare utilization of G0424 divided by the two codes, multipled by 3.

Specialty Pulmonary Medicine Frequency 13005 Percentage 56.00 %

Specialty Internal Medicine Frequency 3716 Percentage 16.00 %

Specialty Neurology Frequency 1393 Percentage 5.99 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,741
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare Utilization of G0424 divided by the two codes from the RUC data base.

Specialty Pulmonary Medicine Frequency 4335 Percentage 56.00 %

Specialty Internal Medicine Frequency 1239 Percentage 16.00 %

Specialty Neurology Frequency 464 Percentage 5.99 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:94626 Tracking Number Z2 Original Specialty Recommended RVU: **0.69**
Presented Recommended RVU: **0.69**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **0.69**

CPT Descriptor: Physician or other qualified health care professional services for outpatient pulmonary rehabilitation; with continuous oximetry monitoring (per session) / (do not report 94625, 94626 in conjunction with 94760, 94761).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: a 67-year-old male with severe chronic obstructive pulmonary disease is enrolled in a pulmonary rehabilitation program with oximetry monitoring 45 days after hospitalization for an exacerbation.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: TThe physician reviews the patient with respiratory failure due to COPD or other chronic respiratory disease with significant symptoms of dyspnea in the pulmonary rehabilitation facility. Initial evaluation of patient at the start of the rehabilitation program includes physician review of outside medical records, focusing on cardiopulmonary history and any limitations to exercise. This includes review of relevant comorbidities such as significant cardiac disease and review of prior cardiac testing (electrocardiogram, echocardiogram, or stress testing), cognitive impairment, or orthopedic/musculoskeletal/rheumatologic disorders or fall risk that may be limitations to exercise. The physician must also perform a detailed review of pulmonary history including prior diagnostic testing such as pulmonary function testing, 6-minute walk testing, imaging including chest x-rays or chest CT scans, medication regimen, and oxygen therapy. Initial evaluation would also include assessing symptoms with validated instruments such as the Modified Medical Research Council scale for dyspnea or the COPD Assessment Test and reviewing results with the patient. For subsequent visits, the physician reviews the patient's recent medical records including any new relevant cardiopulmonary diagnostic testing , if performed, and pulse oximetry tracings from prior sessions along with reviewing past pulmonary rehabilitation sessions as documented by the respiratory therapist.

Description of Intra-Service Work: A review of systems is performed and key information from the patient's medical records is reviewed and confirmed with the patient. The physician reviews the current vital signs including the SpO2 at rest and during exercise, and compares them with previous readings. The physician decides whether or not the patient is fit to participate in the pulmonary rehabilitation program, and whether the patient will require supplemental oxygen (determine the amount of oxygen) and monitoring during the exercise & strengthening portion of the program. The physician is required to be immediately available during the exercise session, and the physician will perform face-to-face evaluation of the patient for any acute issues arising including oxygen desaturations beyond baseline or despite supplemental oxygen, tachypnea or respiratory distress, tachycardia, hypertension or hypotension, or symptoms of acute illness such as developing acute exacerbation of COPD.

Description of Post-Service Work: The physician reviews the progress of every patient regularly with the respiratory therapists or other staff, and the physician uses this information to update the individualized exercise prescription at least every 30 days, and confirm the patient is benefitting from the program and continues to be medically appropriate for rehabilitation. The physician will decide with the therapists which other elements the patient's individualized program should include, such as the decision to repeat or train on devices for inhaled medications or training on airway clearance as

well as the oxygen level required during exercise. If acute issues required face-to-face evaluation in the intra-service time, then communication by phone and/or written report with the referring physician, primary care provider, or relevant specialists would be developed after the visit.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
94621	XXX	1.42	**RUC Time**

CPT Descriptor Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99231	XXX	0.76	**RUC Time**

CPT Descriptor Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99407	XXX	0.50	**RUC Time**	83,194

CPT Descriptor 1 Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95251	XXX	0.70	**RUC Time**	248,288

CPT Descriptor 2 Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; analysis, interpretation and report

Other Reference CPT Code	Global	Work RVU	Time Source
94617	XXX	0.70	**RUC Time**

CPT Descriptor Exercise test for bronchospasm, including pre- and post-spirometry and pulse oximetry; with electrocardiographic recording(s)

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 6 **% of respondents:** 15.3 **%**

Number of respondents who choose 2nd Key Reference Code: 5 **% of respondents:** 12.8 **%**

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	17%	50%	33%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	20%	0%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	40%	60%
Physical effort required	20%	20%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	17%	83%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	40%	20%	0%	40%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	40%	0%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	20%	40%	40%
Physical effort required	20%	40%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	40%	0%	60%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

The AMA CPT panel created two new codes for outpatient pulmonary (OPR) rehabilitation services at the September 2020 CPT meeting. One code describes when pulse oximetry is performed during the session, 94626, while the other CPT code describes the same service without monitoring of pulse oximetry, 94625. The CPT panel approved the same vignette for each service, this recognizes that the same patient can have the OPR services at a site of their choice, based on the protocols of the different rehabilitation facility (following the society guidelines), the resources of oximetry can be identified and tracked with the reporting of one of the two new CPT codes. Of note, CMS created G0424 in 2010, 10+ years ago. However, there are differences in the G code description as well as the development of detailed OPR guidelines from the medical specialties. The societies believe these are new codes and services not previously described.

Compelling Evidence, if required:

Since the G0424 codes does exist with utilization, we are also providing our compelling evidence arguments in case the RUC feels it necessary. In short, the G code was created prior to publication of the detailed joint medical specialty OPR guidelines in 2013 and updated. No RUC survey was performed by the dominant performing specialty, Pulmonary Medicine, therefore we believe we meet the two below RUC compelling evidence arguments, as the G code is a CMS/Other values code not surveyed by pulmonary medicine physicians and the joint society guidelines outline details not captured nor valued in the G code.

"Evidence that incorrect assumptions were made in the previous valuation of the service, as documented, such as:

- a flawed mechanism or methodology used in the previous valuation, for example, evidence that no pediatricians were consulted in assigning pediatric values or **CMS/Other source codes**;

Documentation in the **peer-reviewed medical literature** or other reliable data that there have been changes in physician work due to one or more of the following:

- **knowledge**"

Survey Results & ATS/CHEST Recommendations:
94626

A joint ATS and CHEST RVS panel (ATS/CHEST) reviewed and discussed the survey results. The ATS/CHEST panel was pleased that there were 39 responses to the survey request. This service is provided by subgroups of our larger medical specialties. The survey performance rate median of 8 studies per year among the 39 respondents is an understandable rate given this is a low volume service among our varying membership. The sample drawn from our memberships included all members of the pulmonary rehabilitation assemblies if available from each society, and a random pull of the general membership. These two groups were loaded into Qualtrics and then 90% of that group were surveyed to produce the required RUC random component to the survey pool. Surveying only members of the assemblies would not have given us enough of a pool to reach the required completed surveys. We did extend the survey past our original close date by 6 days and send urgent reminders to those surveyed, stating that we had not yet reached the required minimum, in order to finally reach the RUC minimum. We did receive more than usual number of responses that resources were limited due to COVID surges. In the end we were pleased on our revised deadline to have obtained 39 completed surveys.

Time Discussion:

The ATS/CHEST panel reviewed and discussed at length the pre, intra and post service survey median times of 10, 14 and 10 minutes. The time discussion was the same as 94625 with the exception that it was unfortunate that the intra time came out different at 14 minutes. The expert panel stated they would have expected a minute or two more or at minimum the same 15 minutes of intra time. This presented an awkward situation as the standard is to accept the median times from the survey. The panel did review the data from the surveys from only those that completed both CPT codes. This sub analysis is provided for your information in the RUC excel summary and it does support our expert's opinion regarding the intra time relationships for each CPT code. However, we are not clear if the RUC would allow changing the times to a sub analysis. Therefore, we are recommending the total survey intra times.

In summary, the widely varying times that a physician participates in each session challenged the survey participant, as well as the experts, to consider the total times that are typical for all the sessions and then divide by the number of sessions to come up with a typical average session. We believe our expert panel understood this best and therefore are

recommending a revised survey time of 2 minutes of pre time, with the medians of 14 minutes of intra time and 10 minutes of post time for each session.

Work Discussion:

We compared 94625 to the reference code CPT 94621 *(Cardiopulmonary exercise testing, including measurements of minute ventilation, CO2 production, O2 uptake, and electrocardiographic recordings) RVW 1.42 (10-30-10);* while we believe these procedures are comparable, we believe the work for 94625 would require less time and less work than 94621. The ATS/CHEST panel also compared 94625 to the second key reference code CPT 99231 (*Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.) with an RVW of 0.76 (5-10-5)* and believes this procedure's work total times and RVW are more comparable and somewhat higher than the survey code.

In summary, to maintain rank order we are recommending an RVW of 0.69 for 94626 which is our 25th percentile survey, with a pre-service time 2 minutes, intra-service time 14 minutes and post-service time 10 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) G0424

CHAPTER

3

Exercise Assessment and Training

Chris Garvey, FNP, MSN, MPA, MAACVPR
University of California and San Francisco Medical Center

Rebecca Crouch, PT, DPT, MS, CCS, MAACVPR
Campbell University and Duke Hospital
Durham, NC

David Verrill, MS, CEP, RCEP, FAACVPR
University of North Carolina at Charlotte

Exercise is well established as the cornerstone of pulmonary rehabilitation in persons with chronic lung disease due to its capacity to improve exercise tolerance in people with chronic lung disease (1). Exercise intolerance is multifactorial, resulting from progressive skeletal muscle dysfunction, disabling dyspnea and fatigue, comorbidities, mood disorders, hypoxemia, and in persons with chronic obstructive pulmonary disease (COPD), hyperinflation. Although the majority of evidence for effectiveness of exercise is derived from studies in persons with COPD, growing evidence supports the effectiveness of exercise as part of pulmonary rehabilitation in other lung diseases. The general principles of exercise training in persons with chronic lung disease are the same as for healthy individuals, and are individualized based on history and physical examination, clinical assessment, and objective and subjective findings. To optimize effectiveness, the training load must exceed that normally encountered in daily life to improve fitness and muscle strength (i.e., the training threshold). Exercise levels should progress throughout pulmonary rehabilitation based on ongoing comprehensive assessment. A key focus of exercise in pulmonary rehabilitation is long-term behavior change to achieve ongoing participation in physical activity and exercise. Several adjuncts have the potential to improve exercise in appropriate patients, including bronchodilation, oxygen, breathing techniques such as pursed-lip breathing, one-leg exercise, and use of rollators (rolling walkers). Critical areas of investigation include technology-supported and home- or community-based exercise (1).

RATIONALE FOR EXERCISE TRAINING IN CHRONIC LUNG DISEASE

Many factors must be considered when selecting an exercise plan for persons with lung disease. To achieve the greatest benefit from exercise training, the rehabilitation team works closely with

574-76386_ch03_1P.indd 21 30/11/18 10:20 PM

the physician to achieve optimization of medical therapy, including appropriate use of medications and oxygen. Successful rehabilitation outcomes depend on effective communication and a coordinated team effort to identify and meet the patient's medical, functional, and psychological needs. The patient and the family are at the center of educational interventions that focus on adaptation and behavior change (see chapter 4).

Exercise training is the cornerstone of pulmonary rehabilitation. Virtually all patients with chronic respiratory disease have strong potential to benefit from exercise training (1, 2). Patients whose physical limitations permit them to exercise at higher intensities can achieve significant improvement in aerobic conditioning, while those with more severe limitations can improve with lower-intensity endurance training (3). While aerobic and resistance upper-body exercise training is essential for all appropriate patients, resistance exercise training has been shown to be essential to improve upper- and lower-body strength and muscle volume, activities of daily living (ADL) performance and health-related quality of life (3–10). The evidence base supporting the functional benefits of both short- and long-term exercise training in COPD is among the strongest in pulmonary medicine (1, 2, 11). While more research is needed on the effect of aerobic and resistance exercise training in patients with other chronic lung diseases, including restrictive and interstitial lung diseases such as pulmonary fibrosis, recent trials have shown positive results (1, 12–15). A warm-up period should be included in each exercise session to provide gradual increases in heart rate (HR), blood pressure, ventilation, and blood flow to the exercising muscles. A cool-down reduces the risk of arrhythmias, orthostatic hypotension, syncopal episodes, and bronchospasm (16, 17).

MECHANISMS OF EXERCISE INTOLERANCE IN CHRONIC RESPIRATORY DISEASE

Respiratory and nonrespiratory factors, alone or in combination, can significantly decrease the exercise tolerance of persons with chronic lung disease (1, 18–22). Although cardiopulmonary abnormalities are generally considered of fundamental importance, skeletal muscle dysfunction has been increasingly recognized as a key factor that contributes to exercise intolerance (18). Perception of leg effort or discomfort is the main symptom limiting exercise in 40 to 45% of patients with COPD (21). Skeletal muscle dysfunction in COPD is characterized by reductions in muscle mass and strength; atrophy of slow-twitch, oxidative endurance muscle fibers; and reductions in fiber capillarization, oxidative enzyme capacity, and muscle endurance (18). Both resting and exercise muscle metabolism are impaired, with lower exercise tolerance and lactic acidosis occurring at lower exercise workloads compared to healthy persons (18, 21, 23). Systemic inflammation, nutrition impairment, aging, low anabolic hormone levels, corticosteroid-related myopathy, frailty, and hypoxia further contribute to skeletal muscle dysfunction in COPD (23, 24).

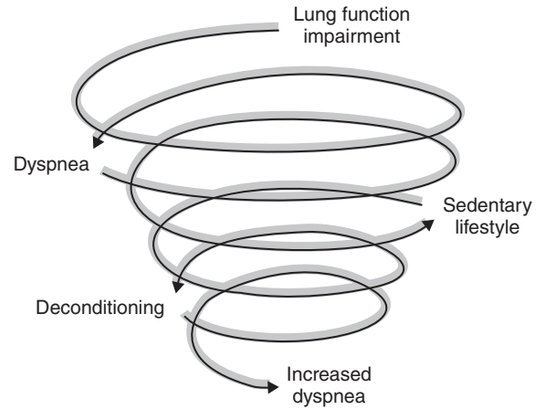

Figure 3.1 Dyspnea spiral.

Reprinted, by permission, from C. Prefaunt, A. Varray, and G. Vallet, "Pathophysiology Basis of Exercise Training in Patients With Chronic Obstructive Lung Disease," *European Respiratory Review* 5, no. 25 (1995): 27–32.

Complicating all of these disease effects is physical deconditioning. This is a consequence of patients assuming an increasingly sedentary lifestyle to avoid the unpleasant sensation of dyspnea. Inactivity in turn leads to further deconditioning and increased exertional dyspnea, creating the dyspnea spiral depicted in figure 3.1.

EXERCISE ASSESSMENT

Prior to exercise assessment, pulmonary rehabilitation providers should carefully review the patient history and physical examination with a focus on disorders that may potentially worsen or become unstable during exercise, including:

-1—
0—
+1—

574-76386_ch03_1P.indd 22 30/11/18 10:20 PM

- History of cardiovascular disease (coronary artery disease; previous myocardial infarction; chest pain; arrhythmia; new onset, untreated, uncontrolled, or chronic atrial fibrillation with resting rate >110 bpm; ventricular tachycardia; second- or third-degree atrioventricular block; T wave inversion or ST elevation)
- Moderate to severe valve disease
- Symptomatic or new onset heart failure
- Large patent foramen ovale causing shunt physiology

Additional disorders and comorbidities such as significant cognitive, severe psychiatric abnormalities, and intractable pain should be reviewed by the medical director with communication to the referring clinician or specialist to determine the patient's appropriateness as a pulmonary rehabilitation candidate.

Purposes of the Exercise Assessment for Patients with Chronic Lung Disease

- Quantify exercise capacity before beginning a program (25, 26)
- Evaluate unexplained dyspnea and exercise intolerance (27, 28)
- Observe for abnormal signs and symptoms of exercise intolerance (25–27)
- Establish a baseline for outcome documentation (28)
- Help establish patient-specific goals (29)
- Prognostic evaluation for patient risk stratification (24, 25)
- Drug treatment efficacy evaluation
- Exercise evaluation for research purposes (26)
- Evaluation of patient impairment and disability for insurance purposes and workman's compensation
- Assist in formulating an exercise prescription for exercise training (3, 16, 27, 28)
- Detect exercise-induced hypoxemia and aid with titrating supplemental oxygen therapy (30, 31)
- Evaluate nonpulmonary limitations to exercise (e.g., musculoskeletal problems) (23, 24, 32, 33)
- Help to detect underlying cardiac abnormalities and coronary artery disease (16, 26, 27)
- Help to evaluate status of congestive heart failure (if present)
- Screen for exercise-induced bronchospasm (34)
- Evaluation for heart, lung, or heart/lung transplant (26, 27)

For most respiratory patients *without* known or suspected cardiac problems, exercise testing, even to maximal levels, is relatively safe. Contraindications to exercise testing in this setting are relatively few. Standard lists of absolute and relative contraindications are concerned primarily with patients with known or suspected cardiovascular.

General safety considerations when performing exercise testing are as follows (26, 29, 34):

- All test administrators must be trained and competent in performing cardiopulmonary resuscitation.
- Oxygen and emergency equipment should be in close proximity to the testing site.
- If testing is not performed in a hospital environment, adequate emergency procedures must be in place.
- If the patient has been prescribed long-term oxygen therapy, the exercise test should usually be carried out using the prescribed level of oxygen. An exception might be the evaluation of a patient who may no longer need supplemental oxygen. If significant hypoxemia is present during activity, consider titrating the patient during ambulation prior to exercise testing.
- At a minimum, continuous pulse oximetry should be used to measure (SpO_2) and HR to monitor the patient's physiological response to exercise.
- Validated dyspnea and exertion scales should be used to measure the patient's perceived shortness of breath and effort during the test (e.g., Borg category-ratio or Borg perceived exertion chart).

FIELD TESTS (WALKING TESTS)

Field (walking) tests are commonly used for measurement of functional capacity in the pulmonary rehabilitation setting. Advantages include

—-1
—0
—+1

that the tests are functional, generally safe and easy to perform, inexpensive, and do not require extensive or expensive equipment. These tests are easily administered in the majority of pulmonary rehabilitation patients, including those that are debilitated. However, the test does not offer comprehensive physiological monitoring.

Six-Minute Walk Test

The 6-minute walk test (6MWT) is a widely used outcome measure for pulmonary rehabilitation (34–37). The test is safe, easy to administer, involves the use of minimal technical resources, is well tolerated, and accurately reflects a familiar activity of daily living (walking). The 6MWT measures the maximum distance walked in 6 minutes. To obtain valid and reliable results, it is essential to standardize the test procedure, such as staff, configuration of track, patient instructions and verbal reinforcement during testing, type, use and flow rate of supplemental oxygen, and walking aids (35).

One must consider the energy expenditure changes that occur while performing the 6MWT under certain circumstances, such as while using an assistive walking aid (e.g., rollator) and when a supplemental oxygen source is placed on the walking aid. It has been suggested that there are a reduction of breathlessness and an improvement in the distance walked when using a walking aid or supplemental oxygen (35). One study found as much as a 20 to 25% energy cost savings with the addition of a walking aid that supported supplemental oxygen. These energy savings appear to be most notable in persons with COPD who have lower exercise performance; e.g., 6MWT distance of <300 meters (38). Consequently, if a walking aid is used on the first test, or a required supplemental oxygen source is carried on the walker, the same walking preparation must be used with subsequent testing.

Directions on performing the 6MWT are given below.

Before the Test

- Standardize the shape of the flat walking course: straight versus continuous circle, oval, or square. If using a corridor, a minimum of 30 meters (98.4 feet) that is free of traffic and obstacles should be used.
- A comfortable ambient temperature and humidity should be maintained for all tests.
- A medical history for the patient has been reviewed and any precautions or contraindications to exercise testing have been taken into account (see absolute and relative contraindications, figures 3.4 and 3.5 later in the chapter).
- Instruct the patient to dress comfortably, wear appropriate footwear, and avoid eating or drinking for at least 2 hours before the test (when possible or appropriate).
- Prescribed inhaled bronchodilator medications should be taken if ordered within 1 hour of testing or when the patient arrives for testing.
- Rest for at least 10 minutes before beginning the test. If two tests are performed on the same day, at least 30 minutes rest should be allowed between tests.
- Record blood pressure BP, HR, SpO_2, and dyspnea score while the patient is sitting or standing. Measure HR and SpO_2 continuously during the test.
- Describe the walking track to the patient and give the patient standardized instructions (35) (see table 4.1).
- If the patient has not performed a 6MWT in the recent past, two tests should be performed for initial testing due to a significant learning effect. Use the greater of the two test results (35).

During the Test

The patient should be asked to walk as far as he or she can in 6 minutes. Standardized encouragement and notification of time elapsed should be given at specific intervals according to the European Respiratory Society (ERS)/American Thoracic Society (ATS) 6MWT script (35) (see table 3.1). Rests are allowed and included in the total test time. If the patient stops during the test (once SpO_2 is ≥85%), advise the patient every 30 seconds to "please resume walking whenever you feel able" (35).

- The total distance covered is recorded.
- The patient is asked to rate shortness of breath and effort using a validated dyspnea and fatigue scale.
- The patient should walk alone; staff, other patients, or family should not walk with the patient performing the test. If necessary to

1 minute	You are doing well. You have five minutes to go.
2 minutes	Keep up the good work. You have four minutes to go.
3 minutes	You are doing well. You are halfway.
4 minutes	Keep up the good work. You have only two minutes left.
5 minutes	You are doing well. You have only one minute to go.
6 minutes	Please stop where you are.
If the patient stops during the test, every 30 seconds (once SpO_2 is ≥85%)	Please resume walking whenever you feel able.

Key: SpO_2 = arterial oxygen saturation measured by pulse oximetry

Reproduced with permission of the © ERS 2018: *European Respiratory Journal* Jun 2004, 23 (6) 832–840; DOI: 10.1183/09031936.04.00116004.

have staff close to the patient during the walk for safety, they should walk behind the patient.

- Oxygen flow should be held constant during any test; oxygen titration should not be performed during a measured distance outcome walk test. Subsequent tests should use the same flow rate and modality if possible and safe.
- Staff should not assist the patient in carrying or pulling supplemental oxygen unless the patient cannot safely maneuver oxygen.
- Count laps with a lap counter.
- The patient may use their usual ambulatory assistive device; make note of which device (e.g., single-point cane, rollator walker, standard walker) is used and why.
- Monitor the patient for untoward signs and symptoms, including continuous SpO_2 and HR.
- The oximeter should not be held by the patient. Either a finger oximeter or a handheld oximeter in a pouch should be used.

Ending the Test

- Once the 6 minutes are completed, the patient is instructed to stop where he or she is.
- Note if the patient exhibits any untoward signs and symptoms.
- Stop the test for:
  - SpO_2 desaturation <80%
  - Chest pain
  - Intolerable dyspnea
  - Intolerable leg cramps, signs of intolerance to exercise exertion such as staggering, or unusual diaphoresis
  - Pale or ashen appearance
- Immediately record SpO_2, HR, dyspnea, fatigue, and blood pressure while patient is sitting (measurements taken before and after the test should be done with the patient in the same position).
- Record the distance completed in feet or meters, number of rest stops, total time of stops, and final vital signs including the lowest SpO_2 level (and oxygen flow rate if used) on a standardized recording form (35, 39).

Figure 3.2 shows a sample evaluation form for use in the 6MWT. The MET level corresponding to the average walking speed can be estimated based on the distance walked in 6 minutes. One MET is the amount of energy required while the body is at rest. This may be useful information for assessing exercise capacity and formulating an initial exercise prescription (see figure 3.3). Other information can be gleaned from the test, including gait analysis, balance, fatigue, and pain assessment.

The 6MWT can be influenced by multiple factors, including motivation, encouragement, learning effect, physical course layout, testing environment, gender, and age. Standardized encouragement must be given. There is a learning effect in performing successive 6MWTs, and distances may increase by 26.3 meters on subsequent tests, therefore two

Figure 3.3 Calculating MET levels from the 6-minute walk test

A MET is a metabolic equivalence of a task or a unit for expressing energy expenditure. One MET is the level of energy expenditure (oxygen consumption) at rest at approximately 3.5 ml O_2/kg/min (2). Activities can be expressed as requiring a multiple of resting requirements. Formulas are available to estimate energy cost (METs) of various activities, such as walking. MET levels during walking may be calculated by using the following formula (1 ml O_2/kg/min of $\dot{V}O_2$ is required for 10 m/min of walking):

METs = [baseline MET + walk MET] / baseline MET

Example: 100 meters walked in a 6-minute walk

METS = [3.5 + (100 m/6 min) × (min/10 m)] / 3.5 = 1.47

An alternative approach (ACSM formula for estimating $\dot{V}O_2$ [METs] for horizontal walking) (16, 37):

$\dot{V}O_2$ (METs) = [3.5ml/kg/min + (0.1 × ___speed (m/min)]/3.5ml/kg/min

Expressing walking distance as average walking speed in miles per hour (e.g., feet/sec × 0.68) or 6MWD (feet) × 10 / 5280 =____mph

METs can be calculated from speed in mph:

METs = [(___mph)(26.83m/min) × (0.1ml/kg/min) + 3.5ml/kg/min]

walks should be performed during the initial testing, using the furthest distance of the two tests (35–36). If two tests are performed, the recommendation is to wait at least 30 minutes, or up to the next day, to repeat the second test and that the greater of the two values be reported (34–37).

The use of a treadmill for 6MWT is not advised (35, 36, 39). The physical layout of the course may impact walking distance. In the National Emphysema Treatment Trial (NETT), centers that used continuous walking courses, either oval or square, reported longer 6MWT distances than those with straight courses. The difference attributable to the course layout was 110 feet (33.5 meters), or a 10% advantage for continuous courses (40). The difference between straight and continuous courses may be due to the time and effort required for the subject to turn around on a straight course. The preassessments and postassessments in pulmonary rehabilitation, therefore, must use the same course to eliminate this potential variability.

Prediction formulas for the 6MWT distance are available. This information can be used to assess the patient's level of impairment, compared to data from healthy adults (36, 39, 41). If using a prediction formula, the formula should be derived populations similar to the pulmonary rehabilitation program population. The minimal clinically meaningful change or minimum clinically important difference (MCID) in the 6MWT distance has been reported to be a mean of 30 meters (98.4 feet) (35). For those patients who walk a very short distance in their initial 6MWT (<200 meters, or <656 feet), an additional strategy has been suggested to help evaluate improvement which involves calculating the percent (%) change in pre—versus post–pulmonary rehabilitation walk distance (feet or meters) (34).

Shuttle Walk Tests

There are two types of shuttle walk tests: the incremental and the endurance shuttle walk tests. The ISWT is an incremental, symptom-limited walk test that simulates a symptom-limited cardiopulmonary exercise test (CPET). It measures a symptom-limited walking distance over a marked walking course of 10 meters (33 feet). This distance correlates well with maximal oxygen uptake (42). The ISWT utilizes an audible pacing timer to incrementally increase the pacing frequency (table 3.2). The subject walks according to the pacing timer frequency until they are too breathless to continue or cannot keep pace with the external pacing signal. Like the 6MWT, the primary test result of the ISWT is the total distance walked. As with the 6MWT, the ISWT should be performed twice prior to an intervention, with the best result

574-76386_ch03_1P.indd 27 30/11/18 10:20 PM

recorded (41). The patient should rest for 30 minutes between tests. Directions for performing the ISWT are given below.

The endurance shuttle test (ESWT) is a standardized, externally controlled, constant-paced walking test for the assessment of endurance capacity. The ISWT is initially performed to determine exercise capacity, and then a paced walk speed corresponding to 85% of walking speed on the ISWT is used to determine the walking speed for the ESWT (42, 43). The ESWT is a field test equivalent of the constant workload test. The primary outcome of the ISWT is distance, measured to the nearest 10 meters, whereas the primary outcome of the ESWT is time, consistent with other endurance tests (35–37).

Since exercise endurance improves more than peak oxygen concentration (peak $\dot{V}O_2$) after pulmonary rehabilitation exercise training, the ESWT is more responsive to pulmonary rehabilitation than the ISWT (28, 35–36). For the ISWT, a change of distance of 47.5 meters has been described as associated with feeling "slightly better," while a change of 78.7 meters has been associated with feeling "better"; therefore, the MCID for the ISWT distance in COPD is 47.5 meters (35). Preliminary data suggests the MID for the ESWT is in the region of 180 seconds (35).

Before the Test

- A medical history for the patient has been reviewed and any precautions or contraindications to exercise testing have been taken into account.
- Instruct the patient to dress comfortably, wear appropriate footwear, and avoid eating or drinking for at least 2 hours before the test (when possible or appropriate).
- Prescribed inhaled bronchodilator medications should be taken if ordered within 1 hour of testing or when the patient arrives for testing.
- Two cones are set 9 meters apart. The distance walked around the cones is 10 meters.
- The patient should rest for at least 15 minutes before beginning the test.
- Record blood pressure, HR, SpO_2, and dyspnea score while the patient is sitting or standing.

-1—
0—
+1—

During the Test

- Standardized instructions should be used via an audio recording.
- No encouragement should be given throughout the test.
- Record each shuttle that is completed on the recording sheet.
- The subject is asked to rate dyspnea and effort using a validated scale.
- The patient should walk alone; staff, other patients, or family should not walk with the patient performing the test.
- Do not assist the patient in carrying or pulling his/her supplemental oxygen.
- The patient may use an ambulatory assistive device; make note of which device (e.g., single-point cane, rollator, standard walker) is used and why.
- A comfortable ambient temperature and humidity should be maintained for all tests.
- Monitor the patient for untoward signs and symptoms.
- Stop the test for:
  - Chest pain suspicious of angina.
  - Evolving mental confusion or lack of coordination.
  - Evolving light-headedness.
  - Intolerable dyspnea.
  - Leg cramps or extreme leg muscle fatigue.
  - Persistent $SpO_2 \leq 85\%$.
  - Any other clinically warranted reason.

Ending the Test

- The patient is more than 0.5 meter (1.6 feet) away from the cone when the beep sounds (allow one lap to catch up).
- The patient determines that he or she is too breathless to continue.
- For the endurance shuttle walk test (ESWT): The patient reaches 85% of predicted maximum HR.
- The patient exhibits any untoward signs and symptoms.
- Immediately record SpO_2, HR, and dyspnea rating while the patient is sitting or standing (measurements taken before and after the test should be done with the patient in the same position).
- Two minutes later, record SpO_2 and HR to assess the recovery rate.
- Record the total number of shuttles completed.
- Record the reason for terminating the test.

Adapted from C. Garvey, *AACVPR Pulmonary Rehabilitation Outcome Toolkit,* https://www.aacvpr.org/Member-Center/Pulmonary-Rehab-Outcomes-Resource-Guide 2017.

Proponents argue that, when compared to a self-paced 6MWT, the shuttle tests are less influenced by motivation or pacing, correlate better with exercise capacity in patients with chronic lung disease, and may be a more sensitive indicator of functional change with rehabilitation or other therapies (35). Performance on the ISWT relates strongly to direct measures of peak $\dot{V}O_2$, allowing the prediction of peak $\dot{V}O_2$ (41). During the ISWT, the cardiorespiratory response to exercise (peak $\dot{V}O_2$) develops in an incremental fashion similar to formal CPET, thus making this a simple test requiring less technical expertise and equipment (35, 42). Furthermore, the ISWT is easier to administer, is less expensive, and incorporates an activity that patients perform on a daily basis (i.e., walking).

GRADED EXERCISE TEST AND CARDIOPULMONARY EXERCISE TESTS

Clinical exercise testing, often described as a graded exercise test (GXT), may additionally include expired gas or metabolic analysis. It is then often described as a cardiopulmonary exercise test (CPET) and provides important clinical information for the pulmonary rehabilitation practitioner. The rationale for performing the GXT is patient-specific (see "Purposes of the Exercise Assessment for Patients with Chronic Lung Disease"). Exercise limitations during the GXT or CPET may be due to various causes. Ventilatory requirements during graded exercise are often higher than expected in patients with chronic lung disease due to the increased work of breathing, increased dead space ventilation, earlier onset of lactic acidosis, respiratory muscle dysfunction, impaired gas exchange (hypoxia), increased ventilatory demand due to deconditioning, and peripheral muscle dysfunction (e.g., lower limb dysfunction) (1).

Maximal exercise tolerance is typically measured with a GXT performed on either a treadmill or stationary cycle ergometer in the laboratory

—-1
—0
—+1

(1, 16, 25, 26). In most clinical circumstances, cycle ergometry using an electronically braked ergometer is the preferred mode of exercise. However, a treadmill may be an acceptable alternative depending upon the purpose of the test. Arm ergometry may be substituted for those patients who are unable to perform lower-extremity exercises, although arm ergometer tests traditionally produce a lower $\dot{V}O_{2peak}$ (16, 25, 44). The GXT can be performed with either a ramped test or incremental increases in exercise load (e.g., 15 to 25 watts/minute on a cycle or arm ergometer) using a variety of established protocols until the patient reaches a symptom-limited maximal level of exertion. Physiologic responses to graded exercise that are commonly evaluated during the GXT include HR, ECG, blood pressure (BP), SpO_2, arterial blood analysis via arterial line on selected pulmonary patients, and ratings of perceived exertion and dyspnea. Symptoms of dyspnea can be rated by using the Borg category-ratio (CR10) dyspnea scale or a visual analog scale (VAS). With the addition of expired gas analysis for CPET, it is possible to evaluate parameters such as $\dot{V}O_2$, carbon dioxide production, and ventilatory threshold. Figure 3.4 provides a few of the parameters that can be assessed and analyzed during the CPET (27, 44). The addition of arterial blood gas analysis allows for the most accurate assessment of arterial oxygenation (e.g., alveolar–arterial oxygen gradient, oxygen partial pressure, PaO_2), carbon dioxide (CO_2) levels, dead space/tidal volume ratio (V_D/V_T), and acid-base balance measurements. CPET provides the most robust method for exercise evaluation in chronic lung disease, but due to its complexity and expense, widespread use may be limited in many pulmonary rehabilitation programs.

Contraindications for Graded Exercise Testing

For most respiratory patients without known or suspected cardiac problems, exercise testing to even maximal levels is relatively safe. Regular 12-lead electrocardiographic graded exercise test (GXT), incremental maximal exercise testing (IMET), and cardiopulmonary exercise testing (CPET) in the medically supervised setting have been shown to be very safe when performed by physicians or specially trained health professionals (45).

Figure 3.4 Common metabolic parameters assessed with cardiopulmonary exercise testing

- $\dot{V}O_2$ (mL/kg/min and L/min)
- % predicted peak $\dot{V}O_2$
- Peak $\dot{V}O_2$ uptake (mL/kg/min)
- First and second ventilatory thresholds (VT, mL/kg/min)
- Workload at the first and second VT
- % predicted VT
- Heart rate (HR) and heart rate reserve (HRR)
- Ventilatory reserve (VR)
- Respiratory exchange ratio (RER)
- Oxygen pulse (mL O_2 /kg/beat)
- Minute or pulmonary ventilation (V_E)
- Tidal volume (TV)
- Respiratory rate (f, breaths/minute)
- V_E/VCO_2 and V_E/O_2 (ventilatory equivalents) slopes, presented as ventilation/volume of expired carbon dioxide or oxygen
- Fraction of inspired oxygen (F_IO_2)
- Fraction of expired carbon dioxide (F_ECO_2)
- Partial pressure of end-tidal carbon dioxide ($P_{ET}CO_2$)
- Exercise oscillatory ventilation
- Circulatory power (CircPw, mmHg/mL/kg/min)
- End-tidal PCO_2 and PaO_2 (e.g., from arterial blood gas measurements)
- Physiologic dead space-to-tidal volume ratio (V_D/V_T)
- $P_{ET}O_2$

Common contraindications and precautions for CPET and GXT have been presented by the American Thoracic Society (ATS) and American College of Chest Physicians (ACCP) (26), as well as the American Heart Association (AHA) and American College of Sports Medicine (ACSM) (16, 44). While these two sets of guidelines are quite similar, there are subtle differences that the pulmonary

574-76386_ch03_1P.indd 30 30/11/18 10:20 PM

Figure 3.5 ATS/ACCP absolute and relative contraindications for cardiopulmonary exercise testing including ISWT.

