RUC Referrals to CPT Editoral Panel - Outstanding Issues

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
0446T	**Creation of subcutaneous pocket with insertion of implantable interstitial glucose sensor, including system activation and patient training**	CMS Request - Final Rule for 2020	January 2020	AACE, ES	February 2021

Background: In the CY 2020 Final Rule, CMS sought information from stakeholders on the resources involved in furnishing the services described by Category III codes 0446T, 0447T and 0448T. CMS was specifically seeking recommendations, including the work RVUs, work time, and direct PE inputs, associated with the resources involved in inserting and removing the device, as well as the resource costs of the implantable device and disposable supplies. The Agency expressed concern for the immediate needs of Medicare beneficiaries with diabetes and stated that "the contractor pricing for these services has contributed to significant confusion in the community with regards to Medicare payment rules for these kinds of monitoring systems." Under existing policies of CMS, any recommendations submitted by February 10, 2020 would be considered for CY 2021 Physician Payment Schedule rulemaking. Accordingly, codes 0446T, 0447T and 0448T were placed on the RUC agenda for the January 2020 meeting. The specialty societies initially requested referral to the CPT Editorial Panel for Category III codes 0446T, 0447T and 0448T. These services were only approved by the FDA in June 2018 and have not yet been widely adopted, therefore a survey may not yield an accurate recommendation to CMS for consideration. It was also understood that this technology would be significantly revised over the next twelve months, which would result in the revision of these services and/or the development of additional codes for consideration. At the RUC meeting, however, the specialties indicated that they had reconsidered their request for referral because their discussions with the manufacturer indicated that it intended to convert the codes to Category I at some point in the future when the data and literature were available to support such an application.The RUC recommends that the codes remain contractor priced and that CPT codes 0446T, 0447T and 0448T be referred to the CPT Editorial Panel time uncertain.

37220	**Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty**	High Volume Growth1	January 2019	SVS, ACS, SIR, ACR, ACC	September 2021

Background: In October 2018, 37225, 37227 and 37229 services were identified by the PE High Cost Supplies screen for services with non-facility Medicare utilization over 10,000, not reviewed in the last five years and include a supply item greater than $500. The RUC requests an action plan for the January 2019 on how to address these services. The Workgroup reviewed the action plan for these services, noting that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing was appropriate. The Workgroup noted that CPT code 37229 was identified on the High Volume Growth screen at this meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies.

49565	**Repair recurrent incisional or ventral hernia; reducible**	Site of Service Anomaly - 2019	January 2020	ACS, SAGES	February 2021

Background: In October 2019, the Relativity Assessment Workgroup identified CPT code 49565 as performed less than 50% of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period with 2018e Medicare utilization over 5,000. The RUC recommended this service be surveyed for January 2020. In January 2020, the specialty societies requested that CPT code 49565 be referred to the May 2020 CPT Editorial Panel to update the descriptor to current standard of practice and typical patient presentation; for example, mesh insertion and removal, and size and number or defects. The RUC questioned if CPT codes 49560, 49561, 49566 and/or 49568 are considered part of this family of services. The specialty society indicated they will define the family of services on the correct coding application (CCA). The RUC recommends that these services be referred to the May 2020 CPT Editorial Panel. The specialties are will submit a CCA for the CPT 2023 cycle.

63030	**Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, lumbar**	Pre-Time Analysis / Site of Service Anomaly - 2018	January 2021	AANS, AAOS, NASS	May 2021

Background: CPT code 63030 was identified via the site of service anomaly screent. In December 2020, the Relativity Assessment Workgroup noted that CPT code 63030 continues to be primarily reported in the outpatient setting yet still includes inpatient hospital visits. The specialty society indicated that there is still confusion, and 63030 is inappropriately being reporting in the outpatient setting. The RUC recommends that CPT code 63030 be referred to CPT (May 2021) to revise the descriptor to exclude the types of procedures that are thought to be causing the incorrect reporting in the outpatient setting, such as explicitly stating the types of situations for which CPT code 63030 should not be used. The RUC understands that this service will be surveyed after the CPT revisions and reviewed by the RUC.

64415	**Injection(s), anesthetic agent(s) and/or steroid; brachial plexus**	CMS Fastest Growing	October 2018	AAPM, ASA	May 2021

Background: During the October 2018 RUC presentation of the Somatic Nerve Injection family of services, the specialty societies stated that codes 64415, 64416, 64417, 64446, 64447, and 64448 were reported with code 76942 Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation more than 50 percent of the time. Specifically, 76 percent with 64415, 85 percent with 64416, 68 percent with 64417, 77 percent with 64446, 77 percent with 64447, and 79 percent with 64448. The societies indicated they would submit a code change application to bundle 76942 into codes 64415, 64416, 64417, 64446, 64447, and 64448 for the 2021 cycle. This overlap was accounted for in the above RUC recommendations for these services. The RUC refers CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 to be bundled with ultrasound guidance, CPT code 76942 to the CPT Editorial Panel for CPT 2021. In September 2019, this issue was postponed until after the CPT Imaging Guidance Workgroup completes its work.

64447	**Injection(s), anesthetic agent(s) and/or steroid; femoral nerve**	CMS Fastest Growing	October 2018	AAPM, ASA	May 2021

Background: During the October 2018 RUC presentation of the Somatic Nerve Injection family of services, the specialty societies stated that codes 64415, 64416, 64417, 64446, 64447, and 64448 were reported with code 76942 Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation more than 50 percent of the time. Specifically, 76 percent with 64415, 85 percent with 64416, 68 percent with 64417, 77 percent with 64446, 77 percent with 64447, and 79 percent with 64448. The societies indicated they would submit a code change application to bundle 76942 into codes 64415, 64416, 64417, 64446, 64447, and 64448 for the 2021 cycle. This overlap was accounted for in the above RUC recommendations for these services. The RUC refers CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 to be bundled with ultrasound guidance, CPT code 76942 to the CPT Editorial Panel for CPT 2021. In September 2019, this issue was postponed until after the CPT Imaging Guidance Workgroup completes its work.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
64448	**Injection(s), anesthetic agent(s) and/or steroid; femoral nerve, continuous infusion by catheter (including catheter placement)**	Site of Service Anomaly / High Volume Growth1 / CMS Fastest Growing / High Volume Growth2	October 2018	ASA	May 2021

Background: During the October 2018 RUC presentation of the Somatic Nerve Injection family of services, the specialty societies stated that codes 64415, 64416, 64417, 64446, 64447, and 64448 were reported with code 76942 Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation more than 50 percent of the time. Specifically, 76 percent with 64415, 85 percent with 64416, 68 percent with 64417, 77 percent with 64446, 77 percent with 64447, and 79 percent with 64448. The societies indicated they would submit a code change application to bundle 76942 into codes 64415, 64416, 64417, 64446, 64447, and 64448 for the 2021 cycle. This overlap was accounted for in the above RUC recommendations for these services. The RUC refers CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 to be bundled with ultrasound guidance, CPT code 76942 to the CPT Editorial Panel for CPT 2021. In September 2019, this issue was postponed until after the CPT Imaging Guidance Workgroup completes its work.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
73580	**Radiologic examination, knee, arthrography, radiological supervision and interpretation**	High Volume Growth1 / CMS Fastest Growing / CPT Assistant Analysis / High Volume Growth3	October 2020	AAOS	May 2021

Background: The Workgroup discussed the long history of the identification of code 73580 and noted that this service has never been surveyed and remains CMS/Other sourced. The specialty societies noted that the increased utilization was due to miscoding of the related CPT code 27370 Injection of contrast for knee arthrography. To address this miscoding, CPT code 27370 was deleted and replaced with a new CPT code 27369 Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography. The new CPT code was valued by the RUC in October 2017. CPT code 27370 was deleted in 2019 and a CPT Assistant article was published in August 2019. CPT code 73580 utilization has decreased in 2019 concurrent with the deletion of 27370 and clarification of the appropriate use of these codes. The specialty societies noted that the RUC rationale for CPT code 27369 provides additional information, including why these services were not previously bundled. However, the Workgroup noted that codes 73580 and 27369 will always be reported in conjunction with one another. The Workgroup also noted that that Rheumatology and Family Medicine are the primary providers of code 73580 and should be involved with the review of this service. The Workgroup recommends that CPT code 73580 be referred to CPT to be bundled with CPT code 27369 Injection procedure for contrast knee arthrography or contrast enhanced CT/MRI knee arthrography.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
76377	**3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation**	CMS Request - Final Rule for 2020	January 2020	ACR, ASNR, SIR	May 2021

Background: In the Final Rule for the CY 2020 Medicare Physician Fee Schedule, CMS nominated CPT code 76377 3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; requiring image postprocessing on an independent workstation as potentially misvalued. The Agency views CPT code 76377 to be part of the same family as CPT code 76376 3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality with image postprocessing under concurrent supervision; not requiring image postprocessing on an independent workstation, which was recently reviewed at the April 2018 RUC meeting. CMS requested that CPT code 76376 also be reviewed to maintain relativity within the code family. The specialty societies disagreed with CMS' rationale for the nomination of CPT code 76377 as potentially misvalued and the specialties do not believe that CPT codes 76376 and 76377 are in the same code family, although the descriptors are similar. The societies noted that the two codes are different because they are utilized on different patient populations (as evidenced by the ICD-10 diagnoses.) They also noted that the technical and professional resources required for 76376 and 76377 are significantly different. For these reasons, the specialty societies recommended, and the RUC agreed to refer CPT codes 76377 and 76376 to the CPT Editorial Panel for further review and potential revision. The specialty societies noted that they will determine the family of services including whether the codes remain a family, based on the recommendations of the CPT Editorial Panel.

76942	**Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation**	CMS-Other - Utilization over 500,000 / CMS Request - Final Rule for 2014 / High Volume Growth3	April 2014	AACE, AAOS, AAPMR, ACR, ACRh, APMA, ASA, ASBS, ASIPP, AUA, SIR	May 2021

Background: During the October 2018 RUC presentation of the Somatic Nerve Injection family of services, the specialty societies stated that codes 64415, 64416, 64417, 64446, 64447, and 64448 were reported with code 76942 Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation more than 50 percent of the time. Specifically, 76 percent with 64415, 85 percent with 64416, 68 percent with 64417, 77 percent with 64446, 77 percent with 64447, and 79 percent with 64448. The societies indicated they would submit a code change application to bundle 76942 into codes 64415, 64416, 64417, 64446, 64447, and 64448 for the 2021 cycle. This overlap was accounted for in the above RUC recommendations for these services. The RUC refers CPT codes 64415, 64416, 64417, 64446, 64447 and 64448 to be bundled with ultrasound guidance, CPT code 76942 to the CPT Editorial Panel for CPT 2021. In September 2019, this issue was postponed until after the CPT Imaging Guidance Workgroup completes its work.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
76998	**Ultrasonic guidance, intraoperative**	CMS-Other - Utilization over 20,000 Part1	October 2019	STS, AATS, ACS, ASBrS, AUA, AVLS, SCAI, SIR, SVS	September 2021

Background: In October 2018, the Workgroup discussed future screens and recommends lowering the threshold and examining the list of CMS/Other source codes with Medicare utilization over 20,000. In October 2019, the RUC refers this issued to CPT Editorial Panel (May 2020) to more accurately differentiate physician work as multiple specialties currently use this code and to clarify correct coding.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
92065	**Orthoptic and/or pleoptic training, with continuing medical direction and evaluation**	Harvard Valued - Utilization over 30,000-Part4	October 2020	AAO, AOA (optometry)	February 2021 May 2020-Tab 37

Background: This service was identified in October 2019 as Harvard Valued utilization over 30,000. The Workgroup requested action plans to examine this service. In January 2020, the RUC recommended that this service be referred to CPT May 2020. This service with an “and/or” connector should be two different codes given their different patient populations and techniques used for the treatment. For that reason, this code should go back to CPT for a descriptor edit as well as creation of separate codes. At the October 2020 RUC meeting, based on pre-facilitation by the RUC, the specialty societies indicated their intent to take this code back to the CPT Editorial Panel to create two separate codes. The societies requested referral to CPT and plan to submit a new code change application for the February 2021 CPT Editorial Panel meeting. During review and analysis of the survey, it became evident that this service is delivered in two different ways. Because of this, it is necessary to create two codes in order to delineate when the training is provided directly by the provider and when it is provided by a technician under the supervision of the provider. Doing so will ensure more accurate valuation of both work and practice expense associated with this service. The RUC supports creation of a companion code and concurs that code 92065 should be referred to the February 2021 CPT Editorial Panel meeting for CPT 2023. The RUC recommends CPT code 92065 be referred to CPT.

99358	**Prolonged evaluation and management service before and/or after direct patient care; first hour**	CMS Request - Final Rule for 2020	October 2020	AAAAI, AACAP, AAFP, AAHPM, AAN, AAP, ACP, ACRh, AGS, ANA, ASE	February 2021

Background: In October 2020, the RUC recommends that CPT codes 99358 and 99459 be referred to the CPT Editorial Panel for February 2021, to be examined and surveyed along with the other E/M services for the CPT 2023 and the 2023 Medicare Physician Payment Schedule.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
99359	**Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes (List separately in addition to code for prolonged service)**	CMS Request - Final Rule for 2020	October 2020	AAAAI, AACAP, AAFP, AAHPM, AAN, AAP, ACP, ACRh, AGS, ANA, ASE	February 2021

Background: In October 2020, the RUC recommends that CPT codes 99358 and 99459 be referred to the CPT Editorial Panel for February 2021, to be examined and surveyed along with the other E/M services for the CPT 2023 and the 2023 Medicare Physician Payment Schedule.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
G0396	**Alcohol and/or substance (other than tobacco) abuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes**	CMS-Other - Utilization over 30,000	January 2018	AAFP, ASA, ASAM	Time Uncertain

Background: In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. This list resulted in 34 services and the RAW requested action plans to be reviewed at the January 2018 meeting. In January 2018, the RUC recommended to maintain the physician work and refer to CPT to editorially remove "screening" from 99408 and 99409 to "assessment" to mirror G0396. At the February 2018 CPT meeting, the Panel postponed until time uncertain this request to revise codes 99408-99409 to identify assessment of alcohol and/or substance abuse. As a rationale for postponement, the Panel said that the service described in this application did not meet the General Criteria for Category I because the proposed service is not unique or well defined, and does not describe a service that is clearly identified and distinguished from existing services already described in CPT by other codes. The Panel's additional rationale for postponement of this item was to allow the relevant specialty societies an opportunity to submit a new code change application to address the differences between assessment and screening services.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
G6001	**Ultrasonic guidance for placement of radiation therapy fields**	CMS-Other - Utilization over 20,000 Part2	January 2021		September 2021

Background: The RUC identified G6001 via the CMS/Other Source Utilization over 20,000 screen. In January 2021, the RUC recommended to refer to CPT to develop new code(s) that reflect the different process of care between the two specialties (dermatology and radiation oncology).

RUC Recommendations to Develop CPT Assistant Articles - Outstanding Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
63685	**Insertion or replacement of spinal neurostimulator pulse generator or receiver, direct or inductive coupling**	Site of Service Anomaly / CMS Fastest Growing/ High Volume Growth7	January 2021	Refer to CPT Assistant. Review action plan in 2 years after CPT article published. 6.05	AAPM, AANS/CNS, ASA, ISIS, NASS	

Background: Oct 2010 re-reviewed site of service issue. In October 2020, the RUC identified six codes with Medicare utilization of 10,000 or more that have increased by at least 100% from 2014 through 2019e. CPT codes 00918, 63685, 75561, 75572, 75574 and 93655. The Workgroup requested that the specialty societies submit an action plan for codes CPT codes 00918, 63685, 75561, 75572, 75574 and 93655 for January 2021. In January 2021, the RUC recommended to refer to CPT Assistant. A CPT Assistant article has already been submitted. The RUC will reeview after 2 years of data are available after article is published.