Absolute

- Acute myocardial infarction (3–5 days)
- Unstable angina
- Uncontrolled arrhythmias causing symptoms or hemodynamic compromise
- Syncope
- Active endocarditis
- Acute myocarditis or pericarditis
- Symptomatic severe aortic stenosis
- Uncontrolled heart failure
- Acute pulmonary embolus or pulmonary infarction
- Thrombosis of lower extremities suspected dissecting aneurysm
- Uncontrolled asthma
- Pulmonary edema
- Room air desaturation at rest ≤85%*
- Respiratory failure
- Acute noncardiopulmonary disorder that may affect exercise performance or be aggravated by exercise (i.e., infection, renal failure, thyrotoxicosis)
- Mental impairment leading to inability to cooperate

Relative

- Left main coronary stenosis or its equivalent
- Moderate stenotic valvular heart disease
- Severe untreated arterial hypertension at rest (>200 mmHg systolic, >120 mm Hg diastolic)
- Tachyarrhythmias or bradyarrhythmias
- High-degree atrioventricular block
- Hypertrophic cardiomyopathy
- Significant pulmonary hypertension
- Advanced or complicated pregnancy
- Electrolyte abnormalities
- Orthopedic impairment that compromises exercise performance

*Exercise patient with supplemental O_2.

Reprinted from American Thoracic Society/American College of Chest Physicians. ATS/ACCP Statement on Cardiopulmonary Exercise Testing," *American Journal of Respiratory Critical Care Medicine* 167 (2003); 211–277.

rehabilitation practitioner needs to consider. Figures 3.5 and 3.6 present common precautions and contraindications to consider prior to performing symptom- or sign-limited submaximal and maximal GXT or CPET for patients with chronic pulmonary disease.

It should be noted that in patients with primary pulmonary arterial hypertension (PAH) and moderate to severe pulmonary hypertension (PH), pulmonary artery pressure often increases with exercise and there is an increased risk of sudden death. Although caution is advised when testing patients with PAH, CPET can be performed safely in both pediatric and adult populations when prescribed by a clinician with expertise in care of PH patients (46, 47, 48). It is ultimately up to the patient's pulmonologist or clinic supervising physician to determine which patients with PH are suitable for CPET. More research is required to ascertain the risks and benefits of testing those with severe PAH and moderate to severe PH in the clinical setting.

It is also vitally important to terminate the GXT or CPET at the appropriate endpoints. Figures 3.7 and 3.8 present common criteria for terminating the symptom- or sign-limited maximal graded exercise test. Two sets of criteria are presented—those from the ATS/ACCP (26) and those from the AHA, American College of Cardiology (ACC) and ACSM (16, 25, 44). The second set of criteria is divided into both absolute and relative indications for exercise test termination.

It is vitally important that all applicable safety precautions are set in place prior to any form of exercise testing. General safety considerations for cardiopulmonary exercise testing are presented in figure 3.9 (29, 49).

In pulmonary patients, two other assessments should also be considered during the GXT. First,

Figure 3.6 AHA and ACSM absolute and relative contraindications to symptom-limited graded exercise testing

Absolute

- Acute myocardial infarction within 2 days
- Ongoing unstable angina
- Uncontrolled cardiac arrhythmia with hemodynamic compromise
- Active endocarditis
- Symptomatic severe aortic stenosis
- Decompensated heart failure
- Acute pulmonary embolism, pulmonary infarction or deep vein thrombosis
- Acute myocarditis or pericarditis
- Acute aortic dissection
- Physical disability that precludes safe and adequate exercise testing

Relative

- Known obstructive left main coronary artery stenosis
- Moderate to severe aortic stenosis with uncertain relationship to symptoms
- Tachyarrhythmia with uncontrolled ventricular rates
- Acquired advanced or complete heart block
- Recent stroke or transient ischemic attack
- Mental impairment with limited ability to cooperate
- Resting hypertension with systolic >200 mmHg or diastolic >110 mmHg
- Uncorrected medical complications, such as significant anemia, important electrolyte imbalance, and hypothyroidism

Reprinted with permission from the American College of Sports Medicine, *ACSM's Guidelines for Exercise Testing and Prescription*, 10th ed. (Philadelphia: Wolters/Kluwer—Lippincott Williams & Wilkins, 2018), 118.

Figure 3.7 ATS/ACCP indications for exercise test termination

- Chest pain suggestive of ischemia
- Ischemic ECG changes
- Complex ectopy
- Second- or third-degree heart block
- Fall in systolic pressure of 20 mmHg from the highest value during the test
- Hypertension (250 mmHg systolic; 120 mm Hg diastolic)
- Severe desaturation: $SpO_2 \leq 80\%$ when accompanied by symptoms and signs of severe hypoxemia
- Sudden pallor
- Loss of coordination
- Mental confusion
- Dizziness or faintness
- Signs of respiratory failure
- Definition of abbreviations: ECG = electrocardiogram; SpO_2 = arterial oxygen saturation measured by pulse oximetry

Adapted from. American Thoracic Society/American College of Chest Physicians. "ATS/ACCP Statement on Cardiopulmonary Exercise Testing," *American Journal of Respiratory Critical Care Medicine*167 (2003): 211–277.

dynamic hyperinflation can develop with increasing ventilation; this can be assessed periodically with maximal flow-volume loops and measurements of inspiratory capacity (3). Second, exercise-induced bronchospasm can be assessed by spirometry for up to 30 minutes postexercise (33). Commonly used criteria to define specific limitations during exercise testing are given in figure 3.10 (29).

FUNCTIONAL PERFORMANCE ASSESSMENT

In addition to formal exercise testing, patients should be assessed by questioning and physical assessment regarding functional performance status. This should include evaluation of respiratory muscle function, breathing mechanics, and thoracic mobility (e.g., diaphragmatic excursion, accessory breathing patterns, and rib cage flexibility). Equally important is the evaluation of balance, fall risk, and any orthopedic or musculoskeletal limitations; for example, the patient's gait

-1—
0—
+1—

Figure 3.8 AHA/ACC/ACSM indications for terminating a symptom-limited maximal exercise test

Absolute

- ST elevation (>10 mm) in leads without preexisting Q waves because of prior MI (other than aVR, aVL, or V_1)
- Drop in systolic blood pressure of >10 mmHg, despite an increase in workload, when accompanied by other evidence of ischemia
- Moderate to severe angina
- Central nervous symptoms (e.g., ataxia, dizziness, or near syncope)
- Signs of poor perfusion (cyanosis or pallor)
- Sustained ventricular tachycardia or other arrhythmia, including second- or third-degree atrioventricular block that interferes with normal maintenance of cardiac output during exercise
- Technical difficulties monitoring the ECG or systolic blood pressure
- The subject's request to stop

Relative

- Marked ST displacement (horizontal or downsloping of >2 mm, measured 60 to 80 ms after the J point in a patient with suspected ischemia)
- Drop in systolic blood pressure >10 mmHg (persistently below baseline) despite an increase in workload, in the absence of other evidence of ischemia
- Increasing chest pain
- Fatigue, shortness of breath, wheezing, leg cramps, or claudication
- Arrhythmias other than sustained ventricular tachycardia, including multifocal ectopy, ventricular triplets, supraventricular tachycardia, and bradyarrhythmia that have the potential to become more complex to interfere with hemodynamic stability
- Exaggerated hypertensive response (systolic blood pressure >250 mm Hg or diastolic blood pressure >115 mmHg)
- Development of bundle-branch block that cannot be distinguished from ventricular tachycardia
- $SpO_2 \leq 80\%$

Key: ECG = electrocardiogram; MI = myocardial infarction; SpO_2 = arterial oxygen saturation measured by pulse oximetry

should be evaluated for abnormalities that may require individualized alterations to the exercise plan and ambulatory assistive devices. Figure 3.11 outlines some of the important considerations in this assessment (23).

Musculoskeletal problems are especially prominent in the pulmonary rehabilitation population. (1, 17, 18, 21). It is important to make a thorough assessment of the patient's baseline levels of strength, range of motion, posture, orthopedic limitations, and simple ADL (e.g., lying to standing, dressing, climbing steps).

EXERCISE PRESCRIPTION

Exercise prescription requires understanding the principles of exercise training, exercise mode, frequency, and duration. Additionally, exercise progression is an important concept used in prescribing exercise.

Principles of Exercise Training

Many factors must be considered when selecting an optimal exercise plan for persons with respiratory disease. To gain the most benefit from exercise training, it is imperative that the rehabilitation team work closely with the physician to achieve optimization of medical therapy, including the use of oxygen for treatment of hypoxemia. Successful rehabilitation outcomes depend on communication and a coordinated effort of the team to identify and meet the patient's medical and functional needs.

Exercise training in pulmonary rehabilitation should encompass upper- and lower-extremity

—-1

Figure 3.9 General safety considerations when performing exercise testing for pulmonary patients (29, 49)

- All test administrators must be trained in cardiopulmonary resuscitation and demonstrate competency in use of exercise prescription in chronic lung disease.
- Oxygen and emergency equipment should be in close proximity to the testing site.
- If testing is not performed in a hospital environment, adequate emergency procedures and equipment must be in place.
- If the patient is using long-term ambulatory oxygen therapy, the exercise test should usually be carried out using the prescribed level of oxygen. An exception might be the evaluation of a patient who may no longer need supplemental oxygen.
- At a minimum, pulse oximetry should be used to measure HR and SpO_2 to monitor the patient's physiological response to exercise. Dyspnea and established exertion scales should be used to measure the patient's perceived effort and shortness of breath and effort during the test.

Figure 3.10 Criteria for determining limitations during a symptom-limited graded exercise test

Ventilatory Limits

- Maximal exercise V_E /MVV >80%
- Rising P_aCO_2
- Rising V_D/V_T
- Development of dynamic hyperinflation
- Development of exercise-induced bronchospasm

Gas Exchange Limits

- Falling S_aO_2 or S_pO_2

Cardiovascular Limits

- Exercise HR >80% age-predicted maximal HR
- Falling blood pressure
- Serious dysrhythmia
- Cardiac symptoms (e.g., chest pain)
- Hypertensive or hypotensive response
- Deconditioning

Other Limits

- Orthopedic
- Peripheral vascular
- Musculoskeletal
- Metabolic
- Motivational or psychological

endurance training, strength training, and possibly respiratory muscle training. Frequency, intensity, time (duration), type (mode), volume, pattern, and progression of exercise should be included in each patient's initial treatment plan (ITP) as part of the exercise prescription. These components should be based upon the patient's disease severity, degree of conditioning, functional evaluation, and initial exercise testing data.

The FITT Principles of Aerobic Exercise Prescription for Pulmonary Patients

The ACSM (16) developed the FITT (Frequency, Intensity, Time, Type, Volume, Pattern, and Progression) technique from evidence-based guidelines for exercise prescription in both apparently healthy and some diseased populations. For patients with chronic lung disease, evidence supports aerobic exercise recommendations for those with COPD (1, 2, 16, 50–52) (table 3.3).

Specific evidence-based exercise training guidelines for patients with asthma are not currently available. However, exercise training is normally well tolerated in asthmatics who are successfully managed with proper pharmacotherapy (53). Position statements on exercise in those with asthma (54) and systematic reviews of this topic (54) support the ACSM FITT principles for exercise for asthmatics (16, 55) (table 3.4).

Figure 3.11 Functional Status Assessment Considerations

- Muscle strength and endurance
- Joint range of motion limitations
- Postural abnormalities (e.g., kyphosis, scoliosis, rounded or elevated shoulders)
- Oxygen equipment (e.g., type, weight and mobility of device)
- Subjective endurance and work tolerance
- Prior level of function
- Dyspnea
- Level of understanding of fitness and exercise
- Fear of exertion
- Ability to pace activities and energy conservation
- Balance abnormalities, gait instability, or increased risk of falling
- Pain levels and locations
- Ability to perform household chores (e.g., vacuuming, laundry, cooking)
- Ability to groom oneself (e.g., showering, dressing)
- Ability to move around home (e.g., climb stairs, walk to bathroom)

Exercise Type (Mode)

It is most beneficial to direct exercise training to those muscles involved in functional daily living. This typically includes training the muscles of both the upper and lower extremities to improve cardiovascular endurance, muscular strength and endurance, and range of motion. Exercise training of the lower extremities often results in dramatic increases in exercise tolerance of patients with COPD (1–3, 52, 60–65, 67, 79–81) and other respiratory diseases (12–15, 82). Exercises that improve neuromotor abilities, such as balance and coordination to decrease fall risk, are equally important with the pulmonary population (23, 29, 74, 83–85). This topic is explored further later in this chapter.

The mode of exercise will vary by the available equipment and space available at the pulmonary rehabilitation facility. Indoor track or treadmill walking is a common mode of lower-body exercise training for most pulmonary rehabilitation programs and may be the most beneficial type of exercise, as walking requires total body movement. For those who can walk, it is recommended to be included in their pulmonary rehabilitation exercise training program and can help contribute to overall functional gains for most people (training specificity). Other aerobic exercise modalities include cycle ergometers (both upright and recumbent), arm ergometers, rowing machines, step machines, recumbent cross-training devices, seated and upright elliptical trainers and use of one-legged training (see table 3.5). Water exercise is ideal for those with arthritic or musculoskeletal abnormalities due to the lack of stress on the joints and overall body conditioning. Nordic walking is another promising option for walking in persons with chronic lung disease (1).

Frequency and Duration

In general, the frequency and duration of medically supervised pulmonary rehabilitation exercise may vary from three to five times per week (1–3, 16, 34, 63, 64), 20 to 90 minutes per session (2, 16, 34, 68), and extend over a period of 8 to 12 weeks (1–3, 52, 65–69). Eight to 12 weeks of pulmonary rehabilitation produces benefits in several outcome areas that eventually decline over 12 to 24 months (52, 69). While there remains no general consensus of opinion on the optimal duration of pulmonary rehabilitation, the duration should be adequate to provide maximal individualized benefits without becoming burdensome. Although research has shown inconsistent findings of the overall benefits of long-term pulmonary rehabilitation maintenance programs of up to 3 years in duration (69–75), longer duration programs (e.g., beyond 12 weeks), may produce greater sustained benefits than shorter-term programs (52, 69–70, 75–79). Longer programs are thought to produce greater gains and maintenance of benefits, with a minimum of 8 weeks recommended to achieve a substantial effect (1, 79–83). The optimal duration for the individual would normally be the longest duration that is possible and practical given programs longer than 12 weeks have been associated with greater long-term benefits versus shorter programs (1, 52, 75, 76, 79).

Importantly, the beneficial effects in symptoms and 6MWT distance achieved with long-term pulmonary rehabilitation training have been shown to vanish after 24 weeks of follow-up (68). Thus,

Table 3.3 ACSM FITT Aerobic Recommendations for Those with COPD

FITT	Aerobic
Frequency	At least 3–5 days/week
Intensity	Moderate to vigorous intensity (i.e., 50%-80% peak work rate or 4–6 on the Borg CR10 Scale or 12–14 RPE scale)
Time	20–60 minutes/day at moderate to high intensities as tolerated; if the 20–60 minute durations are not achievable, accumulate ≥20 minutes of exercise interspersed with intermittent exercise rest periods of lower-intensity work or rest
Type	Common aerobic modes, including walking (free or treadmill), stationary cycling, and upper-body ergometry

Key: CR = category-ratio, RPE = rating of perceived exercise

Data from ACSM (2018).

Table 3.4 ACSM FITT Aerobic Recommendations for Those with Asthma

FITT	Aerobic
Frequency	3–5 days/week
Intensity	Begin with moderate intensity (i.e., 40%-59% of HRR or $\dot{V}O_2R$); if well tolerated, progress to 60%-70% of HRR or $\dot{V}O_2R$ after 1 month.
Time	Progressively increase to at least 30–40 minutes/day
Type	Aerobic activities using large muscle groups such as walking, running, cycling, swimming, or pool exercises

HRR: Heart rate reserve; $\dot{V}O_2R$: Volume of oxygen consumption reserve.

Data from ACSM (2018).

there may be an optimal duration of training for the pulmonary rehabilitation participant to "peak" in many physiologic parameters, and further research should lend insight into this optimal threshold of training.

If program constraints will not allow for supervised exercise at least 3 days per week, two supervised and one or more unsupervised sessions per week, in the home, with specific guidelines and instruction, may be an alternative option (1, 2, 16). If the patient is very debilitated, the duration of the initial exercise sessions can be shorter with more frequent rest breaks; however, the ultimate goal is to achieve fewer or no rest breaks and at least 30 minutes of endurance exercise within the first few weeks of rehabilitation.

Exercise training of the arms is very beneficial in patients with chronic lung disease, although most of the evidence comes from patients with COPD (78, 86, 87). Patients with moderate to severe COPD, especially those with mechanical disadvantage of the diaphragm due to hyperinflation, have difficulty performing ADLs that involve use of the upper extremities (87). Arm elevation is associated with high metabolic and ventilatory demand, and activities involving the arms can lead to irregular or dyssynchronous breathing (86). This happens because some arm muscles are also accessory muscles of inspiration. Benefits of upper-extremity training in COPD include improved arm muscle endurance and strength, reduced metabolic demand associated with arm exercise, and increased sense of well-being. In general, benefits of upper-extremity training are task specific. Because of its benefits, upper-extremity training is recommended in conjunction with lower-extremity training as a routine component of pulmonary rehabilitation (1, 2, 52, 83–89).

Arm ergometry exercise is well tolerated by most pulmonary patients and is particularly beneficial for those who can only walk short distances, who

Recumbent dual action stepping ergometer (e.g., NuStep™)	C
Wall or machine pulleys	UB
Seated aerobic activities (e.g., arm lifting, leg lifts) with or without hand or ankle weights	C

are obese, who have neuromuscular or orthopedic diseases, or who are wheelchair bound.

Caution should be taken with certain exercises in select patients, including those with osteoporosis (known or suspected due to oral steroid therapy) who may have decreased bone density and have an increased risk of vertebral compression fractures. These precautions include avoiding excess spinal flexion and rotation (90). Postoperative thoracic surgery patients (e.g., lung transplant) are generally restricted from upper-body exercise for 6 to 8 weeks postoperative to allow for internal and external incisional healing. Clearance for upper-body exercises is usually based on approval from the thoracic surgeon or transplant team (23).

Intensity of Exercise

The most challenging aspect of developing the exercise prescription for the pulmonary patient is estimation of the proper exercise intensity (16, 57, 81). The rehabilitation team must be prudent in ensuring that the exercise intensity is not too intense to provoke adverse physiologic reactions, yet is sufficient enough to promote a training effect. Individualized initial and ongoing assessments of subjective and objective findings are used to carefully advance intensity of exercise, often following incremental advancement of time. Supervised exercise training coupled with use of dyspnea control techniques works to enhance coping with fear and discomfort associated with breathlessness that often limits exercise capacity; therefore, most types of exercise that the patient enjoys or is willing to do can be beneficial. When developing the exercise prescription, the rehabilitation team must incorporate the patient's individual activity goals into the training plan. For example, if the patient wants to be able to walk the dog for 30 minutes each day at a relatively slow but steady pace without rest stops, the intensity of training should, in part, be designed to help accomplish that goal.

—-1
—0
—+1

As previously noted, both low- and high-intensity exercise training may be used to improve patient exercise tolerance. Principles of basic exercise training suggest that the intensity of exercise should be related to degree of disability, disease state, exercise test results (e.g., 6MWT, CPET, GXT, ISWT), time, workload, physiologic responses observed during exercise, and other factors. Please refer to tables 3.3, 3.4, and 3.5 for exercise intensity recommendations for patients with COPD and asthma, respectively.

High-Intensity Exercise Training

Aerobic endurance training for those with chronic lung disease may be performed at low, moderate and even high intensities (3, 55–59). High-intensity training of 60 to 80% of peak work rate may be undertaken to gain maximal physiological improvements in aerobic fitness. These improvements include increased $\dot{V}O_2$max, delayed anaerobic threshold, decreased HR for any given work rate, increased oxidative enzyme capacity, biochemical cellular changes, and capillarization of muscle (3, 55–58). These physiologic changes can result in a lower ventilatory requirement for a given exercise task as well as a more efficient pattern of breathing, with reduced dead space ventilation due to increased tidal volume and decreased respiratory rate. High-intensity training has been associated with substantial gains in exercise endurance (3).

Not all patients can tolerate sustained high-intensity exercise at the outset of training. Those patients working at their maximal tolerated exercise level will achieve gains over time (55, 57). Interval training, alternating periods of high and low intensity (or rest), has been shown to be an effective training option for persons who cannot sustain extended continuous periods of higher-intensity exercise (55, 56, 59).

Traditional physiologic changes associated with aerobic fitness from high-intensity training are not required to improve exercise tolerance and function in many patients with chronic lung disease. This is important because unpleasant dyspnea and leg fatigue associated with high-intensity exercise may interfere with its incorporation into the patient's daily lives, which affects overall exercise adherence. Moreover, it has not been proven conclusively that high-intensity exercise, with achievement of physiological gains in aerobic fitness, leads to greater improvement in day-to-day functional activity. Thus, lower-intensity aerobic exercise training can lead to significant improvements in exercise endurance, even in the absence of measured gains in aerobic fitness (60–62).

Exercise prescription using METs and MET minutes (see table 3.6) is commonly employed in pulmonary rehabilitation, using a predetermined MET range level for exercise intensity determined from a test of functional capacity. If the results from a CPET are available, one can prescribe exercise using the $\dot{V}O_2$ reserve technique from peak $\dot{V}O_2$ values (16). Peak functional capacity can also be estimated from common metabolic equations employed using GXT and 6MWT results. The rehabilitation team may also choose to have the patient perform any of the following to help gauge exercise intensity:

- Work up to a selected level on a perceived exertion scale or dyspnea level (e.g., 4 to 6 on the Borg CR10 Scale or 12 to 14 on a 6 to 20 RPE scale) (16, 91–93).
- Utilize a numeric rating scale (NRS) (94) or VAS (95–96) (see figure 3.12) to quantify perceived exercise intensity.

Any of these techniques can help guide the pulmonary rehabilitation practitioner in the development of the intensity component of the exercise prescription. Further information on the use of these scales may be found within the selected references.

Another guide for prescribing exercise intensity is using an exercise target HR range (e.g., heart rate reserve or Karvonen method) determined from an initial or follow-up exercise test, or from observations of the patient's HR responses during exercise sessions (16). However, target HR range is not always applicable during exercise training sessions in pulmonary rehabilitation programs due to a myriad of factors that can influence resting and exercise HR responses of the patient with chronic lung disease such as medications, resting dyspnea and deconditioning. Nevertheless, it is prudent to be aware of the patient's HR responses at rest and during exercise. Many pulmonary rehabilitation programs use intermittent "quick-check" HR monitoring during exercise from ECG, HR taken from pulse oximeter readings, and, if available, HR monitored via telemetry to a base station during exercise training. Any uncertainty regarding accuracy of HR based on oximetry reading should be correlated with checking radial or apical HR.

574-76386_ch03_1P.indd 38 30/11/18 10:20 PM

Table 3.6 Methods for Determining Exercise Intensity for Pulmonary Rehabilitation Participants

Method	Description
Heart rate reserve (HRR) (16)	Target Heart Rate (THR) = $[(HR_{max} - HR_{rest}) \times \%\ intensity] + HR_{rest}$
$\dot{V}O_2$ reserve ($\dot{V}O_2R$) (16)	Target $\dot{V}O_2 = [(\dot{V}O_{2max} - \dot{V}O_{2rest}) \times \%\ intensity] + \dot{V}O_{2rest}$ Note: $\dot{V}O_2R$ may be determined from CPET results or estimated $\dot{V}O_2$ from established metabolic equations from GXT results, 6-minute walk tests, or other measurement of peak functional capacity.
Visual analog scale (VAS) (157, 158)	The VAS can be presented in a number of ways, including scales with a middle point, graduations, or numbers (numerical rating scales); meter-shaped scales (curvilinear analogue scales); "box-scales" consisting of circles equidistant from each other; and scales with descriptive terms at intervals along a line (e.g., Likert scale).
Numeric rating scale (NRS) (92, 93)	Unidimensional numeric rating scale (0–10) that measures the general severity or perceived intensity of subjective symptoms or dyspnea at a given point in time.
Borg CR10 Scale modified for dyspnea (16, 90, 91)	Level of perceived dyspnea measured on a 0–10 scale, with 0 being "no breathlessness at all" and 10 being "maximal."
% of METS (16)	1 MET (metabolic equivalent) = 3.5 mlO_2/kg/min. If the subject's actual or measured $\dot{V}O_{2peak}$ was 19.7, their peak MET level is 5.6 METS (19.7 ml O_2/kg/min. / 3.5) (103). If you use ACSM recommended aerobic exercise intensity levels for asthmatics (40 to 59% $\dot{V}O_2R$), the MET exercise intensity range = 2.2 to 3.3 METS (.40 × 19.7 to .59 × 19.7).
MET minutes (16)	A MET minute is a unit used in exercise prescription to quantify energy expenditure by factoring in the time spent exercising. Example: You want your patient to exercise at 60% of their functional capacity (6.7 METS) for 30 minutes, 4 days/week. 4 METS × 30 min. = 120 MET minutes/day. 120 × 4 days/week = 480 MET minutes/week (weekly exercise prescription at a 4 MET level).
Kilocalories (kcal) from METS (16)	Example: 65 kg patient 1 MET = 1 kcal/kg × hour; 5 METS = 5.05 kcal/kg × hour (65 kg subject) 5.05 kcal/~~kg~~ × ~~hour~~ × 65 ~~kg~~ = 5.47 kcal/min 60 min/~~hour~~ You would like your patient to burn ~150 kcal during their exercise session, so they would exercise ~27 minutes.

Key: ACSM = American College of Sports Medicine; CPET = cardiopulmonary exercise test; GXT = graded exercise test; $\dot{V}O_2$ = oxygen uptake

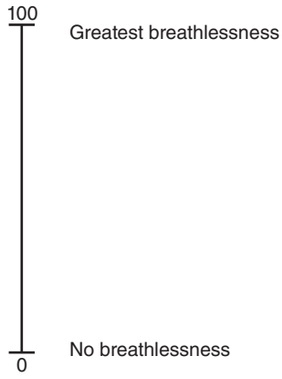

Figure 3.12 Visual Analog Scale

Oxyhemoglobin Monitoring During Exercise Training

In exercising patients with chronic lung disease, it is very important to evaluate and monitor SpO_2 to determine the need for supplemental oxygen. In particular, the arterial oxygen levels of patients with chronic lung disease change with exercise in an unpredictable fashion and cannot be reliably predicted by any measurement made at rest (97). In general, oxyhemoglobin saturation should be maintained at or above 88% during exercise. (16, 29, 98–99). Cutaneous oximetry from finger or handheld pulse oximeters provide an estimate arterial oxygen saturation (SaO_2) with general reliability of SpO_2 during walking, including 6MWT, with mean differences of 1 to 2% (35, 36). Measurements of SpO_2 are generally reliable when an accurate pulse signal is observed. Change in SpO_2 may be more variable in patients with interstitial lung disease, including idiopathic pulmonary fibrosis and systemic sclerosis, such as scleroderma (35). Use of alternative probe sites, including forehead, earlobe, or alternate fingers, may be considered if improved SpO2 accuracy is achieved. Supplemental oxygen therapy should be always readily available in the rehabilitation setting for those patients with hypoxemia during exercise.

Interestingly, some studies indicate that supplemental oxygen allows for higher levels of exercise training in COPD patients who do *not* have significant desaturation or are nonhypoxemic (2, 100–101), including those who participate in high-intensity training (72), while other studies do not have the same findings (102). The mechanisms underlying this potential benefit are unclear, but might involve decreased dyspnea from decreased carotid body stimulation, allowing for a slower respiratory rate and longer expiratory time, thereby decreasing dynamic hyperinflation. Reduced pulmonary vascular resistance may also be important. It is premature to recommend oxygen supplementation for nonhypoxemic pulmonary rehabilitation participants at this time until further research has been conducted.

Previously unrecognized exercise-induced oxygen desaturation should be documented and promptly reported to the patient's physician to facilitate a home oxygen prescription. Pulse delivery of oxygen via electronic demand device may not provide adequate SpO_2 for those patients during activity. Instead, continuous flow delivery of oxygen may be required, particularly in the patient with fibrotic lung disease. Patients should ultimately be tested during the maximal intensity level exercise they may undertake when at home, using the type of portable oxygen system that they use outside the program. The adequacy of the patient's oxygen system and flow rate recommendations during activity and exercise should be reported to the patient's physician. Patients requiring oxygen should be encouraged to obtain an oximeter and trained in ongoing monitoring of SpO_2 and oxygen in collaboration with the prescribing clinician.

In obstructive lung disease, it is also important to optimize bronchodilation and other pharmacological therapy before and during exercise training. This includes assuring not only that maintenance bronchodilators are taken, but also that short-acting bronchodilators are taken (when indicated) before initiating exercise (1, 2). Optimization of respiratory status allows for exercise training at higher intensities in patients with dyspnea limitation. Short-acting bronchodilators should also be part of any emergency kit in the exercise area.

VOLUME, PATTERN, AND PROGRESSION OF EXERCISE TRAINING

Currently the optimal volume (total amount of exercise during each session), pattern (sequence of exercise on various modalities, including rest periods), and progression of exercise training (providing an adequate training effect) remain unknown and require further investigation. A collaborative,

-1—
0—
+1—

574-76386_ch03_1P.indd 40 30/11/18 10:20 PM

multidisciplinary approach is typically used to develop the optimal volume, pattern, and progression of exercise based upon patient-specific characteristics. Gradual increases of exercise workload and intensity should be incorporated over time to provide the optimal training effect for the patient. This will vary by the severity and type of lung disease, the physical capabilities of the patient, age, gender, mobility, and many other factors. With further research, evidence-based guidelines may be developed with regard to these three very important parameters.

RESISTANCE EXERCISE TESTING

Chronic pulmonary disease not only damages the lungs but contributes to overall skeletal muscle dysfunction as well (16, 21, 52, 91). It has been well established that patients with COPD have diminished peripheral and overall muscular strength (22, 103–106). This decrease in strength is accompanied by a reduction in muscle cross-sectional area (105), muscle mass (1, 2, 52, 103) and mobility (103). Peripheral muscle atrophy and weakness combined with weak chest and thoracic muscles along with reduced muscle capillarization contribute to decreased energy expenditure, decreased resting metabolic rate, and a more sedentary lifestyle. Many pulmonary rehabilitation participants present not only with significantly reduced strength, but osteopenia and osteoporosis as well from the detrimental effects of sedentary living, chronic hypoxemia, malnutrition, and prolonged use of corticosteroid therapy. These combined effects may result in overall muscle weakness, increased risk of falls, and permanent injury or disability. Resistive exercise training can help the patient

Recent investigations have shown that resistive exercise training is beneficial in patients with COPD by increasing QOL (52), upper- and lower-body strength (1, 2, 4, 5, 8, 11, 52), and muscle size or mass (5, 52). For these and other benefits, resistive exercise training has now become an integral component of most pulmonary rehabilitation programs. Unfortunately, the effects of resistance training on disease outcomes are not well understood and few evidence-based resistive exercise recommendations currently exist in the literature for those with chronic lung disease. Most research has traditionally been performed on patients with COPD. The effects of resistive exercise training have not been well researched in patients with restrictive lung disease, pulmonary hypertension, cystic fibrosis, and other chronic lung conditions. Published evidence-based guidelines also vary somewhat with respect to resistance exercise prescription in pulmonary patients (95). Other confounding factors for developing evidence-based guidelines include a variation across studies of the number of repetitions performed, amount of weight lifted, rest interval duration between devices, total volume of work performed, pulmonary medications taken that may affect physiologic responses, upper-body versus lower-body exercise protocols, and the patient population, which oftentimes includes men only.

Therefore, the pulmonary rehabilitation practitioner who performs resistive exercise testing and training should rely on individual patient characteristics and published recommendations as well as their own knowledge of exercise prescription techniques. This is especially important for other clinical pulmonary populations until further research studies have been performed and consistent evidence-based guidelines established.

Resistance exercise testing and training serve many important purposes in today's pulmonary rehabilitation program, including:

- To let the patient know how they compare to those in their age and gender group,
- To let the patient know how much they are improving or regressing throughout pulmonary rehabilitation,
- To help determine the patient's ability to perform basic ADLs (e.g., dressing, picking up items, housework, squatting),
- To measure individual success in resistive exercise with validated normative data,
- To boost confidence and self-efficacy,
- To help assess posture, balance, and mobility issues and to prescribe posture and balance exercises,
- For documentation of preresistive and postresistive testing results for documentation of patient improvements in muscular strength and endurance for outcomes assessment, and
- To assess and determine the individual needs of the patient with respect to their unique overall muscular weaknesses.

Prior to resistance training, the patient should be evaluated for any joint or musculoskeletal abnormalities or discomfort. The standard for

—-1
—0
—+1

determining muscular strength in pulmonary populations in most research studies has traditionally been the one repetition maximum test (1-RM) (7, 16, 103, 107–109). This test involves having the patient perform an adequate warm-up and then lifting as much weight as they can for one maximal repetition with correct form and without straining. Protocols for determining the 1-RM threshold vary by the investigation. Some investigators utilize 3-RM, 5-RM, and even 10-RM preliminary testing to determine the final 1-RM threshold. While 1-RM testing has been shown to be safe in both male and female pulmonary rehabilitation participants (7, 104), machine weight exercise oftentimes may not be prescribed until later in the program (if at all), depending upon the patient. Various techniques to determine the initial resistive training workload exist. These techniques include performing a "modified" RM (e.g., 3-RM to 8-RM), where the pulmonary rehabilitation practitioner progressively increases the workload to determine the maximal amount of weight that can be lifted up to eight times with proper form and physiologic responses, and then prescribing a percent of this workload for exercise prescription. Another technique involves a gradual "titration" of weight over time. With this technique, the practitioner initially has the patient perform 10 repetitions comfortably on a piece of upper- or lower-body weight equipment and with lighter weights. The patient then progresses to 15 repetitions per session, increasing the weight load incrementally based on dyspnea or rating of perceived exercise by 1 to 2 pounds gradually over time. Finally, a validated rating of perceived exertion scale or a VAS may be used to rate resistive exercise intensity, starting with low resistance and low numerical ratings and progressively increasing to higher resistance and higher ratings over time. Patients should be reassessed prior to any increase in resistance training intensity or duration.

An inexpensive and effective "resistive circuit" may be developed if space is available. An example of this type of resistive circuit training could include the following stations:

- Dumbbell lifts (chair and dumbbells of varying weights required)
- Bands or tubes (chair and elastic bands or tubes of various tensions required)
- Medicine ball toss station (chair and medicine balls of various weights required)
- Hand-grip squeeze station (tennis balls, squeeze balls, or handgrip devices required)
- Leg-lift station with ankle weights or weighted shopping bags (chair and ankle weights or cloth shopping bags with full cans or stones required)
- Stair step station (adjustable step or set of steps required)
- Station where the patient can perform multiple resistive exercises using their body weight such as standing leg lifts, arm circles, chair raises, squats, or repetitive sit to stand (stable chair required)

Thus, with some creativity, an excellent, relatively inexpensive resistive training circuit can be developed for both the upper and lower body to incorporate the resistive component into pulmonary rehabilitation sessions.

Types of Resistance Modalities

Resistive exercise training can be performed using a number of inexpensive modalities in pulmonary rehabilitation. Patients in the pulmonary rehabilitation setting may be introduced to resistive exercise early in the program with elastic bands or tubes of varying strengths, hand weights, ankle weights, dumbbells, or may use their own body weight with or without chairs (e.g., leg lifts, seated leg extensions, squats, sit to stand, chair presses with both arms). Modalities such as these may be incorporated into warm-up/cool-down activities, used during a specific time period during the pulmonary rehabilitation session in a circuit station format (as described previously), or performed one-on-one with the patient and a pulmonary rehabilitation practitioner. Weight machines and pulley devices using heavier resistance may be used for the participant once they have acclimated to aerobic exercise training and have been cleared by their referring clinician for heavier workloads (108). There are currently no evidence-based recommendations on the time frame for the pulmonary rehabilitation participant to begin heavier resistive training after program entry. Thus, each patient must be evaluated individually with respect to resistive workload, taking into consideration their type and severity of lung disease, existing comorbidities (e.g., cardiovascular status), musculoskeletal limitations, and degree of frailty.

Rate of Progression

The rate of progression is a very important component of the resistive exercise prescription and

574-76386_ch03_1P.indd 42 30/11/18 10:20 PM

ACSM FITT Resistive Exercise Recommendations for Patients with COPD or Asthma

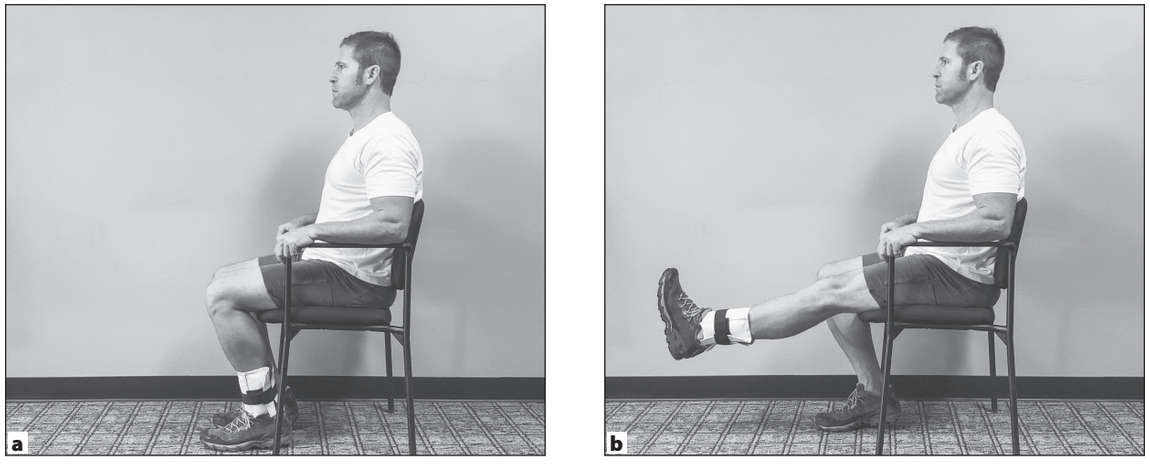
The ACSM FITT (Frequency, Intensity, Time, and Type) principles are evidence-based resistive exercise recommendations for patients with COPD and asthma (table 3.7) (16). These guidelines may apply only to patients with either COPD or asthma, as further research needs to be performed on patients with other types of chronic lung disease before evidence-based guidelines may be presented for these populations. Some of the recommendations presented may not be applicable to specific patients depending upon their individual characteristics, comorbidities, and frailty. Certain patients may not be able to effectively perform sustained aerobic exercise during pulmonary rehabilitation sessions. Thus, low-level resistance exercise may be a good alternative for these patients. While the ACSM recommends two to four sets of exercises to improve muscular strength, other investigators have found that one set of resistive exercises provides comparable strength and physical function improvements in COPD patients compared to multiple-set protocols (7). Nevertheless, these recommendations may help to provide a framework for the pulmonary rehabilitation practitioner in the development of individualized resistive exercise prescriptions for patients with either COPD or asthma.

The ACSM FITT recommendations are also supported, in part, by the American Thoracic Society and the European Respiratory Society (1). The ATS/ERS guidelines recommend that resistance exercise guidelines should follow the same ACSM FITT principle for apparently healthy and older adults (1, 106). The AACVPR currently does not state a specific FITT recommendation for resistive exercise in pulmonary patients (29).

Table 3.7 ACSM FITT Resistive Exercise Recommendations for COPD and Asthma

FITT	Resistance Exercise
Frequency	2–3 days/week
Intensity	*Strength:* 60%-70% of 1-RM for beginners; ≥80% 1-RM for experienced weight trainers *Endurance:* < 50% of 1-RM Assessment of dyspnea or RPE using a validated scale may be considered.
Time	*Strength:* 2–4 sets, 8–12 repetitions *Endurance:* ≤2 sets for 15–20 repetitions
Type	Weight machines, free weight, or body weight exercises

Key: RM = repetition maximum, RPE = rating of perceived exertion



Adapted from American College of Sports Medicine (16).

should be individualized to the patient based upon risk stratification criteria stated previously. The most important part of rate of progression is utilization of the overload principle. Upper- and lower-body musculature must be stressed in a gradual, progressive manner over time for the patient to gain the most benefits from resistive training (1, 109). The principle of overload involves increasing the exercise dosage over time to maximize gains in muscular strength and endurance. This can be achieved by increasing the intensity (weight or resistance), total repetitions per set, repetition speed or rhythm, number of sets of each exercise, and/or decreasing the rest period between sets or exercises (16, 108, 109). Reassessment is required before any advancement of intensity or time and only one feature of intensity should be increased at a time.

OTHER TESTS OF MUSCULAR FITNESS

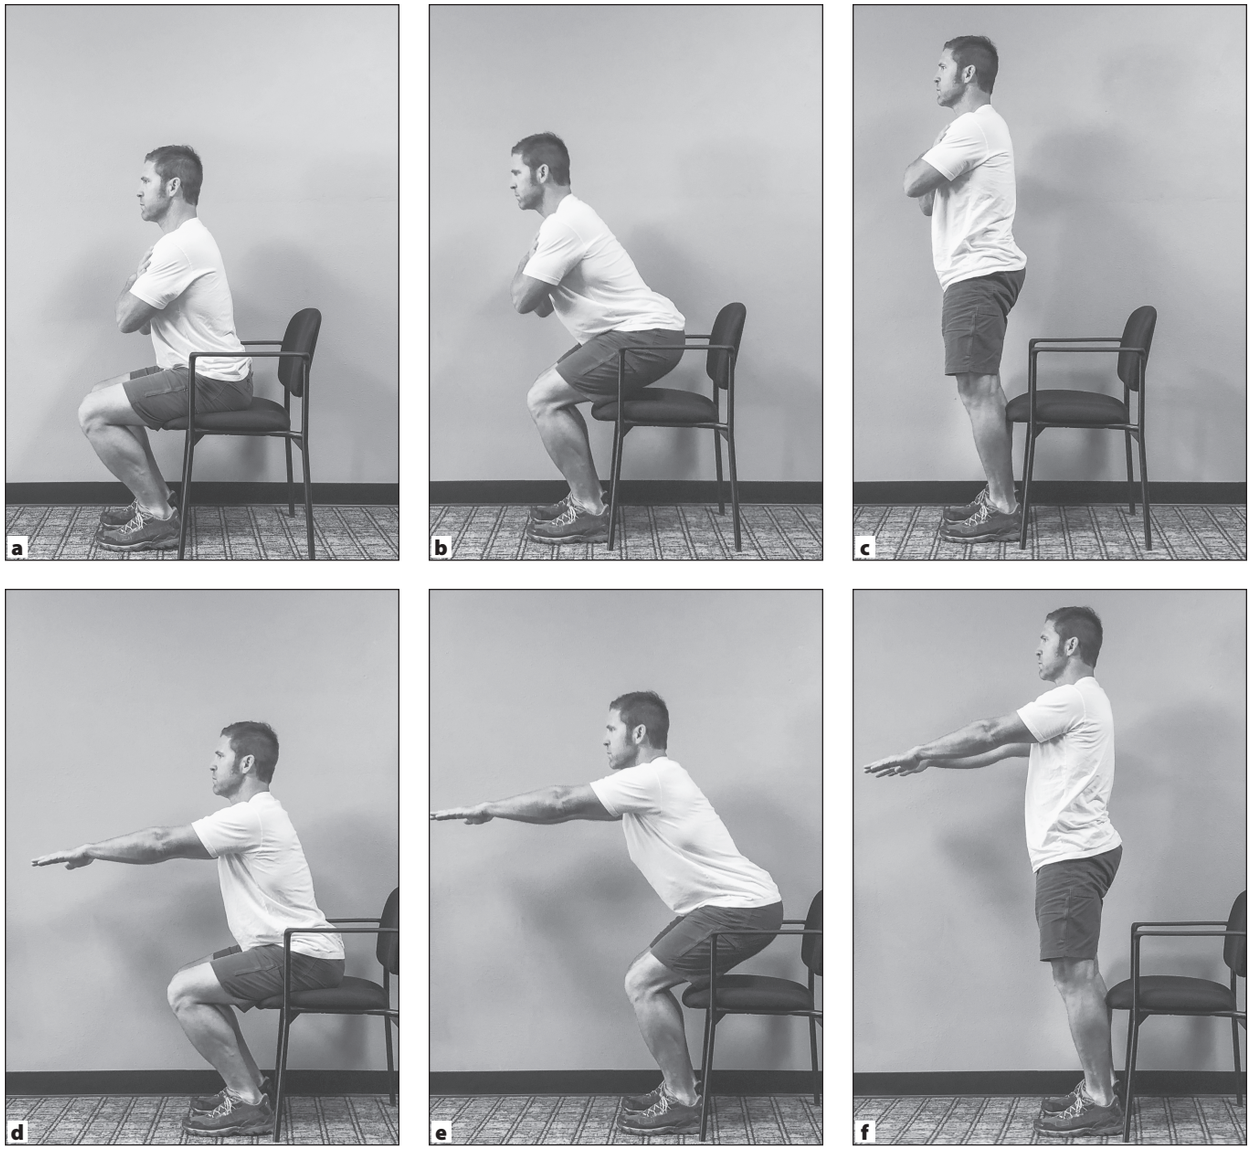
The pulmonary rehabilitation practitioner may choose from any number of validated physical function tests to assess muscular strength and endurance prior to pulmonary rehabilitation participation. The patient can then be tested periodically at regular intervals throughout program participation for outcomes documentation and assessment of improvement or decline. Moreover, upper- and lower-body muscular power (e.g., watts)

—-1
—0
—+1

Seated knee extension. *(a)* Sit in chair with back supported. Ankle weight strapped around ankle. Start with knees bent to approximately 90 degrees, feet resting on floor. *(b)* Straighten one knee and dorsiflex ankle ("toes pointing toward nose"). Pause, then return to start position. Repeat. Perform this exercise on both legs. Considerations: For taller individuals, use higher chair surface or rolled-up towel behind knee. For those with knee pain, work within a pain-free range of motion. Purpose of exercise: strengthen quadriceps/thigh muscles.

Photos courtesy of Kim Eppen.

Partial squat or knee bend. *(a)* Stand up straight while holding on to a firm surface. *(b)* Slightly bend knees while keeping hips back (body weight more on heels, not balls of feet). *(c)* Return to standing position. Repeat. Purpose of exercise: leg strengthening. This is a good option to start with for people who can't perform full sit-to-stand exercise.



Photos courtesy of Kim Eppen.

may be assessed from some of these tests. These tests include, but are not limited to, the following:

- Timed up and go (TUG) test (110–112)
- 30-second chair stand test (113)
- 6-minute pegboard and ring test (6PBRT) (114)
- Five-times-sit-to-stand test (115)
- 30-second arm curl test (111, 116)

-1—

- Handgrip dynamometer test (117–121)
- Seated medicine ball throw test (122)
- Gallon jug shelf transfer test (123)

While normative data currently does not exist for many of these tests for pulmonary populations, these normative values may provide a reasonable reference point for the pulmonary rehabilitation participant to determine their rate of decline or improvement over time, although consideration must be given to severity and type of lung disease, comorbidities, musculoskeletal abnormalities, and hypoxemia with regular subjective and objective assessment. This data also

—0
—+1

574-76386_ch03_1P.indd 45 30/11/18 10:20 PM

shows the patient how they compare to individuals in their age category.

The ACSM (16), ATS/ERS (1) and AACVPR (29) have presented varying but similar recommendations (106) on ways to incorporate resistive exercise progression within the formal pulmonary rehabilitation exercise prescription. The ACSM focuses on a gradual progression, increasing resistance, repetitions, or frequency per session over time (16). The ATS/ERS recommends increasing the weight, number of repetitions per set, and number of sets per session over time, or to reduce rest intervals when the patient can perform one or two repetitions over the desired number during two consecutive sessions (1). The AACVPR has stated that the pulmonary rehabilitation clinician should monitor the patient's RPE as well as muscle/joint fatigue, soreness, and pain over time to incorporate overload and progression. For those with osteoporosis, caution should be exercised with spine flexion or rotation and heavy weight training. For those with pulmonary hypertension, low-level resistance training with paced breathing is acceptable (29). Overall, each of these agencies offers prudent resistive exercise progression and overload guidelines and the pulmonary rehabilitation clinician may use a combination of the above approaches.

INSPIRATORY MUSCLE TRAINING

With any continuous exercise over a period of several minutes, respiratory muscles, with normal mechanical dynamics, can increase minute ventilation (tidal volume × respiratory rate). Consequently, repeating this pattern over a period of weeks at regular intervals, a training effect occurs with improved strength and endurance of the respiratory muscles. This improvement does not occur among those with mechanical disadvantages of the respiratory muscles due to disease, such as a flattened diaphragm muscle because of COPD (1). Whether more specific inspiratory muscle training, using resistive breathing devices, enhances outcome is controversial (1, 17). Some studies have demonstrated that resistance breathing leads to an increase in respiratory muscle strength and endurance, a reduction in dyspnea, walking distance, and health-related quality of life. The British Thoracic Society's guidelines on pulmonary rehabilitation in adults evidence-based clinical practice guidelines do not support the routine use of inspiratory muscle training as an adjunct to pulmonary rehabilitation (17). This therapy may be considered for respiratory patients with documented respiratory muscle weakness (e.g., due to cachexia or corticosteroid use) or persons who use an interval training technique to improve $P_I$max (maximal inspiratory pressure measured at the mouth).

Types of respiratory muscle training include flow resistive training (breathing through a progressively smaller orifice), threshold loading training (a preset inspiratory pressure, usually at some fraction of the maximal inspiratory pressure, is required), and isocapneic hyperventilation. Suggested guidelines for employing resistive inspiratory muscle training include a frequency of 4 or 5 days a week; intensities of 30% of $P_I$max and a duration of one 30-minute session per day or two 15-minute sessions over at least 2 months (29).

FLEXIBILITY TRAINING

The majority of evidence of exercise effectiveness is based on aerobic and resistance training, yet flexibility training is commonly included as part of pulmonary rehabilitation programs (1) (table 3.8). Maintaining flexibility and good posture are very important components of a pulmonary rehabilitation program. Exercises such as yoga (124) and Tai Chi can help patients maintain needed flexibility and good posture. Range of motion improvement exercises should be incorporated into each warm-up and cool-down session to help overcome the effects of postural impairments that limit thoracic mobility and therefore lung function (1, 16). Flexibility exercises may also help to improve range of motion, prevent patient falls, and improve overall QOL, although more research is needed in this area before any steadfast conclusions may be formulated.

PATIENT SAFETY

Safety, clinical stability, and prevention of muscle tears are of crucial importance, especially for persons on chronic steroid therapy who may be at risk of muscle or tendon rupture when exposed to high-intensity loads. Furthermore, strength training precautions are warranted for postsurgical pulmonary patients, those with osteoporosis, and patients diagnosed with pulmonary arterial hypertension (PAH) and moderate to severe pulmonary

hypertension (PH). Light resistance exercise training using dumbbells has been shown to be safe (i.e., no severe adverse effects) in patients with PH (125). However, it is very important to instruct the patient to avoid lifting heavy weights and any breath holding or Valsalva to avoid abnormal increases in intrathoracic pressure and blood pressure during any type of resistive exercise. Until resistance guidelines are established for patients with PH, the pulmonary rehabilitation practitioner should take a prudent approach to incorporating resistance training in this population. Light hand weights, dumbbells, ankle weights, and elastic bands or tubes may be beneficial for upper- and lower-body strength development in this selected patient population.

The need for cardiovascular monitoring may be less of a priority for the pulmonary rehabilitation participant who performs resistance exercise compared to traditional aerobic exercise. While patients with COPD have been shown to work closer to their peak $\dot{V}O_2$ during upper- and lower-body resistance exercise training than age-matched healthy adults (126), resistance exercise training generally elicits a *lower* cardiorespiratory demand than that of aerobic exercise (127). This form of exercise demands a lower level of $\dot{V}O_2$ and minute ventilation and therefore evokes less dyspnea (123).

The pulmonary rehabilitation practitioner should monitor patients who are prone to hypertensive/hypotensive responses with periodic blood pressure checks, even during the resistance movement itself. If an exercise blood pressure can be taken, the rate-pressure product (double-product) can be determined with a measurement of HR for optimal patient safety and refinement of the resistance exercise prescription. If the pulmonary rehabilitation participant is being monitored with continuous ECG telemetry, the practitioner should continue to monitor for arrhythmias and adverse ECG changes during periods of resistance exercise training.

Certain patients will require one-on-one guidance and supervision during resistive testing and training, depending upon their risk level and frailty. Each patient should be given proper training instructions, followed by the pulmonary rehabilitation practitioner demonstrating the exercise. Mild muscle soreness and fatigue are common 12 to 24 hours after testing and training. If the patient complains of persistent or significant soreness or joint pain (>1 week), the referring pulmonologist or physician should be notified. Holding off resistance and aerobic training of the affected area is warranted until discomfort has subsided. Patients with major orthopedic limitations, kyphoscoliosis, acute episodes of joint inflammation, uncontrolled metabolic disease, a resting $SpO_2 < 90\%$, acute systemic illness (e.g., influenza), recent significant increase in dyspnea, fatigue, or who report of experiencing a "bad breathing day" may be contraindicated from resistive testing and training and require further screening.

PRECAUTIONS IN PULMONARY HYPERTENSION

The cardiovascular and ventilatory response to exercise is limited in pulmonary hypertension (PH) due to restriction in maximum cardiac output associated with increased right ventricle afterload (128–131). Persons with PH experience

multiple physiologic abnormalities during exercise, including reduced peak $\dot{V}O_2$, oxygen pulse, and low anaerobic threshold (130, 131). Evaluation and management by skilled specialists, along with the advent and use of disease-targeted agents in appropriate patients has been associated with improved symptoms, exercise capacity, and health-related quality of life in persons with PH. Exercise training is now a class IA recommendation for PH patients (131–134).

Well-designed trials have demonstrated improvement in exercise, functional capacity, and quality of life in people with PH participating in exercise training programs compared to untrained control groups, with exercise-based rehabilitation resulting in clinically relevant improvements in exercise capacity (135, 136*).* Evidence-based guidelines recommend accurate diagnosis, evaluation, and management by a PH specialist, supportive measures including oxygen, supervised exercise training, and avoidance of strenuous physical activity. Prior to exercise, patients should be referred for expert evaluation and treatment recommendations (132).

Optimal exercise training and prescription in PH have not been established, although gradual exercise protocols at low intensity and short duration are often used initially. Interval training should generally be avoided due to the associated rapid changes in pulmonary hemodynamics and risk of syncope. Based upon pulmonary and cardiovascular symptoms, HR, BP, and SpO2 response, the intensity and duration of exercise may be gradually advanced as tolerated with exercise training intensity and duration generally kept at submaximal levels (133). Moderate intensity resistance exercise is generally introduced only when the patient effectively uses appropriate controlled breathing techniques and avoids breath holding or the Valsalva maneuver. There is no evidence for restricting arm lifting above the head (with or without weights) as long as the patient consistently uses controlled breathing and the clinical response is within defined acceptable limits for dyspnea, SpO_2, HR, and blood pressure with absence of syncope or presyncope (137). Reducing or stopping exercise is recommended in the presence of chest pain, lightheadedness, palpitations, hypotension, severe dyspnea, presyncope, or syncope. Extreme caution must be used to avoid interruption of intravenous vasodilator therapy and to prevent falls for individuals taking anticoagulants.

EXERCISE-INDUCED HYPOXEMIA

Hypoxemia during exercise is a common and clinically important finding in the pulmonary rehabilitation setting (138). The incidence of hypoxemia is unknown with very limited guidance or standards available to direct evaluation and management of hypoxemia during exercise. A subset of hypoxemic patients develop severe exercise-induced hypoxemia (SEIH) (139). SEIH is defined as the need for >6 L/min oxygen to yield an $SpO_2 \geq 88\%$ (139). Negative consequences of sustained hypoxemia include pulmonary hypertension, cor pulmonale, cardiac dysfunction, arrhythmias, erythrocytosis, cognitive abnormalities, decline in self-care, and increased mortality (139). Hypoxemia may be managed with supplemental oxygen therapy to improve oxygenation. A potential concern in persons with COPD is suppression of hypoxic ventilatory drive, resulting in hypoventilation and CO_2 retention. Most cases of CO_2 retention result from ventilation/perfusion mismatch rather than respiratory drive suppression (140–142). Clinically stable COPD patients are generally at low risk for significant or unstable hypercapnia, particularly when using low-flow oxygen, although some may experience clinically important respiratory drive suppression when using high-flow oxygen (142).

In cases of SEIH, evaluation and management should be based upon a systematic approach to determining the underlying cause(s) of SEIH, and development and use of appropriate management strategies. If the patient is clinically stable based on HR, symptoms, and BP, gradually progressive, incremental, supervised exercise in a pulmonary rehabilitation setting is reasonable as long as hypoxemia is controlled and the patient demonstrates both objective and subjective clinical stability and exercise tolerance.

Underlying cause(s) of hypoxemia during exercise may be multifactorial and may include ventilation/perfusion mismatch, diffusion defect, right-to-left shunt, or alveolar hypoventilation. Hypoxemia in persons with COPD is usually due to ventilation/perfusion (V/Q) mismatch (143). A diffusion defect is a potential contributing factor, especially at higher exercise intensities (144). Hypoxemia from diffusion defect is generally well controlled versus that due to a right-to-left shunt which may be associated with a more limited

-1—
0—
+1—

574-76386_ch03_1P.indd 48 30/11/18 10:20 PM

response to supplemental oxygen. As the shunt fraction increases, some patients may be refractory to up to 100% oxygen due to shunted blood bypassing alveoli required to transfer oxygen into the bloodstream (145–147). Hypoxemia due to depressed ventilatory drive resulting from oversedation is rare in the pulmonary rehabilitation setting and is typically accompanied by hypercapnia and low pH. Chronic respiratory failure is associated with hypercapnia, near normal pH, and elevated bicarbonate. Hypoxemia is often aggravated with exposure to high altitude or during disease exacerbation.

Evaluation of hypoxemia at a minimum begins with history and physical exam, pulse oximetry at rest and exercise, and evaluation of symptoms and vital signs. Evaluation for severe hypoxemia should include arterial blood gas determination and pulmonology evaluation, if not already in place.

Hypoxemia during Exercise

In chronic lung disease, the ability of the lungs to maintain normal arterial oxygen is often impaired, with compromise of oxygen delivery particularly during exercise. Muscular demand for oxygen increases during exercise in proportion to the amount of work performed (138). Higher cardiopulmonary demand results in complex physiologic adjustments as well as significant potential for dysfunction or failure during activity (147).

Managing Hypoxemia during Exercise

Supplemental oxygen is used to increase arterial oxygen levels, decrease carotid body stimulation (reducing pulmonary ventilation, respiratory muscle work, and dyspnea) and relieve pulmonary vasoconstriction (improving cardiac output restriction). Oxygen improves the effectiveness of short- and long-term exercise training in pulmonary rehabilitation by reducing dyspnea, hypoxic ventilatory drive, and hyperinflation, as well as delaying acidosis. Ambulatory oxygen has the potential to increase mobility, compliance, exercise tolerance, and autonomy in hypoxemic patients. The pulmonary rehabilitation clinician should address appropriate equipment selection, use, and flow rate; communicate these recommendations to the clinical team, including the referring clinician; and assess the patient during rest, activity, and exercise using the patient's portable system. Patients who are unable to obtain appropriate oxygen for rest and ambulation due to lack of access or lack of provision from their medical equipment company should address these concerns with their prescribing clinician and insurance.

Developing an Oxygen Prescription for Exercise-Induced Hypoxemia

A comprehensive assessment requires evaluation of desaturation and oxygen requirements during exercise testing. While a 6MWT or other exercise test may reveal significant hypoxemia associated with exercise, a separate assessment and titration should be conducted to determine severity of desaturation and oxygen needs during usual self-walking pace as well as "purposeful exercise" or other activities of daily life. Assessment must also occur using the patient's ambulatory oxygen source. Nighttime O_2 needs require a separate assessment based on the clinical judgment of the referring clinician. All testing revealing hypoxemia and oxygen titration should be promptly communicated to the referring clinician. Most guidelines recommend oxygen titration to an SpO_2 level of ≥88–93%. Community practice of management of SEIH describes oxygen flow rates of 7–15 L/min by several types of nasal cannula and/or delivering up to 100% oxygen by mask interfaces in one small study (139). Multiple interfaces are used in the pulmonary rehabilitation setting, including nasal cannula, Oxymizer cannula and pendant, non-rebreathing (NRB) mask, Oxymask, Venturi mask, transtracheal oxygen, and other interfaces in an attempt to meet the oxygen needs of this population during exercise.

Inpatient practitioners have extensive experience with various high-flow oxygen systems, including NRB masks and heated, humidified, high-flow oxygen. These modalities have historically had limited use or availability in the outpatient setting due to comfort concerns and lack of portability during exercise. Use, safety, and effectiveness of these systems during exercise are poorly understood.

Oxygen Monitoring, Titration and Exercise Training

In hypoxemic COPD patients, long-term oxygen therapy has been found to improve survival,

—-1
—0
—+1

exercise, sleep, and cognitive performance with a therapeutic goal of SpO_2 level of ≥88–90% during rest, sleep, and exertion (1, 2, 16). Patients with ongoing desaturation despite use of high-flow oxygen require medical evaluation and management prior to resuming exercise. Optimal strategies for exercise training for SEIH patients have not been established (139). Progressive exercise routines should be based upon physiologic findings, such as an adequate SpO_2 determined from a pulse oximeter, symptom level including dyspnea and fatigue, stable heart rate and blood pressure, and the results of a 6MWT or CPET. If available, pulmonary rehabilitation programs should consider telemetry monitoring during the patient's first exercise session and ongoing telemetry monitoring in those with significant pulmonary hypertension or cardiac abnormalities. Patients with significant arrhythmias require medical evaluation and treatment before exercise is performed. Interval training should be avoided in persons with significant PH due to rapid changes in pulmonary hemodynamics and risk of syncope. Exercise should be stopped if the patient develops desaturation refractory to supplemental oxygen, significant tachycardia, arrhythmias, severe dyspnea, hypotension, severe hypertension, dizziness, or chest pain. Patients should have ongoing evaluation and management of their chronic lung disease and comorbidities by a pulmonologist, primary care provider, and other appropriate consultants.

Low-intensity exercise is recommended in the initial stages of exercise based upon evaluation of dyspnea, SpO_2, HR, blood pressure, and subjective symptoms. Guidelines support safe incremental increase in exercise intensity based on clinical stability. Exercise prescription and a home exercise program should be established and communicated to the patient as well as indications for stopping exercise and symptoms to report to their physician. Interval training exercise routines require further investigation in SEIH to determine safety and effectiveness.

HOME EXERCISE CONSIDERATIONS

Patients participating in a formal pulmonary rehabilitation program should be provided with a home exercise prescription to support ongoing exercise. All patient recommendations should be tailored to the individual based upon their performance and achievements during the pulmonary rehabilitation program. Aerobic exercise, muscular strength conditioning, range of motion exercises, and, in select patients, inspiratory muscle training should be included in the home exercise program. It is essential to consider the patient's future exercise setting when prescribing independent exercise to promote adherence to the program. For example, if the patient does not have access to weight-training machines, specific strength training exercises that the patient can perform with inexpensive modalities such as elastic resistance bands, light dumbbells, and hand or cuff weights should be recommended. The home exercise prescription should reflect activities performed during the rehabilitation program to allow the patient to proceed with confidence in their personalized independent program.

Participation in a pulmonary maintenance exercise program in a supervised setting promotes short- and long-term exercise adherence, patient and group support, clinical monitoring of cardiopulmonary signs and symptoms, and the opportunity for ongoing training and reinforcement of self-management strategies.

Home-Based Pulmonary Rehabilitation

Although pulmonary rehabilitation is typically provided in supervised outpatient or inpatient settings, growing evidence suggests that home-based exercise training can be effective (148–150). Home exercise programs should encourage exercise as well as lifestyle modifications to promote improved health and functional status. While home-based pulmonary rehabilitation offers the potential for convenience, cost savings, and increased access, several potential barriers exist. Potential concerns and limitations of home-based pulmonary rehabilitation include safety, liability, supervision responsibilities, outcome measurement, grossly inadequate or absent coverage by insurance, limited group support, and lack of well-developed, evidence-based guidelines that are widely applicable for the home setting and an equally strong evidence base of effectiveness. Ongoing, direct clinical supervision, monitoring, and management of clinical abnormalities in the home is unlikely. Technology systems supporting home pulmonary rehabilitation are in their infancy and have not been extensively tested in this setting. Older patients, particularly those who are less affluent and more disabled may be

-1—
0—
+1—

574-76386_ch03_1P.indd 50 30/11/18 10:20 PM

disconnected from e-health both physically and psychologically (151).

Technology-Supported Home-Based Pulmonary Rehabilitation

Key principles to ensure that technology-supported home-based pulmonary rehabilitation is effective include evaluation for clinical efficacy as well as safety. Goals of care should include enhancement of function, patient independence, symptom control, and improvement in quality of life. Optimized exercise safety is a key requirement for unsupervised exercise. Whether technology-supported home-based pulmonary rehabilitation has the potential to reduce health care utilization and mortality in pulmonary populations requires further research (152–154). Key areas include mechanisms for:

- Evaluation of desaturation at rest and with exercise, and oxygen titration prior to home pulmonary rehabilitation
- Patient training and return demonstration of proper use of inhaled medications and, when appropriate, secretion clearance devices
- Insurance coverage or patient payment for home pulmonary rehabilitation
- Patient support to reinforce new behaviors

As with traditional pulmonary rehabilitation programs, a patient must undergo a complete history and physical examination, symptom assessment, and discussion of optimal control and management of chronic lung disease and comorbidities prior to initiating a home exercise program. The preevaluation includes evaluation of functional capacity typically using a 6MWT, shuttle walk test (endurance or incremental), or CPET (1, 16, 29, 35). Those patients unable to walk 50 feet either unassisted or with their usual walking aid should be referred to either physical therapy for improvement in functional capacity or to a supervised inpatient or outpatient pulmonary rehabilitation. Patients should have had an ECG within the past year. Those with an abnormal ECG, cardiovascular symptoms, or poorly controlled cardiovascular disease should be referred to a cardiologist for further testing, management, and clearance before beginning a home exercise program. Patients with significant ECG or echocardiogram abnormalities or New York Heart Association class III-IV congestive heart failure require close supervision and monitoring not available in the home setting.

Home Exercise Prescription

Guidelines are lacking for home exercise. The following sections provide a general framework for home exercise in stable patients with mild to moderate chronic lung disease.

Dyspnea Control and Symptom Management

Patients should be trained in strategies for dyspnea control, including pursed-lip breathing, three-point posture, intermittent rest periods, use of electric or battery operated fan, open window, and walking in a mall or large store while leaning on a shopping cart or using a rollator or rolling walker (avoiding peak crowds). Considerations for distraction from dyspnea include use of music, TV, scenic locations, and exercising with friends or family.

Moderate breathlessness and fatigue are common symptoms with exercise, particularly during the initial weeks of training. If symptoms increase to beyond 6–10 using a valid 10-point dyspnea or fatigue scale, the patient is advised to slow down or rest until at baseline, then resume walking or activity at a slower speed. If dyspnea does not improve or worsens despite dyspnea controls, the patient is instructed to promptly contact their clinician or seek emergency care.

Adjuncts for Exercise

Tools that may support exercise include walking aids such as rollators that may improve balance, distance, dyspnea, and fatigue (155) and Nordic walking or trekking (156). Alternatively, the patient may use a usual walking aid if preferred.

Patients should be assessed for resting and exercise hypoxemia prior to home exercise along with development of an oxygen prescription and training on oxygen use and safety. Once home oxygen and prescription have been prescribed, the clinician should determine if the patient's portable ambulatory oxygen will adequately oxygenate the patient during activity by monitoring SpO2, heart rate, and dyspnea while performing 3 to 6 minutes of walking at the patient's usual pace. The patient should own an accurate oximeter and be trained in its use and goals for oxygen saturation during rest and exercise (157). If high-flow

—-1
—0
—+1

oxygen is required, consider evaluating use of a reservoir cannula or pendant to reduce continuous flow requirements. These devices require continuous flow oxygen for effective use. Patients with severe exercise-induced hypoxemia should be referred to outpatient or inpatient pulmonary rehabilitation.

Short- and long-acting bronchodilators play a key role in improving dyspnea and hyperinflation in obstructive lung disease (158). The clinician should determine if use of a short-acting bronchodilator such as albuterol alone or combined with ipratropium metered dose inhaler or nebulizer before exercise is warranted. Patients should be trained in and demonstrate proper inhaler use with regular follow-up evaluation.

The patient should be trained in self-monitoring of abnormal symptoms and appropriate management and reporting of abnormalities. The patient should have a mechanism to call for help, either with a family member or friend present, or use of a cellular phone. A summary of when to stop exercise is found in figure 3.13.

Self-Management

Self-management training is a key element of pulmonary rehabilitation and therefore must be addressed as part of home pulmonary rehabilitation. The emphasis of self-management has moved from a formal, didactic approach to a focus on collaborative self-management, behavior change, and adaptation (159). Self-management includes goal setting, problem solving, decision making, and taking action based on a predefined action plan (160, 161). Specific models for providing home self-management training are few and have not been well evaluated. Figure 3.14 identifies topics for self-management training as part of pulmonary rehabilitation. Factors influencing activation of self-management may include anxiety, illness perception, body mass index, age, Global Initiative for Chronic Obstructive Lung Disease (GOLD) COPD stage, and comorbidities (161–165).

Figure 3.13 When to not exercise and get help.

- Breathlessness, fatigue, or weakness beyond normal levels that does not improve with rest or usual management (e.g., oxygen, rescue inhaler or nebulizer, tripod position, etc.)
- Chest pain or tightness
- Heart palpations, including very slow or fast heart rates
- Muscle pain that does not improve
- Feeling dizzy or faint
- Leg pain, weakness, or cramping
- Sweating more than usual with exercise

Outcome Measures

At a minimum, home exercise programs should include measurement of dyspnea and physical activity. A tracking and reporting system should include the patient's resting and exercise heart rate, oxygen saturation, activity tracking using an accurate activity monitor, and oxygen flow rates if oxygen is used. For very slow walking patients, recording walking time or distance is acceptable. Pretesting and posttesting should include measurement of functional capacity such as 6-minute walk testing or shuttle walk testing, health-related quality of life, and mood (e.g., depression and possibly anxiety symptoms). A clinician should be identified to be responsible for tracking outcomes and addressing abnormal findings in home exercise (159).

EMERGENCY PROCEDURES

Appropriate emergency procedures and supplies must be immediately accessible and used appropriately in the pulmonary rehabilitation exercise and patient training areas (1, 16). All staff should regularly demonstrate competency with these emergency procedures. Minimum emergency equipment should include an oxygen source adequate for use during patient resuscitation and delivery apparatus, resuscitation mask, first-aid supplies, bronchodilator medications, and defibrillator (either clinical defibrillator or automated external defibrillator) (figure 3.15). In addition, all staff should have at a minimum current certification in basic life support for health care providers. Personnel who work with pulmonary patients should be familiar with panic and dyspnea control techniques.

In the patient with acute dyspnea, the following interventions are recommended:

- Monitor SpO_2.
- Assess cardiovascular status with HR, blood pressure, and, when available, ECG rhythm strip.
- Have the patient stop the activity and assume a comfortable breathing position.
- Encourage the patient to use pursed-lip breathing and relaxation techniques.
- Administer supplemental oxygen, if indicated.
- Use a rapid-onset bronchodilator medication, if indicated.