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
75710	**Angiography, extremity, unilateral, radiological supervision and interpretation**	CMS High Expenditure Procedural Codes2	January 2021	Refer to CPT Assistant and review after 2 years of data after publication available. 1.75	ACR, ACC, RPA, SCAI, SIR, SVS	

Background: In the NPRM for 2016 CMS re-ran the high expenditure services across specialties with Medicare allowed charges of $10 million or more. CMS identified the top 20 codes by specialty in terms of allowed charges, excluding 010 and 090-day global services, anesthesia and Evaluation and Management services and services reviewed since CY 2010. In October 2016 the RUC noted that with the newly bundled dialysis access maintenance codes that were approved in January 2016 as part of Dialysis Circuit code family 36901-36909, the specialties project that a significant portion of the nephrology volume for 75710 will instead be reported with applicable Dialysis Circuit codes. Nephrology represented 17.8 percent of the 2015 Medicare claims for 75710. The RUC will add a flag for review to confirm that nephrology utilization volume has decreased once 2017 Medicare utilization data is available for review. The RUC noted the nephrology utilization is slightly decreasing. The RUC recommended to review utilization again in 2 years (Oct 2020). In October 2020, the Workgroup reviewed the history of this code and the action plan submitted by SVS, SIR, ACR and ACC. Noting that the 2019e utilization by nephrologists was gradually decreasing (13%) (global & -26 modifier). The Workgroup questioned if the gradual decrease in utilization by nephrologists is appropriate or if nephrologists should not be performing this service at all. The Workgroup noted that RPA was not involved in the development of this action plan. The Workgroup requested the input from Nephrology regarding the reporting of CPT code 75710 and review at the January 2021 meeting. In January 2021, the Relativity Assessment Workgroup noted that the utilization of nephrology continues to decrease but not at the rate the specialty societies thought it would. The specialty societies indicated that they would submit a CPT Assistant article to address the appropriate reporting of this service. The Workgroup recommends that this service be referred to CPT Assistant and reviewed after 2 years of data is available after the publication of the article. The specialty societies noted that the expected utilization for Nephrology would be under 10%.

Detailed Description of Pre-Service Time Packages (Minutes)

		FACILITY				NON-FAC	
		1	2	3	4	5**	6
	Total Pre-Service Time	**20**	**25**	**51**	**63**	**8**	**23**
	CATEGORY SUBTOTALS						
A	Pre-Service Evaluation (IWPUT =0.0224)	13	18	33	40	7	17
B	Pre-Service Positioning (IWPUT = 0.0224)	1	1	3	3	0	1
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	6	15	20	1	5
	DETAILS						
A	History and Exam (Performance and review of appropriate Pre-Tests)	5	10	10	15	4	9
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	2	4	1	1
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	3	5	5	2	3
A	Communicate with other professionals	0	0	5	5	0	2
A	Check/set-up room, supplies and equipment	1	1	5	5	0	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	1	5	5	0	1
A	Prepare/ review/ confirm procedure	1	1	1	1	0	0
B	Perform/ supervise patient positioning	1	1	3	3	0	1
C	Administer local/topical anesthesia	1	1	0	0	1	5
C	Observe (wait anesthesia care)	0	0	10	15	0	0
C	Dress and scrub for procedure	5	5	5	5	0	0

**If the procedure does not require local anesthesia, 1 minute should be removed from pre-service time

- **1** Straightforward Patient/Straightforward Procedure (No anesthesia care)
- **2** Difficult Patient/Straightforward Procedure (No anesthesia care)
- **3** Straightforward Patient/Difficult Procedure
- **4** Difficult Patient/Difficult Procedure
- **5** Procedure with minimal anesthesia care (If no anesthesia care deduct 1 minute)
- **6** Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect

Additional Positioning Times for Spinal Surgical Procedures

SS1	Anterior Neck Surgery (Supine) (eg ACDF)	15 Minutes
SS2	Posterior Neck Surgery (Prone) (eg laminectomy)	25 Minutes
SS3	Posterior Thoracic/Lumbar (Prone) (eg laminectomy)	15 Minutes
SS4	Lateral Thoracic/Lumbar (Lateral) (eg corpectomy)	25 Minutes
SS5	Anterior Lumbar (Supine) (eg ALIF)	15 Minutes

Additional Positioning Times for Spinal Injection Procedures

SI1	Anterior Neck Injection (Supine) (eg discogram)	7 Minutes
SI2	Posterior Neck Injection (Prone) (eg facet)	5 Minutes
SI3	Posterior Thoracic/Lumbar (Prone) (eg epidural)	5 Minutes
SI4	Lateral Thoracic/Lumbar (Lateral) (eg discogram)	7 Minutes

Additional Positioning Times for Urological Procedures

U1	Dorsal Lithotomy	5 Minutes

Notes:

- Roll-over cells for additional detail where available
- Straightforward procedure: Integumentary, Non-incisional endoscopy, natural orifice

Detailed Description of Facility Based Post-Service Time Packages (Minutes)						
	7A Local Anesthesia/ Straightforward Procedure	**7B Local Anesthesia/ Complex Procedure**	**8A IV Sedation/ Straightforward Procedure**	**8B IV Sedation/ Complex Procedure**	**9A General Anesthesia or Complex Regional Block/ Straightforward Procedure**	**9B General Anesthesia or Complex Regional Block/Complex Procedure**
Total Post-Service Time	**18**	**21**	**25**	**28**	**30**	**33**
Details:						
Application of Dressing[1]	2	2	2	2	2	2
Transfer of supine patient off table	1	1	1	1	1	1
Operative Note	5	5	5	5	5	5
Monitor patient recovery/stabilization	1	1	5	5	10	10
Communication with patient and/or family	5	5	5	5	5	5
Written post-operative note	2	5	2	5	2	5
Post-Operative Orders and Order Entry	2	2	5	5	5	5

Advisors may request additional time for circumstances that require additional work beyond the type of work described

1 This represents a simple dressing

15275	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15276	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; each additional 25 sq cm wound surface area, or part thereof (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15277	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm wound surface area, or 1% of body area of infants and children	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15278	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area greater than or equal to 100 sq cm; each additional 100 sq cm wound surface area, or part thereof, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
15769	Grafting of autologous soft tissue, other, harvested by direct excision (eg, fat, dermis, fascia)	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	October 2023		☐
15771	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; 50 cc or less injectate	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	October 2023		☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
15772	Grafting of autologous fat harvested by liposuction technique to trunk, breasts, scalp, arms, and/or legs; each additional 50 cc injectate, or part thereof (List separately in addition to code for primary procedure)	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	October 2023		☐
15773	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; 25 cc or less injectate	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	October 2023		☐
15774	Grafting of autologous fat harvested by liposuction technique to face, eyelids, mouth, neck, ears, orbits, genitalia, hands, and/or feet; each additional 25 cc injectate, or part thereof (List separately in addition to code for primary procedure)	Oct 2018	Tissue Grafting Procedures	04	CPT 2020	October 2023		☐
15777	Implantation of biologic implant (eg, acellular dermal matrix) for soft tissue reinforcement (ie, breast, trunk) (List separately in addition to code for primary procedure)	Apr 2011	Chronic Wound Dermal Substitute	4	CPT 2012	October 2015	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
17106	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); less than 10 sq cm	Oct 2008	Destruction of Skin Lesions	11	CPT 2009	September 2013	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
17107	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); 10.0 to 50.0 sq cm	Oct 2008	Destruction of Skin Lesions	11	CPT 2009	September 2013	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑
17108	Destruction of cutaneous vascular proliferative lesions (eg, laser technique); over 50.0 sq cm	Oct 2008	Destruction of Skin Lesions	11	CPT 2009	September 2013	Remove from list, no demonstrated technology diffusion that impacts work or practice expense.	☑

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
19105	Ablation, cryosurgical, of fibroadenoma, including ultrasound guidance, each fibroadenoma	Apr 2006	Fibroadenoma Cryoablation	11	CPT 2007	September 2011	Remove, code does not need to be re-evaluated	☑
19294	Preparation of tumor cavity, with placement of a radiation therapy applicator for intraoperative radiation therapy (IORT) concurrent with partial mastectomy (List separately in addition to code for primary procedure)	Oct 2016	Intraoperative Radiation Therapy Applicator Procedures	07	CPT 2018	October 2021		☐
20560	Needle insertion(s) without injection(s); 1 or 2 muscle(s)	Jan 2019	Trigger Point Dry Needling	41	CPT 2020	October 2023		☐
20561	Needle insertion(s) without injection(s); 3 or more muscles	Jan 2019	Trigger Point Dry Needling	41	CPT 2020	October 2023		☐
20696	Application of multiplane (pins or wires in more than 1 plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; initial and subsequent alignment(s), assessment(s), and computation(s) of adjustment schedule(s)	Apr 2008	Computer Dependent External Fixation	6	CPT 2009	September 2012	Remove, code does not need to be re-evaluated	☑
20697	Application of multiplane (pins or wires in more than 1 plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; exchange (ie, removal and replacement) of strut, each	Apr 2008	Computer Dependent External Fixation	6	CPT 2009	September 2012	Remove, code does not need to be re-evaluated	☑
20700	Manual preparation and insertion of drug-delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	October 2023		☐
20701	Removal of drug-delivery device(s), deep (eg, subfascial) (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	October 2023		☐
20702	Manual preparation and insertion of drug-delivery device(s), intramedullary (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	October 2023		☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete
20703	Removal of drug-delivery device(s), intramedullary (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	October 2023		☐
20704	Manual preparation and insertion of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	October 2023		☐
20705	Removal of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)	Oct 2018	Drug Delivery Implant Procedures	05	CPT 2020	October 2023		☐
20983	Ablation therapy for reduction or eradication of 1 or more bone tumors (eg, metastasis) including adjacent soft tissue when involved by tumor extension, percutaneous, including imaging guidance when performed; cryoablation	Apr 2014	Cryoablation Treatment of the Bone Tumors	04	CPT 2015	October 2018	Remove from list , no demonstrated technology diffusion that impacts work or practice expense.	☑
20985	Computer-assisted surgical navigational procedure for musculoskeletal procedures, image-less (List separately in addition to code for primary procedure)	Apr 2007	Computer Navigation	7	CPT 2008	September 2011	Resurvey for January 2012	☑
20986	Code Deleted CPT 2009	Apr 2007	Computer Navigation	7	CPT 2008	September 2011	Code Deleted CPT 2009	☑
20987	Code Deleted CPT 2009	Apr 2007	Computer Navigation	7	CPT 2008	September 2011	Code Deleted CPT 2009	☑
21011	Excision, tumor, soft tissue of face or scalp, subcutaneous; less than 2 cm	Feb 2009	Excision of Soft Tissue and Bone Tumors		CPT 2010	October 2017	Review the data for the melanoma diagnoses within these services and the site of service in 2 years (October 2017). In October 2017, recommended to remove from the list, no demonstrated technology diffusion that impacts work or practice expense.	☑

99492	Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional; initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan; review by the psychiatric consultant with modifications of the plan if recommended; entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies.	Jan 2017	Psychiatric Collaborative Care Management Services	20	CPT 2018	October 2022	In January 2020, the RUC identified Psychiatric Collaborative Care Management Services (CPT codes 99492, 99493 and 99494) via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommends that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. This family is also scheduled on the new technology/new services list for review at the October 2020 Relativity Assessment Workgroup meeting. The Workgroup recommends	☐

99494	Initial or subsequent psychiatric collaborative care management, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (List separately in addition to code for primary procedure)	Jan 2017	Psychiatric Collaborative Care Management Services	20	CPT 2018	October 2022	In January 2020, the RUC identifiedPsychiatric Collaborative Care Management Services (CPT codes 99492, 99493 and 99494) via the work neutrality process. These codes show a 468% increase in work RVUs for 2018. In reviewing the utilization data for these services, it appears one independent clinic is performing most of these services in the pediatric population. The Workgroup recommends that CMS investigate the reporting of services by this specific independent clinic. The specialty society indicated, and the Workgroup agreed, that a new CPT Assistant article on the appropriate usage of these codes be developed in 2020. This family is also scheduled on the new technology/new services list for review at the October 2020 Relativity Assessment Workgroup meeting. The Workgroup recommends	☐

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

hAMA/Specialty Society RVS Update Committee Summary of Recommendations
High Volume Growth

January 2021

Anesthesia Services for Image-Guided Spinal Procedures – Tab 4

In 2017, the RUC identified CPT code 01936 *Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic* via the high volume growth screen. The Relativity Assessment Workgroup reviewed data on what procedures are reported with this anesthesia code. The Workgroup noted it was concerned that this service may be reported inappropriately, as the top surgical services reported with 01936 utilization did not show significant increases and some of these services indicate that moderate sedation is included. The Workgroup noted that the specialty society provided significant education on the correct reporting of this service, however, it can not reach all providers of this service or physicians who request the anesthesia service. The Workgroup recommended reviewing 01936 after two years of utilization data were available including the utilization for the top surgical services reported with 01936. In October 2019, the Workgroup reviewed this service and recommended that it be referred to CPT to create more granular codes. In October 2020, the CPT Editorial Panel replaced 01935 and 01936 with six new codes to report percutaneous image-guided spine and spinal cord anesthesia procedures and revised a parenthetical following code 00600 to refer to these newly created CPT codes.

Drainage/Aspiration

01937 ***Anesthesia for percutaneous image-guided injection, drainage or aspiration procedures on the spine or spinal cord; cervical or thoracic***
The RUC reviewed the survey results from 41 anesthesiologists and determined that the survey 25th percentile base unit of 4 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes pre-anesthesia patient evaluation time, 7 minutes pre-anesthesia equipment/drug/supply preparation, 2 minutes intra-operative anesthesia induction period, 15 minutes intra-operative anesthesia post-induction period and 8 minutes post-anesthesia evaluation, totaling 42 minutes.

The majority of survey respondents indicated that the intensity and complexity measures for 01937 are identical to somewhat more intense than top key reference service 01630 *Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified* (base unit = 5) and identical to somewhat more intense than the second top key reference service 00142 *Anesthesia for procedures on eye; lens surgery* (base unit = 4), which support the base unit recommendation. In examining anesthesia services, the RUC also uses a regression line to compare all anesthesia services to the 14 reference service list anesthesia codes. Code 01937 aligns appropriately with the regression line, which supports the recommended base unit.

The specialty societies noted that the surveyed service is performed in the prone position, which adds a significant complexity, necessitating a higher base unit value than the nerve procedure described by reference service list code 01810 *Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand* (base unit = 3). The surveyed service also has higher intensity and complexity than

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

reference service list code 00812 *Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy* (base unit = 3). Therefore, a base unit of 4 appropriately values 01937 relative to other anesthesia services. **The RUC recommends a base unit of 4 for CPT code 01937**.

01938 ***Anesthesia for percutaneous image-guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral***
The RUC reviewed the survey results from 44 anesthesiologists and determined that the survey 25th percentile base unit of 4 appropriately accounts for the work required to perform this service. The RUC recommends 10 minutes pre-anesthesia patient evaluation time, 7 minutes pre-anesthesia equipment/drug/supply preparation, 2 minutes intra-operative anesthesia induction period, 15 minutes intra-operative anesthesia post-induction period and 8 minutes post-anesthesia evaluation, totaling 42 minutes.

The majority of survey respondents that selected each of the corresponding top two key reference services indicated that the intensity and complexity measures for 01938 are identical to somewhat more intense and complex than top key reference service 01630 *Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified* (base unit = 5) and identical to somewhat more intense than the second top key reference service 00142 *Anesthesia for procedures on eye; lens surgery* (base unit = 4), which support the base unit recommendation. In examining anesthesia services, the RUC also uses a regression line to compare all anesthesia services to the 14 reference service list anesthesia codes. Code 01938 aligns appropriately with the regression line, which supports the recommended base unit. The RUC agreed with the survey respondents that these anesthesia for percutaneous image-guided injection drainage or aspiration procedures are the same whether they are performed in the cervical/thoracic (01937) or lumbar/sacral areas (01938).

The specialty societies noted that the surveyed service is performed in the prone position, which adds a significant complexity, necessitating a higher base unit value than the nerve procedure described by reference service list code 01810 *Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand* (base unit = 3). The surveyed service also has higher intensity and complexity than reference service list code 00812 *Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy* (base unit = 3). Therefore, a base unit of 4 appropriately values 01938 relative to other anesthesia services. **The RUC recommends a base unit of 4 for CPT code 01938**.

Destruction

01939 ***Anesthesia for percutaneous image-guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic***
The RUC reviewed the survey results from 40 anesthesiologists and determined that a base unit of 4 appropriately accounts for the work required to perform this service. The RUC noted that the survey 25th percentile and median were both a base unit of 5. However, RUC determined that the anesthesia for percutaneous image-guided destruction by neurolytic agent procedures are the same whether they are performed in the cervical/thoracic (01939) or lumbar/sacral areas (01940), the same as the injection or aspiration services 01937 and 01938.
The RUC recommends 11 minutes pre-anesthesia patient evaluation time, 7 minutes pre-anesthesia equipment/drug/supply preparation, 2 minutes intra-operative anesthesia induction period, 15 minutes intra-operative anesthesia post-induction period and 10 minutes post-anesthesia evaluation,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

totaling 45 minutes. The RUC recommends for 01939 to have a direct base unit crosswalk to the second top key reference service 00142 *Anesthesia for procedures on eye; lens surgery* (base unit = 4 and 50 minutes total time), thus maintaining the appropriate relativity with 01937, 01938 and 01940, all with a base unit of 4. CPT code 01939 and 00142 are similar anesthesia services both requiring similar precision. The surveyed code requires precision in the tight cervical area with little movement to prevent injury and CPT code 00142 requires precision regarding delicate surgeries to the lens to avoid injury.

The majority of survey respondents indicated that the intensity and complexity measures for 01939 are identical to somewhat more intense than top key reference service 01630 *Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified* (base unit = 5) and identical to somewhat more intense than the second top key reference service 00142 *Anesthesia for procedures on eye; lens surgery* (base unit = 4), which bracket the base unit recommendation.

The specialty societies noted that the surveyed service is performed in the prone position, which adds a significant complexity, necessitating a higher base unit value than the nerve procedure described by reference service list code 01810 *Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand* (base unit = 3). The surveyed service also has higher intensity and complexity than reference service list code 00812 *Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy* (base unit = 3). Therefore, a base unit of 4 appropriately values 01939 relative to other anesthesia services. **The RUC recommends a base unit of 4 for CPT code 01939**.

01940 ***Anesthesia for percutaneous image-guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral***
The RUC reviewed the survey results from 41 anesthesiologists and determined that the survey 25th percentile base unit of 4 appropriately accounts for the work required to perform this service. The RUC recommends 11 minutes pre-anesthesia patient evaluation time, 7 minutes pre-anesthesia equipment/drug/supply preparation, 2 minutes intra-operative anesthesia induction period, 15 minutes intra-operative anesthesia post-induction period and 10 minutes post-anesthesia evaluation, totaling 45 minutes.

The majority of survey respondents that selected each of the corresponding top two key reference services indicated that the intensity and complexity measures for 01940 are identical to somewhat more intense than top key reference service 01630 *Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified* (base unit = 5) and identical to somewhat more intense than the second top key reference service 00142 *Anesthesia for procedures on eye; lens surgery* (base unit = 4), which support the base unit recommendation. In examining anesthesia services, the RUC also uses a regression line to compare all anesthesia services to the 14 reference service list anesthesia codes. Code 01940 aligns appropriately with the regression line, which supports the recommended base unit. The RUC determined that that the anesthesia for percutaneous image-guided destruction by neurolytic agent procedures are the same whether they are performed in the cervical/thoracic (01939) or lumbar/sacral areas (01940), the same as the injection or aspiration services codes 01937 and 01938.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialty societies noted that the surveyed service is performed in the prone position, which adds a significant complexity, necessitating a higher base unit value than the nerve procedure described by reference service list code 01810 *Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand* (base unit = 3). The surveyed service also has higher intensity and complexity than reference service list code 00812 *Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy* (base unit = 3). Therefore, a base unit of 4 appropriately values 01940 relative to other anesthesia services. **The RUC recommends a base unit of 4 for CPT code 01940**.

Neuromodulation

01941 ***Anesthesia for percutaneous image-guided neuromodulation or intravertebral procedures (eg, kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic***

The RUC reviewed the survey results from 47 anesthesiologists and determined that a base unit of 6 appropriately accounts for the work required to perform this service. The RUC recommends 13 minutes pre-anesthesia patient evaluation time, 7 minutes pre-anesthesia equipment/drug/supply preparation, 8 minutes intra-operative anesthesia induction period, 20 minutes intra-operative anesthesia post-induction period and 10 minutes post-anesthesia evaluation, totaling 48 minutes. The RUC noted that the survey median of 7 base units was a bit high and the survey 25th percentile of 5 base units was a bit low compared to other anesthesia services. The RUC noted that the anesthesia reference service list does not contain any services with 6 base units, which reduces the likelihood of a survey respondent estimating 6 base units versus either 5 or 7 base units. Therefore, the RUC recommends that 01941 be crosswalked to 00732 *Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum; endoscopic retrograde cholangiopancreatography (ERCP)* (base unit = 6).

In examining anesthesia services, the RUC also uses a regression line to compare all anesthesia services to the 14 reference service list anesthesia codes. Code 01941 aligns appropriately with the regression line, which supports the recommended base unit. The RUC determined that that the anesthesia for percutaneous image-guided neuromodulation procedures is the same whether they are performed in the cervical/thoracic (01941) or lumbar/sacral areas (01942), the same as the comparison between the other services in this family.

The specialty society indicated and the RUC agreed that 01941 and 01942 require a more complex anesthetic technique to protect the patients while in the prone position. This position takes extra care prior to the start of the procedure to ensure the airway is properly secured. During the procedure, the patient is unable to protect their own airway, causing the potential for significant complications and requires constant monitoring. Additionally, spinal procedures performed in the prone position cause additional pressure points for the anesthetist to monitor throughout the procedure. These risks and added complexities exist for these procedures performed on the spine.

The complexity of the service, the added comorbidities of the typical patient, and the required constant monitoring of the patient in the prone position support the 6 base unit recommendation for CPT code 01941. **The RUC recommends a base unit of 6 for CPT code 01941**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

01942 ***Anesthesia for percutaneous image-guided neuromodulation or intravertebral procedures (eg, kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral***
The RUC reviewed the survey results from 49 anesthesiologists and determined that a base unit of 6 appropriately accounts for the work required to perform this service. The RUC recommends 13 minutes pre-anesthesia patient evaluation time, 7 minutes pre-anesthesia equipment/drug/supply preparation, 8 minutes intra-operative anesthesia induction period, 20 minutes intra-operative anesthesia post-induction period and 10 minutes post-anesthesia evaluation, totaling 48 minutes. The RUC noted that the survey median of 7 base units was a bit high and the survey 25th percentile of 5 base units was a bit low compared to other anesthesia services. The RUC noted that the anesthesia reference service list does not contain any services with 6 base units. Therefore, the RUC recommends that 01942 be crosswalked to 00732 *Anesthesia for upper gastrointestinal endoscopic procedures, endoscope introduced proximal to duodenum; endoscopic retrograde cholangiopancreatography (ERCP)* (base unit = 6).

In examining anesthesia services, the RUC also uses a regression line to compare all anesthesia services to the 14 reference service list anesthesia codes. Code 01941 aligns appropriately with the regression line, which supports the recommended base unit. The RUC determined that the anesthesia for percutaneous image-guided neuromodulation procedures is the same whether they are performed in the cervical/thoracic (01941) or lumbar/sacral areas (01942), the same as the comparison between the other services in this family.

The specialty society indicated, and the RUC agreed that 01941 and 01942 require a more complex anesthetic technique to protect the patients while in the prone position. This position takes extra care prior to the start of the procedure to ensure the airway is properly secured. During the procedure, the patient is unable to protect their own airway, causing the potential for significant complications and requires constant monitoring. Additionally, spinal procedures performed in the prone position cause additional pressure points for the anesthetist to monitor throughout the procedure. These risks and added complexities exist for procedures performed on the spine.

The complexity of the service, the added comorbidities of the typical patient, and the required constant monitoring of the patient in the prone position support the 6 base unit recommendation for CPT code 01942. **The RUC recommends a base unit of 6 for CPT code 01942**.

Practice Expense
The RUC recommends the anesthesia standard of eight minutes for clinical staff pre-time for the entire family of services.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01937 Tracking Number: Original Specialty Recommended Base Unit Value: **4**
Presented Recommended Base Unit Value: 4
Global Period:XXX Current Base Unit Value: **NA** RUC Recommended Base Unit Value: **4**

CPT Descriptor: Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; cervical or thoracic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old female has chronic neck pain radiating toward her right shoulder. An MRI demonstrated facet arthropathy at C4-C5 and multilevel degenerative disc disease. Diagnostic testing with cervical facet blocks under fluoroscopic guidance on the right at the C4-C5 level is indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 100.00%

Description of Pre-Service Work: A pre-procedure evaluation and targeted physical examination of the patient is performed. Review laboratory studies, ECG results, and imaging studies as necessary. Discuss with patient anesthetic technique to be used given the nature of the procedure and the requirements of the physician performing the procedure. Obtain informed consent. Set up anesthetic and drugs in preparation for the procedure and check anesthesia equipment, supplies, and monitors. A peripheral intravenous catheter is placed.

Description of Intra-Service Work: In the procedure room, monitoring is established and a presurgical review is performed. The patient is placed in the prone position. Sufficient sedation and analgesia are provided to allow the patient to remain comfortable and cooperative with the procedure. Medications are titrated and the patient is monitored to preserve stable vital signs and adequate respiratory efforts throughout.

At the end of the procedure, the patient is turned supine and transferred to the postanesthetic care unit where a postanesthetic report is provided. Elements of the anesthesia care including vital signs (at least every five minutes), positioning, anesthesia procedures, medications, and significant events are personally documented in the anesthetic record.

Description of Post-Service Work: Appropriate analgesic and/or antiemetic are ordered for postprocedure discomfort, as necessary. Anesthesia equipment and medications are disposed of. A postoperative evaluation is made in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and to determine whether any anesthetic-related complications have occurred. Any postanesthesia care is provided, as needed, in the postanesthesia care unit. The patient is discharged from the unit.

Level 3 Problems are of moderate severity; Medical decision making of moderate complexity and treatment of high complexity	10.63	16.90	5.68
Level 4 Problems are moderate to high severity; Medical decision making of moderate to high complexity and treatment of high complexity	5.59	7.01	4.14
Level 5 Problems are of high severity; Medical decision making and treatment of high complexity; Critically ill or critically injured patient	6.15	4.63	3.92
Total (must total 100%)	101.00%	101.00%	100.00%

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Society of Anesthesiologists (ASA) is pleased to submit an anesthesia base unit recommendation for code 01937 (*Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic).*

Code	Descriptor	Jan RUC 2021 Recommendation	Rationale
01937	**Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic**	**4**	**25th**
01938	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral	4	25th
01939	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic	4	Xwalk
01940	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral	4	25th
01941	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic	6	Xwalk
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral	6	Xwalk

Background

CPT code 01937 was created at the October 2020 CPT meeting, along with the entire code family (01937-01942) describing anesthesia for image-guided procedures on the spine. The code family replaces CPT code 01935 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic)* and 01936 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic).*

The new code family was created to provide more granularity for anesthesia services that are used for image-guided procedures on the spine after CPT code 01936 was flagged in 2017 for high volume growth and the RAW recommended that the codes be reviewed by CPT.

The approved methodology to identify the vignette for an anesthesia service is to base the typical patient off of the most common underlying procedure reported with the anesthesia code. Based on an analysis of the Medicare 5% file, the most common procedure billed with the anesthesia procedure (01936) for the same patient on the same day by a different provider, after add-on codes and ancillary codes were removed is:

64490 Injection(s), diagnostic or therapeutic agent, paravertebral facet (zygapophyseal) joint (or nerves innervating that joint) with image guidance (fluoroscopy or CT), cervical or thoracic; single level

As approved by the RUC Research subcommittee, the vignette used in the survey was from the typical patient described by CPT code 64490.

Expert Panel Recommendation

ASA is recommending the survey 25th percentile of 4 base units for CPT code 01937.

For time we are recommending:

Time Period	Minutes	Source
Pre-Service Evaluation	10	Survey median
Equipment/Drug Supply Preparation	7	Time package: straightforward patient/straightforward anesthetic
Induction Period Procedure	2	Time package: straightforward patient/straightforward anesthetic
Post-Induction Period Anesthesia	15	Survey median
Post-Anesthesia Evaluation	8	Survey median

Survey Sample and Process

The survey data and recommendations are based upon a random sample of 7,404 physician anesthesiologist members of ASA. The surveying society convened an expert panel to review the survey data.

Recommendation Rationale

An expert panel of anesthesiologists was convened to consider the survey data and provide recommendations. In developing recommendations the expert panel considered survey data, key reference codes, the Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis; and Post-Induction Period Procedure Anesthesia (PIPPA).

Survey Data

The panel is recommending the survey 25th percentile of 4 anesthesia base units.

A total of 41 responses were received, 100% of respondents agreed that the patient vignette was typical and the median experience in the past 12 months was 5.

The recommended value is a reduction in base units from the original CPT codes (01935 and 01936), which this new code family is replacing. The expert panel agreed this recommendation was appropriate and that it maintained appropriate rank order in the family.

Key Reference Codes

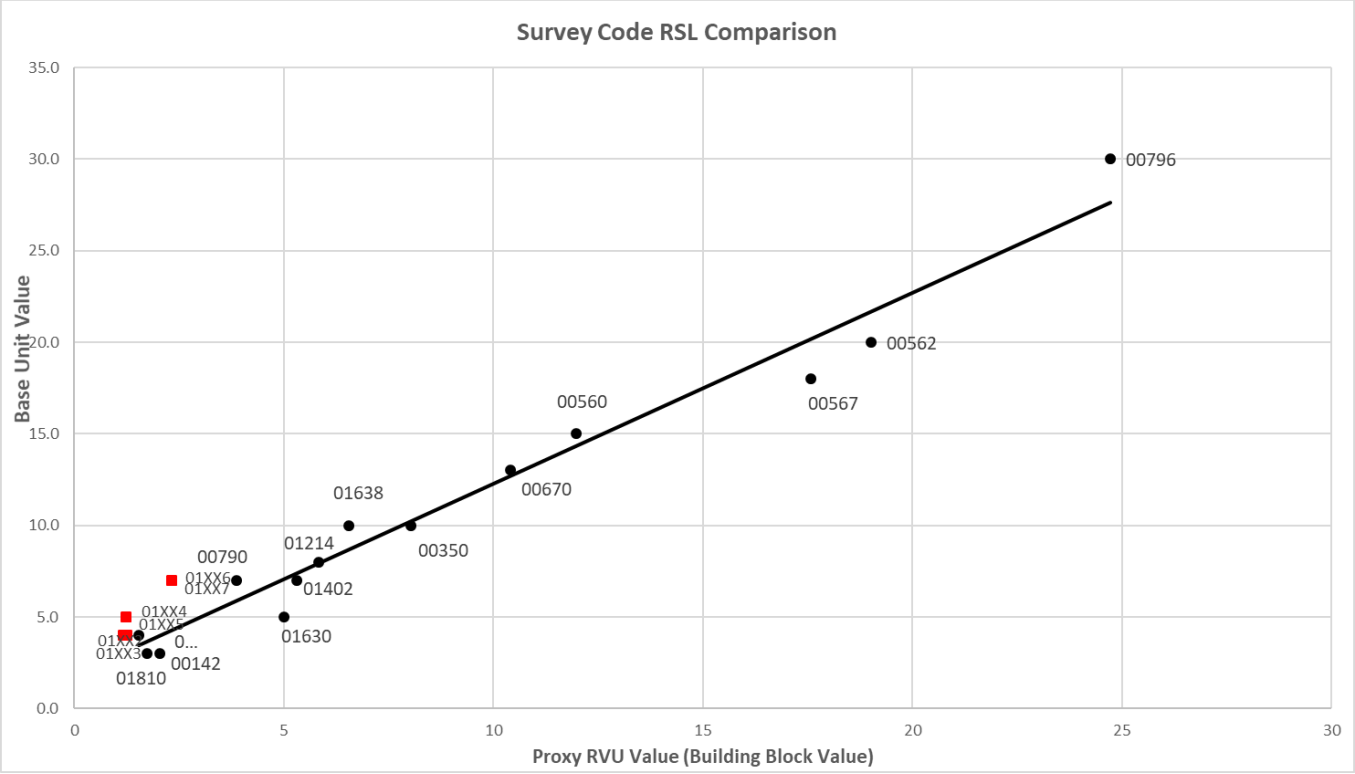
39% of survey respondents selected 01630 (*Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified*) valued at 5 base units as the top key reference service code.