Figure 3.15 Emergency equipment for pulmonary rehabilitation.

- Telephone in the room
- Sphygmomanometer
- Stethoscope
- Pulse oximeter
- Clinical defibrillator or automated external defibrillator (AED)
- Oxygen with delivery apparatus
- Resuscitation mask (Ambu bag)
- First-aid supplies

If available:

- Fully equipped crash cart with emergency drugs, including bronchodilator medications*
- IV pole for fluid administration*

*A ongoing system is required for proper training and use of equipment, medications, and supplies.

Immediately summon the supervising physician, rapid response team, or code blue team if the patient continues to deteriorate despite the above emergency measures or when indicated.

DOCUMENTATION OF THE EVALUATION AND TREATMENT SESSION

As part of initial and ongoing patient pulmonary rehabilitation evaluation and reevaluation, every skilled clinician treating patients in pulmonary rehabilitation should perform an independent evaluation of each patient specific to the clinician's particular scope of practice. For example, the respiratory therapist would evaluate a patient's use of MDIs and (when appropriate) secretion clearance devices, whereas a physical therapist or clinical exercise physiologist should evaluate a patient's functional mobility. Cross-training of clinicians is appropriate and reasonable to further strengthen the competency

—-1
—0
—+1

of the clinical team and patient rehabilitation interventions. Within this evaluation, the clinician should identify the patient's problems, set goals to address these problems, and create a plan of care directed toward the defined goals. Overall, the patient initial assessment and evaluation should include the following: history of pulmonary and nonpulmonary disease; comorbidities and clinical manifestations; physician's review of pulmonary function tests, arterial blood gases (if available), and other relevant diagnostic tests; past medical history; current medications and oxygen liter flow (if used); baseline functional level; psychosocial status; ADL and mobility functional deficits; and an assessment of the patient's rehabilitation potential.

Documentation from treatment sessions should include the time and date; frequency, intensity, time, and type of exercise; education provided to the patient; patient's response to treatment; patient progress; and, importantly, rationale for continuing skilled intervention. Documentation of patient problems or deficits and the above information is summarized on the individualized treatment plan (ITP) in collaboration with the supervising physician at start of care, every 30 days, and at discharge.

SUMMARY

The importance of an exercise training program cannot be overemphasized. However, before a safe exercise program can be provided, a thorough patient assessment is required to evaluate exercise tolerance, formulate an appropriate exercise training prescription, detect exercise-induced hypoxemia or bronchospasm, and detect occult cardiac or other pulmonary and nonpulmonary limitations to exercise. The benefits of exercise training are well documented and include improved aerobic capacity, decreased dyspnea, increased physical capability, increased muscular strength and endurance, and improved quality of life. Areas requiring further research regarding effectiveness and use in the pulmonary rehabilitation setting include add-on or adjuncts to exercise (166), home- or community-based pulmonary rehabilitation (159), and use of high-flow oxygen systems (139).

APPENDIX

D

Example of a Typical Pulmonary Rehabilitation Facility and Examples of Pulmonary Rehabilitation Programs That Meet 2, 3, and 5 Days a Week

This appendix provides one example of a pulmonary rehabilitation facility, including descriptions of the various areas possible and detailed examples of activities that could be included in pulmonary rehabilitation programs.

EXAMPLE PULMONARY REHABILITATION FACILITY

Facility Areas

- Waiting or reception area
- Pulmonary rehabilitation administrative assistant's office
- Pulmonary rehabilitation program coordinator's office
- Storage room
- Classroom

Description of Areas

- Pulmonary rehabilitation waiting or reception area and office
  - Equipment includes desks, computer, chairs for patients, staff equipment and supplies, and public telephone.
- Pulmonary rehabilitation classroom
  - Equipment includes patient notebooks and supplies appropriate for pulmonary rehabilitation training, tables, chairs, whiteboard, and VCR.
- Gymnasium
  - Equipment includes exercise equipment appropriate for pulmonary rehabilitation exercise sessions (e.g., indoor level-surface track, treadmills, stationary bikes, rowing machines, stair stepper, treadmills, floor exercise space, and weights) as well as blood pressure cuffs, stethoscopes, supplemental oxygen sources, pulse oximeters, and emergency equipment.

*Make sure there is a 5–10 minute rest break between each activity

574-76386_ch14_AppendixD_1P.indd 178 30/11/18 10:20 PM

Three-Day Pulmonary Rehabilitation Program

- Monday, Wednesday, Friday; 2-hour format
- Check-in: 10 minutes
- Warm-up and breathing retraining: 10 minutes
- Weight training and stretching: 20 minutes
- Aerobic training (ambulation on treadmill or level surface): 20 minutes
- Biking aerobic training (bike ergometer with arms and legs, legs only, or arm ergometry—patient may do one of the bike choices or a combination that would total 20 minutes): 20 minutes
- Cool-down: 10 minutes
- Education: 30 minutes
- Make sure there is a 5–10 minute rest break between each activity

Five-Day Pulmonary Rehabilitation Program

- Monday through Friday, 4-hour format
- Check-in: 10 minutes
- Circuit weight training: 20 minutes
- Pulmonary hygiene (may include chest physical therapy, nebulizer, instruction in inhaler use, or breathing retraining): 30 minutes
- Floor exercise (breathing retraining, muscle toning, stretching): 60 minutes
- Aerobic training (ambulation on treadmill or level surface): 30 minutes
- Biking aerobic training (bike ergometer with arms and legs, legs only, or arm ergometry—patient may do one of the bike choices or a combination that would total 30 minutes): 30 minutes
- Education: 60 minutes
- Make sure there is a 5–10 minute rest break between each activity.

CHAPTER

4

Collaborative Self-Management and Patient Education

Gerene Bauldoff, PhD, RN, MAACVPR
The Ohio State University College of Nursing

Jane Knipper, RN, MA, AE-C, MAACVPR
University of Iowa Hospital and Clinics

Debbie Koehl, MS, RRT-NPS, AE-C, FAARC
Indiana University Health Methodist Hospital

Expert opinion and systematic reviews support the inclusion of education as an essential component of a comprehensive pulmonary rehabilitation program (1–7). As discussed in chapter 2, evaluation of the education needs of the patient and family or caregiver is the base on which an individualized education program is designed. Traditionally, education in pulmonary rehabilitation has been presented by a health care provider, one on one or in a group lecture setting, with the content being a disease-specific but not necessarily patient-specific focus. This approach has been shown to have low overall effectiveness (2). Rather than present information in the traditional didactic format, the education process that is currently recommended is to utilize the model of collaborative self-management training. This promotes learning by doing, which increases knowledge, enhances skills mastery, and increases self-efficacy (2). Traditional didactic education is insufficient to promote health behavior change and optimize disease control. Self-management training changes a patient's behavior by teaching individualized problem-solving skills that improve self-efficacy, which is defined as the patient's confidence to perform a behavior required to reach a specific goal. Continued development of innovative self-management programs is ongoing (2–5). Collaborative self-management training benefits both the patients and the caregivers. The patients become active partners in the management of their chronic lung disease. Patients gain the ability to assess their progress and problems, set goals, and problem solve (4, 5). Strategies that integrate self-management training and enhance communication between the patients and their health care providers have been shown to improve adherence to their treatment plans (7–9), reduce health care utilization, and reduce the probability of hospitalizations and readmissions (7). An important benefit of self-management strategies is reduction in non-adherence (2).

574-76386_ch04_1P.indd 55 30/11/18 10:20 PM

DEVELOPING AN INDIVIDUALIZED SELF-MANAGEMENT PROGRAM

Self-management interventions must be individualized to each patient's needs and concerns, diagnosis, disease severity, and comorbidities. Self-management training may be presented one on one or in a group setting, but the content must be sufficient to meet the specific needs of each patient. In addition, the interventions must focus on the patient's motivation to change (2).

Important characteristics to include in self-management training are as follows:

- Encourage active rather than passive learner participation (e.g., include group discussions instead of all classes in lecture format).
- Utilize a variety of presentation styles: visual, auditory, models and demonstrations, and active participation with return demonstrations (see, hear, do).
- Evaluate patient and family comprehension and skill mastery (e.g., use of teach-back, direct questioning, and observation).
- Provide repetition and reinforcement.
- Supply written material for reinforcement and for sharing with the family and caregiver.
- Encourage interaction between participants (fellow classmates and pulmonary rehabilitation professionals).
- Take advantage of teachable moments (e.g., discuss prevention of exacerbations and when to call the doctor when a patient returns after a hospitalization for an exacerbation).

IMPLEMENTING SELF-MANAGEMENT TRAINING

The most effective form and content of self-management intervention has not been standardized and is an ongoing challenge. However, the goal is clear, to target behavior change by assisting the patient in achieving the knowledge, self-confidence, and skills to effectively self-manage their disease. The training should enhance the patient's ability to

- engage in activities that promote health and prevent adverse sequelae,
- effectively interact with health care providers,
- adhere to treatment protocols, and
- self-monitor physical and mental status to inform appropriate management decisions.

Interdisciplinary team members with special training or expertise in a particular content area should present the relevant information at training sessions. Many excellent resources are available for content development. The COPD Foundation serves as the repository for the U.S. copyrighted COPD Assessment Test (see chapter 7). To access the COPD Assessment Test, register for a free account at www.copdfoundation.org.

Depending on the patient's individual needs, any or all of the topics listed in figure 4.1, may be appropriate for inclusion in a self-management training program. Education content should also be included in the Individual Treatment Plan (ITP) (see chapter 10). The content is not listed by order of importance but rather in a sequence that builds on previous information presented.

Normal Pulmonary Anatomy and Physiology

A basic understanding of the normal anatomy and physiology of the respiratory system is the foundation on which an understanding of respiratory illness can be built. It is particularly useful to use demonstration models and other teaching aids when discussing this material because laypersons frequently have difficulty envisioning the pulmonary anatomy.

Pathophysiology of Chronic Lung Disease

Content discussed regarding the pathophysiology of the patient's disease should be tailored to mirror the diagnosis that the patient has received from the health care provider. With a basic understanding of their specific respiratory disease, patients may be more willing to adhere to their prescribed therapeutic interventions.

For example:

- Link medication actions to lung physiology and symptoms, bronchodilation, airway swelling.
- Show oxygen transport through the lungs and how it varies with the different disease states and its effect on the heart.

    b. Role and timing of hospice

Description and Interpretation of Medical Tests

The description and interpretation of medical tests can be very confusing to the patient, so explanations should be kept simple. Many times patients have never seen their test results, nor have they understood how their results compare to the normal range. The patient's ability to understand the medical tests and their results can facilitate adherence with treatment plans.

Here are some examples:

- Increased adherence to the use of inhaled bronchodilators after being shown spirometry that demonstrates a significant degree of postbronchodilator reversibility
- Increased adherence to the use of nocturnal oxygen or CPAP after review of pulse oximetry results during a sleep study or nocturnal oxygen study

Breathing Strategies

Every patient in pulmonary rehabilitation should be instructed in breathing strategies. If the strategies are found to reduce symptoms, the patient will adopt the strategy. Pursed-lip breathing and active expiration (contraction of abdominal muscles during exhalation) may help patients control and relieve breathlessness as well as reduce panic by improving their ventilatory dynamics and pattern. These breathing strategies may prevent dynamic airway compression and (in COPD) improve gas exchange by decreasing dynamic hyperinflation through slowing the respiratory rate. It is important to recognize that not all patients respond positively to pursed-lip breathing, and the nonresponders may develop asynchronous breathing with use of the technique (10). Patient response to use of pursed-lip breathing should be observed closely. Instruction in abdominal breathing has fallen out of favor because of the lack of evidence to support its use. One effective teaching technique to

-1—
0—
+1—

574-76386_ch04_1P.indd 58 30/11/18 10:20 PM

demonstrate the effectiveness of pursed-lip breathing in increasing oxygen saturation is to have your patient monitor oxygen saturation while walking and performing pursed-lip breathing. Breathing strategies should not be presented as "exercises" but rather as techniques that utilize the lungs more efficiently. The strategies are effective not only for decreasing dyspnea when in a panic situation but also as a preventative measure to reduce dyspnea and forestall panic. The sense of being in control of breathing when utilizing pursed-lip and active expiration increases the patient's self-efficacy.

Figure 4.2 provides an example of program documentation for educational interventions and outcomes.

Secretion Clearance

Instruction in secretion clearance techniques is important in patients who have difficulty raising sputum. Instruction should begin with controlled coughing, the least complicated technique, and progress to more complex techniques if clinically indicated. Recommendations for patients who produce excessive amounts of sputum (e.g., bronchiectasis, cystic fibrosis) are to instruct in the technique that the patient is most apt to use, since no one technique has been found to be more beneficial than any other. Emphasis should be placed on the use of inhaled bronchodilators before secretion clearance, followed with inhaled steroids and inhaled antibiotics, if prescribed. Instruction in secretion clearance techniques should utilize return demonstrations. If supplemental oxygen is used with exercise, it should also be used during secretion clearance techniques. The goal to maintain secretion clearance, without the need for hospitalization, is important in self-management and enhancing self-efficacy. It is important that the pulmonary rehabilitation professional not only be able to teach cough techniques but also understand the many devices available for secretion clearance. Devices range from Positive Expiratory Pressure (PEP) therapy, vibratory devices, and high frequency chest wall oscillation devices (the "vest"). Patients should additionally be instructed on the importance of hydration and (if needed) expectorant use.

Medications

Pulmonary rehabilitation is an excellent venue to assess a patient's oxygen needs at rest and with activity and to determine the delivery system that best meets their needs. Although the primary care or referring physician is responsible for prescribing medications, it is the role of the pulmonary rehabilitation staff to train patients in the proper use of their respiratory medications, including oxygen. Patients should be aware of what their medicines are supposed to do and what they are not supposed to do. For example, the simple explanation that oxygen is being prescribed to treat a low blood oxygen level, and that oxygen alone may not prevent shortness of breath, can improve adherence to supplemental oxygen therapy.

Individualized medication education should include the usual prescribed dosage, frequency, side effects, indications, contraindications, and potential interactions. Although the primary emphasis in pulmonary rehabilitation is on respiratory medications, a review of all medications may be clinically beneficial and improve adherence. Patients should understand the importance of maintaining a list of all medications, including complementary, alternative, and over the counter, and of telling all their health care providers what medications they are taking. This can reduce the possibility of harmful drug interactions and duplication. Medication instruction should include return demonstrations of proper inhaler technique and cleaning of the inhalation device. The use of a spacer chamber with a metered-dose inhaler is recommended if coordination of actuation and inhalation is impaired. By having a solid understanding of the proper use of their medications, the patient's self-management is enhanced.

With so many different inhaled devices on the market, nebulizers, MDI, DPIs, MDIs with built-in spacers, it is vitally important that pulmonary rehabilitation professionals ensure that patients use these devices correctly and in the proper order of administration. Many patients do not understand that an inhaler is not just an inhaler. Knowing a SABA from a LABA and a rescue medication from a controller medication is equally as important. It is the responsibility of the pulmonary rehabilitation professional to keep up to date on current medication delivery systems.

Respiratory Devices

Patients with chronic respiratory disease frequently use various types of respiratory therapy devices. Specific treatments are based on the patient's disease and individual needs. Reinforcement and additional education and training may

be necessary to ensure that patients are correctly using their equipment and are adherent to their physician's instructions. The discussion of proper use of devices should begin by asking the patient to bring in *all* the "gizmos and gadgets" they have received from various health care interactions. Instruction should include appropriateness of use, indications, contraindications, and proper cleaning of each device.

Benefits of Exercise and Maintaining Physical Activities

The benefits of exercise and increased physical activity for patients with chronic pulmonary disease are well established (see chapter 3). Teaching this information underscores the importance of adherence to individualized exercise programs and participation in activities of daily living. To facilitate continued adherence and promote physical activity, each patient should receive an individualized home exercise program before the completion of pulmonary rehabilitation. An exercise log or diary may be useful for patients to self-record their home exercise and physical activity. The benefits of lifelong exercise should be stressed, and patients should be encouraged to continue in a maintenance exercise program in addition to remaining physically active.

Activities of Daily Living (ADLs)

Independence in activities of daily living is a primary goal for patients with chronic respiratory disease. By applying breathing strategies to ADLs and using energy conservation and work simplification techniques, patients find they have the self-confidence and breathing capacity to participate in many activities. Return demonstrations while performing ADLs are imperative. Patients who have the confidence to perform an activity in the rehabilitation setting are more apt to attempt the activity elsewhere. This confidence is an example of increased self-efficacy and improved self-management skills.

Eating Right

General nutrition principles apply to all patients who have chronic respiratory disease (see chapter 2). The pulmonary patient can fall anywhere along the weight spectrum, from severe nutrition depletion to morbid obesity. Patients should be educated on the reasons for their nutrition abnormalities, such as the increased metabolic cost of breathing resulting in weight loss, a sedentary lifestyle or oral corticosteroids resulting in weight gain, risk for the development of Type 2 diabetes and osteoporosis. Instruction should be geared to the individual needs of the patient, as determined on initial and follow-up assessments. In some instances, it may be beneficial to refer the patient for intensive nutrition counseling.

Irritant Avoidance

The major intervention in reducing the progression of respiratory disease is avoidance of inhaled irritants. Patients must learn to avoid all environmental and occupational irritants, especially firsthand and secondhand cigarette smoke. Current smokers and ex-smokers benefit from receiving information on becoming and remaining nonsmokers. Many excellent resources for smoking cessation programs are available online.

Early Recognition and Treatment of Exacerbations

The importance of teaching early recognition and treatment of exacerbations in pulmonary rehabilitation cannot be overstated. Open communication and collaboration between patients and their health care providers is essential in the early treatment of exacerbations. Strategies that teach patients to recognize an impending exacerbation and promptly initiate treatment may reduce severity and complications as well as decrease hospitalizations. The use of an action plan (figure 4.3) is a promising strategy to improve collaborative self-management. Action plans can simply instruct the patient to contact his health care provider when symptoms increase, as in figure 4.3, or if the patient has mastered a higher level of self-management, action plans can be personalized with specific medication and dosage recommendations. The appropriateness of receiving influenza and pneumonia immunizations, along with the importance of frequent hand washing and covering the mouth when coughing, should also be covered when discussing exacerbations.

Leisure Activities

The ability to participate in leisure activities is a goal of many patients attending pulmonary

Figure 4.3 COPD action plan

Name: _____ Date: _____

Health care provider: _____ Phone: _____

Pharmacy: _____ Phone: _____

Green Zone

- My sputum is clear/white/usual color and easily cleared.
- My breathing is no harder than usual.
- I can do my usual activities, including exercise.
- I am able to think clearly.
- I am eating well.
- I am sleeping well.

Take your usual medicines, including oxygen, as you are told to do by your health care provider. Avoid cigarette smoke, secondhand smoke, and other inhaled irritants.

Yellow Zone

- My sputum has changed (color, thickness, amount).
- I am more short of breath than usual.
- I cough or wheeze more.
- I weigh more and my legs/feet swell.
- I have less energy and cannot do my usual activities or exercise without resting.
- My sleeping is bad, and my symptoms wake me up
- I am not eating well, I have lost my appetite.
- I am using my rescue inhaler or nebulizer more often.

Continue your daily medications. Call your health care provider. You may be told to begin taking an antibiotic and prednisone. Have your pharmacy phone number available.

Red Zone

- I cannot cough out my sputum, it is thicker, the color has changed, or there is blood in it.
- I am really short of breath, even when I rest.
- I need to sit up to breathe.
- I cannot sleep.
- I cannot do my usual activities or exercise.
- I am unable to speak more than one or two words at a time.
- I cannot think clearly, and I feel sleepy.
- I have chest pains.

Call your health care provider as you need medical care right away. You may be asked to come in to be seen, be told to go to the emergency room, or be told to call 9-1-1.

rehabilitation. Forfeiting the ability to travel is a loss that is difficult for many patients to accept. Information on the availability and use of supplemental oxygen when traveling is readily available on the Internet. Traveling with lung disease is not easy; patients need to understand how to plan for that travel. The COPD Foundation has many great resources to assist the patient with travel preparations. The inclusion of a discussion on sexuality can be intimidating for some rehabilitation staff, but with preparation, the topic can be thoughtfully presented and well accepted. There are resources available via the COPD Foundation's website to assist health care providers and

patients. Registration is free on the foundation website (www.copdfoundation.org). Once registered, information such as the Slim Skinny Reference Guide (SSRG) provides detailed information for the health care provider.

Coping with Chronic Lung Disease

Chronic lung disease is often accompanied by comorbidities. Psychosocial comorbidities are common and are detailed in chapter 5. Pulmonary rehabilitation is an excellent setting for group discussions on panic control, where patients can appreciate that they are not alone in their fears. Shortness of breath during exercise sessions provides the opportunity to demonstrate to patients the effectiveness of breathing strategies to slow their respiratory rate and help them remain in control of their breathing. Relaxation techniques and stress management strategies should also be offered to assist the patient in preventing panic and in coping effectively with their chronic lung disease. As with breathing strategies, if the patients find relaxation techniques or stress management effective, they will adopt their use. It is also important that pulmonary rehabilitation staff recognize the burden placed on caregivers. Family and social roles often change when someone has a chronic illness. Pulmonary rehabilitation professionals should recognize when caregivers feel overwhelmed, stressed, and helpless. Referring the caregiver for support and informing them of resources is important as well. This can include friends, counselors, family physician, or even clergy.

Care Transitions: Hospital to Home

The pulmonary rehabilitation staff are important members of the care transition team. There is increasing evidence of the benefits of pulmonary rehabilitation in the acute setting, either during or shortly after hospitalization for acute exacerbation of COPD (11). The immediate posthospitalization period is a high-risk time for a new exacerbation to occur. Persistent inactivity following a hospitalization has been shown to increase the likelihood of readmission with a subsequent exacerbation. In addition, self-reported daily physical activity in patients with severe COPD has been shown to be independently associated with hospitalizations for acute exacerbation (12). Pulmonary rehabilitation staff have a responsibility to design programs to allow enrollment in pulmonary rehabilitation as soon as possible following a hospitalization. This can assist the patient in improving their functional activity tolerance and disease self-management skills, which may then prevent readmission.

End-of-Life Planning

Palliative care is an example of collaborative self-management, in which the goal is to relieve suffering and improve quality of life. Pulmonary rehabilitation can provide a forum to institute palliative care for patients with chronic pulmonary diseases. For example, end-of-life discussions and decision making require communication among the patient, family, and caregivers that can be facilitated in the pulmonary rehabilitation setting.

Palliative care may transition into hospice care. Most patients believe when the term *palliative care* is used that the end of life is looming, and the mention of *hospice* means death is imminent. Dispelling these notions by initiating discussions on these topics in pulmonary rehabilitation is appropriate and encouraged (13). Providing the opportunity to discuss options for end-of-life care leads to an increase in adoption of advance directives (durable power of attorney for health care, living will, and prehospital medical directive), and patients will become more comfortable initiating discussions with their families and physicians regarding their care.

SUMMARY

Collaborative self-management training is an essential component of comprehensive pulmonary rehabilitation. Self-management training promotes learning by doing and taking advantage of teachable moments. The recommended content should be patient-specific, yet it is imperative to include for all patients training in early recognition and treatment of exacerbations, including the use of an action plan, proper medication use with emphasis on adherence and technique for inhaled medications, and the importance of daily exercise. Educational sessions are an opportunity to facilitate the discussion of end-of-life decision making.

Survey of Exercise Prescription in US Pulmonary Rehabilitation Programs

Chris Garvey, MSN, MPA, FNP, MAACVPR; Richard Casaburi, PhD, MD; Martijn A. Spruit, PhD; Jana De Brandt, MSc

Downloaded from http://journals.lww.com/jcrpjournal by BhDMf5ePHKav1zEoum1tQfN4a+kJLhEZgbsIHo4XMi0hCywCX1AWnYQp/IlQrHD3i3D0OdRyi7TvSFl4Cf3VC1y0abggQZXdgGj2MwlZLeI= on 01/11/2021

Purpose: Pulmonary rehabilitation (PR) is the standard of care for chronic, symptomatic lung disease. Current scientific and clinical guidelines recommend PR to improve dyspnea, functional capacity, and quality of life. Several PR guidelines provide recommendations about the mode, intensity, duration, frequency, and progression of exercise-based interventions. There are variations in the components of PR exercise prescription that may influence the response to PR, as well as variations in how the exercise prescription and its components are determined and monitored. Therefore, the purpose of this investigation was to identify current PR exercise prescription practices via survey sent to 1758 PR programs in the United States.
Methods: The American Association of Cardiovascular and Pulmonary Rehabilitation administered surveys in 2013 and 2016 to US-based PR providers.
Results: Responses were returned from 371 PR providers (vs 380 in 2013). There was an increase in responses for all options describing exercise prescription methodology in the 2016 survey, with each element (frequency, intensity, time [duration], and type [mode]; FITT) demonstrating significant increase in use. There was a significant increase in 3 methods of determining exercise goals in 2016 versus 2013: duration ($P = .017$), distance ($P = .010$), and metabolic equivalents of task ($P \leq .001$).
Conclusions: The 2016 survey responses show a greater use of guideline-based exercise prescription methodology, with an increase in use of FITT methodology for exercise prescription.

Key Words: COPD • exercise • exercise prescription • outcomes • pulmonary rehabilitation

Supervised exercise training, coupled with education and behavior change, is one of the pillars of a comprehensive pulmonary rehabilitation (PR) program for patients with chronic obstructive pulmonary disease (COPD).[1] Indeed, exercise-based PR programs are safe and generally reduce daily symptoms, improve exercise tolerance, and improve quality of life in patients with COPD.[2]

Multiple PR guidelines provide recommendations about the mode, intensity, duration, frequency, and progression of well-known exercise-based interventions.[1,3,4] Still, the duration and combination of types of exercise modalities vary to a great extent between PR programs globally,[5-8] as well as exercise training intensity and progression between individual patients with COPD.[9-11] This may, at least in part, explain the large variation in response to PR in patients with COPD.[2,11]

Stationary cycling, treadmill walking, and resistance training with handheld weights are commonly applied in North America-based PR programs,[5] yet information regarding methodology is lacking. An earlier survey was conducted by the American Association of Cardiovascular and Pulmonary Rehabilitation (AACVPR) in 2012-2013 to evaluate PR exercise prescription practices.[12] Findings of the 2013 survey identified PR exercise prescription practices that are consistent with national guidelines; however, wide variations in measures of intensity and method of exercise progression were reported, including what the patient can tolerate, and when the patient and staff feel the patient is ready. This study describes the results of an updated 2016 survey, compares the 2016 survey results with the 2013 survey, and discusses implications of changing trends in exercise prescription development and application in the PR setting.

METHODS

SURVEY

A 15-question survey administered in 2013 has been previously described.[12] A 22-question survey was recently developed by the authors based on the 2013 survey[12] to evaluate PR exercise prescription practices in the United States (see Table 1, Table 2, and Supplemental Digital Content 1, available at: http://links.lww.com/JCRP/A167). Both surveys were developed by the authors with input from experts in PR research, exercise physiology, and program management. Survey questions asked about PR exercise prescription, methodology, exercise testing, and exercise goals. Patient education topics, oxygen titration and system used, staff clinical discipline, team makeup, patient diagnoses, program setting, and program size were also surveyed and responses are described in Supplemental Digital Content 1 (available at: http://links.lww.com/JCRP/A167). The 2016 survey was sent to all individuals listed as PR program directors in the AACVPR database. The database has a total of 1831 individual e-mail addresses. The AACVPR has identified the approximate

Copyright © 2020 Wolters Kluwer Health, Inc. Unauthorized reproduction of this article is prohibited.

number of PR and cardiac rehabilitation (CR) programs in the United States in a recent national search, titled "AACVPR Finding the N," based on self-report (Kate Maude, BA, e-mail communication, April 26, 2017). The search determined that there are 237 PR centers and 1521 combined CR and PR centers in United States. The exercise prescription survey was sent via an e-mail message with invitation to complete the survey via surveymonkey.com. Data collection was voluntary. Analysis and statistical comparison of the survey results were performed using SPSS Statistics Version 24 (IBM Corp.). Chi-square analysis was performed to compare relationships between 2 variables: the survey outcome measures (eg, Do you develop an exercise prescription for your PR patients?: Yes or No) and the year of survey (2013 or 2016). Assumptions to perform a χ^2 analysis were met, as variables were categorical and consisted of $\geq$2 categorical, independent groups. Chi-square analysis was not performed for the following survey items: If intensity is measured, check which measure is used; and If yes, describe method of exercise used during titration (Table 1) as survey response options were different across the 2013 and 2016 survey (see Supplemental Digital Content 1, available at: http://links.lww.com/JCRP/A167). $P < .05$ was set as significant.

EXERCISE PRESCRIPTION IN PR

Exercise prescriptions may be derived from various sources including guidelines and statements from the American College of Sports Medicine (ACSM),[13] AACVPR,[14] and American Thoracic Society(ATS)/European Respiratory Society (ERS)[1] and combinations of PR guidelines and/or exercise methodologies developed by the PR program or health system.

RESULTS

Responses were returned for 371 (20.3% of requests sent) versus 380 in 2013. Survey responses regarding exercise prescription are summarized in Table 1, with a question added in 2016 in Table 2. Exercise prescription was offered to patients by >96% of respondents in both 2013 and 2016 surveys ($P = .787$; $\chi^2 = 0.073$). There was an increase in responses for all options describing exercise prescription methodology in the 2016 survey, with elements of the ACSM (frequency, intensity, time [duration], and type [mode]; FITT) demonstrating significant increase in use. Other components of exercise increased, but changes were not statistically significant: progression ($P = .304$), continuous exercise ($P = .075$), interval exercise ($P = .188$), resting intervals ($P = .151$), training intensity baseline and progression over time ($P = .426$), and supervision ($P = .405$). There was a significant increase in 3 methods of determining exercise goals in 2016 versus 2013: duration ($P = .017$), distance ($P = .010$), and metabolic equivalents of task (METs) ($P \leq .001$). Specific methodology for assessing METs was not requested or stated. There was a similar number of respondents offering a formal exercise class in 2016 versus 2013 ($P = .318$).

INTENSITY

The most frequently used measures of exercise intensity (>50% of respondents) were rating of perceived exertion (RPE), Borg 10-point dyspnea scale, 6-min walk test (6MWT), target heart rate (THR), and METs. A comparison between the 2013 and 2016 surveys was not possible, as in 2013, only one option could be selected while the 2016 survey allowed multiple options.

PROGRESSION

A new question in the 2016 survey asked about methodology used to determine progression of exercise using 1 of 11 response options versus an open-ended question used in 2013. Nearly half of the 2016 respondents reported use of RPE, Borg 10-point dyspnea scale, METs, THR, or 6MWT. The 2013 survey showed wide variability of progression methodologies, with 99 different descriptions of measures of progression. The 2016 survey lacked an open response option.

RESISTANCE TRAINING

The number of respondents using a resistance training protocol increased more than 2-fold from 40.2% in 2013 to 93.5% in 2016 ($P \leq .001$, $\chi^2 = 209.9$). Components of resistance training (not asked in 2013) included weight lifting (75.9%), elastic bands (69.0%), weight or resistance machines (57.1%), and resistance using one's own body weight, for example, wall push-ups (41.6%).

DISCUSSION

The content of the exercise training as part of US-based PR programs is changing over time. Indeed, the 2016 survey clearly shows that a majority of the PR programs develop an exercise prescription for their patients, using the FITT principles. Exercise intensity is measured more frequently using multiple methods, such as symptom ratings and heart rate. Interestingly, the number of PR programs that used any resistance training protocol doubled between 2013 and 2016. This suggests that more focus is placed on the training of lower-limb muscles to counteract atrophy-induced muscle weakness. Although weight lifting/resistance machines are used frequently for the resistance training (up to 75% of the PR programs), the 1-repetition maximum is only used in 5% of the PR programs. This suggests that there are still gains to be made to determine the progression of the resistance training.

Translating scientific evidence for PR into effective clinical care may challenge PR clinicians. A multidisciplinary model that supports competency in provision of supervised exercise training in a range of severities and manifestations of chronic lung disease as well as comorbidities is essential. The 2016 survey responses show a greater use of guideline-based exercise prescription methodology. The majority of programs provide both PR and CR. This may offer some advantages including shared use of gym, equipment, and possibly cross training for both PR and CR staff, which could improve both preparation and skills for caring of patients with multiple common comorbidities in the 2 settings. Both interventions have clear, distinct, and important differences that must be considered and applied to daily practice.

Limitations of the survey include low return rate and sample size and unknown characteristics of noncompleters. The exact number of PR programs in the United States is unknown, although recently estimated at 237 PR centers and 1521 combined CR and PR centers in United States (data provided by the AACVPR).

The AACVPR offers program certification that evaluates PR program quality, safety, staff competency, and exercise prescription. Nearly two-thirds of respondents reported that their PR program has been certified by the AACVPR. The AACVPR PR program certification requires that exercise prescription is based on AACVPR and/or ACSM guidelines. This requirement for national certification may influence exercise prescription practices. It is unclear why ATS/ERS PR guidelines are not included as an option and the exact influence of guidelines on exercise prescription methodology.

The American College of Chest Physicians (ACCP)/AACVPR PR evidence-based guidelines updated the graded

Table 2

New Question for 2016

Question	Results, % (n)
If you do prescribe resistance training, which components are included? Check all that apply. (n = 303)	
Weight lifting	75.9 (230)
Weight or resistance machines	57.1 (173)
Elastic bands	69.0 (209)
Resistance using one's own weight, eg, wall push-ups	41.6 (126)

evidence base of PR in 2007.[4] The evidence base has been further strengthened by updated statements and guidelines from the ATS/ERS,[1] ACSM,[13] AACVPR,[14] as well as multiple studies. Since publication of the 2013 survey,[12] the ATS/ERS has published an updated comprehensive PR statement that updates the evidence for exercise in diverse pulmonary populations that provides detailed guidance on exercise prescription.[1] The ACSM regularly publishes updated guidelines for exercise testing and prescription.[13] Survey responses and approaches to exercise prescription suggest some variation in approaches to exercise prescription, with a trend toward more consistent use of ACSM and ATS/ERS guidelines. The updated 5th edition of AACVPR guidelines was released in 2019.[14] Variations in responses and practices may be influenced by diverse national and international recommendations, exercise prescription requirements of the AACVPR national certification, lack of formal exercise science training for many respiratory therapy and registered nurses, programs with CR focus providing PR, and various models of PR used throughout the United States and possibly regional variations. It is unclear whether diverse practices also reflect the heterogeneity of PR patients.

All major guidelines recommend a comprehensive assessment, history and focused physical examination, and baseline exercise testing before beginning PR. Initial and ongoing assessment is key regardless of the PR setting or staff composition. Long-term adherence to exercise is a major priority in PR, particularly translating gains from PR into increased physical activity.

A comprehensive PR program results in improvement in exercise capacity, dyspnea, and quality of life. Exercise training is the core component of effective PR. Exercise recommendations are available from several US and international organizations. While there are consistencies among the various guideline recommendations of aerobic and resistance training, differences exist regarding methodology and details of exercise prescription. Exercise prescription differences may reflect variations in daily practice, background, and training of clinicians and influence from professional and scientific guidelines and organizations. It may be tempting to embrace one guideline over another. However, even multisociety international statements such as the ACCP/ATS/ERS "Diagnosis and Management of Stable Chronic Obstructive Pulmonary Disease: A Clinical Practice Guideline Update" identifies a strong level of evidence for PR-only in COPD patients with a forced expiratory volume in the first second (FEV_1) of <50% predicted.[15] This is inconsistent with major PR and COPD guidelines as well as current Medicare coverage of outpatient PR that identify PR for COPD with an FEV_1 of <80% predicted. Clinicians should be familiar with major, evidence-based PR guidelines and use a collaborative, multidisciplinary team approach to individualized exercise training and prescription in the context of a PR program. A baseline and ongoing assessment that includes disease and symptom severity, comorbidities, and patient goals should be emphasized. This should be coupled with individual and aggregate measurement and analysis of patient-centered outcomes including exercise performance. PR should emphasize sustainable exercise that translates into both improved muscle function and increased physical activity.