- 94% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

29% of survey respondents selected 00142 (*Anesthesia for procedures on eye; lens surgery*) valued at 4 base units as the second key reference service code.

- 100% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

The expert panel concluded that the intensity/complexity measures supported their recommendation.



Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis

The RUC recently approved the BBM and RSL Regression Analysis. This supplemental tool to traditional RUC survey techniques is a way to compare relativity among anesthesia services. It is used to validate the presented recommendation. Using survey data and the RUC approved time packages, the expert panel calculated the BBM value known as a "proxy RVU." This value was plotted on the "Survey Code RSL Comparison Graph." This is a linear regression

analysis of anesthesia codes on the RSL that plotted base unit values against anesthesia code building block values ("proxy RVUs"). The proxy RVU for 01937 was plotted on the graph. The closer a point is to the regression line, the better the proxy RVU and the base unit align, regardless if the point is above or below the regression line.

The recommended value was supported when the calculated proxy RVU was plotted on the RSL Regression Analysis Graph. The proxy RVU value for 01937 is plotted close to the graph with the base unit recommendation of 4 base units, indicating that the recommendation maintains appropriate rank order when compared to the other codes on the Anesthesia RSL.

The regression line tool developed by the Anesthesia Workgroup is a line of best fit, and by definition will have data points above and below the regression line. Two data points that are equidistant from the regression line, either above or below the line, would be equally supported by the model. In evaluating the plotted data points for the recommended base unit values, the expert panel believes the data points support the recommendations which are based on survey data and clinical expertise.

Anesthesia RSL and Surveyed Code 01937

CPT Code	Long Descriptor	Anesthesia Base Units	BBM Value
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3.0	1.735
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3.0	1.857
00142	Anesthesia for procedures on eye; lens surgery	4.0	1.538
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4.0	1.19

01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5.0	4.772
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7.0	3.858
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7.0	5.309
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8.0	5.833
00350	Anesthesia for procedures on major vessels of neck; not otherwise specified	10.0	8.841
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	10.0	6.550
00670	Anesthesia for extensive spine and spinal cord procedures (eg, spinal instrumentation or vascular procedures)	13.0	10.406
00560	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; without pump oxygenator	15.0	11.965
00567	Anesthesia for direct coronary artery bypass grafting; with pump oxygenator	18.0	17.577
00562	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator, age 1 year or older, for all noncoronary bypass procedures (eg, valve procedures) or for re-operation for coronary bypass more than 1 month after original operation	20.0	19.006
00796	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; liver transplant (recipient)	30.0	24.719

Post-Induction Period Procedure Anesthesia (PIPPA)

PIPPA is a relative intensity methodology used by the RUC to validate anesthesia base unit values. It is important to remember that PIPPA only looks at the post-induction period and estimates of varying levels of intensity. PIPPA does not account for differences in intensity of induction of anesthesia (part of intra-service work), or any work done in the pre or post service period. Survey respondents are asked to allocate the post-induction anesthesia time to five different intensity levels. Without a measure of the intensity of the post-induction period, all anesthesia procedures would be valued at the same intensity for this period based upon time units, which do not vary in intensity from one procedure to another.

Conceptually, it may be considered the time for the surgeon to perform the procedure. The level of intensity and complexity during the PIPPA period is divided into five levels, or quintiles, each of which has its own descriptor. Survey respondents rate the percentage of the total PIPPA time that the typical patient falls under each of the quintiles. During its third five-year review, which was initiated in February 2005, the RUC assigned intensity values to each quintile. Intensity values do not appear on the RUC survey. The survey responses are used to determine a weighted average of the combined PIPPA intensity/complexity value. PIPPA values do not determine base unit values, but may be used to validate the reasonableness of proposed values.

RUC Assigned PIPPA Intensity Values	
Level 1: Presenting problems are self-limited or minor. Straightforward medical decision-making and treatment.	0.031
Level 2: Problems are of low intensity. Medical decision-making and treatment of low complexity.	0.044
Level 3: Problems are of moderate severity. Medical decision making and treatment of moderate complexity.	0.055
Level 4: Problems are of moderate to high severity. Medical decision-making of moderate to high complexity and treatment of high complexity. Critically ill or critically injured patients.	0.070
Level 5: Problems are of high severity medical decision making and treatment of high complexity. Critically ill or critically injured patients.	0.090

The weighted average PIPPA for 01937 is 0.0429. This value validates the recommendation of 4 base units in comparison with other codes on the Anesthesia RSL. PIPPA is used to validate recommendations and not establish recommended base unit values.

The weighted PIPPA intensity for 01937 is consistent with other codes of similar value on the anesthesia RSL. The expert panel believes the distribution of PIPPA, provides additional confirmation of the appropriateness of the recommended value of 4 base units for 01937.

Code	Descriptor	Base Unit	Weighted PIPPA Intensity	Level 1	Level 2	Level 3	Level 4	Level 5
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3	0.0406	58.02%	24.69%	7.89%	5.38%	4.02%
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3	0.0406	58.35%	24.03%	8.59%	4.66%	4.37%
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4	0.0429	52.95%	24.68%	10.63%	5.59%	6.15%
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5	0.0445	40.88%	30.58%	16.90%	7.01%	4.63%

Budget Neutrality

In drafting recommendations for this code family, the specialty society considered the impact of the recommendation on budget neutrality. Based on the presented base unit recommendations and utilization, there is a resulting negative impact on total base units (-0.47%) across the entire family.

The pattern of base units proposed provides the best balance between the survey responses, expert panel opinion regarding rank order within the family, and budget neutrality.

In conclusion, ASA is recommending the survey 25th percentile of 4 anesthesia base units. For time the specialty is recommending:

- Pre-Anesthesia

- *Evaluation:* 10 minutes
- *Equipment/Drug/Supple preparation:* 7 minutes

- Intra-op
  - *Induction:* 2 minutes
  - *Post-induction:* 15 minutes
- *Post-induction:* 8 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01935 and 01936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physician Anesthesiologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 60,296
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Analysis of Medicare 5% Carrier File (2019) and RUC database (2020, V.2)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01938 Tracking Number: Original Specialty Recommended Base Unit Value: **4**
Presented Recommended Base Unit Value: 4
Global Period:XXX Current Base Unit Value: **NA** RUC Recommended Base Unit Value: **4**

CPT Descriptor: Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old male presents with recurrent right leg pain, the ability to stand for only 10 minutes and walk less than one block, and minimal problems sitting. The patient's history includes a previous laminectomy at L4-L5; MRI with contrast material, showing a small recurrent herniation between L4-L5 with scar tissue; and neurodiagnostic studies compatible with L5 radiculopathy. He undergoes a transforaminal epidural injection of an anesthetic and/or anti-inflammatory agent at the L5-SI level.

Percentage of Survey Respondents who found Vignette to be Typical: 100.00%

Description of Pre-Service Work: A pre-procedure evaluation and targeted physical examination of the patient is performed. Review laboratory studies, ECG results, and imaging studies as necessary. Discuss with patient anesthetic technique to be used given the nature of the procedure and the requirements of the physician performing the procedure. Obtain informed consent. Set up anesthetic and drugs in preparation for the procedure and check anesthesia equipment, supplies, and monitors. A peripheral intravenous catheter is placed.

Description of Intra-Service Work: In the procedure room, monitoring is established and a presurgical review is performed. The patient is placed in the prone position. Sufficient sedation and analgesia are provided to allow the patient to remain comfortable and cooperative with the procedure. Medications are titrated and the patient is monitored to preserve stable vital signs and adequate respiratory efforts throughout.

At the end of the procedure, the patient is turned supine and transferred to the postanesthetic care unit where a postanesthetic report is provided. Elements of the anesthesia care including vital signs (at least every five minutes), positioning, anesthesia procedures, medications, and significant events are personally documented in the anesthetic record.

Description of Post-Service Work: Appropriate analgesic and/or antiemetic are ordered for postprocedure discomfort, as necessary. Anesthesia equipment and medications are disposed of. A postoperative evaluation is made in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and to determine whether any anesthetic-related complications have occurred. Any postanesthesia care is provided, as needed, in the postanesthesia care unit. The patient is discharged from the unit.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	60%	33%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	80%	13%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	7%	73%	20%
Physical effort required	33%	20%	47%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	40%	53%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	36%	64%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	36%	55%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	55%	45%
Physical effort required	0%	36%	64%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	9%	27%	64%

Post-Induction Period Procedure Anesthesia Time Allocation

	Survey Code Percentage of Time (%)	**Top Key** Percentage of Time (%)	**2nd Key** Percentage of Time (%)
Level 1 Problems are self-limited or minor; Straightforward medical decision making and treatment	55.50	40.88	67.83
Level 2 Problems are of low severity; Medical decision making and treatment of low complexity	25.52	30.58	18.42
Level 3 Problems are of moderate severity; Medical decision making of moderate complexity and treatment of high complexity	9.68	16.90	5.68
Level 4 Problems are moderate to high severity; Medical decision making of moderate to high complexity and treatment of high complexity	4.45	7.01	4.14
Level 5 Problems are of high severity; Medical decision making and treatment of high complexity; Critically ill or critically injured patient	4.84	4.63	3.92
Total (must total 100%)	101.00%	101.00%	100.00%

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Society of Anesthesiologists (ASA) is pleased to submit an anesthesia base unit recommendation for code 01938 (*Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral).*

Code	Descriptor	Jan RUC 2021 Recommendation	Rationale
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4	25th
01938	**Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral**	**4**	**25th**
01939	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic	4	Xwalk
01940	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral	4	25th
01941	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic	6	Xwalk
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral	6	Xwalk

CPT code 01938 was created in October 2020, along with the entire code family (01937-01942) describing anesthesia for image-guided procedures on the spine. The code family replaces CPT code 01935 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic)* and 01936 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic).*

The new code family was created to provide more granularity for anesthesia services that are used for image-guided procedures on the spine after CPT code 01936 was flagged in 2017 for high volume growth and the RAW recommended that the codes be reviewed by CPT.

The approved methodology to identify the vignette for an anesthesia service is to base the typical patient off of the most common underlying procedure reported with the anesthesia code. Based on an analysis of the Medicare 5% file, the most common procedure billed with the anesthesia procedure (01936) for the same patient on the same day with by a different provider, after add-on codes and ancillary codes were removed is:

64483 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level

As approved by the RUC Research subcommittee, the vignette used in the survey was from the typical patient described by CPT code 64483.

Expert Panel Recommendation

ASA is recommending the survey 25th percentile of 4 base units for CPT code 01938.

For time we are recommending:

Time Period	Minutes	Source

Pre-Service Evaluation	10	Survey median
Equipment/Drug Supply Preparation	7	Time package: straightforward patient/straightforward anesthetic
Induction Period Procedure	2	Time package: straightforward patient/straightforward anesthetic
Post-Induction Period Anesthesia	15	Survey median
Post-Anesthesia Evaluation	8	Survey median

Survey Sample and Process

The survey data and recommendations are based upon a random sample of 7,404 physician anesthesiologist members of ASA. The surveying society convened an expert panel to review the survey data.

Recommendation Rationale

An expert panel of anesthesiologists was convened to consider the survey data and provide recommendations. In developing recommendations the expert panel considered survey data, key reference codes, the Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis; and Post-Induction Period Procedure Anesthesia (PIPPA).

Survey Data

The panel is recommending the survey 25th percentile of 4 anesthesia base units.

A total of 44 responses were received, 100% of respondents found the patient vignette to be typical and the median experience in the past 12 months was 5.

The recommended value is a reduction in base units from the original CPT codes (01935 and 01936), which this new code family is replacing. The expert panel agreed this recommendation was appropriate and that it maintained appropriate rank order in the family.

Key Reference Codes

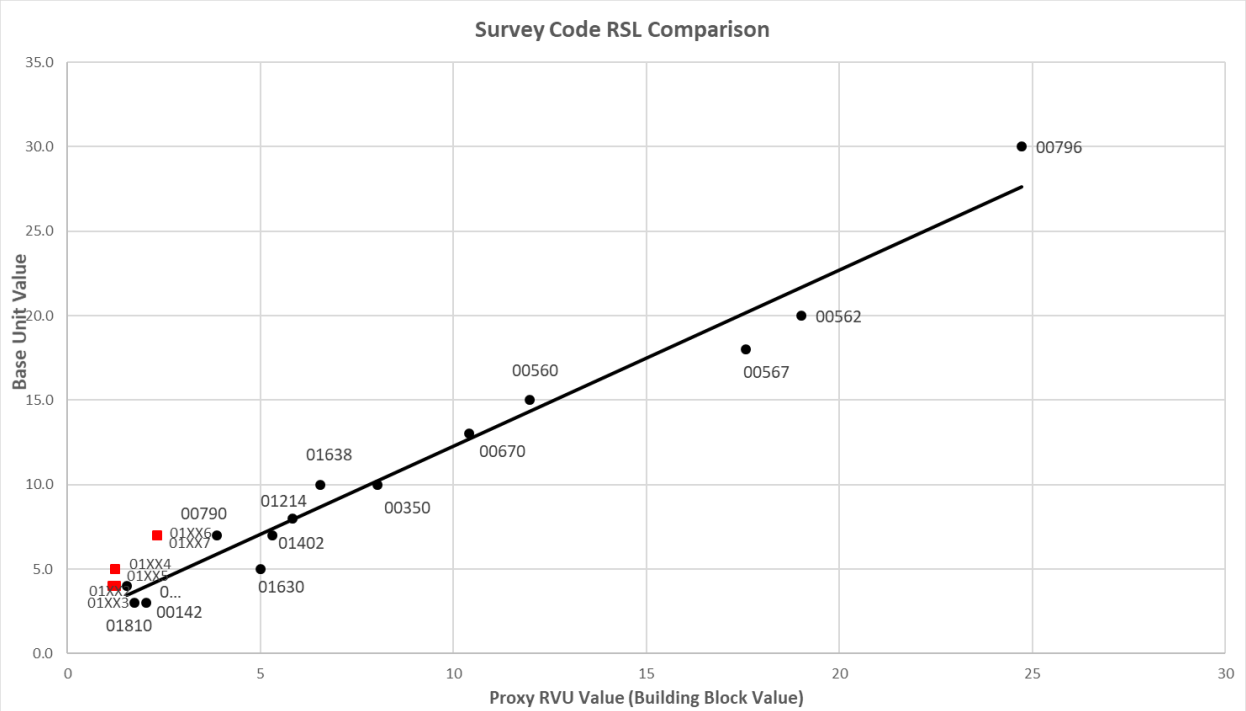
34% of survey respondents selected 01630 (*Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified*) valued at 5 base units as the top key reference service code.

- 93% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

25% of survey respondents selected 00142 (*Anesthesia for procedures on eye; lens surgery*) valued at 4 base units as the second key reference service code.

- 100% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

The expert panel concluded that the intensity/complexity measures supported their recommendation.



Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis

The RUC recently approved the BBM and RSL Regression Analysis. This supplemental tool to traditional RUC survey techniques is a way to compare relativity among anesthesia services. It is used to validate the presented recommendation. Using survey data and the RUC approved time packages, the expert panel calculated the BBM value known as a "proxy RVU." This value was plotted on the "Survey Code RSL Comparison Graph." This is a linear regression analysis of anesthesia codes on the RSL that plotted base unit values against anesthesia code building block values

("proxy RVUs"). The proxy RVU for 01938 was plotted on the graph. The closer a point is to the regression line, the better the proxy RVU and the base unit align, regardless if the point is above or below the regression line.

The recommended value is supported when it was plotted on the RSL Regression Analysis Graph. The proxy RVU value for 01938 is plotted close to the graph with the base unit recommendation of 4 base units, indicating that the recommendation maintains appropriate ran order when compared to the other codes on the Anesthesia RSL.

The regression line tool developed by the Anesthesia Workgroup is a line of best fit, and by definition will have data points above and below the regression line. Two data points that are equidistant from the regression line, either above or below the line, would be equally supported by the model. In evaluating the plotted data points for the recommended base unit values, the expert panel believes the data points support the recommendations which are based on survey data and clinical expertise.

Anesthesia RSL and Surveyed Code 01938

CPT Code	Long Descriptor	Anesthesia Base Units	BBM Value
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3.0	1.735
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3.0	1.857
00142	Anesthesia for procedures on eye; lens surgery	4.0	1.538
01938	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; lumbar or sacral	4.0	1.17
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5.0	4.772
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7.0	3.858

01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7.0	5.309
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8.0	5.833
00350	Anesthesia for procedures on major vessels of neck; not otherwise specified	10.0	8.841
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	10.0	6.550
00670	Anesthesia for extensive spine and spinal cord procedures (eg, spinal instrumentation or vascular procedures)	13.0	10.406
00560	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; without pump oxygenator	15.0	11.965
00567	Anesthesia for direct coronary artery bypass grafting; with pump oxygenator	18.0	17.577
00562	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator, age 1 year or older, for all noncoronary bypass procedures (eg, valve procedures) or for re-operation for coronary bypass more than 1 month after original operation	20.0	19.006
00796	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; liver transplant (recipient)	30.0	24.719

Post-Induction Period Procedure Anesthesia (PIPPA)

PIPPA is a relative intensity methodology used by the RUC to validate anesthesia base unit values. It is important to remember that PIPPA only looks at the post-induction period and estimates of varying levels of intensity. PIPPA does not account for differences in intensity of induction of anesthesia (part of intra-service work), or any work done in the pre or post service period. Survey respondents are asked to allocate the post-induction anesthesia time to five different intensity levels. Without a measure of the intensity of the post-induction period, all anesthesia procedures would be valued at the same intensity for this period based upon time units, which do not vary in intensity from one procedure to another.

Conceptually, it may be considered the time for the surgeon to perform the procedure. The level of intensity and complexity during the PIPPA period is divided into five levels, or quintiles, each of which has its own descriptor. Survey respondents rate the percentage of the total PIPPA time that the typical patient falls under each of the quintiles. During its third five-year review, which was initiated in February 2005, the RUC assigned intensity values to each quintile. Intensity values do not appear on the RUC survey. The survey responses are used to determine a weighted average of the combined PIPPA intensity/complexity value. PIPPA values do not determine base unit values, but may be used to validate the reasonableness of proposed values.

RUC Assigned PIPPA Intensity Values	
Level 1: Presenting problems are self-limited or minor. Straightforward medical decision-making and treatment.	0.031
Level 2: Problems are of low intensity. Medical decision-making and treatment of low complexity.	0.044
Level 3: Problems are of moderate severity. Medical decision making and treatment of moderate complexity.	0.055

Level 4: Problems are of moderate to high severity. Medical decision-making of moderate to high complexity and treatment of high complexity. Critically ill or critically injured patients.	0.070
Level 5: Problems are of high severity medical decision making and treatment of high complexity. Critically ill or critically injured patients.	0.090

The weighted average PIPPA for 01938 is 0.0415. This value validates the recommendation of 4 base units in comparison with other codes on the Anesthesia RSL. PIPPA is used to validate recommendations and not establish recommended base unit values.

The weighted PIPPA intensity for 01938 is consistent with other codes of similar value on the anesthesia RSL. The expert panel believes the distribution of PIPPA, confirms the recommended value of 4 base units for 01938.

Code	Descriptor	Base Unit	Weighted PIPPA Intensity	Level 1	Level 2	Level 3	Level 4	Level 5
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3	0.0406	58.02%	24.69%	7.89%	5.38%	4.02%
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3	0.0406	58.35%	24.03%	8.59%	4.66%	4.37%
01938	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; lumbar or sacral	4	0.0415	55.50%	25.52%	9.68%	4.45%	4.84%
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5	0.0445	40.88%	30.58%	16.90%	7.01%	4.63%

Budget Neutrality

In drafting recommendations for this code family, the specialty society considered the impact of the recommendation on budget neutrality. Based on the presented base unit recommendations and utilization, there is a resulting negative impact on total base units (-0.47%) across the entire family.

The pattern of base units proposed provides the best balance between the survey responses, expert panel opinion regarding rank order within the family, and budget neutrality.

In conclusion, ASA is recommending the survey 25th percentile of 4 anesthesia base units. For time the specialty is recommending:

- Pre-Anesthesia
  - *Evaluation:* 10 minutes
  - *Equipment/Drug/Supple preparation:* 7 minutes
- Intra-op
  - *Induction:* 2 minutes
  - *Post-induction:* 15 minutes
- *Post-induction:* 8 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01935 and 01936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physician Anesthesiologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 237,009
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Analysis of Medicare 5% Carrier File (2019) and RUC database (2020, V.2)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01939 Tracking Number: Original Specialty Recommended Base Unit Value: **5**
Presented Recommended Base Unit Value: 5
Global Period:XXX Current Base Unit Value: **NA** RUC Recommended Base Unit Value: **4**

CPT Descriptor: Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; cervical or thoracic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female with constant neck pain caused by degenerative disc disease and cervical spondylosis received insufficient relief with conservative treatments. Previous trials of cervical medial branch nerve blocks proved beneficial (separately reported). Radiofrequency neurotomy is performed on two medial branch nerves innervating the unilateral symptomatic facet joint.

Percentage of Survey Respondents who found Vignette to be Typical: 100.00%

Description of Pre-Service Work: A pre-procedure evaluation and targeted physical examination of the patient is performed. Review laboratory studies, ECG results, and imaging studies as necessary. Discuss with patient anesthetic technique to be used given the nature of the procedure and the requirements of the physician performing the procedure. Obtain informed consent. Set up anesthetic and drugs in preparation for the procedure and check anesthesia equipment, supplies, and monitors. A peripheral intravenous catheter is placed.

Description of Intra-Service Work: In the procedure room, monitoring is established and a presurgical review is performed. The patient is placed in the prone position with special care to avoid positioning injuries. Sufficient sedation and analgesia are provided to allow the patient to remain comfortable and cooperative with the procedure. Medications are titrated and the patient is monitored to preserve stable vital signs and adequate respiratory efforts throughout.

At the end of the procedure, the patient is turned supine and transferred to the postanesthetic care unit where a postanesthetic report is provided. Elements of the anesthesia care including vital signs (at least every five minutes), positioning, anesthesia procedures, medications, and significant events are personally documented in the anesthetic record.

Description of Post-Service Work: Appropriate analgesic and/or antiemetic are ordered for postprocedure discomfort, as necessary. Anesthesia equipment and medications are disposed of. A postoperative evaluation is made in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and to determine whether any anesthetic-related complications have occurred. Any postanesthesia care is provided, as needed, in the postanesthesia care unit. The patient is discharged from the unit.

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Society of Anesthesiologists (ASA) is pleased to submit anesthesia base unit recommendations for code 01939 *(Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; cervical or thoracic).*

Code	Descriptor	Jan RUC 2021 Recommendation	Rationale
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4	25th
01938	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral	4	25th
01939	**Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic**	**4**	**Xwalk**
01940	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral	4	25th
01941	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic	7	Median
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral	7	Median

Background

CPT code 01939 was created in October 2020, along with the entire code family 01937-01942) describing anesthesia for image-guided procedures on the spine. The code family replaces CPT code 01935 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic)* and 01936 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic).*

The new code family was created to provide more granularity for anesthesia services that are used for image-guided procedures on the spine after CPT code 01936 was flagged in 2017 for high volume growth and the RAW recommended that the codes be reviewed by CPT.

The approved methodology to identify the vignette for an anesthesia service is to base the typical patient off of the most common underlying procedure reported with the anesthesia code. Based on an analysis of the Medicare 5% file, the most common procedure billed with the anesthesia procedure (01936) for the same patient on the same day by a different provider, after add-on codes and ancillary codes were removed is:

64633 Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); cervical or thoracic, single facet joint

As approved by the RUC Research subcommittee, the vignette used in the survey was from the typical patient described by CPT code 64633.

Expert Panel Recommendation

ASA is recommending the survey 25th percentile of 5 base units for CPT code 01939.

For time we are recommending:

Time Period	Minutes	Source
Pre-Service Evaluation	11	Survey median
Equipment/Drug Supply Preparation	7	Time package: straightforward patient/straightforward anesthetic
Induction Period Procedure	2	Time package: straightforward patient/straightforward anesthetic
Post-Induction Period Anesthesia	15	Survey median
Post-Anesthesia Evaluation	10	Survey median

Survey Sample and Process

The survey data and recommendations are based upon a random sample of 7,404 physician anesthesiologist members of ASA. The surveying society convened an expert panel to review the survey data.

Recommendation Rationale

An expert panel of anesthesiologists was convened to consider the survey data and provide recommendations. In developing recommendations the expert panel considered survey data, key reference codes, the Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis; and Post-Induction Period Procedure Anesthesia (PIPPA).

Survey Data

A total of 40 responses were received, 100% of respondents agreed the patient vignette was typical and the median experience in the past 12 months was 3.

The recommended value maintains the base unit value from the original CPT codes (01935 and 01936), which this new code family is replacing. The expert panel agreed this recommendation was appropriate and that it maintained appropriate rank order in the family.

Key Reference Codes

45% of survey respondents selected 01630 (*Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified*) valued at 5 base units as the top key reference service code.

- 94% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

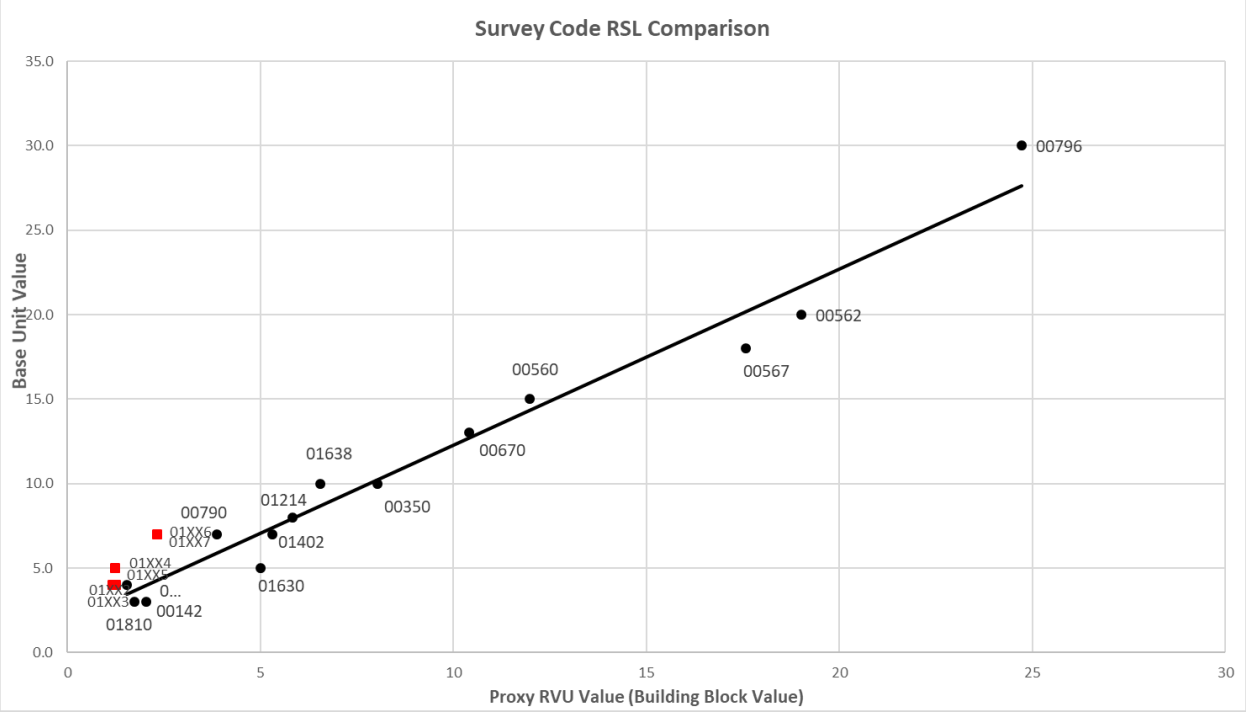
23% of survey respondents selected 00142 (*Anesthesia for procedures on eye; lens surgery*) valued at 4 base units as the second key reference service code.

- 100% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

The expert panel concluded that the intensity/complexity measures supported their recommendation.

Comparison with Paired Spinal Code (01940)

CPT code 01939 is reported for services performed in the cervical or thoracic region whereas 01940 is used for services in the lumbar or sacral regions. Procedures performed in the cervical or thoracic region are inherently more complex and have higher associated risk.



The expert panel believes that this higher recommended value for code 01939 is appropriate when compared to code 01940.

Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis

The RUC recently approved the BBM and RSL Regression Analysis. This supplemental tool to traditional RUC survey techniques is a way to compare relativity among anesthesia services. It is used to validate the presented recommendation. Using survey data and the RUC approved time packages, the expert panel calculated the BBM value known as a "proxy RVU." This value was plotted on the "Survey Code RSL Comparison Graph." This is a linear regression analysis of anesthesia codes on the RSL that plotted base unit values against anesthesia code building block values ("proxy RVUs"). The proxy RVU for 01939 was plotted on the graph. The closer a point is to the regression line, the better the proxy RVU and the base unit align, regardless if the point is above or below the regression line.

The recommended value is supported when it was plotted on the RSL Regression Analysis Graph. The proxy RVU value for 01939 is plotted close to the graph with the base unit recommendation, indicating that the recommendation maintains appropriate ran order when compared to the other codes on the Anesthesia RSL.

The regression line tool developed by the Anesthesia Workgroup is a line of best fit, and by definition will have data points above and below the regression line. Two data points that are equidistant from the regression line, either above or below the line, would be equally supported by the model. In evaluating the plotted data points for the recommended base unit values, the expert panel believes the data points support the recommendations which are based on survey data and clinical expertise.