ACKNOWLEDGMENTS

Jana De Brandt was supported by funding from the Flemish government. The research of FWO aspirant Jana De Brandt is sponsored by FWO-grant #11B4718N. The authors acknowledge and thank Kate Maude of the AACVPR and Smith Bucklin Association for her considerable assistance with survey formatting, administration, data collection, aggregation, and reporting.

Supplemental Digital Content

The topics and findings below were part of the survey beyond the specifics of exercise prescrption.

Oxygen Titration

There was a modest increase in respondents providing oxygen titration during exercise in 2016 vs. 2013 (94.7% vs. 92.7%; $p = 0.302$). 6MWT was added to the 2016 survey as an option for oxygen titration and was the most frequent method used followed by treadmill walking and stationary bicycle. Oxygen systems used during titration showed a modest but non-significant increase in use of the patient's system, continuous and pulse dose systems in 2016 vs. 2013 (Figure 1).

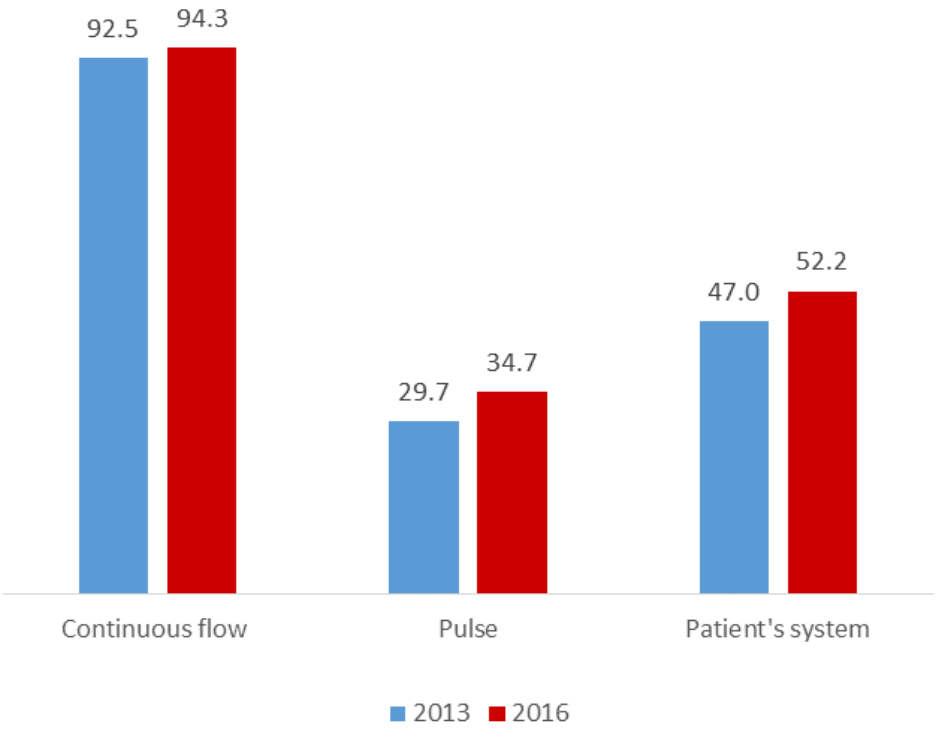
Additional Patient Education Topics

A new question in the 2016 survey asked about patient education topics. In addition to formal exercise classes, over 90% of respondents reported providing educational sessions on oxygen use, prescription, and safety, exacerbation prevention and management, medication management, inhaler and nebulizer use, self-management education, and activities of daily living management and pacing. Fewer reported providing formal education on secretion clearance, dietician counseling, traveling with lung disease, managing panic and mood disorders, and communication with the medical team, with only 66.6% reporting the provision of a class on advanced directives.

Staff Role and Discipline

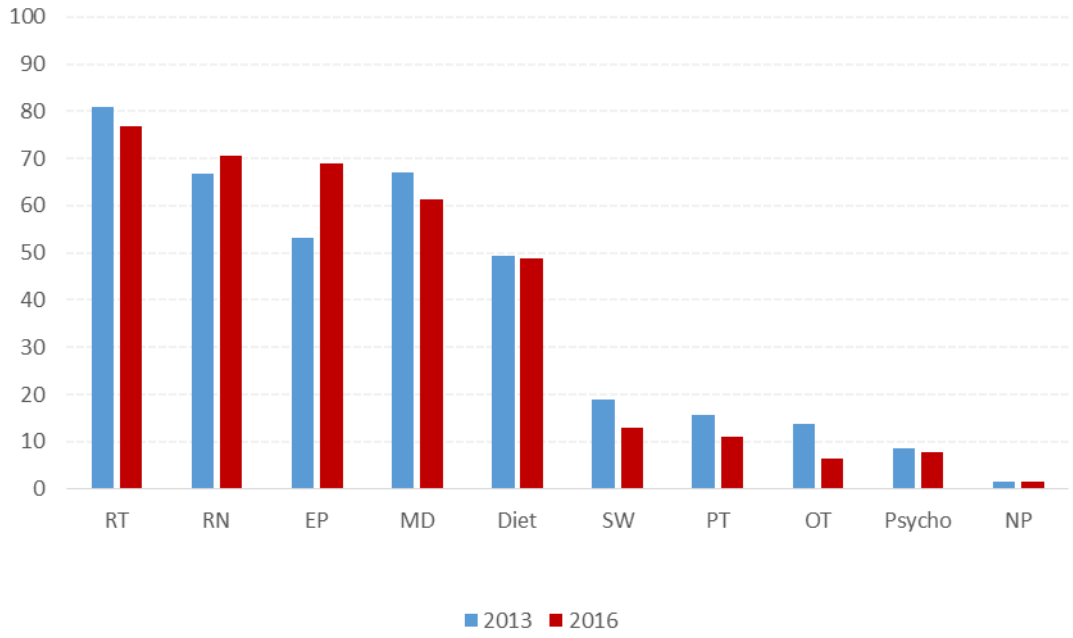
In the 2016 survey, exercise physiologists (EP) surpassed respiratory therapists (RT) and registered nurses (RN) as the discipline most frequently developing the exercise prescription. In the 2013 survey, RT was most frequent, followed by RN and EP. Over 50% of programs included RT, RN, EP and physicians, with significant increase in EP ($p \leq 0.001$) in 2016 vs. 2013 in their core PR team. Use of RT, physical therapists, physicians, occupational therapists, social workers, dieticians, and psychologists declined non-significantly in 2016 vs. 2013 (see Figure 2). There was an increase in use of EPs developing PR exercise prescriptions. This may reflect the greater emphasis of exercise prescription in EP education and certification vs. other disciplines. There was a decrease in proportion of programs involving occupational therapists, social workers, and psychologists, and physicians and dieticians are lacking in 40 to 50% of the programs, respectively. This trend is concerning given the clinical complexity of patients with chronic lung disease, such as COPD, requiring the involvement of diverse healthcare disciplines. Even though exercise training is the corner stone of improvement in physical performance, varied healthcare disciplines are necessary to improve health-related behaviors.

PR Program Demographics



All respondents reported including patients with COPD, with over 80% of programs including patients with interstitial lung disease (e.g., idiopathic pulmonary fibrosis, sarcoid, scleroderma), asthma, and pulmonary hypertension. Fewer programs included neuromuscular disorders (amyotrophic lateral sclerosis, Parkinson's, etc.) and 6.7% included pediatric patients (Figure 3). Other observational trends in the 2016 survey included an increase in programs caring for patients with chest wall abnormalities and thoracic surgery. New patient diagnoses in the 2016 survey included patients immediately post exacerbation and/or hospitalization, pediatric lung diseases and pulmonary hypertension (Figure 3).

Program Size and Setting



Over 95% of programs identified themselves as hospital based vs. less than 4% as free standing. One percent described their program as having an academic affiliation, with slight non-significant changes compared to 2013. Observations regarding the size of the program based on the number of PR patients (excludes maintenance patients) per year showed an increase in medium and very large size programs vs. the 2013 survey (Figure 4). A new question in 2016 asked about providing PR vs. cardiac rehabilitation (CR) vs. both programs. The vast majority (82.3%) provide both vs. 17.4% PR only and 0.3% CR only. Only two thirds of programs offer training on advance directives. PR patients identify a strong interest in advanced care planning that strongly suggests an important opportunity for PR clinicians to increase provision of this essential component of self-management training.[1]

Patients immediately post-acute exacerbation and / or hospitalization *(new for 2016)*	N/A	52.2% (163)		
What best describes your PR program? (2013 n = 302) (2016 n = 300)			**0.862**	**0.650**
Hospital-based	94.7% (286)	95.7% (287)		
Free-standing	4.6% (14)	3.3% (10)		

Academic affiliation	0.7% (2)	1.0% (3)		
Approximate number of Phase II patients seen per year? (2013 n = 305) (2016 n = 301)			**8.057**	**0.153**
Less than 10	6.6% (20)	6.0% (18)		
10-25	17.0% (52)	15.0% (45)		
26-50	35.7% (109)	29.6% (89)		
51-100	28.5% (87)	30.2% (91)		
More than 100	12.1% (37)	19.3% (58)		

6MWT = 6 minute walking test; RT = respiratory therapist; RN = registered nurse; EP = exercise physiologist; PT = physical therapist; NP = nurse practitioner; OT = occupational therapist; COPD = chronic obstructive pulmonary disease; IPF = idiopathic pulmonary fibrosis; ALS = amyotrophic lateral sclerosis

SDC Table 2: New questions in 2016 survey

Question	Results survey 2016
Please check the components your program offers beyond exercise training. Check all that apply. (2016 n= 305)	
Oxygen use, prescription, safety	98.4% (300)
Medication management, inhaler and nebulizer use	97.7% (298)
Exacerbation prevention, management	95.7% (292)
Self-management education	93.8% (286)
Activity of Daily Living management, pacing	93.1% (284)
Secretion clearance	88.2% (269)
Dietician counseling	87.2% (266)
Traveling with chronic lung disease	81.6% (249)
Management of panic and mood disorders	81.0% (247)
Communication with the medical team	78.0% (238)
Advance directives	66.6% (203)
Is your program certified as part of the AACVPR Pulmonary Rehabilitation Program Certification? (2016 n = 302)	
Yes	65.2% (197)
No	34.8% (105)
Do you provide: (2016 n = 305)	
Pulmonary Rehabilitation only	17.4% (53)
Cardiac Rehabilitation only	0.3% (1)
Both	82.3% (251)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: **January 2021-**
REVISED 1-13-2021

CPT Code	Long Descriptor	Global Period
94625	Physician or other qualified health care professional services for outpatient pulmonary rehabilitation; without continuous oximetry monitoring (per session).	XXX
94626	Physician or other qualified health care professional services for outpatient pulmonary rehabilitation; with continuous oximetry monitoring (per session) / (do not report 94625, 94626 in conjunction with 94760, 94761).	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
94625	A 67-year-old male with severe chronic obstructive pulmonary disease is enrolled in a pulmonary rehabilitation program without oximetry monitoring 45 days after hospitalization for an exacerbation.
94626	A 67-year-old male with severe chronic obstructive pulmonary disease is enrolled in a pulmonary rehabilitation program with oximetry monitoring 45 days after hospitalization for an exacerbation.

The reason the patient is the same for both CPT codes is to allow for the varying protocols (acceptable following the guidelines referenced later in this document) by the different sites. The use of oximetry continuously monitored is typically site driven rather than patient driven. To explain further, some sites intermittently monitor during the exercise rather than continuous. As per the society guidelines, oximetry would be monitored during these sessions.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   We convened a joint society consensus panel with members from the two participating societies including: American Thoracic Society (ATS) and the American College of Chest Physicians (CHEST)

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   93798 Physician or other qualified health care professional services for outpatient cardiac rehabilitation; with continuous ECG monitoring (per session) and 93017 Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; tracing only, without interpretation and report

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

No, according to the billed together data in the RUC database, G0424 is billed alone 83 percent of the time and billed with an E/M 1 percent of the time.

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

Pulmonary Disease 56 percent of the time

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

CA009 Obtain Vital signs – we are obtaining 4 vital signs, BP, HR, RR and Sp02

CA011 Provide education - as per society guidelines of the American Thoracic Society /European Respiratory Society Statement: Key Concepts and Advances in Pulmonary Rehabilitation https://www.thoracic.org/statements/resources/copd/PRStatementrccm-2E201309-1634st.pdf" https://www.thoracic.org/statements/resources/copd/PRStatementrccm-2E201309-1634st.pdf Education is an integral component of pulmonary rehabilitation programs. There is education provided at each separate session following a curriculum outlined in the guideline and covers the following topics: These are different at each session.

EDUCATIONAL TOPICS CONCERNING SELF-MANAGEMENT
- Normal pulmonary anatomy and physiology
- Pathophysiology of chronic respiratory disease
- Communicating with the health care provider
- Interpretation of medical testing
- Breathing strategies
- Secretion clearance techniques
- Role and rationale for medications, including oxygen therapy
- Effective use of respiratory devices
- Benefits of exercise and physical activities
- Energy conservation during activities of daily living
- Healthy food intake
- Irritant avoidance/smoking cessation
- Early recognition and treatment of exacerbations
- Leisure activities
- Coping with chronic lung disease

EDUCATIONAL TOPICS CONCERNING ADVANCE CARE PLANNING
- Diagnosis and disease process
- Patient autonomy in medical decision-making
- Life-sustaining treatments
- Advance directives documents
- Surrogate decision-making
- Durable powers of attorney for health care
- Discussing advance care planning with health care professionals and family caregivers
- Process of dying
- Prevention of suffering

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Further evidence for adoption of guideline-based exercise prescription methodology is noted in this recent publication from March 2020: Survey of Exercise Prescription in US Pulmonary Rehabilitation Programs. https://journals.lww.com/jcrjournal/Fulltext/2020/03000/Survey_of_Exercise_Prescription_in_US_Pulmonary.13.aspx. Supplemental digital content figure 3, demonstrates that RT is the predominant Staff type in PR programs 75-80% of the time. http://links.lww.com/JCRP/A167

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

The increase is not related to physician time.
These services are new CPT codes. While there is a G code, that code is a CMS other and has not been through the RUC or AMA society participated survey process. Of note the G code and the CPT codes are not the same; the G code describes services for up to two sessions on one day. The CPT code is for the typical comprehensive service that is typically a 90 minute single session with the elements that are outlined in the guidelines that are referenced in this summary.
Since these are both new codes, it is not clear if compelling evidence is necessary, however in case the RUC believes compelling evidence is necessary, then we believe the evidence that the G code was not surveyed by the specialty that provides the service and therefore the CMS data is flawed. We also believe the published guidelines referenced, meet the compelling evidence PE criteria, we reference below the two criteria below from CE that have been met.

1.) "Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in the clinical staff time, supplies and equipment due to one or more of the following:

- technique
- knowledge/technology"
- patient population

See Attachments A, B and C

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

We obtain 4 vital signs, HR BP, RR and Sp02

9. Please provide a brief description of the clinical staff work for the following:
   Pre-Service period:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

a. Service period (includes pre, intra and post):

PRE-SERVICE PERIOD;
Room prep/ situate o2 tanks/pulse oximeters/Position chairs/ review patient's treatment plan
Obtain Vital signs/ BP/HR/RR/Spo2
Education / Interview patient for changes/review plan for the day

INTRA SERVICE PERIOD:
As per society guidelines of the American Thoracic Society /European Respiratory Society Statement: Key Concepts and Advances in Pulmonary Rehabilitation
https://www.thoracic.org/statements/resources/copd/PRStatementrccm-2E201309-1634st.pdf AMERICAN JOURNAL OF RESPIRATORY AND CRITICAL CARE MEDICINE VOL 188 2013
3 Attachments A, B, C for supporting documentation
Individualized programs are developed which integrate various modes of training at each session, encompassing endurance training of both upper and lower extremities, resistance/strength training and flexibility training. Each component will be followed by vitals and an assessment of exercise and dyspnea.
Each session will have the following.
Exercise of lower extremity endurance -20 min
Assess exercise, Sp02, HR, ratings of dyspnea and exertion-5 min
Resistance/Strength – 10min
Assess exercise, Sp02, HR, ratings of dyspnea and exertion-5 min
Exercise of upper extremity endurance- 10 min
Assess exercise, Sp02, HR, ratings of dyspnea and exertion-5 min
Stretching/Flexibility-5 min
Vital signs, HR, BP, Sp02 review day and plan-5 min
Documentation/charting throughout

POST-SERVICE (OF SERVICE PERIOD)
Clean room and equipment

b. Post-service period:

N/A

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

See above

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.
    N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):
    N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.
    N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

N/A

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

N/A

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
    N/A

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.
    N/A

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:
    N/A

19. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitude D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code? N/A
    c. Does the computer include code specific software that is typically used to provide the service(s)? N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

20. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EQ118	exercise equipment (treadmill, bike, stepper, UBE, pulleys, balance board)

Default formula

21. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

22. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

SK059 was changed to SK057 as the incorrect paper was requested.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Remote Therapeutic Monitoring – Tab 24

In October 2020, the CPT Editorial Panel created five new CPT codes to report remote therapeutic monitoring services. Remote physiologic monitoring treatment management services are provided when a physician or qualified health care professional (QHP) and/or clinical staff use the results of remote physiological monitoring to manage a patient under a specific treatment plan.

98980 ***Remote therapeutic monitoring treatment management services, physician/other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; first 20 minutes***
The RUC reviewed the survey results from 50 physicians and qualified health care professionals (QHPs) for CPT code 98980 and determined that the survey 25th percentile work RVU of 0.62 appropriately accounts for the work required to perform this service. The RUC recommends 20 minutes of intra-service time. The RUC noted that a physician/QHP would not be permitted to report this code if that physician/QHP spent less than 20 minutes performing these services across a given calendar month and that this work would include 2-3 minutes of data review every few days and an interactive communication with the patient once per month. The RUC also discussed the vignette and the fact that the typical patient is an 8-year-old with asthma. The specialty societies noted that only 46 percent of survey respondents found the vignette to be typical. The respondents and the specialty noted the typical patient to be older and have complex medical conditions and co-morbidities, particularly following surgical procedures after which these treatment/monitoring devices would be provided.

The RUC compared CPT code 98980 to the top key reference service CPT code 99457 *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes* (work RVU = 0.61, 20 minutes total time) and determined that both services require nearly identical physician work, time and intensity, which supports the RUC recommended work RVU valuation of 98980. The RUC also compared 98980 to CPT code 99422 *Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days; 11-20 minutes* (work RVU = 0.50, 15 minutes total time) and noted that 98980 requires 5 minutes of additional time because there is considerably more data review and collection associated with 98980 across a period of 30 days, compared with a period of 7 days for 99422. **The RUC recommends a work RVU of 0.62 for CPT code 98980.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

98981 ***Remote therapeutic monitoring treatment management services, physician/other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; each additional 20 minutes (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 physicians and qualified health care professionals (QHPs) for CPT code 98981 and determined that the survey 25th percentile work RVU of 0.61 appropriately accounts for the work required to perform this service. The RUC recommends 20 minutes of intra-service time. The RUC compared CPT code 98981 to the top key reference service CPT code 99458 *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; each additional 20 minutes (List separately in addition to code for primary procedure)* (work RVU = 0.61, total time 20 minutes) and determined that both services require the same physician work, time and intensity.

The RUC discussed the valuation of key reference services 99457 (work RVU = 0.61) and 99458 (work RVU =0.61) and noted that these key reference services have identical work RVU values. This supports the same relativity between CPT codes 98980 and 98981 being nearly identical. The specialty societies also noted that a typical patient for 98981 is inherently complex and needs additional evaluation and information gathering and that the work associated with this would essentially be identical to that of the base code. **The RUC recommends a work RVU of 0.61 for CPT code 98981.**

New Technology/New Services
CPT codes 98975, 98976, 98977, 98980 and 98981 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Practice Expense
The Practice Expense Subcommittee adjusted the CA021 clinical staff time to reflect the typical musculoskeletal patient for CPT code 98975; discussed the leasing/rental fee for the new supply item associated with CPT code 98976; and noted the need for the specialty societies to obtain a paid invoice for the new equipment item for CPT code 98977. **The RUC recommends the direct practice expense inputs as modified** by the Practice Expense Subcommittee. The RUC notes that the specialty societies were unable to obtain a paid invoice for the new equipment item by the date of submission and **recommends that CMS work directly with the specialty societies and others to determine the acquisition costs for the new equipment item *Remote musculoskeletal therapy system.*** CMS has experience with a similar situation where the Agency worked directly with a cardiac device manufacturer to attain the manufacturing costs and other proprietary information for a separate cardiac device.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Non-Face-to-Face Services** **Digitally Stored Data Services/Remote Physiologic Monitoring** *Codes 99453 and 99454 are used to report remote physiologic monitoring services (eg, weight, blood pressure, pulse oximetry) during a 30-day period. To report 99453, 99454, the device used must be a medical device as defined by the FDA, and the service must be ordered by a physician or other qualified health care professional. Code 99453 may be used to report the setup and patient education on use of the device(s). Code 99454 may be used to report supply of the device for daily recording or programmed alert transmissions. Codes 99453, 99454 are not reported if monitoring is less than 16 days. Do not report 99453, 99454 when these services are included in other codes for the duration of time of the physiologic monitoring service (eg, 95250 for continuous glucose monitoring requires a minimum of 72 hours of monitoring).* *Code 99091 should be reported no more than once in a 30-day period to include the physician or other qualified health care professional time involved with data accession, review and interpretation, modification of care plan as necessary (including communication to patient and/or caregiver), and associated documentation.* *If the services described by 99091 or 99474 are provided on the same day the patient presents for an evaluation and management (E/M) service to the same provider, these services should be considered part of the E/M service and not reported separately.* *Do not report 99091 for time in the same calendar month when used to meet the criteria for care plan oversight services (99374, 99375, 99377, 99378, 99379, 99380), home, domiciliary, or rest home care plan oversight services (99339, 99340), remote physiologic monitoring services (99457, 99458), or personally performed chronic or principal care management (99491, 99437, 99424, 99425,99426, 99427). Do not report 99091 if other more specific codes exist (eg, 93227, 93272 for cardiographic services; 95250 for continuous glucose monitoring). Do not report 99091 for transfer and interpretation of data from hospital or clinical laboratory computers.* *Code 99453 is reported for each episode of care. For coding remote monitoring of physiologic parameters, an episode of care is defined as beginning when the remote monitoring physiologic service is initiated, and ends with attainment of targeted treatment goals.* *#99453 Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on use of equipment*				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(Do not report 99453 more than once per episode of care)

(Do not report 99453 for monitoring of less than 16 days)

#99454 *device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days*

(For physiologic monitoring treatment management services, use 99457)

(Do not report 99454 for monitoring of less than 16 days)

(Do not report 99453, 99454 in conjunction with codes for more specific physiologic parameters [eg, 93296, 94760])

(For self-measured blood pressure monitoring, see 99473, 99474)

(For remote therapeutic monitoring, see 98975, 98976, 98977)

#99091 *Collection and interpretation of physiologic data (eg, ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days*

(Do not report 99091 in conjunction with 99457, 99458)

(Do not report 99091 ~~if it occurs within 30 days of~~ for time in a calendar month when used to meet the criteria for 99339, 99340, 99374, 99375, 99377, 99378, 99379, 99380, 99457, 99487, 99491, 99437, 99424, 99425)

Remote Physiologic Monitoring Treatment Management Services

Remote physiologic monitoring treatment management services are provided when clinical staff/physician/other qualified health care professional use the results of remote physiological monitoring to manage a patient under a specific treatment plan. To report remote physiological monitoring, the device used must be a medical device as defined by the FDA, and the service must be ordered by a physician or other qualified health care professional. Do not use 99457, 99458 for time that can be reported using more specific monitoring services ~~(eg, for the patient that requires reevaluation of medication regimen and/or changes in treatment)~~. Codes 99457, 99458 may be reported during the same service period as chronic care management services (99437, 99439, 99487, 99489, 99490, 99491), principal care management services (99424, 99425, 99426, 99427), transitional care management services (99495, 99496), and behavioral health integration services (99484, 99492, 99493, 99494)~~;~~, ~~h~~However, time spent performing these services should remain separate and no time should be counted twice toward the required time for any~~both~~ services in a single month. Codes 99457, 99458 require a live, interactive communication with the patient/caregiver. For the first completed 20 minutes of clinical staff/physician/other qualified health care professional time in a calendar month report 99457, and report 99458 for each additional completed 20 minutes. Do not report 99457, 99458 for services of less than 20 minutes. Report 99457 one time regardless of the number of physiologic monitoring modalities performed in a given calendar month.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To report remote therapeutic monitoring treatment management services provided by physician/other qualified health care professional, see 98980, 98981.

Do not count any time on a day when the physician or other qualified health care professional reports an E/M service (office or other outpatient services 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, domiciliary, rest home services 99324, 99325, 99326, 99327, 99328, 99334, 99335, 99336, 99337, home services 99341, 99342, 99343, 99344, 99345, 99347, 99348, 99349, 99350, inpatient services 99221, 99222, 99223, 99231, 99232, 99233, 99251, 99252, 99253, 99254, 99255). Do not count any time related to other reported services (eg, 93290, 93793, 99291, 99292).

#99457 *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes*

(Report 99457 once each 30 days, regardless of the number of parameters monitored)

(Do not report 99457 for services of less than 20 minutes)

(Do not report 99457 in conjunction with 93264, 99091)

(Do not report 99457 in the same month as 99473, 99474)

+#99458 *each additional 20 minutes (List separately in addition to code for primary procedure)*

(Use 99458 in conjunction with 99457)

(For remote therapeutic monitoring treatment management services, see 98980, 98981)

~~*(Report only 99457 if you have not completed 20 minutes of additional treatment regardless of time spent)*~~

(Do not report 99458 for services of less than an additional increment of 20 minutes)

Medicine
Non-Face-to-Face Nonphysician Services
Qualified Nonphysician Health Care Professional Online Digital Assessment and Management Service

Qualified nonphysician health care professional online digital assessment and management services are…

98970 *Qualified nonphysician health care professional online digital assessment and management, for an established patient, for up to 7 days, cumulative time during the 7 days; 5-10 minutes*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

98971 *11-20 minutes*

98972 *21 or more minutes*

(Report 98970, 98971, 98972 once per 7-day period)

(Do not report online digital E/M services for cumulative visit time less than 5 minutes)

(Do not count 98970, 98971, 98972 time otherwise reported with other services)

(Do not report 98970, 98971, 98972 for home and outpatient INR monitoring when reporting 93792, 93793)

(Do not report 98970, 98971, 98972 when using 99091, 99339, 99340, 99374, 99375, 99377, 99378, 99379, 99380, 99487, 99489, 99490, 99491, 99426, 99427 for the same communication[s])

Remote Therapeutic Monitoring Services

Remote therapeutic monitoring services (eg, musculoskeletal system status, respiratory system status, therapy adherence, therapy response) represent the review and monitoring of data related to signs, symptoms, and functions of a therapeutic response. These data may represent objective device-generated integrated data or subjective inputs reported by a patient. These data are reflective of therapeutic responses that provide a functionally integrative representation of patient status.

Codes 98975, 98976, 98977 are used to report remote therapeutic monitoring services during a 30-day period. To report 98975, 98976, 98977 the service must be ordered by a physician or other qualified health care professional. Code 98975 may be used to report the set-up and patient education on use of any device(s) used for therapeutic data collection. Codes 98976, 98977 may be used to report supply of the device for scheduled (eg, daily) recording(s) and/or programmed alert(s) transmissions. To report 98975, 98976, 98977, the device used must be a medical device as defined by the FDA. Codes 98975, 98976, 98977 are not reported if monitoring is less than 16 days. Do not report 98975, 98976, 98977 with other physiologic monitoring services (eg, 95250 for continuous glucose monitoring requires a minimum of 72 hours of monitoring or 99453, 99454 for remote monitoring of physiologic parameter[s]).

Code 98975 is reported for each episode of care. For reporting remote therapeutic monitoring parameters, an episode of care is defined as beginning when the remote therapeutic monitoring service is initiated and ends with attainment of targeted treatment goals.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

● 98975	AA1	Remote therapeutic monitoring (eg, respiratory system status, musculoskeletal system status, therapy adherence, therapy response); initial set-up and patient education on use of equipment (Do not report 98975 more than once per episode of care) (Do not report 98975 for monitoring of less than 16 days)	XXX	0.00 (PE Only)
● 98976	AA2	device(s) supply with scheduled (eg, daily) recording(s) and/or programmed alert(s) transmission to monitor respiratory system, each 30 days	XXX	0.00 (PE Only)
● 98977	AA3	device(s) supply with scheduled (eg, daily) recording(s) and/or programmed alert(s) transmission to monitor musculoskeletal system, each 30 days (For therapeutic monitoring treatment management services, use 98980) (For physiologic monitoring treatment management services, use 99457) (Do not report 98976, 98977 for monitoring of less than 16 days) (Do not report 98975, 98976, 98977 in conjunction with codes for more specific physiologic parameters [93296, 94760, 99453, 99454]) (For remote physiologic monitoring, see 99453, 99454) (For self-measured blood pressure monitoring, see 99473, 99474)	XXX	0.00 (PE Only)

Remote Therapeutic Monitoring Treatment Management Services

Remote therapeutic monitoring treatment management services are provided when a physician/other qualified health care professional uses the results of remote therapeutic monitoring to manage a patient under a specific treatment plan. To report remote therapeutic monitoring, the service must be ordered by a physician or other qualified health care professional. To report 98980, 98981, any device used must be a medical device as defined by the FDA. Do not use 98980, 98981 for time that can be reported using more specific monitoring services. Codes 98980, 98981 may be reported during the same service period as chronic care management services (99439, 99487, 99489, 99490, 99491), transitional care management services (99495, 99496), *principal care management services (99424, 99425, 99426, 99427)* and behavioral health integration services (99484, 99492, 99493, 99494); however, time spent performing these services should remain separate and no time should

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

be counted toward the required time for both services in a single month. Codes 98980, 98981 require at least one interactive communication with the patient/caregiver. The interactive communication contributes to the total time but need not represent cumulative reported time of the treatment management service. For the first completed 20 minutes of physician/other qualified health care professional time in a calendar month report 98980, and report 98981 for each additional completed 20 minutes. Do not report 98980, 98981 for services of less than 20 minutes. Report 98980 one time regardless of the number of therapeutic monitoring modalities performed in a given calendar month.

Do not count any time on a day when the physician or other qualified health care professional reports an E/M service (office or other outpatient services 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, domiciliary, rest home services 99324, 99325, 99326, 99327, 99328, 99334, 99335, 99336, 99337, home services 99341, 99342, 99343, 99344, 99345, 99347, 99348, 99349, 99350, inpatient services 99221, 99222, 99223, 99231, 99232, 99233, 99251, 99252, 99253, 99254, 99255).

Do not count any time related to other reported services (eg, psychotherapy services 90832, 90833, 90834, 90836, 90837, 90838, interrogation device evaluation services 93290, anticoagulant management services 93793, respiratory monitoring services 94774, 94775, 94776, 94777, health behavior assessment and intervention services 96156, 96158, 96159, 96164, 96165, 96167, 96168, 96160, 96161, 96170, 96171, therapeutic interventions that focus on cognitive function services 97129, 97130, adaptive behavior treatment services 97153, 97154, 97155, 97156, 97157, 97158, therapeutic activities 97530, physical therapy evaluation services 97161, 97162, 97163, 97164, occupational therapy evaluations 97165, 97166, 97167, 97168, orthotic management and training and prosthetic training services 97760, 97661, 97763, medical nutrition therapy services 97802, 97803, 97804, medication therapy management services 99605, 99606, 99607, critical care services 99291, 99292, *principal care management services 99424, 99425, 99426, 99427*) in the cumulative time of the remote therapeutic monitoring treatment management service during the calendar month of reporting.

● 98980	AA4	Remote therapeutic monitoring treatment management services, physician/other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; first 20 minutes (Report 98980 once each 30 days, regardless of the number of therapeutic parameters monitored) (Do not report 98980 for services of less than 20 minutes) (Do not report 98980 in conjunction with 93264, 99091, 99457, 99458) (Do not report 98980 in the same calendar month as 99473, 99474)	XXX	0.62
✚● 98981	AA5	each additional 20 minutes (List separately in addition to code for primary procedure)	ZZZ	0.61

CPT Code:98980 Tracking Number AA4 Original Specialty Recommended RVU: **0.62**
Presented Recommended RVU: **0.62**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **0.62**

CPT Descriptor: Remote therapeutic monitoring treatment management services, physician/other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; first 20 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 8-year-old presents to the physician's or other qualified health care professional's office with exacerbation of asthma. The physician or other qualified health care professional initiates a remote therapeutic monitoring program to support therapeutic management through data collection and monitoring.

Percentage of Survey Respondents who found Vignette to be Typical: 46%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Physician or QHP analyzes and interprets the data. Based on the interpreted data, the physician/QHP uses medical/clinical decision making to assess the patient's condition, communicate with the patient, and oversee, coordinate, and/or modify the patient's care through shared decision making in order to achieve established outcomes/goals of care.

Description of Post-Service Work: N/A

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 12 **% of respondents:** 24.0 **%**

Number of respondents who choose 2nd Key Reference Code: 12 **% of respondents:** 24.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 98980	Top Key Reference CPT Code: 99457	2nd Key Reference CPT Code: 99442
Median Pre-Service Time	0.00	0.00	5.00
Median Intra-Service Time	20.00	20.00	20.00
Median Immediate Post-service Time	0.00	0.00	5.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00

Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	58%	42%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	50%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required		67%	33%
Physical effort required	8%	67%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	58%	34%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	17%	50%	33%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	42%	33%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	59%	33%
Physical effort required	33%	50%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	58%	42%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

An expert panel of providers from each of the participating specialty societies (ie, AAPM&R, ANA, APTA, AAP) reviewed and discussed survey results for the Remote Therapeutic Monitoring (RTM) codes (98980 and 98981).

98980
We are recommending the **median intraservice time** (20 minutes). This code is reported for the first completed 20 minutes of physician/other qualified health care professional time in a calendar month. The expert panel agreed that the median time of 20 minutes was appropriate and properly aligned with the intraservice/total time for 99457 (20 minutes) which was one of the two key reference services.

We also are recommending the survey **25th percentile work relative value units** (wRVU) of 0.62. This value places this code in proper rank order to 99457 as well as to the key reference services.

98981
We are recommending the **median intraservice time** (20 minutes). This code is reported for each additional completed 20 minutes in a calendar month. The expert panel agreed that the median time of 20 minutes was appropriate and properly aligned with the intraservice/total time for 99458 (20 minutes) which was the top key reference service.

We also are recommending the survey **25th percentile work relative value units** (wRVU) of 0.61. This value places this code in proper rank order to 99458 as well as to the key reference services.

While the median Service Performance Rate for this code was zero, we believe that the number of responses received and the data for both codes was sufficient to support making a recommendation to the RUC.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A This is a new service

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physical Medicine & Rehabilitation How often? Sometimes

Specialty Nurse Practitioner How often? Commonly

Specialty Physical Therapy How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 60000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare claims for 99457

Specialty Physical Medicine & Rehabilitation Frequency 20000 Percentage 33.33 %

Specialty Nurse Practitioner Frequency 20000 Percentage 33.33 %

Specialty Physical Therapy Frequency 20000 Percentage 33.33 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2019 Medicare claims for 99457

Specialty Physical Medicine & Rehabilitation Frequency 16500 Percentage 33.00 %

Specialty Nurse Practitioner Frequency 16500 Percentage 33.00 %

Specialty Physical Therapy Frequency 16500 Percentage 33.00 %

Do many physicians perform this service across the United States? No

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 20553

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:98981 Tracking Number AA5 Original Specialty Recommended RVU: **0.61**
Presented Recommended RVU: **0.61**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **0.61**

CPT Descriptor: Remote therapeutic monitoring treatment management services, physician/other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month;each additional 20 minutes (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 8-year-old presents to the physician's or other qualified health care professional's office with exacerbation of asthma. The physician or other qualified health care professional initiates a remote therapeutic monitoring program to support therapeutic management through data collection and monitoring. Note: This is an add-on service. Only consider the additional work related to the additional physician or QHP staff time beyond the 20 minutes reported with 98980.