Anesthesia RSL and Surveyed Code 01939

CPT Code	Long Descriptor	Anesthesia Base Units	BBM Value
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3.0	1.735
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3.0	1.857

00142	Anesthesia for procedures on eye; lens surgery	4.0	1.538
01939	Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; cervical or thoracic	4.0	1.23
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5.0	4.772
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7.0	3.858
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7.0	5.309
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8.0	5.833
00350	Anesthesia for procedures on major vessels of neck; not otherwise specified	10.0	8.841
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	10.0	6.550
00670	Anesthesia for extensive spine and spinal cord procedures (eg, spinal instrumentation or vascular procedures)	13.0	10.406
00560	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; without pump oxygenator	15.0	11.965
00567	Anesthesia for direct coronary artery bypass grafting; with pump oxygenator	18.0	17.577
00562	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator, age 1 year or older, for all noncoronary bypass procedures (eg, valve procedures) or for re-operation for coronary bypass more than 1 month after original operation	20.0	19.006
00796	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; liver transplant (recipient)	30.0	24.719

Post-Induction Period Procedure Anesthesia (PIPPA)

PIPPA is a relative intensity methodology used by the RUC to validate anesthesia base unit values. It is important to remember that PIPPA only looks at the post-induction period and estimates of varying levels of intensity. PIPPA does not account for differences in intensity of induction of anesthesia (part of intra-service work), or any work done in the pre or post service period. Survey respondents are asked to allocate the post-induction anesthesia time to five different intensity levels. Without a measure of the intensity of the post-induction period, all anesthesia procedures would be valued at the same intensity for this period based upon time units, which do not vary in intensity from one procedure to another.

Conceptually, it may be considered the time for the surgeon to perform the procedure. The level of intensity and complexity during the PIPPA period is divided into five levels, or quintiles, each of which has its own descriptor. Survey respondents rate the percentage of the total PIPPA time that the typical patient falls under each of the quintiles. During its third five-year review, which was initiated in February 2005, the RUC assigned intensity values to each quintile. Intensity values do not appear on the RUC survey. The survey responses are used to determine a weighted

average of the combined PIPPA intensity/complexity value. PIPPA values do not determine base unit values, but may be used to validate the reasonableness of proposed values.

RUC Assigned PIPPA Intensity Values	
Level 1: Presenting problems are self-limited or minor. Straightforward medical decision-making and treatment.	0.031
Level 2: Problems are of low intensity. Medical decision-making and treatment of low complexity.	0.044
Level 3: Problems are of moderate severity. Medical decision making and treatment of moderate complexity.	0.055
Level 4: Problems are of moderate to high severity. Medical decision-making of moderate to high complexity and treatment of high complexity. Critically ill or critically injured patients.	0.070
Level 5: Problems are of high severity medical decision making and treatment of high complexity. Critically ill or critically injured patients.	0.090

The weighted average PIPPA for 01939 is 0.0437. PIPPA is used to validate recommendations and not establish recommended base unit values.

The weighted PIPPA intensity for 01939 is consistent with other codes of similar value on the anesthesia RSL.

Code	Descriptor	Base Unit	Weighted PIPPA Intensity	Level 1	Level 2	Level 3	Level 4	Level 5
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3	0.0406	58.02%	24.69%	7.89%	5.38%	4.02%
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3	0.0406	58.35%	24.03%	8.59%	4.66%	4.37%
01939	Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; cervical or thoracic	4	0.0437	47.28%	28.28%	12.50%	6.65%	5.30%
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5	0.0445	40.88%	30.58%	16.90%	7.01%	4.63%

Budget Neutrality

In drafting recommendations for this code family, the specialty society considered the impact of the recommendation on budget neutrality. Based on the presented base unit recommendations and utilization, there is a resulting negative impact on total base units (-0.47%) across the entire family.

The pattern of base units proposed provides the best balance between the survey responses, expert panel opinion regarding rank order within the family, and budget neutrality.

For time the specialty is recommending:

- Pre-Anesthesia
  - *Evaluation:* 10.5 minutes
  - *Equipment/Drug/Supple preparation:* 7 minutes
- Intra-op
  - *Induction:* 2 minutes
  - *Post-induction:* 15 minutes
- *Post-induction:* 9.5 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01935 and 01936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physician Anesthesiologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 112,872
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Analysis of Medicare 5% Carrier File (2019) and RUC database (2020, V.2)

ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01940 Tracking Number: Original Specialty Recommended Base Unit Value: **4**
Presented Recommended Base Unit Value: 4
Global Period:XXX Current Base Unit Value: **NA** RUC Recommended Base Unit Value: **4**

CPT Descriptor: Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; lumbar or sacral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old male with constant low back pain due to degenerative disc disease and facet arthropathy received insufficient relief with conservative treatments. Previous trials of lumbar medial branch nerve blocks proved beneficial (separately reported). He undergoes radiofrequency neurotomy of the two medial branch nerves innervating the unilateral symptomatic facet joint.

Percentage of Survey Respondents who found Vignette to be Typical: 100.00%

Description of Pre-Service Work: A pre-procedure evaluation and targeted physical examination of the patient is performed. Review laboratory studies, ECG results, and imaging studies as necessary. Discuss with patient anesthetic technique to be used given the nature of the procedure and the requirements of the physician performing the procedure. Obtain informed consent. Set up anesthetic and drugs in preparation for the procedure and check anesthesia equipment, supplies, and monitors. A peripheral intravenous catheter is placed.

Description of Intra-Service Work: In the procedure room, monitoring is established and a presurgical review is performed. The patient is placed in the prone position with special care to avoid positioning injuries. Sufficient sedation and analgesia are provided to allow the patient to remain comfortable and cooperative with the procedure. Medications are titrated and the patient is monitored to preserve stable vital signs and adequate respiratory efforts throughout.

At the end of the procedure, the patient is turned supine and transferred to the postanesthetic care unit where a postanesthetic report is provided. Elements of the anesthesia care including vital signs (at least every five minutes), positioning, anesthesia procedures, medications, and significant events are personally documented in the anesthetic record.

Description of Post-Service Work: Appropriate analgesic and/or antiemetic are ordered for postprocedure discomfort, as necessary. Anesthesia equipment and medications are disposed of. A postoperative evaluation is made in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and to determine whether any anesthetic-related complications have occurred. Any postanesthesia care is provided, as needed, in the postanesthesia care unit. The patient is discharged from the unit.

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Society of Anesthesiologists (ASA) is pleased to submit anesthesia base unit recommendations for code 01940 *(Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; lumbar or sacral).*

Code	Descriptor	Jan RUC 2021 Recommendation	Rationale
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4	25th
01938	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral	4	25th
01939	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic	4	Xwalk
01940	**Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral**	**4**	**25th**
01941	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic	6	Xwalk
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral	6	Xwalk

Background

CPT code 01940 was created in October 2020, along with the entire code family (0193701942) describing anesthesia for image-guided procedures on the spine. The code family replaces CPT code 01935 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic)* and 01936 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic).*

The new code family was created to provide more granularity for anesthesia services that are used for image-guided procedures on the spine after CPT code 01936 was flagged in 2017 for high volume growth and the RAW recommended that the codes be reviewed by CPT.

The approved methodology to identify the vignette for an anesthesia service is to base the typical patient off of the most common underlying procedure reported with the anesthesia code. Based on an analysis of the Medicare 5% file, the most common procedure billed with the anesthesia procedure code (01936), after add-on codes and ancillary codes were removed is:

64635 Destruction by neurolytic agent, paravertebral facet joint nerve(s), with imaging guidance (fluoroscopy or CT); lumbar or sacral, single facet joint

As approved by the RUC Research subcommittee, the vignette used in the survey was from the typical patient described by CPT code 64635.

Expert Panel Recommendation

ASA is recommending the survey 25th percentile of 4 base units for CPT code 01940.
For time we are recommending:

Time Period	Minutes	Source
Pre-Service Evaluation	11	Survey median
Equipment/Drug Supply Preparation	7	Time package: straightforward patient/straightforward anesthetic
Induction Period Procedure	2	Time package: straightforward patient/straightforward anesthetic
Post-Induction Period Anesthesia	15	Survey median
Post-Anesthesia Evaluation	10	Survey median

Survey Sample and Process

The survey data and recommendations are based upon a random sample of 7,404 physician anesthesiologist members of ASA. The surveying society convened an expert panel to review the survey data.

Recommendation Rationale

An expert panel of anesthesiologists was convened to consider the survey data and provide recommendations. In developing recommendations the expert panel considered survey data, key reference codes, the Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis; and Post-Induction Period Procedure Anesthesia (PIPPA).

Survey Data

The panel is recommending the survey 25th percentile of 4 anesthesia base units.

A total of 41 responses were received, 100% of respondents agreed the patient vignette was typical and the median experience in the past 12 months was 2.

The recommended value is a reduction in base units from the original CPT codes (01935 and 01936), which this new code family is replacing. The expert panel agreed this recommendation was appropriate and that it maintained appropriate rank order in the family.

Key Reference Codes

37% of survey respondents selected 01630 (*Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified*) valued at 5 base units as the top key reference service code.

- 93% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

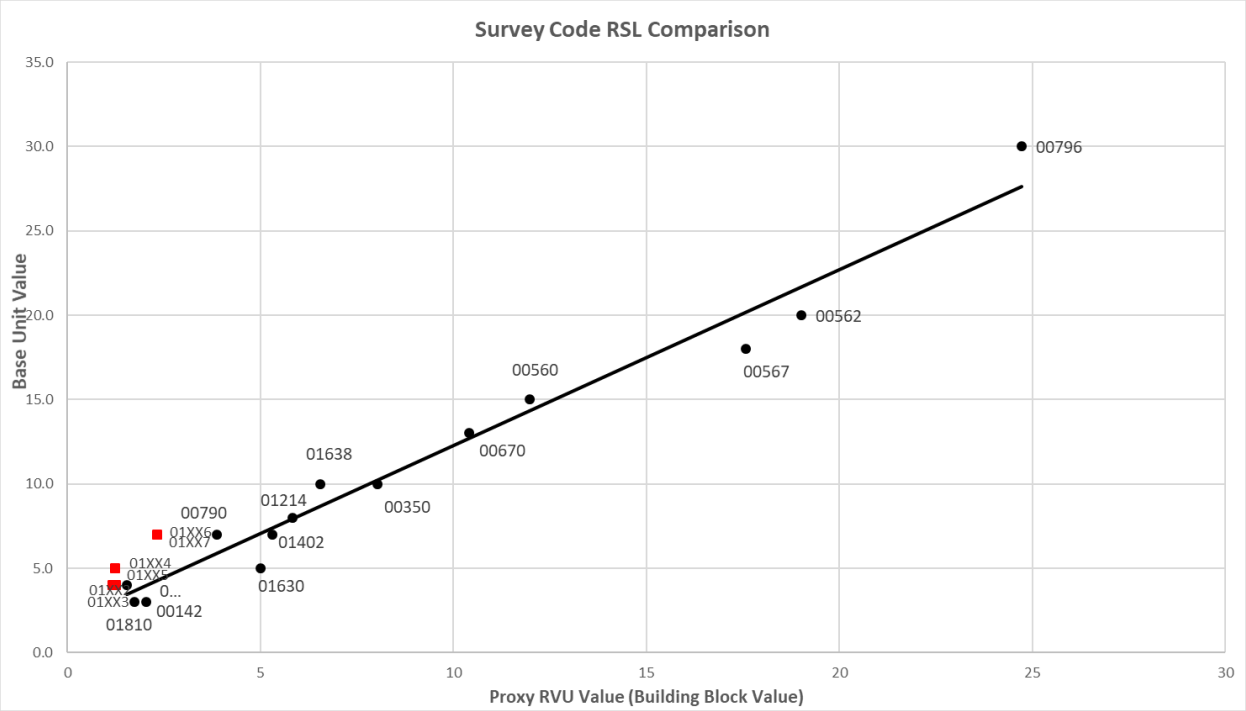
27% of survey respondents selected 00142 (*Anesthesia for procedures on eye; lens surgery*) valued at 4 base units as the second key reference service code.

- 100% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

The expert panel concluded that the intensity/complexity measures supported their recommendation.

Comparison with Paired Spinal Code

The expert panel is recommending the survey 25th percentile base unit value of 4 for CPT code 01940. This value is lower than the paired spinal code 01939 that is used to report anesthesia for the same procedure, but in a different spinal region. CPT code 01939 is used for services performed in the cervical or thoracic region. Procedures performed in this region are inherently more complex and have higher associated risk.



The expert panel believes that the lower recommended value for code 01940 is appropriate when compared to code 01939.

Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis

The RUC recently approved the BBM and RSL Regression Analysis. This supplemental tool to traditional RUC survey techniques is a way to compare relativity among anesthesia services. It is used to validate the presented recommendation. Using survey data and the RUC approved time packages, the expert panel calculated the BBM value known as a "proxy RVU." This value was plotted on the "Survey Code RSL Comparison Graph." This is a linear regression analysis of anesthesia codes on the RSL that plotted base unit values against anesthesia code building block values ("proxy RVUs"). The proxy RVU for 01940 was plotted on the graph. The closer a point is to the regression line, the better the proxy RVU and the base unit align, regardless if the point is above or below the regression line.

The recommended value is supported when it was plotted on the RSL Regression Analysis Graph. The proxy RVU value for 01940 is plotted close to the graph with the base unit recommendation of 4 base units, indicating that the recommendation maintains appropriate rank order when compared to the other codes on the Anesthesia RSL.

The regression line tool developed by the Anesthesia Workgroup is a line of best fit, and by definition will have data points above and below the regression line. Two data points that are equidistant from the regression line, either above or below the line, would be equally supported by the model. In evaluating the plotted data points for the recommended base unit values, the expert panel believes the data points support the recommendations which are based on survey data and clinical expertise.

Anesthesia RSL and 01940

CPT Code	Long Descriptor	Anesthesia Base Units	BBM Value
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3.0	1.735
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3.0	1.857
00142	Anesthesia for procedures on eye; lens surgery	4.0	1.538

01940	Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; lumbar or sacral	4.0	1.26
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5.0	4.772
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7.0	3.858
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7.0	5.309
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8.0	5.833
00350	Anesthesia for procedures on major vessels of neck; not otherwise specified	10.0	8.841
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	10.0	6.550
00670	Anesthesia for extensive spine and spinal cord procedures (eg, spinal instrumentation or vascular procedures)	13.0	10.406
00560	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; without pump oxygenator	15.0	11.965
00567	Anesthesia for direct coronary artery bypass grafting; with pump oxygenator	18.0	17.577
00562	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator, age 1 year or older, for all noncoronary bypass procedures (eg, valve procedures) or for re-operation for coronary bypass more than 1 month after original operation	20.0	19.006
00796	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; liver transplant (recipient)	30.0	24.719

Post-Induction Period Procedure Anesthesia (PIPPA)

PIPPA is a relative intensity methodology used by the RUC to validate anesthesia base unit values. It is important to remember that PIPPA only looks at the post-induction period and estimates of varying levels of intensity. PIPPA does not account for differences in intensity of induction of anesthesia (part of intra-service work), or any work done in the pre or post service period. Survey respondents are asked to allocate the post-induction anesthesia time to five different intensity levels. Without a measure of the intensity of the post-induction period, all anesthesia procedures would be valued at the same intensity for this period based upon time units, which do not vary in intensity from one procedure to another.

Conceptually, it may be considered the time for the surgeon to perform the procedure. The level of intensity and complexity during the PIPPA period is divided into five levels, or quintiles, each of which has its own descriptor. Survey respondents rate the percentage of the total PIPPA time that the typical patient falls under each of the quintiles. During its third five-year review, which was initiated in February 2005, the RUC assigned intensity values to each quintile. Intensity values do not appear on the RUC survey. The survey responses are used to determine a weighted

average of the combined PIPPA intensity/complexity value. PIPPA values do not determine base unit values, but may be used to validate the reasonableness of proposed values.

RUC Assigned PIPPA Intensity Values	
Level 1: Presenting problems are self-limited or minor. Straightforward medical decision-making and treatment.	0.031
Level 2: Problems are of low intensity. Medical decision-making and treatment of low complexity.	0.044
Level 3: Problems are of moderate severity. Medical decision making and treatment of moderate complexity.	0.055
Level 4: Problems are of moderate to high severity. Medical decision-making of moderate to high complexity and treatment of high complexity. Critically ill or critically injured patients.	0.070
Level 5: Problems are of high severity medical decision making and treatment of high complexity. Critically ill or critically injured patients.	0.090

The weighted average PIPPA for 01940 is 0.0443. This value validates the recommendation of 4 base units in comparison with other codes on the Anesthesia RSL. PIPPA is used to validate recommendations and not establish recommended base unit values.

The weighted PIPPA intensity for 01940 is consistent with other codes of similar value on the anesthesia RSL. The expert panel believes the distribution of PIPPA, confirms the recommended value of 4 base units for 01940.

Code	Descriptor	Base Unit	Weighted PIPPA Intensity	Level 1	Level 2	Level 3	Level 4	Level 5
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3	0.0406	58.02%	24.69%	7.89%	5.38%	4.02%
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3	0.0406	58.35%	24.03%	8.59%	4.66%	4.37%
01940	Anesthesia for image guided destruction procedures by neurolytic agent on the spine and spinal cord; lumbar or sacral	4	0.0443	46.49%	28.12%	12.34%	6.66%	6.39%
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5	0.0445	40.88%	30.58%	16.90%	7.01%	4.63%

Budget Neutrality

In drafting recommendations for this code family, the specialty society considered the impact of the recommendation on budget neutrality. Based on the presented base unit recommendations and utilization, there is a resulting negative impact on total base units (-0.47%) across the entire family.

The pattern of base units proposed provides the best balance between the survey responses, expert panel opinion regarding rank order within the family, and budget neutrality.

In conclusion, ASA is recommending the survey 25th percentile of 4 anesthesia base units. For time the specialty is recommending:

- Pre-Anesthesia
  - *Evaluation:* 11 minutes
  - *Equipment/Drug/Supple preparation:* 7 minutes
- Intra-op
  - *Induction:* 2 minutes
  - *Post-induction:* 15 minutes
- *Post-induction:* 10 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01935 and 01936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physician Anesthesiologists How often? Sometimes

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01941 Tracking Number: Original Specialty Recommended Base Unit Value: **7**
Presented Recommended Base Unit Value: 7
Global Period:XXX Current Base Unit Value: **NA** RUC Recommended Base Unit Value: **6**

CPT Descriptor: Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; cervical or thoracic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old female develops sudden, severe mid-back pain after lifting her grandchild. Plain radiographs reveal an acute compression fracture with severe anterior wedging involving T10 and consequent new kyphosis. Pain persists despite a period of conservative care. After referral, percutaneous thoracic vertebral augmentation (and bone biopsy, if indicated) is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97.87%

Description of Pre-Service Work: A pre-procedure evaluation and targeted physical examination of the patient is performed. Review laboratory studies, ECG results, and imaging studies as necessary. Discuss with patient anesthetic technique to be used given the nature of the procedure and the requirements of the physician performing the procedure. Obtain informed consent. Set up anesthetic and drugs in preparation for the procedure and check anesthesia equipment, supplies, and monitors. A peripheral intravenous catheter is placed.

Description of Intra-Service Work: In the procedure room, monitoring is established and a presurgical review is performed. General anesthesia is induced and the trachea intubated. After the airway is secured and the patient's vital signs are stable the patient is placed in the prone position with special care to avoid positioning injuries. The patient is placed in a prone position with special care to avoid positioning injuries to the eyes, cervical spine, peripheral nerves and/or soft tissues. Anesthesia care is provided, medications are titrated, and the patient is monitored and reassessed throughout the procedure.

At the end of the procedure, the patient is turned supine, "emerged," and extubated when medically appropriate. The patient is transferred to the postanesthetic care unit where a postanesthetic report is provided. Elements of the anesthesia care including vital signs (at least every five minutes), positioning, anesthesia procedures, medications, and significant events are personally documented in the anesthetic record.

Description of Post-Service Work: Appropriate analgesic and/or antiemetic are ordered for postprocedure discomfort, as necessary. Anesthesia equipment and medications are disposed of. A postoperative evaluation is made in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and to determine whether any anesthetic-related complications have occurred. Any postanesthesia care is provided, as needed, in the postanesthesia care unit. The patient is discharged from the unit.

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Society of Anesthesiologists (ASA) is pleased to submit anesthesia base unit recommendations for code 01941 *(Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; cervical or thoracic).*

Code	Descriptor	Jan RUC 2021 Recommendation	Rationale
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4	25th
01938	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral	4	25th
01939	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic	5	25th
01940	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral	4	25th
01941	**Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic**	**6**	**Xwalk**
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral	6	Xwalk

Background

CPT code 01941 was created in October 2020, along with the entire code family (01937-01942) describing anesthesia for image-guided procedures on the spine. The code family replaces CPT code 01935 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic)* and 01936 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic).*

The new code family was created to provide more granularity for anesthesia services that are used for image-guided procedures on the spine after CPT code 01936 was flagged in 2017 for high volume growth and the RAW recommended that the codes be reviewed by CPT.

The approved methodology to identify the vignette for an anesthesia service is to base the typical patient off of the most common underlying procedure reported with the anesthesia code. Based on an analysis of the Medicare 5% file, the most common procedure billed with anesthesia procedure (01936) for the same patient on the same day by a different provider, after add-on codes and ancillary codes were removed is:

22513 Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; thoracic

As approved by the RUC Research subcommittee, the vignette used in the survey was from the typical patient described by CPT code 22513.

Expert Panel Recommendation

For time we are recommending:

Time Period	Minutes	Source
Pre-Service Evaluation	13	Survey median
Equipment/Drug Supply Preparation	7	Time package: straightforward patient/straightforward anesthetic
Induction Period Procedure	8	Time package: complex patient/straightforward anesthetic
Post-Induction Period Anesthesia	20	Survey median
Post-Anesthesia Evaluation	10	Survey median

Survey Sample and Process

The survey data and recommendations are based upon a random sample of 7,404 physician anesthesiologist members of ASA. The surveying society convened an expert panel to review the survey data.

Recommendation Rationale

An expert panel of anesthesiologists was convened to consider the survey data and provide recommendations. In developing recommendations the expert panel considered survey data, key reference codes, the Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis; and Post-Induction Period Procedure Anesthesia (PIPPA).

Survey Data

The panel is recommending the survey median of 7 anesthesia base units.

The survey was viewed as robust with 47 responses, 98% of respondents agreed with the typical patient vignette and the median experience in the past 12 months was 5.

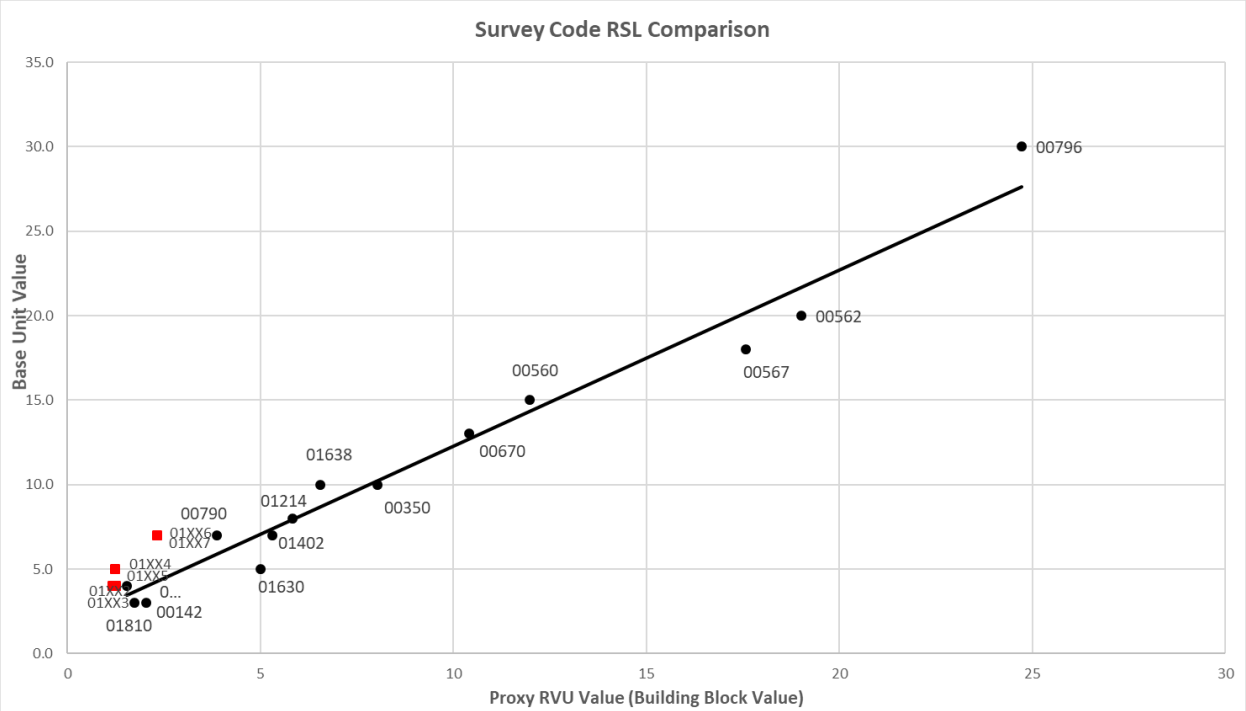
The recommended value is an increase in from the original CPT codes (01935 and 01936), which this new code family is replacing. The expert panel agreed this increase was appropriate and maintained rank order in the family.

Key Reference Codes

23% of survey respondents selected 01630 (*Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified*) valued at 5 base units as the top key reference service code. 93% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

15% of survey respondents selected 00670 *(Anesthesia for extensive spine and spinal cord procedures (e.g., spinal instrumentation or vascular procedures))* valued at 13 base units as the second key reference service code. 91% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

The expert panel concluded that the intensity/complexity measures supported their recommendation of 7 base units for code 01941.



Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis

The RUC recently approved the BBM and RSL Regression Analysis. This supplemental tool to traditional RUC survey techniques is a way to compare relativity among anesthesia services. It is used to validate the presented recommendation. Using survey data and the RUC approved time packages, the expert panel calculated the BBM value known as a “proxy RVU.” This value was plotted on the “Survey Code RSL Comparison Graph.” This is a linear regression analysis of anesthesia codes on the RSL that plotted base unit values against anesthesia code building block values

("proxy RVUs"). The proxy RVU for 01941 was plotted on the graph. The closer a point is to the regression line, the better the proxy RVU and the base unit align, regardless if the point is above or below the regression line.

The recommended is supported when it was plotted on the RSL Regression Analysis Graph. The proxy RVU value for 01941 is plotted close to the graph, indicating that the recommendation maintains appropriate ran order when compared to the other codes on the Anesthesia RSL.

The regression line tool developed by the Anesthesia Workgroup is a line of best fit, and by definition will have data points above and below the regression line. Two data points that are equidistant from the regression line, either above or below the line, would be equally supported by the model. In evaluating the plotted data points for the recommended base unit values, the expert panel believes the data points support the recommendations which are based on survey data and clinical expertise.

Anesthesia RSL and 01941

CPT Code	Long Descriptor	Anesthesia Base Units	BBM Value
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3.0	1.735
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3.0	1.857
00142	Anesthesia for procedures on eye; lens surgery	4.0	1.538
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5.0	4.772
01941	Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; cervical or thoracic	6.0	2.32
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise	7.0	3.858

	specified		
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7.0	5.309
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8.0	5.833
00350	Anesthesia for procedures on major vessels of neck; not otherwise specified	10.0	8.841
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	10.0	6.550
00670	Anesthesia for extensive spine and spinal cord procedures (eg, spinal instrumentation or vascular procedures)	13.0	10.406
00560	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; without pump oxygenator	15.0	11.965
00567	Anesthesia for direct coronary artery bypass grafting; with pump oxygenator	18.0	17.577
00562	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator, age 1 year or older, for all noncoronary bypass procedures (eg, valve procedures) or for re-operation for coronary bypass more than 1 month after original operation	20.0	19.006
00796	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; liver transplant (recipient)	30.0	24.719

Post-Induction Period Procedure Anesthesia (PIPPA)

PIPPA is a relative intensity methodology used by the RUC to validate anesthesia base unit values. It is important to remember that PIPPA only looks at the post-induction period and estimates of varying levels of intensity. PIPPA does not account for differences in intensity of induction of anesthesia (part of intra-service work), or any work done in the pre or post service period. Survey respondents are asked to allocate the post-induction anesthesia time to five different intensity levels. Without a measure of the intensity of the post-induction period, all anesthesia procedures would be valued at the same intensity for this period based upon time units, which do not vary in intensity from one procedure to another.

Conceptually, it may be considered the time for the surgeon to perform the procedure. The level of intensity and complexity during the PIPPA period is divided into five levels, or quintiles, each of which has its own descriptor. Survey respondents rate the percentage of the total PIPPA time that the typical patient falls under each of the quintiles. During its third five-year review, which was initiated in February 2005, the RUC assigned intensity values to each quintile. Intensity values do not appear on the RUC survey. The survey responses are used to determine a weighted average of the combined PIPPA intensity/complexity value. PIPPA values do not determine base unit values, but may be used to validate the reasonableness of proposed values.

RUC Assigned PIPPA Intensity Values	
Level 1: Presenting problems are self-limited or minor. Straightforward medical decision-making and treatment.	0.031
Level 2: Problems are of low intensity. Medical decision-making and treatment of low complexity.	0.044

Level 3: Problems are of moderate severity. Medical decision making and treatment of moderate complexity.	0.055
Level 4: Problems are of moderate to high severity. Medical decision-making of moderate to high complexity and treatment of high complexity. Critically ill or critically injured patients.	0.070
Level 5: Problems are of high severity medical decision making and treatment of high complexity. Critically ill or critically injured patients.	0.090

The weighted average PIPPA for 01941 is 0.0443. This value validates the recommendation of 7 base units in comparison with other codes on the Anesthesia RSL. PIPPA is used to validate recommendations and not establish recommended base unit values.

The weighted PIPPA intensity for 01941 is consistent with other codes of similar value on the anesthesia RSL. The expert panel believes the distribution of PIPPA, confirms the recommended value of 7 base units for 01941.

Code	Descriptor	Base Unit	Weighted PIPPA Intensity	Level 1	Level 2	Level 3	Level 4	Level 5
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5	0.0445	40.88%	30.58%	16.90%	7.01%	4.63%
01941	Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; cervical or thoracic	6	0.0443	41.17%	32.94%	15.30%	6.04%	4.55%
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7	0.0440	44.48%	28.78%	15.28%	5.94%	5.52%
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7	0.0444	42.20%	30.57%	15.24%	6.67%	5.32%
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8	0.0450	40.20%	30.62%	15.96%	8.04%	5.18%

Relativity within Code Family

In reviewing survey data and the supporting BBM value and regression analysis, the expert panel concluded that the relatively higher values for 01941 and 01942 were appropriate given the clinical complexity of the anesthesia procedure and the more complex typical patient.

CPT code 01941 and 01942 are used to report anesthesia for image guided neuromodulation or intravertebral procedures. The surveying society conducted an analysis detailing the services typically reported with the previous anesthesia codes (01935/01936) that would now be reported with codes 01941 and 01942. The society identified 22513 and 22514 as the most frequently reported underlying procedure with 01941 and 01942.