Percentage of Survey Respondents who found Vignette to be Typical: 48%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Physician or QHP analyzes and interprets the data. Based on the interpreted data, the physician/QHP uses medical/clinical decision making to assess the patient's condition, communicate with the patient, and oversee, coordinate, and/or modify the patient's care through shared decision making in order to achieve established outcomes/goals of care. Additional time is needed due to the specific needs of the patient's medical condition(s).

Description of Post-Service Work: N/A

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2021

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	64%	29%	3%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	14%	50%	36%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	11%	68%	21%
Physical effort required	29%	57%	14%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	53%	36%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	42%	50%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	42%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	50%	42%
Physical effort required	33%	50%	17%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	33%	59%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

An expert panel of providers from each of the participating specialty societies (ie, AAPM&R, ANA, APTA, AAP) reviewed and discussed survey results for the Remote Therapeutic Monitoring (RTM) codes (989 and 98981).

98980
We are recommending the **median intraservice time** (20 minutes). This code is reported for the first completed 20 minutes of physician/other qualified health care professional time in a calendar month. The expert panel agreed that the

median time of 20 minutes was appropriate and properly aligned with the intraservice/total time for 99457 (20 minutes) which was one of the two key reference services.

We also are recommending the survey **25th percentile work relative value units** (wRVU) of 0.62. This value places this code in proper rank order to 99457 as well as to the key reference services.

98981
We are recommending the **median intraservice time** (20 minutes). This code is reported for each additional completed 20 minutes in a calendar month. The expert panel agreed that the median time of 20 minutes was appropriate and properly aligned with the intraservice/total time for 99458 (20 minutes) which was the top key reference service.

We also are recommending the survey **25th percentile work relative value units** (wRVU) of 0.61. This value places this code in proper rank order to 99458 as well as to the key reference services.

While the median Service Performance Rate for this code was zero, we believe that the number of responses received and the data for both codes was sufficient to support making a recommendation to the RUC.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A This is a new service

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physical Medicine & Rehabilitation How often? Sometimes

Specialty Nurse Practitioner How often? Commonly

Specialty Physical Therapy How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 40000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Two-thirds of the estimate for 98980

Specialty Physical Medicine & Rehabilitation Frequency 13333 Percentage 33.33 %

Specialty Nurse Practitioner Frequency 13333 Percentage 33.33 %

Specialty Physical Therapy Frequency 13333 Percentage 33.33 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 33,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Two-thirds of the estimate for 98980

Specialty Physical Medicine & Rehabilitation Frequency 11000 Percentage 33.33 %

Specialty Nurse Practitioner Frequency 11000 Percentage 33.33 %

Specialty Physical Therapy Frequency 11000 Percentage 33.33 %

Do many physicians perform this service across the United States? No

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
98975	Remote therapeutic monitoring (eg, respiratory system status, musculoskeletal system status, therapy adherence, therapy response); initial set-up and patient education on use of equipment	XXX
98976	Remote therapeutic monitoring (eg, respiratory system status, musculoskeletal system status, therapy adherence, therapy response); device(s) supply with scheduled (eg, daily) recording(s) and/or programmed alert(s) transmission to monitor respiratory system, each 30 days	XXX
98977	Remote therapeutic monitoring (eg, respiratory system status, musculoskeletal system status, therapy adherence, therapy response); device(s) supply with scheduled (eg, daily) recording(s) and/or programmed alert(s) transmission to monitor musculoskeletal system, each 30 days	XXX
98980	Remote therapeutic monitoring treatment management services, physician/ other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; first 20 minutes	XXX
98981	Remote therapeutic monitoring treatment management services, physician/ other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; each additional 20 minutes	ZZZ

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
98975	A 65-year-old male presents to the physician's or other qualified health care professional's office with exacerbation of a chronic condition. Following the visit, the physician initiates a remote therapeutic monitoring program to enable data collection and monitoring to support therapeutic management.
98976	An 8-year-old female presents to the physician's or other qualified health care professional's office with cough and wheezing. She is diagnosed with a respiratory condition exacerbated by environmental factors. Following the visit, the physician or other qualified health care professional initiates a remote therapeutic monitoring program to enable data collection and monitoring to support therapeutic management of her respiratory condition.
98977	A 66-year-old female who has limited mobility caused by osteoarthritis of her knees is enrolled in a remote therapeutic monitoring program to enable data collection and monitoring to support treatment management of her musculoskeletal condition.
98980	An 8-year-old presents to the physician's or other qualified health care professional's office with exacerbation of asthma. The physician or other qualified health care professional initiates a remote therapeutic monitoring program to support therapeutic management through data collection and monitoring.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

98981	An 8-year-old presents to the physician's or other qualified health care professional's office with exacerbation of asthma. The physician or other qualified health care professional initiates a remote therapeutic monitoring program to support therapeutic management through data collection and monitoring. Note: This is an add-on service. Only consider the additional work related to the additional physician or QHP staff time beyond the 20 minutes reported with 98980.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

The practice expense recommendations for codes 98975 were determined through email dialogue amongst our Specialty Society RVS Committee Expert Panel. Our panel was comprised of the advisors and alternate advisors from the participating specialties. The panel reviewed existing practice expense inputs the remote physiological monitoring codes (99453, 99454, 99457 and 99458). Further, the societies contacted representatives from two remote therapeutic monitoring technology companies: specifically, Aria (formerly VERA), which produces a musculoskeletal system monitoring device and Propeller Health which produces a respiratory system monitoring device. Both companies provided receipt information as well as insights into staff time related to their technologies. This information was taken into consideration as recommendations were developed.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

Reference for 98975 - 99453 - Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), intial; set-up and patient education on use of equipment

Reference for 98976 and 98977 – Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, oximetry, respiratory flow rate), device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days

Reference for 98980 – Remote physiologic monitoring treatment management services, clinical staff/ physician/ other qualified health professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes

Reference for 98981 – Remote physiologic monitoring treatment management services, clinical staff/ physician/ other qualified health professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; each additional 20 minutes

The remote physiologic monitoring (RPM) code family was used as a reference in the development of our recommendations for this code family. This was due to the remote therapeutic codes being modeled, with some variations, after the RPM codes in structure. The RPM codes are reflective of similar staff work though the specific equipment is different.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)
   New code

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?
   Is the dominant provider in the nonfacility different than for the global?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)
   New code

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:
   Not applicable

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:
   Not applicable

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:
   Not applicable

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:
   Not applicable as vital signs are not taken for this code.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

   b. Service period (includes pre, intra and post):
   98975 - Clinical staff greets the patient and reviews medical records to confirm service. Clinical staff conducts set up of the technology and educates the patient regarding its use.

   98980 and 98981 – Clinical staff reviews therapeutic monitoring data with the physician. Data outside of expected norms

   c. Post-service period:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

98975 - Clinical staff contacts the patient following the encounter to ensure the technology is working and that the patient is on track to complete their daily tasks related to therapeutic monitoring.

98980 and 98981 – Clinical staff conducts patient communications throughout the month to improve therapy adherence, address lack of improvement/control of condition, and resolve any technology or data transmission concerns.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

98975 - Clinical staff walks the patient through set up of the therapeutic monitoring technology. The patient is educated regarding how to use the technology and related daily tasks. For respiratory therapy monitoring, this includes introduction to the device as well as mobile app. For musculoskeletal therapy monitoring, this includes set up of the device, review of the 3D motion capture technology, and review of the specific exercises as prescribed by the physician/QHP. The patient is given the opportunity to ask questions.

98980 and 98981 – Clinical staff reviews the therapeutic monitoring data with the physician/QHP. Areas in which data reflects poor control of condition or deviation from expected treatment adherence are identified. This data review is typically done on a weekly basis throughout the 30 days.

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

Not applicable.

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

Not applicable.

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

Not applicable

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☒ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

Propeller Health invoice for $300 documenting the leasing of the Bluetooth sensors (2 provided in each rental) placed on top of the patient's inhalers (typically 1 daily use inhaler and 1 rescue inhaler) as well as use of the app technology for tracking. This is included in line 102 of the spreadsheet as a monthly rental price of $25. The useful life of this technology is 1 year as the sensors are replaced after 1 year.

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

The only supply used is the new supply described in question 16.

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

19. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No

21. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

Line 113 – remote musculoskeletal therapy system uses the monitoring equipment formula, however no staff time is associated with this code.

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

23. If this is a PE only code please select a crosswalk based on a similar specialty mix:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Crosswalk for 98975 is 99453 - Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), intial; set-up and patient education on use of equipment

Crosswalk for 98976 and 98977 is 99454 - Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, oximetry, respiratory flow rate), device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

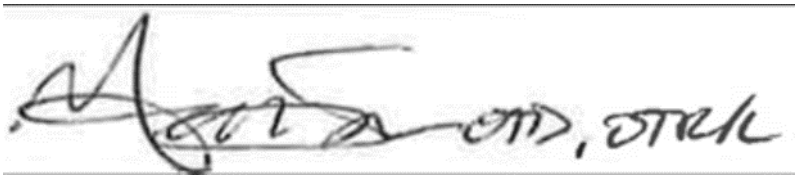
American Occupational Therapy Association

December 21, 2020

Peter K. Smith, MD
Chair, AMA/Specialty Society RVS Update committee
Relative Value Systems, American Medical Association
330 N. Wabash Ave., Suite 39300
Chicago, IL 60611



Dear Dr. Smith,

The American Occupational Therapy Association is interested in the new CPT codes for remote therapeutic monitoring as it was surveyed by a related specialty and has relevance to our membership. AOTA's RUC advisors met, reviewed the recommendation, and respectfully submit the following comments.

AOTA is generally supportive of the Remote Therapeutic Monitoring submission. We agree with the selection of key reference services used in the survey. AOTA agrees with the practice expense inputs, but wonders if a valid purchase invoice should be submitted. AOTA noticed that respondents appeared to be lacking experience with the service.

Thank you for the opportunity to comment.

Sincerely,

Katie Jordan, OTD, OTR/L, FAOTA
Primary RUC Advisor

ASHA
American
Speech-Language-Hearing
Association

January 4, 2021

Peter K. Smith, MD
Chair, AMA/Specialty Society RVS Update Committee Relative Value Systems
American Medical Association

Suite 39300
Chicago, IL 60611

Re: Tab 24 – Remote Therapeutic Monitoring (98975, 98980, and 98981)

Dear Dr. Smith:

On behalf of the American Speech-Language-Hearing Association, I write to offer comments on the specialty society recommendations for codes **98975**, *remote therapeutic monitoring (eg, respiratory system status, musculoskeletal system status, therapy adherence, therapy response); initial set-up and patient education on use of equipment***; 98980**, *remote therapeutic monitoring treatment management services, physician/ other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient/caregiver during the calendar month; first 20 minutes*; and **98981**, *each additional 20 minutes.*

The American Speech-Language-Hearing Association (ASHA) is the national professional, scientific, and credentialing association for 211,000 members and affiliates who are audiologists; speech-language pathologists; speech, language, and hearing scientists; audiology and speech-language pathology support personnel; and students.

A small subset of audiologists and speech-language pathologists may report codes 98975, 98980, and 98981, to remotely monitor the progress of treatment for certain hearing, communication, and swallowing disorders, such as tinnitus and dysphagia. As such, ASHA's advisors and Health Care Economics Committee reviewed the recommendations put forth by the submitting specialty societies. For codes **98980 and 98981,** we agree the 25th percentile work RVU and median intra-service times are appropriate and align well with the key reference service codes. ASHA also agrees with the practice expense inputs for **98975**, **98980, and 98981**. The recommended clinical staff times align with the remote physiologic monitoring reference codes, which were also used as a model for the structure of the new codes. **Therefore, ASHA fully supports the work and practice expense recommendations for codes 98975, 98980, and 98981**

Thank you for the opportunity to offer comments on the recommendations for remote therapeutic monitoring. If you or AMA staff have any questions, please contact Neela Swanson, ASHA's director of health care policy for coding and reimbursement, at nswanson@ash.org.

Sincerely,

Leisha R Eiten

Leisha R. Eiten, AuD, CCC-A
ASHA RUC HCPAC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations
New Technology/ New Services

January 2021

Principal Care Management and Chronic Care Management – Tab 25

In September 2019, the CPT Editorial Panel created add-on code 99439 and in January 2020, the RUC made an interim recommendation. At that time, the RUC noted that the specialty societies were developing a CPT coding change application (CCA) to establish principal care management codes and CPT codes 99490, 99439, 99491, 99487 and 99489 would be resurveyed as part of this family of services. Additionally, in October 2020, the RUC flagged CPT codes 99487-99490 via the New Technology/New Services screen. The Relativity Assessment Workgroup reviewed the most recent years of available Medicare claims data (2017, 2018 and preliminary 2019 data) and the RUC recommended these services be surveyed for January 2021, along with the principal care management codes considered at the October 2020 CPT meeting. In October 2020, the CPT Editorial Panel created a new subsection within the Evaluation and Management (E/M) section to identify Principal Care Management (PCM) and to describe principal care management services for management of a single high-risk disease.

CHRONIC CARE MANAGEMENT (CCM)

Compelling Evidence

Chronic care management (CCM) has significantly increased in complexity because complex medical conditions can now more often be managed while the patient is at home instead of during face-to-face services. For example, services to patients with heart failure, diabetes, and autoimmune disorders can be provided by, or under the supervision of, a physician or other qualified health care professional (QHP) while the patient is at home to decrease emergency department visits, hospitalizations, and placement in nursing homes and to improve quality of life. This shift occurred before the COVID-19 public health emergency (PHE), was accelerated by the COVID-19 PHE, and will continue after the COVID-19 PHE.

The rapid evolution of sophisticated tools such as remote monitoring apps, patient portals, self-management apps and the ability for patients to transmit complex data (e.g., high resolution photographs) in real time has increased the ability to provide CCM to patients, since it is primarily a non-face-to-face service. Development of robust remote monitoring technologies (e.g., measurement of pulmonary artery pressures via permanently implanted sensors, continuous monitoring of vital signs by sensors that can transmit data over the internet in real-time) also enables clinicians to make diagnoses and alter treatment regimens without needing to see a patient face-to-face.

Clinicians can now often stratify patients according to risk using CCM so they have time to properly care for those patients who require office visits. This can mean some patients are now contacted daily instead of weekly. The need to recognize and treat mental health issues has also increased as growing evidence demonstrates that psychosocial issues play a major role in the treatment of chronic disease and contact with family members and caregivers is essential to help keep these patients functional and able to live at home.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Regarding patient communication, data from the Washington University School of Medicine in St. Louis tracking portal over the last four years indicates the numbers of users and logins annually has increased significantly. In 2017, they reported just over 403,000 logins with over 44,000 users. Only two years later in 2019, the logins had increased by 17-fold from 403,000 logins to 6.8 million. Likewise, individual users increased more than six times to over 297,000. Additionally, not only did the number of users increase, but the average login per user more than doubled from nine to 22 during that same time. This translates to a significant increase in data entry and information to review for each patient and this is consistent with practices around the country.

Examples of information shared via patient portals and other methods of electronic communication include messages from case managers, family members, caregivers, and patients who submit information with questions about financial barriers to care, need for durable medical equipment, medication confusion, forms and letter requests. In addition, there is more data to review through this technology. Interoperability of medical records, while undoubtedly facilitating the exchange of information, also increases the amount of data to review in a way that simply did not exist in the past.

In summary, the complexity of CCM has significantly increased since the codes were established and last reviewed by the RUC. The RUC agreed there is compelling evidence that there has been a change in knowledge/technology and patient population for CCM and CCCM services.

CCM Services

These services are reported per calendar month with codes differentiated based on the amount of time spent by either the physician personal or by the clinical staff under physician supervision, whichever is greater. The specialty societies indicated that at the beginning of the month, it is not known whether the physician/QHP or the clinical staff will be dedicating greater time to the individual patient management activities. Therefore, the cumulative time and who is performing each of those activities, whether it is clinical staff or whether it is the QHP personally, must be tracked. Regardless of whether the QHP codes or the clinical staff codes are used, there is QHP work taking place. For example, the codes with greater clinical staff time require QHP supervision of the clinical staff. When the QHP personal code is used, there are clinical staff specific activities.

For example, some practices utilize their electronic medical record (EMR) for CCM documentation, which includes a time calculator. The physician submits the management time and indicates whether they as the provider are directly providing that care management with the patient or if the clinical staff is providing this under his/her supervision. It is always assumed clinical staff time is supervised by the QHP. For many patients, the QHP and clinical staff may not meet the calendar month time threshold to report these services, so they do not report them. Therefore, it is only a subset of the patients for whom the threshold is met and the codes reported. At the end of the month a report is generated that indicates which patients have met a certain time threshold, divided out by clinical staff and QHP. Additionally, all the exclusion time will be examined. For instance, time for E/M services on the same date as management services are excluded. There are a series of exclusions to make sure time is not double counted and that time is included on the monthly report. Only after review of the time collated by the report does the QHP determine those which patients might be potentially eligible to report these services, determine and verify that they consented to the services and have a care plan. Only then can the QHP report these services. Smaller practices might count their time on a spreadsheet, whereas others have more sophisticated time counters that are embedded within their EMR.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CCM Clinical Staff Services

99490 ***Chronic care management services … first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.***
The RUC reviewed the survey responses from 84 physicians and other QHPs and determined the survey 25th percentile work RVU of 1.00 appropriately accounts for the work required to perform this service. The RUC recommends 25 minutes intra-service time. The RUC noted the physician time for this service has increased, thus validating the increase in physician work.

The RUC compared the surveyed code to the second top reference code 99497 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate* (work RVU = 1.50, 30 minutes intra-service time and 45 minutes total time), noting that the surveyed code requires less physician time and work to perform.

For additional support, the RUC referenced codes 99486 *Supervision by a control physician of interfacility transport care of the critically ill or critically injured pediatric patient, 24 months of age or younger, includes two-way communication with transport team before transport, at the referring facility and during the transport, including data interpretation and report; each additional 30 minutes (List separately in addition to code for primary procedure)* (work RVU = 1.30 and 25 minutes total time) as this ZZZ service requires the same physician time and similar physician work. **The RUC recommends a work RVU of 1.00 for CPT code 99490.**

99439 ***Chronic care management services … each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month. (List separately in addition to code for primary procedure).***
The RUC reviewed the survey responses from 75 physicians and other QHPs and determined the survey 25th percentile work RVU of 0.70 appropriately accounts for the work required to perform this service. The RUC recommends 20 minutes intra-service time. The RUC noted the physician time for this service has increased, thus validating the increase in physician work. The RUC agreed that code 99439 was in the proper rank order with base code 99490.

The RUC compared the surveyed code to the top two reference codes 99231 *Subsequent hospital care, per day, for the evaluation and management of a patient…*(work RVU = 0.76, 10 minutes intra-service time and 20 minutes total time) and 99457 *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes* (work RVU = 0.61 and 20 minutes total time), which requires identical time and similar physician work. CPT code 99439 is slightly more intense than 99457, due to the sicker patient population receiving CCM services, having two or more chronic conditions and the QHP is using a care plan to manage the patient. **The RUC recommends a work RVU of 0.70 for CPT code 99439.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CCM Physician/QHP Services

99491 ***Chronic care management services… first 30 minutes, provided personally by a physician or other qualified health care professional, per calendar month.***
The RUC reviewed the survey responses from 55 physicians and other QHPs and determined the survey 25th percentile work RVU of 1.50 appropriately accounts for the work required to perform this service. The RUC recommends 33 minutes intra-service time. The RUC noted the physician time for this service has increased, thus validating the increase in physician work.

The RUC compared the surveyed code to the second top key reference code 99239 *Hospital discharge day management; more than 30 minutes* (work RVU = 1.90, 30 minutes intra-service time and 55 minutes total time), noting CPT code 99491 requires less physician work and time than 99239, thus is in the proper rank order.

For additional support, the RUC referenced MPC code 99309 *Subsequent nursing facility care, per day, for the evaluation and management of a patient…* (work RVU = 1.55 and 45 minutes total time), code 99493 *Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional,…* (work RVU = 2.05 and 36 minutes total time), and code 99498 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; each additional 30 minutes (List separately in addition to code for primary procedure*) (work RVU = 1.40 and 30 minutes total time). **The RUC recommends a work RVU of 1.50 for CPT code 99491.**

99437 ***Chronic care management services… each additional 30 minutes by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)***
The RUC reviewed the survey responses from 48 physicians and other QHPs and determined the survey 25th percentile work RVU of 1.00 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes intra-service time.

The RUC compared the surveyed code to the second top key reference service 99498 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; each additional 30 minutes (List separately in addition to code for primary procedure)* (work RVU = 1.40 and 30 minutes total time), which requires the same physician time but more physician work than 99437. The RUC agreed that is appropriate considering that 99498 is a care planning service that is reported when there are family disagreements and multiple family members with whom discussion is needed.

For additional support, the RUC referenced MPC code 99308 *Subsequent nursing facility care, per day, for the evaluation and management of a patient…* (work RVU = 1.16 and 31 minutes total time). **The RUC recommends a work RVU of 1.00 for CPT code 99437.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

COMPLEX CHRONIC CARE MANAGEMENT (CCCM)

99487 ***Complex chronic care management services… first 60 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.***
The RUC reviewed the survey responses from 51 physicians and other QHPs and determined the survey 25th percentile work RVU of 1.81 appropriately accounts for the work required to perform this service. The RUC recommends 45 minutes intra-service time. The RUC noted the physician time for this service has increased, thus validating the increase in physician work.

The RUC compared the surveyed code to the second top key reference service 99226 *Subsequent observation care, per day, for the evaluation and management of a patient* (work RVU = 2.00, 30 minutes intra-service time and 55 minutes total time), which requires more total physician time and work than 99487, thus is valued appropriately.

For additional support, the RUC referenced MPC code 99235 *Domiciliary or rest home visit for the evaluation and management of an established patient* (work RVU = 1.72 and 44 minutes total time) and 99239 *Hospital discharge day management; more than 30 minutes* (work RVU = 1.90 and 55 minutes total time). **The RUC recommends a work RVU of 1.81 for CPT code 99487.**

99489 ***Complex chronic care management services… each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)***
The RUC reviewed the survey responses from 51 physicians and other QHPs and determined the survey 25th percentile work RVU of 1.00 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes intra-service time. The RUC noted the physician time for this service has increased, thus validating the increase in physician work.

The RUC compared the surveyed code to the second top key reference service 99457 *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes* (work RVU = 0.61 and 20 minutes total time). The RUC determined that 99489 was in the appropriate rank order based on the intensity, physician work and physician time compared to these services.

For additional support, the RUC referenced MPC code 99308 *Subsequent nursing facility care, per day, for the evaluation and management of a patient…* (work RVU = 1.16 and 31 minutes total time). **The RUC recommends a work RVU of 1.00 for CPT code 99489.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

PRINICPAL CARE MANAGEMENT (PCM)

Compelling Evidence

For 2020, CMS created two G codes for principal care management G2064 *Comprehensive care management services for a single high-risk disease, e.g., principal care management, at least 30 minutes of physician or other qualified health care professional time per calendar month with the following elements: one complex chronic condition lasting at least 3 months, which is the focus of the care plan, the condition is of sufficient severity to place patient at risk of hospitalization or have been the cause of a recent hospitalization, the condition requires development or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen, and/or the management of the condition is unusually complex due to comorbidities* (work RVU = 1.45) and G2065 *Comprehensive care management for a single high-risk disease services, e.g. principal care management, at least 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month with the following elements: one complex chronic condition lasting at least 3 months, which is the focus of the care plan, the condition is of sufficient severity to place patient at risk of hospitalization or have been cause of a recent hospitalization, the condition requires development or revision of disease-specific care plan, the condition requires frequent adjustments in the medication regimen, and/or the management of the condition is unusually complex due to comorbidities* (work RVU = 0.61), both of which were crosswalked to existing CCM codes 99491 and 99490, respectively. There was no survey conducted and no review by the RUC for these services. The RUC agreed that there is compelling evidence that a flawed mechanism or methodology was used in the previous valuation of the G codes.

In October 2020, the CPT Editorial Panel created four new codes for principal care management (PCM). Two of the codes describe principal care management performed by clinical staff under the supervision of a qualified health professional (QHP) and the other two describe principal care management performed by the QHP. The PCM codes differ from the CCM codes in that they are to be reported by physicians or other QHPs when that professional is responsible for managing a patient's single chronic illness as opposed to being responsible for managing the entire care of a patient with two or more chronic illnesses.

Physician/QHP PCM

99424 ***Principal care management services, for a single high-risk disease… first 30 minutes provided personally by a physician or other qualified health care professional, per calendar month.***

The RUC reviewed the survey responses from 53 physicians and determined the survey 25th percentile work RVU of 1.45 appropriately accounts for the work required to perform this service. The RUC recommends 32 minutes intra-service time. The RUC noted this is in the proper rank order with the recommended work RVU of 1.50 for CPT code 99491 *CCM services by the physician/QHP, first 30 minutes per calendar month*. The principal care management codes are for one single-high risk condition. However, the intensity of managing that high-risk condition is comparable and perhaps higher than managing multiple less urgent, less high-risk chronic conditions.

The RUC compared the surveyed code to the top key reference service 99226 *Subsequent observation care, per day, for the evaluation and management of a patient* (work RVU = 2.00, 30 minutes intra-service time and 55 minutes total time). The RUC agreed that 99424 is valued appropriately compared to this key reference service as 99226 requires almost the same intra-service time but more total time and overall physician work to perform.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC referenced MPC codes 99232 *Subsequent hospital care, per day, for the evaluation and management of a patient…* (work RVU = 1.39 and 40 minutes total time) and 99309 *Subsequent nursing facility care, per day, for the evaluation and management of a patient…* (work RVU = 1.55 and 45 minutes total time). **The RUC recommends a work RVU of 1.45 for CPT code 99424.**

99425 ***Principal care management services, for a single high-risk disease… additional 30 minutes provided personally by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)***
The RUC reviewed the survey responses from 47 physicians and determined the survey 25th percentile work RVU of 1.00 appropriately accounts for the work required to perform this service. The RUC recommends 30 minutes intra-service time. The RUC agreed that 99425 is a less intense service than base code 99424. The RUC also agreed that the physician work, time and intensity of CPT code 99425 is the same as CPT code 99437 the add-on code for QHP CCM.

The RUC compared the surveyed code to the second key reference code 99498 *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; each additional 30 minutes (List separately in addition to code for primary procedure)* (work RVU = 1.40 and 30 minutes total time). The RUC agreed that 99498 requires the same physician time but more physician work and intensity than 99425, which is appropriate considering that 99498 is a care planning service that is reported when there are family disagreements and multiple family members with whom discussion is needed.

For additional support, the RUC referenced MPC code 99308 *Subsequent nursing facility care, per day, for the evaluation and management of a patient…* (work RVU = 1.16 and 31 minutes total time). **The RUC recommends a work RVU of 1.00 for CPT code 99425.**

Clinical Staff PCM

99426 ***Principal care management services, for a single high-risk disease… first 30 minutes of clinical staff time directed by physician or other qualified health care professional, per calendar month.***
The RUC reviewed the survey responses from 53 physicians and determined the survey 25th percentile work RVU of 1.10 was too high and would place it out of rank order with physician work and time required for CPT code 99490 *Chronic care management services… first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.* Therefore, the RUC recommends a work RVU of 1.00 for CPT code 99426, a crosswalk to CPT 88121 *Cytopathology, in situ hybridization (eg, FISH), urinary tract specimen with morphometric analysis, 3-5 molecular probes, each specimen; using computer-assisted technology* (work RVU = 1.00 and 25 minutes total time). The RUC recommends 25 minutes intra-service time for CPT code 99426.

The RUC compared the surveyed code to the second top key reference service 99091 *Collection and interpretation of physiologic data (eg, ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days* (work RVU = 1.10, 30 minutes intra-service time and 40 minutes total time), noting that the reference code requires more physician time and is less intense than 99426, which involves direct patient care for patients with a deteriorating medical condition over a period of one month.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC referenced MPC codes 99308 *Subsequent nursing facility care, per day, for the evaluation and management of a patient…* (work RVU = 1.16 and 31 minutes total time) and 99282 *Emergency department visit for the evaluation and management of a patient…* (work RVU = 0.93 and 19 minutes total time). **The RUC recommends a work RVU of 1.00 for CPT code 99426.**

99427 ***Principal care management services, for a single high-risk disease… each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)***
The RUC reviewed the survey responses from 51 physicians and determined the survey 25th percentile work RVU of 0.91 was too high and would place it out of rank order with the physician time and work required to perform CPT code 99439 *Chronic care management services … each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month. (List separately in addition to code for primary procedure.* Therefore, the RUC recommends a work RVU of 0.71 for CPT code 99427, a crosswalk to CPT 95887 *Needle electromyography, non-extremity (cranial nerve supplied or axial) muscle(s) done with nerve conduction, amplitude and latency/velocity study (List separately in addition to code for primary procedure)* (work RVU = 0.71 and 20 minutes total time). The RUC recommends 20 minutes intra-service time.

The RUC compared the surveyed code to the second top key reference service 99091 *Collection and interpretation of physiologic data (eg, ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days* (work RVU = 1.10, 30 minutes intra-service time and 40 minutes total time), noting 99091 requires more physician time though is less intense than 99427, which involves direct patient care for patients with a deteriorating medical condition over a period of one month.

For additional support, the RUC referenced MPC code 99231 *Subsequent hospital care, per day, for the evaluation and management of a patient…* (work RVU = 0.76 and 20 minutes total time). **The RUC recommends a work RVU of 0.71 for CPT code 99427.**

Practice Expense
The Practice Expense subcommittee determined that there is compelling evidence that technology and patient/ provider knowledge has changed for the CCM services. The Practice Expense Subcommittee noted that the specialty societies were unable to obtain clinical staff time survey responses for the CCM and PCM services and therefore the recommendations were provided by the specialty societies' expert panel. The Practice Expense Subcommittee voted on a revised spreadsheet with increased minutes for CA021 *Perform procedure/service---NOT directly related to physician work time*. Modifying the CCM codes by increasing the clinical staff time by 25% and the clinical staff times for PCM services to reflect the minimum times to report each service. **The RUC recommends the direct practice expense inputs as modified by the specialty societies.** The PE Subcommittee noted that when these codes come back as part of the New Technology/New Services screen, the specialty societies should conduct a clinical staff survey.

G Code Deletion
The RUC recommends that CMS delete G2064 and G2065 as these services may now be reported with CPT codes 99424, 99425, 99426 and 99427.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology/New Services
CPT codes 99424-99427 will be placed on the New Technology/New Services list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions. The RUC noted that the CCM codes should also be re-reviewed at that time, primarily because the clinical staff time survey responses were not obtained for the 2021 review.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Evaluation and Management **Domiciliary, Rest Home (eg, Assisted Living Facility), or Home Care Plan Oversight Services**				
99339		*Individual physician supervision of a patient (patient not present) in home, domiciliary or rest home (eg, assisted living facility) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of related laboratory and other studies, communication (including telephone calls) for purposes of assessment or care decisions with health care professional(s), family member(s), surrogate decision maker(s) (eg, legal guardian) and/or key caregiver(s) involved in patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy, within a calendar month;15-29 minutes*		
99340		*30 minutes or more*		
		(Do not report 99339, 99340 for patients under the care of a home health agency, enrolled in a hospice program, or for nursing facility residents) (Do not report 99339, 99340 during the same month with 99439, 99487, 99489, 99490, 99439, 99491, 99437, 99424, 99425, 99426, 99427)		
Prolonged Services **Prolonged Service Without Direct Patient Contact**				
		Codes 99358 and 99359 are used when a prolonged service is provided that is neither face-to-face time in the outpatient, inpatient, or observation setting, nor additional unit/floor time in the hospital or nursing facility setting. Codes 99358, 99359 may be used during the same session of an evaluation and management service, except office or other outpatient services (99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215). For prolonged total time in addition to office or other outpatient services (ie, 99205, 99215) on the same date of service without direct patient contact, use 99417. Codes 99358, 99359 may also be used for prolonged services on a date other than the date of a face-to face encounter.		
		This service is to be reported . . .		

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code 99358 and 99359 are used . . .

Prolonged service of less than 30 minutes . . .

Code 99359 is used . . .

Prolonged service of less than 15 minutes beyond the first hour or less than 15 minutes beyond the final 30 minutes is not reported separately.

Do not report 99358, 99359 for time without direct patient contact reported in other services such as care plan oversight services (99339, 99340, 99374-99380), chronic care management by a physician or other qualified health care professional (99491), home and outpatient INR monitoring (93792, 93793), medical team conferences (99366-99368), interprofessional telephone/Internet/electronic health record consultations (99446, 99447, 99448, 99449, 99451, 99452), online digital evaluation and management services (99421, 99422, 99423) or Principal Care Management services (99424).

99358 ***Prolonged evaluation and management service*** *before and/or after direct patient care; first hour*

+99359 *each additional 30 minutes (List separately in addition to code for prolonged service)*

(Use 99359 in conjunction with 99358)

(Do not report 99358, 99359 on the same date of service as 99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99417)

Case Management Services
Medical Team Conferences
Medical Team Conference, Direct (Face-to-Face) Contact With Patient and/or Family

99366 ***Medical team conference*** *with interdisciplinary team of health care professionals, face-to-face with patient and/or family, 30 minutes or more, participation by nonphysician qualified health care professional*

(Team conference services of less than 30 minutes duration are not reported separately)

(For team conference services by a physician with patient and/or family present, see Evaluation and Management services)

(Do not report 99366 during the same month with 99439, 99487, 99489, 99490, 99491, 99437, 99424, 99425, 99426, 99427)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Medical Team Conference, Without Direct (Face-to-Face) Contact With Patient and/or Family

99367 ***Medical team conference*** *with interdisciplinary team of health care professionals, patient and/or family not present, 30 minutes or more; participation by physician*

99368 *participation by nonphysician qualified health care professional*

(Team conference services of less than 30 minutes duration are not reported separately)

(Do not report 99367, 99368 during the same month with 99439, 99487, 99489, 99490, 99491, 99437, 99424, 99425, 99426, 99427)

Care Plan Oversight Services

Care plan oversight services are reported separately from codes for office/outpatient, hospital, home, nursing facility or domiciliary, or non-face-to-face services. The complexity and approximate time of the care plan oversight services provided within a 30-day period determine code selection. Only one individual may report services for a given period of time, to reflect the sole or predominant supervisory role with a particular patient. These codes should not be reported for supervision of patients in nursing facilities or under the care of home health agencies unless they require recurrent supervision of therapy.

The work involved in providing . . .

(For care plan oversight services . . .

(Do not report 99374-99380 for time reported with 98966, 98967, 98968, 99421, 99422, 99423, 99441, 99442, 99443)

(Do not report 99374-99378 during the same month with 99487, 99489)

Non-Face-to-Face Services

Online Digital Evaluation and Management Services

Online digital evaluation and management (E/M) services . . .

. . .

#99421 *Online digital evaluation and management service, for an established patient, for up to 7 days, cumulative time during the 7 days;5-10 minutes*

#99422 *11-20 minutes*

#99423 *21 or more minutes*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(Report 99421, 99422, 99423 once per 7-day period)

(Clinical staff time is not calculated as part of cumulative time for 99421, 99422, 99423)

(Do not report online digital E/M services for cumulative service time less than 5 minutes)

(Do not count 99421, 99422, 99423 time otherwise reported with other services)

(Do not report 99421, 99422, 99423 on a day when the physician or other qualified health care professional reports E/M services [99202, 99203, 99204, 99205, 99212, 99213, 99214, 99215, 99241, 99242, 99243, 99244, 99245])

(Do not report 99421, 99422, 99423 when using 99091, 99339, 99340, 99374, 99375, 99377, 99378, 99379, 99380, 99487, 99489, 99437, 99424, 99425, 99426, 99427,-99495, 99496 for the same communication[s])

(Do not report 99421, 99422, 99423 for home and outpatient INR monitoring when reporting 93792, 93793)

(99444 has been deleted. To report, see 99421, 99422, 99423)

Digitally Stored Data Services/Remote Physiologic Monitoring

Codes 99453 and 99454 are used to report remote physiologic monitoring services (eg, weight, blood pressure, pulse oximetry) during a 30-day period. To report 99453, 99454, the device used must be a medical device as defined by the FDA, and the service must be ordered by a physician or other qualified health care professional. Code 99453 may be used to report the set-up and patient education on use of the device(s). Code 99454 may be used to report supply of the device for daily recording or programmed alert transmissions. Codes 99453, 99454 are not reported if monitoring is less than 16 days. Do not report 99453, 99454 when these services are included in other codes for the duration of time of the physiologic monitoring service (eg, 95250 for continuous glucose monitoring requires a minimum of 72 hours of monitoring).

Code 99091 should be reported no more than once in a 30-day period to include the physician or other qualified health care professional time involved with data accession, review and interpretation, modification of care plan as necessary (including communication to patient and/or caregiver), and associated documentation.

If the services described by 99091 or 99474 are provided on the same day the patient presents for an evaluation and management (E/M) service to the same provider, these services should be considered part of the E/M service and not reported separately.

Do not report 99091 for time in the same calendar month when used to meet the criteria for care plan oversight services (99374, 99375, 99377, 99378, 99379, 99380), home, domiciliary, or rest home care plan oversight services (99339, 99340), remote physiologic monitoring services (99457, 99458), or personally performed chronic or principal care management (99491, 99437, 99424, 99425). Do not report 99091 if other more specific codes exist (eg, 93227, 93272 for cardiographic services; 95250 for continuous glucose monitoring). Do not report 99091 for transfer and interpretation of data from hospital or clinical laboratory computers.

Code 99453 is reported for each episode ...

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

#99453	*Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on use of equipment*
#99454	*device(s) supply with daily recording(s) or programmed alert(s) transmission, each 30 days*
	(For physiologic monitoring treatment management services, use 99457)
	(Do not report 99454 for monitoring of less than 16 days)
	(Do not report 99453, 99454 in conjunction with codes for more specific physiologic parameters [eg, 93296, 94760])
	(For self-measured blood pressure monitoring, see 99473, 99474)
	(For remote therapeutic monitoring, see 989X1, 989X2, 989X3)
#99091	*Collection and interpretation of physiologic data (eg, ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days*
	(Do not report 99091 in conjunction with 99457)
	(Do not report 99091 for time in a calendar month when used to meet the criteria for 99339, 99340, 99374, 99375, 99377, 99378, 99379, 99380, 99457, 99487, 99491, 99437, 99424, 99425)
#99473	*Self-measured blood pressure using a device validated for clinical accuracy; patient education/training and device calibration*
	(Do not report 99473 more than once per device)
	(For ambulatory blood pressure monitoring, see 93784, 93786, 93788, 93790)
#99474	*separate self-measurements of two readings one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average systolic and diastolic pressures and subsequent communication of a treatment plan to the patient*
	(Do not report 99473, 99474 in the same calendar month as 93784, 93786, 93788, 93790, 99091, 99439, 99453, 99454, 99457, 99487, 99489, 99490, 99491, 99437, 99424, 99425, 99426, 99427)
	(Do not report 99474 more than once per calendar month)

Remote Physiologic Monitoring Treatment Management Services

Remote physiologic monitoring treatment management services are provided when clinical staff/physician/other qualified health care professional use the results of remote physiological monitoring to manage a patient under a specific treatment plan. To report remote physiological monitoring, the device used must be a medical device as defined by the FDA, and the service must be ordered by a physician or other qualified health care professional. Do not use 99457, 99458 for time that can be reported using more specific monitoring services ~~(eg, for~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~the patient that requires reevaluation of medication regimen and/or changes in treatment)~~. Codes 99457, 99458 may be reported during the same service period as chronic care management services (99439, 99487, 99489, 99490, 99491, 99437), principal care management services (99424, 99425, 99426, 99427), transitional care management services (99495, 99496), and behavioral health integration services (99484, 99492, 99493, 99494)~~;~~. ~~h~~However, time spent performing these services should remain separate and no time should be counted twice toward the required time for any~~both~~ services in a single month. Codes 99457, 99458 require a live, interactive communication with the patient/caregiver. For the first completed 20 minutes of clinical staff/physician/other qualified health care professional time in a calendar month report 99457, and report 99458 for each additional completed 20 minutes. Do not report 99457, 99458 services of less than 20 minutes. Report 99457 one time regardless of the number of physiologic monitoring modalities performed in a given calendar month.

To report remote therapeutic monitoring treatment management services provided by physician/other qualified health care professional, see 989X4, 989X5.

Do not count any time on a day when the physician or other qualified health care professional reports an E/M service (office or other outpatient services 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, domiciliary, rest home services 99324, 99325, 99326, 99327, 99328, 99334, 99335, 99336, 99337, home services 99341, 99342, 99343, 99344, 99345, 99347, 99348, 99349, 99350, inpatient services 99221, 99222, 99223, 99231, 99232, 99233, 99251, 99252, 99253, 99254, 99255). Do not count any time related to other reported services (eg, 93290, 93793, 99291, 99292).

Care Management Services

Care management services are management and support services provided by clinical staff, under the direction of a physician or other qualified health care professional, or may be provided personally by a physician or other qualified health care professional to a patient residing at home or in a domiciliary, rest home, or assisted living facility. Services include establishing, implementing, revising, or monitoring the care plan, coordinating the care of other professionals and agencies, and educating the patient or caregiver about the patient's condition, care plan, and prognosis. Care management services improve care coordination, reduce avoidable hospital services, improve patient engagement, and decrease care fragmentation. The physician or other qualified health care professional provides or oversees the management and/or coordination of care management services, which include establishing, implementing, revising, or monitoring the care plan, coordinating the care of other professionals and agencies, and educating the patient or caregiver about the patient's condition, care plan, and prognosis. ~~as needed, for all medical conditions, psychosocial needs, and activities of daily living.~~

There are three general categories of care management services: chronic care management (99490, 99439, 99491, 99437), complex chronic care management (99487, 99489) and principal care management (99424, 99425, 99426, 99427). Complex chronic care management addresses all of the patient's medical conditions, and principal care management services address a single condition. Each of the three categories is further subdivided into those services which are personally performed by the physician or other qualified health care professional and those services which are performed by the clinical staff and overseen by the physician or other qualified health care professional. Code selection for these services is based upon time in a calendar month, and time used in reporting these services may not represent time spent in another reported service. Chronic care management services do not require moderate or high-level medical decision making and may be reported for a shorter time threshold than complex chronic care management services. Both chronic care and complex chronic care management address, as needed,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

all medical conditions, psychosocial needs, and activities of daily living. Principal care management services are disease specific management services. A patient may have multiple chronic conditions of sufficient severity to warrant complex chronic care management but may receive principal care management if the reporting physician or other qualified health care professional is providing single disease rather than comprehensive care management.

Coding Tip

If the treating physician or other qualified health care professional personally performs any of the care management services and those activities are not used to meet the criteria for a separately reported code (99491, 99424), then his or her time may be counted toward the required clinical staff time to meet the elements of 99490, 99487, 99426, as applicable.

Care Planning

A ~~comprehensive~~ plan of care for health problems is based on a physical, mental, cognitive, social, functional, and environmental evaluation. It is intended to provide a simple and concise overview of the patient, and his or her medical condition(s) and be a useful resource for patients, caregivers, health care professionals, and others, as necessary.

A typical plan of care is not limited to, but may include:

- *Problem list*
- *Expected outcome and prognosis*
- *Measurable treatment goals*
- *Cognitive assessment*
- *Functional assessment*
- *Symptom management*
- *Planned interventions*
- *Medical management*
- *Environmental evaluation*
- *Caregiver assessment*
- Interaction and coordination with outside resources and ~~other~~ health care professionals and others, as necessary
- *Summary of advance directives*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The above elements are intended to be a guide for creating a meaningful plan of care rather than a strict set of requirements, so each should be addressed only as appropriate for the individual.

The plan of care should include specific and achievable goals for each condition relevant to the patient's well-being and lifestyle. When possible, the treatment goals should also be measurable and time bound. The plan should be updated periodically based on status or goals changes. The entire care plan should be reviewed or revised as needed but at least annually.

An electronic and/or printed plan of care must be documented and shared with the patient and/or caregiver.

Codes 99487, 99490, 99491, 99437, 99424, 99425, 99426, and 99427 are reported only once per calendar month. Code 99439 is reported no more than twice per calendar month. Code 99439, 99487, 99489, 99490, 99491, 99437 may only be reported by the single physician or other qualified health care professional who assumes the care management role with a particular patient for the calendar month. Codes 99424, 99425, 99426, 99427 may be reported by different physicians or qualified healthcare professionals in the same calendar month for the same patient, and documentation in the patient's medical record should reflect coordination among relevant managing clinicians.

For 99439, 99487, 99489, 99490, 99426, 99427 the face-to-face and non-face-to-face time spent by the clinical staff in communicating with the patient and/or family, caregivers, other professionals, and agencies; creating, revising, documenting, and implementing the care plan; or teaching self-management is used in determining the care management clinical staff time for the month. Only the time of the clinical staff of the reporting professional is counted and additionally the reporting professional's time is included if he or she is not otherwise reporting his or her care management time with another service (see Coding Tip). Only count the time of one clinical staff member or physician or qualified health care professional when two or more are meeting about the patient at the same time. For 99491, 99437, 99424, 99425 only count the time personally spent by the physician or other qualified health care professional. Time spent by the physician or other qualified health care professional that does not meet the threshold to report 99491, 99437, 99424, 99425 may be used toward the time necessary to report 99439, 99490, 99487, 99489, 99426, 99427. Do not count ~~any of the~~ clinical staff time spent as part of a separately reported service ~~on the day of an initiating visit (the creation of the care plan, initial explanation to the patient and/or caregiver, and obtaining consent)~~.

Care management activities performed by clinical staff, or personally by the physician or other qualified health care professional, typically include:

- *communication and engagement with patient, family members, guardian or caretaker, surrogate decision makers, and/or other professionals regarding aspects of care;*
- *communication with home health agencies and other community services utilized by the patient;*
- *collection of health outcomes data and registry documentation;*
- *patient and/or family/caregiver education to support self-management, independent living, and activities of daily living;*
- *assessment and support for treatment regimen adherence and medication management;*
- *identification of available community and health resources;*
- *facilitating access to care and services needed by the patient and/or family;*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

- *management of care transitions not reported as part of transitional care management (99495, 99496);*
- *ongoing review of patient status, including review of laboratory and other studies not reported as part of an E/M service, noted above;*
- development, communication, and maintenance of a comprehensive or disease specific (as applicable) care plan.

The care management office/practice must have the following capabilities:

- *provide 24/7 access to physicians or other qualified health care professionals or clinical staff including providing patients/caregivers with a means to make contact with health care professionals in the practice to address urgent needs regardless of the time of day or day of week;*
- *provide continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;*
- *provide timely access and management for follow-up after an emergency department visit or facility discharge;*
- utilize an electronic health record system for ~~so that care providers have~~ timely access to clinical information;
- ~~use a standardized methodology to identify patients who require care management services;~~
- ~~have an internal care management process/function whereby a patient identified as meeting the requirements for these services starts receiving them in a timely manner;~~
- ~~use a form and format in the medical record that is standardized within the practice;~~
- be able to engage and educate patients and caregivers as well as coordinate and integrate care among all service professionals, as appropriate for each patient.
- *reporting physician or other qualified health care professional oversees activities of the care team;*
- *all care team members providing services are clinically integrated.*

Each minute of service time is counted toward only one service. Do not count any time and activities used to meet criteria for another reported service. However, time of clinical staff and time of a physician or other qualified health care professional are ~~distinct~~ reported separately when each provides ~~a~~ distinct, ~~separately reportable~~ service**s** to the same patient at different times during the same ~~period of time (eg,~~ calendar month~~)~~. A list of services not reported in the same calendar month as 99439, 99487, 99489, 99490 is provided in the parenthetical instructions following the care management codes ~~99439, 99489. See the parenthetical instruction below 99491 for a list of services not separately reported in the same calendar month that 99491 is reported. Do not report 99439, 99487, 99489, 99490, when reporting 99491 for the same calendar month.~~ If the care management services are performed within the postoperative period of a reported surgery, the same individual may not report 99439, 99487, 99489, 99490, 99491. ~~For service time used for reporting 99439, 99487, 99489, 99490, 99491, do not also include service time used to report 99421, 99422, 99423.~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~Care management may be reported in any calendar month during which the clinical staff time or physician or other qualified health care professional personal time requirements are met.~~

When behavioral or psychiatric collaborative care management services are also provided, 99484, 99492, 99493, 99494 may be reported in addition.

Chronic Care Management Services

Chronic care management services are provided when medical and/or psychosocial needs of the patient require establishing, implementing, revising, or monitoring the care plan. Patients who receive chronic care management services have two or more chronic continuous or episodic health conditions that are expected to last at least 12 months, or until the death of the patient, and that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline. Code 99490 is reported when, during the calendar month, at least 20 minutes of clinical staff time is spent in care management activities. Code 994939 is reported in conjunction with 99490 for each additional 20 minutes of clinical staff time spent in care management activities during the calendar month up to a maximum of 60 minutes total time (ie, 99439 may only be reported twice per calendar month). Code 99491 is reported for at least ~~when~~ 30 minutes of physician or other qualified health care professional ~~personal~~ time personally ~~is~~ spent in care management ~~activities~~during the calendar month. Code 99437 is reported in conjunction with 99491 for each additional minimum 30 minutes of physician or other qualified health care professional time. ~~Do not report 99439, 99490 in the same calendar month as 99491.~~ If reporting 99491, 99437, do not ~~count~~ include any time devoted to the patient and/or family on the date that the reporting physician or other qualified health care professional time ~~on the date of~~ also performed a face-to-face E/M encounter ~~towards the time used in reporting 99491~~.

(f)99490	BB5	Chronic care management services, with the following required elements: • multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; • chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; • comprehensive care plan established, implemented, revised, or monitored~~.~~: first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month. Complex Chronic Care Management Services

Complex chronic care management services are services that require at least 60 minutes clinical staff time, under the direction of a physician or other qualified healthcare professional. ~~provided during a calendar month that includes criteria for chronic care management services including establishing, revising, implementing, or monitoring the care plan; medical, functional, and/or psychosocial problems requiring medical decision making of moderate or high complexity; and clinical staff care management services for at least 60 minutes, under the direction of a physician or other qualified health care professional~~ Complex chronic care management services require moderate or high ~~M~~medical decision making as defined in the Evaluation and Management (E/M) guidelines. ~~is determined by the problems addressed by the reporting individual during the month.~~

Patients who require complex chronic care management services may be identified by practice-specific or other published algorithms that recognize multiple illnesses, multiple medication use, inability to perform activities of daily living, requirement for a caregiver, and/or repeat admissions or emergency department visits. Typical adult patients who receive complex chronic care management services are treated with three or more prescription medications and may be receiving other types of therapeutic interventions (eg, physical therapy, occupational therapy). Typical pediatric patients receive three or more therapeutic interventions (eg, medications, nutritional support, respiratory therapy). All patients have two or more chronic continuous or episodic health conditions that are expected to last at least 12 months, or until the death of the patient, and that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline. Typical patients have complex diseases and morbidities and, as a result, demonstrate one or more of the following:

- *need for the coordination of a number of specialties and services;*
- *inability to perform activities of daily living and/or cognitive impairment resulting in poor adherence to the treatment plan without substantial assistance from a caregiver;*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

• *psychiatric and other medical comorbidities (eg, dementia and chronic obstructive pulmonary disease or substance abuse and diabetes) that complicate their care; and/or* • *social support requirements or difficulty with access to care.*				
(f)99487	BB9	Complex chronic care management services, with the following required elements: • multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, • chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, • comprehensive care plan established, implemented, revised, or monitored, • moderate or high complexity medical decision making; first 60 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month. (Complex chronic care management services of less than 60 minutes duration, in a calendar month, are not reported separately)	XXX	1.81

Principal Care Management Services

Principal care management represents services which focus on the medical and/or psychological needs manifested by a single complex chronic condition expected to last at least three months and includes establishing, implementing, revising, or monitoring a care plan specific to that single disease. Code 99424 is reported for at least 30 minutes of physician or other qualified health care professional personal time in care management activities during a calendar month. Code 99425 is reported in conjunction with 99424 when at least an additional 30 minutes of physician or other qualified health care professional personal time is spent in care management activities during the calendar month. Code 99426 is reported for the first 30 minutes of clinical staff time spent in care management activities during the calendar month. Code 99427 is reported in conjunction with 99426 when at least an additional 30 minutes of clinical staff time is spent in care management activities during the calendar month.

●99424	BB1	Principal care management services, for a single high-risk disease, with the following required elements: • one complex chronic condition expected to last at least 3 months, and which places the patient at significant risk of hospitalization, acute exacerbation/decompensation, functional decline, or death, • the condition requires development, monitoring, or revision of disease-specific care plan, • the condition requires frequent adjustments in the medication regimen, and/or the management of the condition is unusually complex due to comorbidities • ongoing communication and care coordination between relevant practitioners furnishing care; first 30 minutes provided personally by a physician or other qualified health care professional, per calendar month	XXX	1.45

CPT Descriptor: Chronic care management services, with the following required elements:

• multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient;
• chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline;
• comprehensive care plan established, implemented, revised, or monitored.:

first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: (Adult) A 75-year-old female with diabetes, hypertension, and mild congestive heart failure. She requires chronic care management services.

(Child) A 3-year-old former 26-week preterm child presents with bronchopulmonary dysplasia, chronic lung disease, status post tracheostomy, and cerebral palsy. Patient receives physical, occupational and speech therapy services and requires chronic care management services.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Chronic care management services are management and support services provided by clinical staff, under the direction of a physician or other qualified health care professional, to a patient with two or more chronic diseases residing at home or in a domiciliary, rest home, assisted living facility, or nursing home. This service typically involves at least 20 minutes of clinical staff time implementing a care plan directed by the physician or other qualified health care professional, per calendar month, when medical and/or psychosocial needs of the patient require establishing and implementing, revising, or monitoring the care plan. Services typically include establishing, implementing, revising, or monitoring the care plan; coordinating the care of other professionals and agencies; and educating the patient or caregiver about the patient's condition, care plan, and prognosis. The physician or other qualified health care professional provides or oversees the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living.

A plan of care must be documented and shared with the patient and/or caregiver. A care plan is based on a physical, mental, cognitive, social, functional, and environmental assessment. It is a comprehensive plan of care for all health problems. It typically includes, but is not limited to, the following elements: problem list, expected outcome and prognosis, measurable treatment goals, symptom management, planned interventions, medication management, community and social services ordered, how the services of agencies and specialists unconnected to the practice will be directed and coordinated,

identification of the individuals responsible for each intervention, requirements for periodic review, and, when applicable, revision of the care plan.

The care management office/practice must have the following capabilities:
Provide 24/7 access to physicians or other qualified health care professionals or clinical staff including providing patients and caregivers with a means to make contact with health care professionals in the practice to address urgent needs regardless of the time of day or day of week; provide continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments; provide timely access and management for follow up after an emergency department visit or facility discharge; utilize an electronic health record system so that care providers have timely access to clinical information; use a standardized methodology to identify patients who require care management services; have an internal care management process/function whereby a patient identified as meeting the requirements for these services starts receiving them in a timely manner; use a form and format in the medical record that is standardized within the practice; be able to engage and educate patients and caregivers as well as coordinate care among all service professionals, as appropriate for each patient.

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
G0181	XXX	1.73	**RUC Time**

CPT Descriptor Physician supervision of a patient receiving medicare-covered services provided by a participating home health agency (patient not present) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of laboratory and other studies, communication (including telephone calls) with other health care professionals involved in the patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy, within a calendar month, 30 minutes or more

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99497	XXX	1.50	**RUC Time**

CPT Descriptor Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99231	XXX	0.76	**RUC Time**	6,736,945

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99308	XXX	1.16	**RUC Time**	11,302,104

CPT Descriptor 2 Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Typically, 15 minutes are spent at the bedside and on the patient's facility floor or unit.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Introduction

CPT created four new codes for principal care management (PCM) at the September 2020 CPT meeting. Two of the codes describe principal care management performed by clinical staff under the supervision of a qualified health professional (QHP) and the other two describe principal care management performed by the QHP herself. The PCM codes differ from the chronic care management (CCM) codes in that they are to be reported by QHPs when that professional is responsible for managing a patient's single chronic illness as opposed to being responsible for managing the entire care of a patient with two or more chronic illnesses. Therefore, it is possible that a PCM code will be reported during the same month as a CCM code - albeit by different QHPs.

Because the CCM codes are in the same family as the new PCM codes, the entire code family, CCM, CCCM and PCM, were surveyed. We note that the CCM codes were due to be surveyed in 2019 because they were identified as high growth services but, in consultation with the Research Subcommittee, the surveys were delayed until this cycle so the CCM, CCCM and PCM codes could be surveyed at the same time. The surveying societies were the American College of Physicians (ACP), the American Academy of Family Physicians (AAFP), the American Geriatrics Society (AGS), the American Academy of Pediatrics (AAP), the American Osteopathic Association (AOA), the American Nurses Association (ANA), the American College of Rheumatology (ACR), the American Academy of Neurology (AAN), the American Association of Hospice and Palliative Care Medicine (AAHPM), and the Society for Post-Acute and Long-Term Care Medicine (AMDA). The surveying societies met with the Research Subcommittee and obtained approval of the survey tool, making the vignettes more general (i.e., similar to those used for the office visit codes), the RSL codes, and combining the XXX and ZZZ codes in a single RSL that did not include the office visit codes.

Background

The CCM survey was randomly distributed to members of the ACP, AAFP, AGS, AOA, ANA AAHPM, AAP, AMDA, and ACR. The PCM survey was randomly distributed to members of AAN and all the above societies except for AAFP. In other words, all societies except for AAFP and AAN surveyed both sets of codes.

The surveying societies convened an expert panel to review the summary data. The panel noted that it was important not only for the CCM and the PCM code sets to be ranked correctly internally, but that the CCM and PCM codes must be ranked correctly to each other. Therefore, the panel looked very closely at the sub analysis survey responses from respondents who responded to both sets of codes in the survey.

The panel noted the low response rates. The panel believes this was mostly due to COVID-19-19 surges across the US. While the response rates were low, the panel agreed that the survey data appeared valid in terms of the spread of times and work RVUs and did not show any indication of confusion on the part of the respondents.

Compelling Evidence

The panel considered whether there was compelling evidence for an increase in work RVUs for the CCM codes. The panel reviewed a number of articles on how medical care is shifting from the office to the home.

As evidenced by the included literature:

CCM has significantly increased in complexity because complex medical conditions can now more often be managed while the patient is at home instead of during face-to-face services. For example, services to patients with heart failure, diabetes, and autoimmune disorders can be provided by, or under the supervision of, QHP while the patient is at home in order to decrease emergency department visits, hospitalizations, and placement in nursing homes and to improve quality of life. This shift occurred before COVID-19, was accelerated by COVID-19, and will continue after COVID-19.

The shift to caring for sicker, more complex patients began a little more than ten years ago, shortly before the CCM codes were established. The rapid evolution of sophisticated tools such as remote monitoring apps, self-management apps, ability for patients to transmit complex data (e.g., high resolution photographs) in real time has increased the ability to care for patients remotely. Development of robust remote monitoring technologies (e.g., measurement of pulmonary artery pressures via permanently

implanted sensors, continuous monitoring of vital signs by sensors that are able to transmit data over the internet in real-time) also enables clinicians to make diagnoses and alter treatment regimens without needing to see a patient face-to-face.

Clinicians can now often stratify patients according to risk remotely so that they have time to properly care for those patients who require office visits. This can mean that some patients are now contacted daily instead of weekly. The need to recognize and treat mental health issues has also increased as more and more evidence demonstrates that psychosocial issues play a major role in the treatment of chronic disease and contact with family members and caregivers is essential to help keep these patients functional and able to live at home.

The COVID-19 pandemic has accelerated this transformation and increased the number and complexity of patients needing CCM in order to keep them out of the hospital and to identify those patients who are deteriorating and need admission. COVID-19 has also highlighted the need for physicians to continually counsel patients on lifestyle choices that go far beyond the usual advice regarding exercise and diet. While the need to counsel on socially distancing and wearing a mask may be temporary, the heightened awareness of how all our patients' choices can influence disease management is a permanent addition to the matters in which QHPs and their clinical staff interact with patients.

In summary, the complexity of CCM has significantly increased since the codes were established.

Specifically, the CCM codes meet the following RUC criterion for compelling evidence:

> Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in physician work due to one or more of the following:
> ▪ technique
> ▪ **knowledge/technology**
> ▪ **patient populations**
> ▪ site-of-service
> ▪ length of hospital stay
> ▪ physician time

Literature:

1.) Hospital at home: feasibility and outcomes of a program to provide hospital-level care at home for acutely ill older patients, Bruce Leff 1, Lynda Burton, Scott L Mader, Bruce Naughton, Jeffrey Burl, Sharon K Inouye, William B Greenough 3rd, Susan Guido, Christopher Langston, Kevin D Frick, Donald Steinwachs, John R Burton Affiliations expand

- PMID: 16330791
- DOI: 10.7326/0003-4819-143-11-200512060-00008

Background: Acutely ill older persons often experience adverse events when cared for in the acute care hospital.
Objective: To assess the clinical feasibility and efficacy of providing acute hospital-level care in a patient's home in a hospital at home.
Participants: 455 community-dwelling elderly patients who required admission to an acute care hospital for community-acquired pneumonia, exacerbation of chronic heart failure, exacerbation of chronic obstructive pulmonary disease, or cellulitis.
Intervention: Treatment in a hospital-at-home model of care that substitutes for treatment in an acute care hospital.
Measurements: Clinical process measures, standards of care, clinical complications, satisfaction with care, functional status, and costs of care.
Results: Hospital-at-home care was feasible and efficacious in delivering hospital-level care to patients at home. In 2 of 3 sites studied, 69% of patients who were offered hospital-at-home care chose it over acute hospital care; in the third site, 29% of patients chose hospital-at-home care. Although less procedurally oriented than acute hospital care, hospital-at-home care met quality standards at rates similar to those of acute hospital care. On an intention-to-treat basis, patients treated in hospital-at-home had a shorter length of stay (3.2 vs. 4.9 days) ($P = 0.004$), and there was some evidence that they also had fewer complications. The mean cost was lower for hospital-at-home care than for acute hospital care (5081 dollars vs. 7480 dollars) ($P < 0.001$).
Conclusions: The hospital-at-home care model is feasible, safe, and efficacious for certain older patients with selected acute medical illnesses who require acute hospital-level care. Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition t

2.) Impact of complex care management on spending and utilization for high-need, high-cost Medicaid patients. Am J Manag Care. 2020 Feb 1;26(2):e57-e63. doi: 10.37765/ajmc.2020.42402.

3.) The Common Attributes of Successful Care Manager Programs for High-Need, High-Cost Persons: A Cross-Case Analysis. Ambul Care Manage. 2019 Oct/Dec;42(4):230-241. doi:0.1097/JAC.0000000000000305.PMID: 31449160

https://pubmed.ncbi.nlm.nih.gov/31449160/

4.) Attributes Common to Programs That Successfully Treat High-Need, High-Cost Individuals. November 10, 2015. The American Journal of Managed Care, November 2015, Volume 21, Issue 11

https://pubmed.ncbi.nlm.nih.gov/26735292/" https://pubmed.ncbi.nlm.nih.gov/26735292/

Summary: Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition to outside of traditional face-to-face office visits.

Therefore, the panel believes that compelling evidence has been met.

Discussion 99490

The panel reviewed the CCM codes first and started with 99490, chronic care management services, first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; comprehensive care plan established, implemented, revised, or monitored.

There were 84 responses and 88% of respondents found the vignettes to be typical. The current values for 99490 are 15 minutes (all intra) and a work RVU of 0.61. The panel noted that the current time and work are far below the 25th percentile of the previous survey which were 20 minutes and a work RVU of 1.00. Note that the median time and work from the previous survey were 30 and 1.50.

The current survey had a median time of 25 minutes and a median work RVU of 1.30 and a time of 20 minutes and work RVU of 1.00 at the 25th percentile. The two most common reference services were G0181, *Physician supervision of a patient receiving Medicare-covered services provided by a participating home health agency (patient not present) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of laboratory and other studies, communication (including telephone calls) with other health care professionals involved in the patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy, within a calendar month, 30* minutes or more, which has times of 10/32/15/57 and a work RVU of 1.73 and 99497, *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate,* which has times and a work RVU of 5/30/10/45/1.50.

Given that the office visit codes were not on the RSL, the panel agreed that these were appropriate reference services. In fact, the panel agreed that the median time (25 minutes) and 25th percentile work RVU (1.00) fit in correct rank order to both reference services. For example, 99497 has a higher total time of 45 minutes and an intra time of 30 minutes with a RVU of 1.5. The median survey time of 25 minutes is 55% of the total time of 99497 and the median intraservice time of 25 minutes is 83% that of 99497 while the 25th percentile survey RVU of 1.0 is 66% that of 99497.

In addition, the survey median of 25 minutes and 25th percentile RVU of 1.0 results in an IWPUT (0.040) which is virtually identical to the current IWPUT (0.041).

In summary, the surveys from both 2014 and 2020 supported a higher time than 15 minutes and a higher RVU than 0.61 and the panel agreed that the values from the current survey were appropriate.

Therefore, the societies recommend the median time of 25 minutes and 25th percentile work RVU of 1.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99490

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty (See associated frequency spreadsheet) How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 12564684
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumed to be three times Medicare utilization

Specialty (See associated frequency spreadsheet) Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,188,228 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare claims volume from RUC database

Specialty (See associated frequency spreadsheet) Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Chronic care management services, with the following required elements:

• multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient;
• chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline;
• comprehensive care plan established, implemented, revised, or monitored.

each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month. (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a month of chronic care management services, a 78-year-old female or 3 year old who has just received 39 minutes of clinical staff time, requires additional care management services.

[Note: This is an add-on service. Only consider the additional physician/QHP work beyond the work separately reported with base code 99490.]

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Chronic care management services are management and support services provided by clinical staff, under the direction of a physician or other qualified health care professional, to a patient with two or more chronic diseases residing at home or in a domiciliary, rest home, assisted living facility, or nursing home. This service typically involves 20 additional minutes of clinical staff implementing a care plan directed by the physician or other qualified health care professional when medical and/or psychosocial needs of the patient require establishing and implementing, revising, or monitoring the care plan. Services typically include establishing, implementing, revising, or monitoring the care plan; coordinating the care of other professionals and agencies; and educating the patient or caregiver about the patient's condition, care plan, and prognosis. The physician or other qualified health care professional provides or oversees the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living.

A plan of care must be documented and shared with the patient and/or caregiver. A care plan is based on a physical, mental, cognitive, social, functional, and environmental assessment. It is a comprehensive plan of care for all health problems. It typically includes, but is not limited to, the following elements: problem list, expected outcome and prognosis, measurable treatment goals, symptom management, planned interventions, medication management, community and social services ordered, how the services of agencies and specialists unconnected to the practice will be directed and coordinated,

identification of the individuals responsible for each intervention, requirements for periodic review, and, when applicable, revision of the care plan.

The care management office/practice must have the following capabilities:
Provide 24/7 access to physicians or other qualified health care professionals or clinical staff including providing patients and caregivers with a means to make contact with health care professionals in the practice to address urgent needs regardless of the time of day or day of week; provide continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments; provide timely access and management for follow up after an emergency department visit or facility discharge; utilize an electronic health record system so that care providers have timely access to clinical information; use a standardized methodology to identify patients who require care management services; have an internal care management process/function whereby a patient identified as meeting the requirements for these services starts receiving them in a timely manner; use a form and format in the medical record that is standardized within the practice; be able to engage and educate patients and caregivers as well as coordinate care among all service professionals, as appropriate for each patient.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Introduction

CPT created four new codes for principal care management (PCM) at the September 2020 CPT meeting. Two of the codes describe principal care management performed by clinical staff under the supervision of a qualified health professional (QHP) and the other two describe principal care management performed by the QHP herself. The PCM codes differ from the chronic care management (CCM) codes in that they are to be reported by QHPs when that professional is responsible for managing a patient's single chronic illness as opposed to being responsible for managing the entire care of a patient with two or more chronic illnesses. Therefore, it is possible that a PCM code will be reported during the same month as a CCM code - albeit by different QHPs.

Because the CCM codes are in the same family as the new PCM codes, the entire code family, CCM, CCCM and PCM, were surveyed. We note that the CCM codes were due to be surveyed in 2019 because they were identified as high growth services but, in consultation with the Research Subcommittee, the surveys were delayed until this cycle so the CCM, CCCM and PCM codes could be surveyed at the same time. The surveying societies were the American College of Physicians (ACP), the American Academy of Family Physicians (AAFP), the American Geriatrics Society (AGS), the American Academy of Pediatrics (AAP), the American Osteopathic Association (AOA), the American Nurses Association (ANA), the American College of Rheumatology (ACR), the American Academy of Neurology (AAN), the American Association of Hospice and Palliative Care Medicine (AAHPM), and the Society for Post-Acute and Long-Term Care Medicine (AMDA). The surveying societies met with the Research Subcommittee and obtained approval of the survey tool, making the vignettes more general (i.e., similar to those used for the office visit codes), the RSL codes, and combining the XXX and ZZZ codes in a single RSL that did not include the office visit codes.

Background

The CCM survey was randomly distributed to members of the ACP, AAFP, AGS, AOA, ANA AAHPM, AAP, AMDA, and ACR. The PCM survey was randomly distributed to members of AAN and all the above societies except for AAFP. In other words, all societies except for AAFP and AAN surveyed both sets of codes.

The surveying societies convened an expert panel to review the summary data. The panel noted that it was important not only for the CCM and the PCM code sets to be ranked correctly internally, but that the CCM and PCM codes must be ranked correctly to each other. Therefore, the panel looked very closely at the sub analysis survey responses from respondents who responded to both sets of codes in the survey.

The panel noted the low response rates. The panel believes this was mostly due to COVID-19-19 surges across the US. While the response rates were low, the panel agreed that the survey data appeared valid in terms of the spread of times and work RVUs and did not show any indication of confusion on the part of the respondents.

Compelling Evidence

The panel considered whether there was compelling evidence for an increase in work RVUs for the CCM codes. The panel reviewed a number of articles on how medical care is shifting from the office to the home.

As evidenced by the included literature:

CCM has significantly increased in complexity because complex medical conditions can now more often be managed while the patient is at home instead of during face-to-face services. For example, services to patients with heart failure, diabetes, and autoimmune disorders can be provided by, or under the supervision of, QHP while the patient is at home in order to decrease emergency department visits, hospitalizations, and placement in nursing homes and to improve quality of life. This shift occurred before COVID-19, was accelerated by COVID-19, and will continue after COVID-19.

The shift to caring for sicker, more complex patients began a little more than ten years ago, shortly before the CCM codes were established. The rapid evolution of sophisticated tools such as remote monitoring apps, self-management apps, ability for patients to transmit complex data (e.g., high resolution photographs) in real time has increased the ability to care for patients remotely. Development of robust remote monitoring technologies (e.g., measurement of pulmonary artery pressures via permanently implanted sensors, continuous monitoring of vital signs by sensors that are able to transmit data over the internet in real-time) also enables clinicians to make diagnoses and alter treatment regimens without needing to see a patient face-to-face.

Clinicians can now often stratify patients according to risk remotely so that they have time to properly care for those patients who require office visits. This can mean that some patients are now contacted daily instead of weekly. The need to recognize and treat mental health issues has also increased as more and more evidence demonstrates that psychosocial issues play a major role in the treatment of chronic disease and contact with family members and caregivers is essential to help keep these patients functional and able to live at home.

The COVID-19 pandemic has accelerated this transformation and increased the number and complexity of patients needing CCM in order to keep them out of the hospital and to identify those patients who are deteriorating and need admission. COVID-19 has also highlighted the need for physicians to continually counsel patients on lifestyle choices that go far beyond the usual advice regarding exercise and diet. While the need to counsel on socially distancing and wearing a mask may be temporary, the heightened awareness of how all our patients' choices can influence disease management is a permanent addition to the matters in which QHPs and their clinical staff interact with patients.

In summary, the complexity of CCM has significantly increased since the codes were established.

Specifically, the CCM codes meet the following RUC criterion for compelling evidence:

> Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in physician work due to one or more of the following:
> ▪ technique
> ▪ **knowledge/technology**
> ▪ **patient populations**
> ▪ site-of-service
> ▪ length of hospital stay
> ▪ physician time

Literature:

1.) Hospital at home: feasibility and outcomes of a program to provide hospital-level care at home for acutely ill older patients, Bruce Leff 1, Lynda Burton, Scott L Mader, Bruce Naughton, Jeffrey Burl, Sharon K Inouye, William B Greenough 3rd, Susan Guido, Christopher Langston, Kevin D Frick, Donald Steinwachs, John R Burton Affiliations expand

- PMID: 16330791
- DOI: 10.7326/0003-4819-143-11-200512060-00008

Background: Acutely ill older persons often experience adverse events when cared for in the acute care hospital.
Objective: To assess the clinical feasibility and efficacy of providing acute hospital-level care in a patient's home in a hospital at home.
Participants: 455 community-dwelling elderly patients who required admission to an acute care hospital for community-acquired pneumonia, exacerbation of chronic heart failure, exacerbation of chronic obstructive pulmonary disease, or cellulitis.
Intervention: Treatment in a hospital-at-home model of care that substitutes for treatment in an acute care hospital.
Measurements: Clinical process measures, standards of care, clinical complications, satisfaction with care, functional status, and costs of care.
Results: Hospital-at-home care was feasible and efficacious in delivering hospital-level care to patients at home. In 2 of 3 sites studied, 69% of patients who were offered hospital-at-home care chose it over acute hospital care; in the third site, 29% of patients chose hospital-at-home care. Although less procedurally oriented than acute hospital care, hospital-at-home care met quality standards at rates similar to those of acute hospital care. On an intention-to-treat basis, patients treated in hospital-at-home had a shorter length of stay (3.2 vs. 4.9 days) ($P = 0.004$), and there was some evidence that they also had fewer complications. The mean cost was lower for hospital-at-home care than for acute hospital care (5081 dollars vs. 7480 dollars) ($P < 0.001$).
Conclusions: The hospital-at-home care model is feasible, safe, and efficacious for certain older patients with selected acute medical illnesses who require acute hospital-level care. Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition t

2.) Impact of complex care management on spending and utilization for high-need, high-cost Medicaid patients. Am J Manag Care. 2020 Feb 1;26(2):e57-e63. doi: 10.37765/ajmc.2020.42402.

3.) The Common Attributes of Successful Care Manager Programs for High-Need, High-Cost Persons: A Cross-Case Analysis. Ambul Care Manage. 2019 Oct/Dec;42(4):230-241. doi:0.1097/JAC.0000000000000305.PMID: 31449160

https://pubmed.ncbi.nlm.nih.gov/31449160/

4.) Attributes Common to Programs That Successfully Treat High-Need, High-Cost Individuals. November 10, 2015. The American Journal of Managed Care, November 2015, Volume 21, Issue 11

https://pubmed.ncbi.nlm.nih.gov/26735292/" https://pubmed.ncbi.nlm.nih.gov/26735292/

Summary: Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition to outside of traditional face-to-face office visits.

Therefore, the panel believes that compelling evidence has been met.

Discussion 99439

The panel reviewed 99439 which is the add-on code to 99490 and which will replace G2058 in 2021. Both have identical descriptors: *Chronic care management services, each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (list separately in addition to code for primary procedure). (do not report G2058 for care management services of less than 20 minutes additional to the first 20 minutes of chronic care management services during a calendar month)*.

CMS created G2058 and its current values are based on a Centers for Medicare and Medicaid Services (CMS) crosswalk from 99490 (work RVU of 0.61 and time of 15 minutes). In January 2020, the RUC reviewed 99439 which was established at the September 2019 CPT meeting. The RUC had agreed that a survey of 99439 should be delayed until 2020 so the entire family of CCM and PCM services could be surveyed at once. After its review, the RUC recommended a work RVU of 0.54 and time of 15 minutes, based on a crosswalk from 11107 Incisional biopsy of skin (eg, wedge) (including simple closure, when performed); each separate/additional lesion (List separately in addition to code for primary procedure) and 96171 *Health behavior intervention, family (without the patient present), face-to-face; each additional 15 minutes (List separately in addition to code for primary service)*. This will be the value for G2058 for 2001 until it is replaced by 99439 in 2021.

The survey for 99439 had 75 respondents, of whom 91% agreed that vignette was typical. The survey had a median work RVU of 0.93 and a median intra/total time of 20 minutes. The survey 25th percentile RVU was 0.70. The main reference services were 99457, *Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes*, with a work RVU of 0.61 and total/intra time of 20 minutes, 99238, *Hospital discharge day management, 30 minutes or less* with a work RVU of 1.28 and times of 8/20/10/38, and 99231, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Typically, 15 minutes are spent at the bedside and on the patient's hospital floor or unit*, with times 5/10/5/20 and a and work RVU of 0.76.

The expert panel agreed that the work RVU for 99439 should be less than the work RVU for 99490 and that the 25th percentile work RVU placed this add-on code in correct rank order with 99490 because the median time was 20 minutes (20% less than for 99490). In addition, the median survey time for 99439 was identical to the time for 99457, the first key reference service, and the survey 25th percentile work RVU of 0.70 is slightly higher than that of 99457 and reflects the higher intensity of 99439 because the patient population is sicker than that of 99497. Similarly, these values place 99439 in correct rank order to 99231 which is a hospital inpatient service with similar total time and a higher work RVU. In addition, the resultant IWPUT of 0.035 is appropriate and places it in proper rank order with 99490 (0.040).

Therefore, the specialties recommend a time of 20 minutes and a work RVU of 0.63 for 99439.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3.	Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time

SUMMARY OF RECOMMENDATION

CPT Code:99491 Tracking Number Original Specialty Recommended RVU: **1.50**
Presented Recommended RVU: **1.50**
Global Period: XXX Current Work RVU: **1.45** RUC Recommended RVU: **1.50**

CPT Descriptor: Chronic care management services with the following required elements:

• multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient,
• chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline,
• comprehensive care plan established, implemented, revised, or monitored;

first 30 minutes, provided personally by a physician or other qualified health care professional, per calendar month.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
(Adult) An 83-year-old female with congestive heart failure and early cognitive dysfunction, who has been hospitalized twice in the prior 12 months, is becoming increasingly confused and refuses an office visit. She has a certified nursing assistant supervised by a home care agency, participates in a remote weight and vital signs monitoring program, and sees a cardiologist and neurologist.

(Child) A 6-year-old boy with spastic quadriplegia, gastrostomy, gastroesophageal reflux with recurrent bouts of aspiration pneumonia and reactive airway disease, chronic seizure disorder, failure to thrive, and severe neurodevelopment delay. He receives home occupational, physical, and speech therapy services.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A physician or other qualified health care professional personally provides at least 30 minutes of chronic care management (CCM) services, per calendar month, to a patient with two or more chronic conditions residing at home or in a domiciliary, rest home, assisted living facility, or nursing home. These services typically include establishing, implementing, revising, or monitoring the care plan; coordinating the care of other professionals and agencies; and educating the patient or caregiver about the patient's condition, care plan, and prognosis. The physician or other qualified health care professional provides and/or oversees the coordination of services as needed for all medical conditions, psychosocial needs, and activities of daily living and documents and shares a plan of care with the patient and/or caregiver. A care plan is based on a physical, mental, cognitive, social, functional, and environmental assessment. It is a comprehensive plan of care for all health problems. It typically includes, but is not limited to, the following elements:

- Problem list;
- Expected outcome and prognosis;
- Measurable treatment goals;
- Symptom management;

- Planned interventions;
- Medication management;
- Community and social services ordered;
- How the services of agencies and specialists not associated with the practice will be directed and coordinated;
- Identification of the individuals responsible for each intervention;
- Requirements for periodic review; and
- When applicable, revision of the care plan.

In addition, the care management office/practice must have the following capabilities:

- Provide 24/7 access to physicians or other qualified health care professionals or clinical staff, including providing patients and caregivers with a means to make contact with health care professionals in the practice to address urgent needs, regardless of the time of day or day of week;
- Provide continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;
- Provide timely access and management for follow up after an emergency department visit or facility discharge;
- Use an electronic health record system so that care providers have timely access to clinical information; and
- Engage and educate patients and caregivers as well as coordinate care among all service professionals, as appropriate for each patient.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	12%	30%	20%	38%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	40%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	65%	35%
Physical effort required	10%	80%	10%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	45%	50%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	40%	60%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	45%	35%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	80%	20%
Physical effort required	20%	25%	55%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	30%	60%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Introduction

CPT created four new codes for principal care management (PCM) at the September 2020 CPT meeting. Two of the codes describe principal care management performed by clinical staff under the supervision of a qualified health professional (QHP) and the other two describe principal care management performed by the QHP herself. The PCM codes differ from the chronic care management (CCM) codes in that they are to be reported by QHPs when that professional is responsible for managing a patient's single chronic illness as opposed to being responsible for managing the entire care of a patient with two or more chronic illnesses. Therefore, it is possible that a PCM code will be reported during the same month as a CCM code - albeit by different QHPs.

Because the CCM codes are in the same family as the new PCM codes, the entire code family, CCM, CCCM and PCM, were surveyed. We note that the CCM codes were due to be surveyed in 2019 because they were identified as high growth services but, in consultation with the Research Subcommittee, the surveys were delayed until this cycle so the CCM, CCCM and PCM codes could be surveyed at the same time. The surveying societies were the American College of Physicians (ACP), the American Academy of Family Physicians (AAFP), the American Geriatrics Society (AGS), the American Academy of Pediatrics (AAP), the American Osteopathic Association (AOA), the American Nurses Association (ANA), the American College of Rheumatology (ACR), the American Academy of Neurology (AAN), the American Association of Hospice and Palliative Care Medicine (AAHPM), and the Society for Post-Acute and Long-Term Care Medicine (AMDA). The surveying societies met with the Research Subcommittee and obtained approval of the survey tool, making the vignettes more general (i.e., similar to those used for the office visit codes), the RSL codes, and combining the XXX and ZZZ codes in a single RSL that did not include the office visit codes.

Background

The CCM survey was randomly distributed to members of the ACP, AAFP, AGS, AOA, ANA AAHPM, AAP, AMDA, and ACR. The PCM survey was randomly distributed to members of AAN and all the above societies except for AAFP. In other words, all societies except for AAFP and AAN surveyed both sets of codes.

The surveying societies convened an expert panel to review the summary data. The panel noted that it was important not only for the CCM and the PCM code sets to be ranked correctly internally, but that the CCM and PCM codes must be ranked correctly to each other. Therefore, the panel looked very closely at the sub analysis survey responses from respondents who responded to both sets of codes in the survey.

The panel noted the low response rates. The panel believes this was mostly due to COVID-19-19 surges across the US. While the response rates were low, the panel agreed that the survey data appeared valid in terms of the spread of times and work RVUs and did not show any indication of confusion on the part of the respondents.

Compelling Evidence

The panel considered whether there was compelling evidence for an increase in work RVUs for the CCM codes. The panel reviewed a number of articles on how medical care is shifting from the office to the home.

As evidenced by the included literature:

CCM has significantly increased in complexity because complex medical conditions can now more often be managed while the patient is at home instead of during face-to-face services. For example, services to patients with heart failure, diabetes, and autoimmune disorders can be provided by, or under the supervision of, QHP while the patient is at home in order to decrease emergency department visits, hospitalizations, and placement in nursing homes and to improve quality of life. This shift occurred before COVID-19, was accelerated by COVID-19, and will continue after COVID-19.

The shift to caring for sicker, more complex patients began a little more than ten years ago, shortly before the CCM codes were established. The rapid evolution of sophisticated tools such as remote monitoring apps, self-management apps, ability for patients to transmit complex data (e.g., high resolution photographs) in real time has increased the ability to care for patients remotely. Development of robust remote monitoring technologies (e.g., measurement of pulmonary artery pressures via permanently

implanted sensors, continuous monitoring of vital signs by sensors that are able to transmit data over the internet in real-time) also enables clinicians to make diagnoses and alter treatment regimens without needing to see a patient face-to-face.

Clinicians can now often stratify patients according to risk remotely so that they have time to properly care for those patients who require office visits. This can mean that some patients are now contacted daily instead of weekly. The need to recognize and treat mental health issues has also increased as more and more evidence demonstrates that psychosocial issues play a major role in the treatment of chronic disease and contact with family members and caregivers is essential to help keep these patients functional and able to live at home.

The COVID-19 pandemic has accelerated this transformation and increased the number and complexity of patients needing CCM in order to keep them out of the hospital and to identify those patients who are deteriorating and need admission. COVID-19 has also highlighted the need for physicians to continually counsel patients on lifestyle choices that go far beyond the usual advice regarding exercise and diet. While the need to counsel on socially distancing and wearing a mask may be temporary, the heightened awareness of how all our patients' choices can influence disease management is a permanent addition to the matters in which QHPs and their clinical staff interact with patients.

In summary, the complexity of CCM has significantly increased since the codes were established.

Specifically, the CCM codes meet the following RUC criterion for compelling evidence:

> Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in physician work due to one or more of the following:
> ▪ technique
> ▪ **knowledge/technology**
> ▪ **patient populations**
> ▪ site-of-service
> ▪ length of hospital stay
> ▪ physician time

Literature:

1.) Hospital at home: feasibility and outcomes of a program to provide hospital-level care at home for acutely ill older patients, Bruce Leff 1, Lynda Burton, Scott L Mader, Bruce Naughton, Jeffrey Burl, Sharon K Inouye, William B Greenough 3rd, Susan Guido, Christopher Langston, Kevin D Frick, Donald Steinwachs, John R Burton Affiliations expand

- PMID: 16330791
- DOI: 10.7326/0003-4819-143-11-200512060-00008

Background: Acutely ill older persons often experience adverse events when cared for in the acute care hospital.
Objective: To assess the clinical feasibility and efficacy of providing acute hospital-level care in a patient's home in a hospital at home.
Participants: 455 community-dwelling elderly patients who required admission to an acute care hospital for community-acquired pneumonia, exacerbation of chronic heart failure, exacerbation of chronic obstructive pulmonary disease, or cellulitis.
Intervention: Treatment in a hospital-at-home model of care that substitutes for treatment in an acute care hospital.
Measurements: Clinical process measures, standards of care, clinical complications, satisfaction with care, functional status, and costs of care.
Results: Hospital-at-home care was feasible and efficacious in delivering hospital-level care to patients at home. In 2 of 3 sites studied, 69% of patients who were offered hospital-at-home care chose it over acute hospital care; in the third site, 29% of patients chose hospital-at-home care. Although less procedurally oriented than acute hospital care, hospital-at-home care met quality standards at rates similar to those of acute hospital care. On an intention-to-treat basis, patients treated in hospital-at-home had a shorter length of stay (3.2 vs. 4.9 days) ($P = 0.004$), and there was some evidence that they also had fewer complications. The mean cost was lower for hospital-at-home care than for acute hospital care (5081 dollars vs. 7480 dollars) ($P < 0.001$).
Conclusions: The hospital-at-home care model is feasible, safe, and efficacious for certain older patients with selected acute medical illnesses who require acute hospital-level care. Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition t

2.) Impact of complex care management on spending and utilization for high-need, high-cost Medicaid patients. Am J Manag Care. 2020 Feb 1;26(2):e57-e63. doi: 10.37765/ajmc.2020.42402.

3.) The Common Attributes of Successful Care Manager Programs for High-Need, High-Cost Persons: A Cross-Case Analysis. Ambul Care Manage. 2019 Oct/Dec;42(4):230-241. doi:0.1097/JAC.0000000000000305.PMID: 31449160

https://pubmed.ncbi.nlm.nih.gov/31449160/

4.) Attributes Common to Programs That Successfully Treat High-Need, High-Cost Individuals. November 10, 2015. The American Journal of Managed Care, November 2015, Volume 21, Issue 11

https://pubmed.ncbi.nlm.nih.gov/26735292/" https://pubmed.ncbi.nlm.nih.gov/26735292/

Summary: Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition to outside of traditional face-to-face office visits.

Therefore, the panel believes that compelling evidence has been met.

Discussion 99491
The panel reviewed the QHP CCM code 99491, *Chronic care management services, provided personally by a physician or other qualified health care professional, at least 30 minutes of physician or other qualified health care professional time, per calendar month, with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient; chronic conditions place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline; comprehensive care plan established, implemented, revised, or monitored.*

The survey had 55 respondents, 87% of whom found the vignette to be typical.
The current times 0/30/0/30 and work RVU are 1.45 which were the median and 25th percentile figures respectively, from the previous survey in 2017. The current survey median time was 33 minutes, the median work RVU was 1.75, and the 25th percentile RVU was 1.50. The two key reference services were G0181 with times 10/32/15/57 and work RVU of 1.73 and 99239, *Hospital discharge day management, greater than 30 minutes*, with times 10/30/15/55 and work RVU of 1.90. The expert panel agreed that the median time of 33 minutes was appropriate and the 25th percentile work RVU of 1.50 was also appropriate and placed 99491 in correct rank order with the key reference services and with 99490 and 99487.

The survey intra time for 99491 was one minute higher than both key reference services but lower than total time by 24 and 22 minutes, respectively. The panel also noted that this code is reported for the first 30 minutes of QHP time, but that it was not surprising that QHPs were spending more than 30 minutes in providing this service. Therefore, the 25th percentile survey work RVU places 99491 in correct rank order with both key reference services.

The panel then considered whether these values placed 99491 in proper rank order with 99490 and 99487. The panel agreed that they did. For example, the survey QHP time of 45 minutes for 99487 which is reported based on a minimum of 60 minutes of clinical staff time was appropriately longer than the survey QHP time of 33 minutes for a code that is reported based on QHP time - not staff time. Further, a work RVU for 99491 of 1.50 places 99491 in proper rank order to a work value of 1.81 for 99487. Specifically, the recommended QHP time of 33 minutes is 73% of the recommended QHP time for 99487 and the recommended work RVU for 99491 is 83% of the recommended work RVU for 99487. Similarly, the recommended QHP time of 33 minutes for 99491 is 32% higher than the recommended QHP time for 99490 and the recommended work RVU of 1.5 is 50% higher than the recommended work RVU for 99490.

Therefore, the expert panel recommends the survey median of 33 minutes and the 25th percentile work RVU of 1.50.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99491

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty (See associated frequency spreadsheet) How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 144273
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumed to be three times estimated Medicare utilization

Specialty (See associated frequency spreadsheet) Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 48,091 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 Medicare utilization

Specialty (See associated frequency spreadsheet) Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:99437 Tracking Number Original Specialty Recommended RVU: **1.00**
Presented Recommended RVU: **1.00**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **1.00**

CPT Descriptor: Chronic care management services with the following required elements:

• multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient,
• chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline,
• comprehensive care plan established, implemented, revised, or monitored;

each additional 30 minutes by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
(Adult) An 80-year-old male who has already received 59 minutes of physician or qualified healthcare professional chronic care management services during the calendar month requires additional care management services during the same calendar month.

[Note: This is an add-on service. Only consider the additional physician/QHP work beyond the work separately reported with base code [99491].]

(Child) An 11-year-old female with past medical history of meconium aspiration at birth resulting in anoxic brain injury with cerebral palsy, asthma, allergic rhinitis and global developmental delay who has already received 59 minutes of physician or qualified healthcare professional chronic care management services during the calendar moth and requires additional care management services during the same calendar month.

[Note: This is an add-on service. Only consider the additional physician/QHP work beyond the work separately reported with base code [99491].]

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A physician or other qualified health care professional personally provides these chronic care management (CCM) services, which are management and support services, to a patient with two or more chronic conditions residing at home or in a domiciliary, rest home, assisted living facility, or nursing home. These services typically include establishing, implementing, revising, or monitoring the care plan; coordinating the care of other professionals and agencies; and educating the patient or caregiver about the patient's condition, care plan, and prognosis. The physician or other qualified health care professional provides and/or oversees the coordination of services as needed for all medical conditions, psychosocial needs, and activities of daily living and documents and shares a plan of care with

the patient and/or caregiver. A care plan is based on a physical, mental, cognitive, social, functional, and environmental assessment. It is a comprehensive plan of care for all health problems. It typically includes, but is not limited to, the following elements:

- Problem list;
- Expected outcome and prognosis;
- Measurable treatment goals;
- Symptom management;
- Planned interventions;
- Medication management;
- Community and social services ordered;
- How the services of agencies and specialists not associated with the practice will be directed and coordinated;
- Identification of the individuals responsible for each intervention;
- Requirements for periodic review; and
- When applicable, revision of the care plan.

In addition, the care management office/practice must have the following capabilities:

- Provide 24/7 access to physicians or other qualified health care professionals or clinical staff, including providing patients and caregivers with a means to make contact with health care professionals in the practice to address urgent needs, regardless of the time of day or day of week;
- Provide continuity of care with a designated member of the care team with whom the patient is able to schedule successive routine appointments;
- Provide timely access and management for follow up after an emergency department visit or facility discharge;
- Use an electronic health record system so that care providers have timely access to clinical information; and
- Engage and educate patients and caregivers as well as coordinate care among all service professionals, as appropriate for each patient.

Description of Post-Service Work: N/A

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	70%	30%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Introduction

CPT created four new codes for principal care management (PCM) at the September 2020 CPT meeting. Two of the codes describe principal care management performed by clinical staff under the supervision of a qualified health professional (QHP) and the other two describe principal care management performed by the QHP herself. The PCM codes differ from the chronic care management (CCM) codes in that they are to be reported by QHPs when that professional is responsible for managing a patient's single chronic illness as opposed to being responsible for managing the entire care of a patient with two or more chronic illnesses. Therefore, it is possible that a PCM code will be reported during the same month as a CCM code - albeit by different QHPs.

Because the CCM codes are in the same family as the new PCM codes, the entire code family, CCM, CCCM and PCM, were surveyed. We note that the CCM codes were due to be surveyed in 2019 because they were identified as high growth services but, in consultation with the Research Subcommittee, the surveys were delayed until this cycle so the CCM, CCCM and PCM codes could be surveyed at the same time. The surveying societies were the American College of Physicians (ACP), the American Academy of Family Physicians (AAFP), the American Geriatrics Society (AGS), the American Academy of Pediatrics (AAP), the American Osteopathic Association (AOA), the American Nurses Association (ANA), the American College of Rheumatology (ACR), the American Academy of Neurology (AAN), the American Association of Hospice and Palliative Care Medicine (AAHPM), and the Society for Post-Acute and Long-Term Care Medicine (AMDA). The surveying societies met with the Research Subcommittee and obtained approval of the survey tool, making the vignettes more general (i.e., similar to those used for the office visit codes), the RSL codes, and combining the XXX and ZZZ codes in a single RSL that did not include the office visit codes.

Background

The CCM survey was randomly distributed to members of the ACP, AAFP, AGS, AOA, ANA AAHPM, AAP, AMDA, and ACR. The PCM survey was randomly distributed to members of AAN and all the above societies except for AAFP. In other words, all societies except for AAFP and AAN surveyed both sets of codes.

The surveying societies convened an expert panel to review the summary data. The panel noted that it was important not only for the CCM and the PCM code sets to be ranked correctly internally, but that the CCM and PCM codes must be ranked correctly to each other. Therefore, the panel looked very closely at the sub analysis survey responses from respondents who responded to both sets of codes in the survey.

The panel noted the low response rates. The panel believes this was mostly due to COVID-19-19 surges across the US. While the response rates were low, the panel agreed that the survey data appeared valid in terms of the spread of times and work RVUs and did not show any indication of confusion on the part of the respondents.

Compelling Evidence

The panel considered whether there was compelling evidence for an increase in work RVUs for the CCM codes. The panel reviewed a number of articles on how medical care is shifting from the office to the home.

As evidenced by the included literature:

CCM has significantly increased in complexity because complex medical conditions can now more often be managed while the patient is at home instead of during face-to-face services. For example, services to patients with heart failure, diabetes, and autoimmune disorders can be provided by, or under the supervision of, QHP while the patient is at home in order to decrease emergency department visits, hospitalizations, and placement in nursing homes and to improve quality of life. This shift occurred before COVID-19, was accelerated by COVID-19, and will continue after COVID-19.

The shift to caring for sicker, more complex patients began a little more than ten years ago, shortly before the CCM codes were established. The rapid evolution of sophisticated tools such as remote monitoring apps, self-management apps, ability for patients to transmit complex data (e.g., high resolution photographs) in real time has increased the ability to care for patients remotely. Development of robust remote monitoring technologies (e.g., measurement of pulmonary artery pressures via permanently

implanted sensors, continuous monitoring of vital signs by sensors that are able to transmit data over the internet in real-time) also enables clinicians to make diagnoses and alter treatment regimens without needing to see a patient face-to-face.

Clinicians can now often stratify patients according to risk remotely so that they have time to properly care for those patients who require office visits. This can mean that some patients are now contacted daily instead of weekly. The need to recognize and treat mental health issues has also increased as more and more evidence demonstrates that psychosocial issues play a major role in the treatment of chronic disease and contact with family members and caregivers is essential to help keep these patients functional and able to live at home.

The COVID-19 pandemic has accelerated this transformation and increased the number and complexity of patients needing CCM in order to keep them out of the hospital and to identify those patients who are deteriorating and need admission. COVID-19 has also highlighted the need for physicians to continually counsel patients on lifestyle choices that go far beyond the usual advice regarding exercise and diet. While the need to counsel on socially distancing and wearing a mask may be temporary, the heightened awareness of how all our patients' choices can influence disease management is a permanent addition to the matters in which QHPs and their clinical staff interact with patients.

In summary, the complexity of CCM has significantly increased since the codes were established.

Specifically, the CCM codes meet the following RUC criterion for compelling evidence:

> Documentation in the peer-reviewed medical literature or other reliable data that there have been changes in physician work due to one or more of the following:
> ▪ technique
> ▪ **knowledge/technology**
> ▪ **patient populations**
> ▪ site-of-service
> ▪ length of hospital stay
> ▪ physician time

Hospital at home: feasibility and outcomes of a program to provide hospital-level care at home for acutely ill older patients, Bruce Leff 1, Lynda Burton, Scott L Mader, Bruce Naughton, Jeffrey Burl, Sharon K Inouye, William B Greenough 3rd, Susan Guido, Christopher Langston, Kevin D Frick, Donald Steinwachs, John R Burton
Affiliations expand

- PMID: 16330791
- DOI: 10.7326/0003-4819-143-11-200512060-00008

Background: Acutely ill older persons often experience adverse events when cared for in the acute care hospital.
Objective: To assess the clinical feasibility and efficacy of providing acute hospital-level care in a patient's home in a hospital at home.
Participants: 455 community-dwelling elderly patients who required admission to an acute care hospital for community-acquired pneumonia, exacerbation of chronic heart failure, exacerbation of chronic obstructive pulmonary disease, or cellulitis.
Intervention: Treatment in a hospital-at-home model of care that substitutes for treatment in an acute care hospital.
Measurements: Clinical process measures, standards of care, clinical complications, satisfaction with care, functional status, and costs of care.
Results: Hospital-at-home care was feasible and efficacious in delivering hospital-level care to patients at home. In 2 of 3 sites studied, 69% of patients who were offered hospital-at-home care chose it over acute hospital care; in the third site, 29% of patients chose hospital-at-home care. Although less procedurally oriented than acute hospital care, hospital-at-home care met quality standards at rates similar to those of acute hospital care. On an intention-to-treat basis, patients treated in hospital-at-home had a shorter length of stay (3.2 vs. 4.9 days) ($P = 0.004$), and there was some evidence that they also had fewer complications. The mean cost was lower for hospital-at-home care than for acute hospital care (5081 dollars vs. 7480 dollars) ($P < 0.001$).
Conclusions: The hospital-at-home care model is feasible, safe, and efficacious for certain older patients with selected acute medical illnesses who require acute hospital-level care. Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition t

Impact of complex care management on spending and utilization for high-need, high-cost Medicaid patients. Am J Manag Care. 2020 Feb 1;26(2):e57-e63. doi: 10.37765/ajmc.2020.42402.

https://pubmed.ncbi.nlm.nih.gov/31449160/
Attributes Common to Programs That Successfully Treat High-Need, High-Cost Individuals. November 10, 2015. The American Journal of Managed Care, November 2015, Volume 21, Issue 11

https://pubmed.ncbi.nlm.nih.gov/26735292/" https://pubmed.ncbi.nlm.nih.gov/26735292/

Summary: Successful management of the highly complex (high-need, high-cost) patients requires team based care that is in addition to outside of traditional face-to-face office visits.

Therefore, the panel believes that compelling evidence has been met.

Discussion 99437
The expert panel reviewed the new CPT code 99437 which is an add-on code to 99491 and is reported for each additional 30 minutes of QHP time spent on CCM per calendar month.

The survey had 48 respondents, 94% of whom found the vignette to be typical. The median time was 30 minutes and the median work RVU was 1.29 while the 25th percentile work RVU was 1.00. The two key reference services were G0181, and 99498, *Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; each additional 30 minutes (List separately in addition to code for primary procedure)*. G0181 has times 10/32/15/57 and work RVUs of 1.73 and 99498 has times 0/30/0/30 and work of RVUs 1.40

The expert panel agreed that the median time of 30 minutes and the 25th percentile work RVU of 1.00 placed 99437 in proper rank order to 99491 and the other CCM codes. Specifically, the time of 30 minutes for 99437 is identical to that of 99498 the 25th percentile survey work RVU of 1.00 is 71% the work RVU of 99498 which is appropriate considering that 99498 is a care planning service that is reported when there are family disagreements and multiple family members with whom discussion is needed. Similarly, 30 minutes for 99437 is 0.52% the total time of G0181 and the survey 25th percentile work RVU of 1.00 is 0.58% the work RVU for G0181.

In comparing the recommendations for 99491 and 99437, the expert panel noted that 30 minutes was appropriate given the code requirement of 30 minutes of QHP time and that the work RVU of 1.00, which is 67% of the work RVU for 99491, is appropriate given the relative intensities of the two services. This is also reflected in the relative IWPUTs for these two services of 0.045 and 0.033, respectively.

Therefore, the expert panel recommends the median time of 30 minutes and the 25th percentile work RVU of 1.00 for 99437.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

	Code	Global	Work RVU	Pre-Time	Intra-Time	Post-Time
3.	99491	XXX	1.50	0	35	0
4.	+99437	ZZZ	0.95	0	30	0
5.	Total		2.45	0	65	0

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 99491

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty (See associated frequency spreadsheet) How often?

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 115418
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Assumed to be three times estimated Medicare utilization

Specialty (See associated frequency spreadsheet) Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 38,473 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization assumed to be 80% of 99490, based on 99489 as percent of 99487

Specialty (See associated frequency spreadsheet) Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Global Period: XXX Current Work RVU: **1.00** RUC Recommended RVU: **1.81**

CPT Descriptor: Complex chronic care management services, with the following required elements:

• multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient,
• chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline,
• comprehensive care plan established, implemented, revised, or monitored,
• moderate or high complexity medical decision making;

first 60 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey:
(Adult) An 83-year-old woman with congestive heart failure and early cognitive dysfunction, who has been hospitalized twice in the prior 12 months, is becoming increasingly confused and refuses an office visit. She has a certified nursing assistant supervised by a home care agency, participates in a remote weight and vital signs monitoring program and sees a cardiologist and neurologist.

(Child) A 6-year-old boy with spastic quadriplegia, gastrostomy, gastroesophageal reflux with recurrent bouts of aspiration pneumonia and reactive airway disease, chronic seizure disorder, failure to thrive and severe neurodevelopment delay. He receives home occupational, physical and speech therapy services.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Complex chronic care coordination services are patient centered management and support services provided by physicians, other qualified health care professionals, and clinical staff to an individual who resides at home or in a domiciliary, rest home, assisted living facility, or nursing home. This service typically involves 60 minutes of clinical staff time implementing a care plan directed by the physician or other qualified health care professional, per calendar month. This service addresses the coordination of care by multiple disciplines and community service agencies. The reporting individual provides or oversees the management and/or coordination of services, as needed, for all medical conditions, psychosocial needs, and activities of daily living. Patients who require complex chronic care coordination services may be identified by algorithms that utilize reported conditions and services (e.g. predictive modeling risk score or repeat admissions or emergency department use) or by clinician judgment. Typical patients have two or more chronic continuous or episodic health conditions expected to last at least 12 months, or until the death of the patient, that place the patient at significant risk of death, acute exacerbation or decompensation or functional decline. Because of the complex nature of their diseases and morbidities, these patients commonly require the coordination of a number of specialties and services. Patients may have medical and psychiatric behavioral co-morbidities (e.g. dementia and chronic

obstructive pulmonary disease or substance abuse and diabetes) that complicate their care. Social support weaknesses or access to care difficulties may cause a need for these services. Medical, functional, and/or psychosocial problems that require medical decision making of moderate or high complexity and extensive clinical staff support are expected. Medical decision making as defined in the Evaluation and Management (E/M) guidelines is not only applied to the face-to-face services but is determined by the nature of the problems addressed by the reporting individual during the month. A plan of care should be documented and shared with the patient and/or caregiver.

Description of Post-Service Work: N/A

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
G0181	XXX	1.73	**CMS Time File**

CPT Descriptor Physician supervision of a patient receiving medicare-covered services provided by a participating home health agency (patient not present) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of laboratory and other studies, communication (including telephone calls) with other health care professionals involved in the patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy, within a calendar month, 30 minutes or more

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99226	XXX	2.00	**RUC Time**

CPT Descriptor Subsequent observation care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Typically, 35 minutes are spent at the bedside and on the patient's hospital floor or unit

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99335	XXX	1.72	**RUC Time**	1,241,609

CPT Descriptor 1 Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and/or coordination of care with other physicians, other qualified health care professionals, or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Typically, 25 minutes are spent with the patient and/or family or caregiver.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization

99239	XXX	1.90	**RUC Time**	5,189,830

CPT Descriptor 2 Hospital discharge day management; more than 30 minutes

Other Reference CPT Code	Global	Work RVU	Time Source

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 12 **% of respondents:** 23.5 **%**

Number of respondents who choose 2nd Key Reference Code: 8 **% of respondents:** 15.6 **%**

TIME ESTIMATES (Median)

	CPT Code: 99487	**Top Key Reference CPT Code:** G0181	**2nd Key Reference CPT Code:** **99226**
Median Pre-Service Time	0.00	10.00	10.00
Median Intra-Service Time	45.00	32.00	30.00
Median Immediate Post-service Time	0.00	15.00	15.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Prolonged Services Time	0.0	0.00	0.00
Median Subsequent Observation Care Time	0.0	0.00	0.00
Median Total Time	**45.00**	**57.00**	**55.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	10%	25%	30%	35%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	40%	60%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	30%	65%
Physical effort required	10%	50%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	30%	70%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	75%	25%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	50%	40%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	45%	45%
Physical effort required	10%	50%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	20%	30%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Introduction

CPT created four new codes for principal care management (PCM) at the September 2020 CPT meeting. Two of the codes describe principal care management performed by clinical staff under the supervision of a qualified health professional (QHP) and the other two describe principal care management performed by the QHP herself. The PCM codes differ from the chronic care management (CCM) codes in that they are to be reported by QHPs when that professional is responsible for managing a patient's single chronic illness as opposed to being responsible for managing the entire care of a patient with two or more chronic illnesses. Therefore, it is possible that a PCM code will be reported during the same month as a CCM code - albeit by different QHPs.