These procedures require a more complex anesthetic technique to protect the patients while in the prone position. This position takes extra care prior to the start of the procedure to ensure the airway is properly secured. During the procedure, the patient is unable to protect their own airway, causing the potential for significant complications and requires constant monitoring. Additionally, spinal procedures performed in the prone position cause additional

pressure points for the anesthetist to monitor throughout the procedure. These risks and added complexities exist for procedures performed on the upper and lower regions of the spine.

The complexity of the service, the added comorbidities of the typical patient, and the required constant monitoring of the patient in the prone position support the value of 6 base unit for CPT code 01941.

Budget Neutrality

In drafting recommendations for this code family, the specialty society considered the impact of the recommendation on budget neutrality. Based on the presented base unit recommendations and utilization, there is a resulting negative impact on total base units (-0.47%) across the entire family.

The pattern of base units proposed provides the best balance between the survey responses, expert panel opinion regarding rank order within the family, and budget neutrality.

For time the specialty is recommending:

- Pre-Anesthesia
  - *Evaluation:* 13 minutes
  - *Equipment/Drug/Supple preparation:* 7 minutes
- Intra-op
  - *Induction:* 8 minutes
  - *Post-induction:* 20 minutes
- *Post-induction:* 10 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01935 and 01936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physician Anesthesiologists How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 141,535
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Analysis of Medicare 5% Carrier File (2019) and RUC database (2020, V.2)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
ANESTHESIA SUMMARY OF RECOMMENDATION

CPT Code:01942 Tracking Number: Original Specialty Recommended Base Unit Value: **7**
Presented Recommended Base Unit Value: 6
Global Period:XXX Current Base Unit Value: **NA** RUC Recommended Base Unit Value: **6**

CPT Descriptor: Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; lumbar or sacral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old female presents with severe, persistent low back pain and progressive spinal deformity secondary to osteoporotic vertebral collapse. Plain radiographs reveal an acute compression fracture of L3. Despite conservative medical management, pain persists. Percutaneous lumbar vertebral augmentation (and bone biopsy, if indicated) is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95.92%

Description of Pre-Service Work: A pre-procedure evaluation and targeted physical examination of the patient is performed. Review laboratory studies, ECG results, and imaging studies as necessary. Discuss with patient anesthetic technique to be used given the nature of the procedure and the requirements of the physician performing the procedure. Obtain informed consent. Set up anesthetic and drugs in preparation for the procedure and check anesthesia equipment, supplies, and monitors. A peripheral intravenous catheter is placed.

Description of Intra-Service Work: In the procedure room, monitoring is established and a presurgical review is performed. General anesthesia is induced and the trachea intubated. After the airway is secured and the patient's vital signs are stable the patient is placed in the prone position with special care to avoid positioning injuries. The patient is placed in a prone position with special care to avoid positioning injuries to the eyes, cervical spine, peripheral nerves and/or soft tissues. Anesthesia care is provided, medications are titrated, and the patient is monitored and reassessed throughout the procedure.

At the end of the procedure, the patient is turned supine, "emerged," and extubated when medically appropriate. The patient is transferred to the postanesthetic care unit where a postanesthetic report is provided. Elements of the anesthesia care including vital signs (at least every five minutes), positioning, anesthesia procedures, medications, and significant events are personally documented in the anesthetic record.

Description of Post-Service Work: Appropriate analgesic and/or antiemetic are ordered for postprocedure discomfort, as necessary. Anesthesia equipment and medications are disposed of. A postoperative evaluation is made in the postanesthesia care unit to determine satisfactory recovery from anesthetic care and to determine whether any anesthetic-related complications have occurred. Any postanesthesia care is provided, as needed, in the postanesthesia care unit. The patient is discharged from the unit.

ADDITIONAL RATIONALE

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Society of Anesthesiologists (ASA) is pleased to submit anesthesia base unit recommendations for code 01942 *(Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; lumbar or sacral).*

Code	Descriptor	Jan RUC 2021 Recommendation	Rationale
01937	Anesthesia for image guided injection, drainage or aspiration procedures on the spine and spinal cord; cervical or thoracic	4	25th
01938	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral	4	25th
01939	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic	4	Xwalk
01940	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral	4	25th
01941	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic)	6	Xwalk
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral)	6	Xwalk

Background

CPT code 01942 was created in October 2020, along with the entire code family (01937-01942) describing anesthesia for image-guided procedures on the spine. The code family replaces CPT code 01935 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; diagnostic)* and 01936 (*Anesthesia for percutaneous image guided procedures on the spine and spinal cord; therapeutic).*

The new code family was created to provide more granularity for anesthesia services that are used for image-guided procedures on the spine after CPT code 01936 was flagged in 2017 for high volume growth and the RAW recommended that the codes be reviewed by CPT.

The approved methodology to identify the vignette for an anesthesia service is to base the typical patient off of the most common underlying procedure reported with the anesthesia code. Based on an analysis of the Medicare 5% file, the most common procedure billed with the underlying anesthesia procedure (01936), after add-on codes and ancillary codes were removed is:

22514 Percutaneous vertebral augmentation, including cavity creation (fracture reduction and bone biopsy included when performed) using mechanical device (eg, kyphoplasty), 1 vertebral body, unilateral or bilateral cannulation, inclusive of all imaging guidance; lumbar

As approved by the RUC Research subcommittee, the vignette used in the survey was from the typical patient described by CPT code 22514.

Expert Panel Recommendation

Time Period	Minutes	Source

Pre-Service Evaluation	13	Survey median
Equipment/Drug Supply Preparation	7	Time package: straightforward patient/straightforward anesthetic
Induction Period Procedure	8	Time package: complex patient/straightforward anesthetic
Post-Induction Period Anesthesia	20	Survey median
Post-Anesthesia Evaluation	10	Survey median

Survey Sample and Process

The survey data and recommendations are based upon a random sample of 7,404 physician anesthesiologist members of ASA. The surveying society convened an expert panel to review the survey data.

Recommendation Rationale

An expert panel of anesthesiologists was convened to consider the survey data and provide recommendations. In developing recommendations the expert panel considered survey data, key reference codes, the Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis; and Post-Induction Period Procedure Anesthesia (PIPPA).

Survey Data

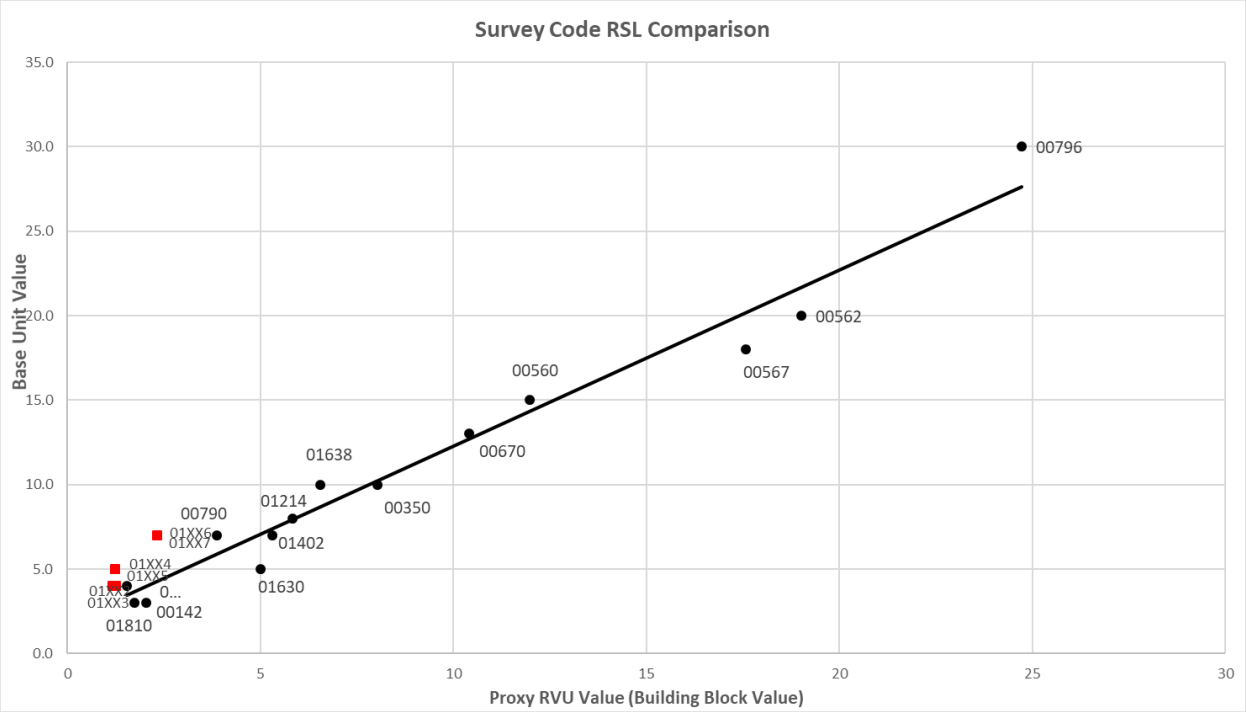
The panel is recommending the survey median of 7 anesthesia base units.

A total of 49 responses were received, 96% of respondents agreed that the patient vignette was typical and the median experience in the past 12 months was 5.

The recommended value is an increase in from the original CPT codes (01935 and 01936) for which this new code family is replacing. The expert panel agreed this increase was appropriate and maintained rank order in the family.

Key Reference Codes

22% of survey respondents selected 01630 (*Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified*) valued at 5 base units as the top key reference service code. 100% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.



14% of survey respondents selected 00670 *(Anesthesia for extensive spine and spinal cord procedures (e.g., spinal instrumentation or vascular procedures))* valued at 13 base units as the second key reference service code. 86% of these respondents rated the surveyed code to be identical, somewhat more, or much more in overall intensity and complexity compared with the selected reference code.

Building Block Methodology (BBM) and Reference Service List (RSL) Regression Analysis

The RUC recently approved the BBM and RSL Regression Analysis. This supplemental tool to traditional RUC survey techniques is a way to compare relativity among anesthesia services. It is used to validate the presented recommendation. Using survey data and the RUC approved time packages, the expert panel calculated the BBM value known as a "proxy RVU." This value was plotted on the "Survey Code RSL Comparison Graph." This is a linear regression analysis of anesthesia codes on the RSL that plotted base unit values against anesthesia code building block values ("proxy RVUs"). The proxy RVU for 01942 was plotted on the graph. The closer a point is to the regression line, the better the proxy RVU and the base unit align, regardless if the point is above or below the regression line.

The recommended value was supported when it was plotted on the RSL Regression Analysis Graph. The proxy RVU value for 01942 is plotted close to the graph, indicating that the recommendation maintains appropriate ran order when compared to the other codes on the Anesthesia RSL.

The regression line tool developed by the Anesthesia Workgroup is a line of best fit, and by definition will have data points above and below the regression line. Two data points that are equidistant from the regression line, either above or below the line, would be equally supported by the model. In evaluating the plotted data points for the recommended base unit values, the expert panel believes the data points support the recommendations which are based on survey data and clinical expertise.

Anesthesia RSL & 01942

CPT Code	Long Descriptor	Anesthesia Base Units	BBM Value
00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3.0	1.735
01810	Anesthesia for all procedures on nerves, muscles, tendons, fascia, and bursae of forearm, wrist, and hand	3.0	1.857
00142	Anesthesia for procedures on eye; lens surgery	4.0	1.538
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5.0	4.772
01942	Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; lumbar or sacral	6.0	2.32
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7.0	3.858
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7.0	5.309

01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8.0	5.833
00350	Anesthesia for procedures on major vessels of neck; not otherwise specified	10.0	8.841
01638	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; total shoulder replacement	10.0	6.550
00670	Anesthesia for extensive spine and spinal cord procedures (eg, spinal instrumentation or vascular procedures)	13.0	10.406
00560	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; without pump oxygenator	15.0	11.965
00567	Anesthesia for direct coronary artery bypass grafting; with pump oxygenator	18.0	17.577
00562	Anesthesia for procedures on heart, pericardial sac, and great vessels of chest; with pump oxygenator, age 1 year or older, for all noncoronary bypass procedures (eg, valve procedures) or for re-operation for coronary bypass more than 1 month after original operation	20.0	19.006
00796	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; liver transplant (recipient)	30.0	24.719

Post-Induction Period Procedure Anesthesia (PIPPA)

PIPPA is a relative intensity methodology used by the RUC to validate anesthesia base unit values. It is important to remember that PIPPA only looks at the post-induction period and estimates of varying levels of intensity. PIPPA does not account for differences in intensity of induction of anesthesia (part of intra-service work), or any work done in the pre or post service period. Survey respondents are asked to allocate the post-induction anesthesia time to five different intensity levels. Without a measure of the intensity of the post-induction period, all anesthesia procedures would be valued at the same intensity for this period based upon time units, which do not vary in intensity from one procedure to another.

Conceptually, it may be considered the time for the surgeon to perform the procedure. The level of intensity and complexity during the PIPPA period is divided into five levels, or quintiles, each of which has its own descriptor. Survey respondents rate the percentage of the total PIPPA time that the typical patient falls under each of the quintiles. During its third five-year review, which was initiated in February 2005, the RUC assigned intensity values to each quintile. Intensity values do not appear on the RUC survey. The survey responses are used to determine a weighted average of the combined PIPPA intensity/complexity value. PIPPA values do not determine base unit values, but may be used to validate the reasonableness of proposed values.

RUC Assigned PIPPA Intensity Values	
Level 1: Presenting problems are self-limited or minor. Straightforward medical decision-making and treatment.	0.031
Level 2: Problems are of low intensity. Medical decision-making and treatment of low complexity.	0.044
Level 3: Problems are of moderate severity. Medical decision making and treatment of moderate complexity.	0.055
Level 4: Problems are of moderate to high severity. Medical decision-making of moderate to high complexity and treatment of high	0.070

complexity. Critically ill or critically injured patients.	
Level 5: Problems are of high severity medical decision making and treatment of high complexity. Critically ill or critically injured patients.	0.090

The weighted average PIPPA for 01942 is 0.0447. This value validates the recommendation of 7 base units in comparison with other codes on the Anesthesia RSL. PIPPA is used to validate recommendations and not establish recommended base unit values.

The weighted PIPPA intensity for 01942 is consistent with other codes of similar value on the anesthesia RSL. The expert panel believes the distribution of PIPPA, confirms the recommended value of 7 base units for 01942.

Code	Descriptor	Base Unit	Weighted PIPPA Intensity	Level 1	Level 2	Level 3	Level 4	Level 5
01630	Anesthesia for open or surgical arthroscopic procedures on humeral head and neck, sternoclavicular joint, acromioclavicular joint, and shoulder joint; not otherwise specified	5	0.0445	40.88%	30.58%	16.90%	7.01%	4.63%
01942	Anesthesia for image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) in the spine and spinal cord; lumbar or sacral	6	0.0447	39.90%	33.35%	15.49%	6.22%	5.04%
00790	Anesthesia for intraperitoneal procedures in upper abdomen including laparoscopy; not otherwise specified	7	0.0440	44.48%	28.78%	15.28%	5.94%	5.52%
01402	Anesthesia for open or surgical arthroscopic procedures on knee joint; total knee arthroplasty	7	0.0444	42.20%	30.57%	15.24%	6.67%	5.32%
01214	Anesthesia for open procedures involving hip joint; total hip arthroplasty	8	0.0450	40.20%	30.62%	15.96%	8.04%	5.18%

Relativity within Code Family

In reviewing survey data and the supporting BBM value and regression analysis, the expert panel concluded that the relatively higher values for 01941 and 01942 were appropriate given the clinical complexity of the anesthesia procedure and the more complex typical patient.

CPT code 01941 and 01942 are used to report anesthesia for image guided neuromodulation or intravertebral procedures. The surveying society conducted an analysis detailing the services typically reported with the previous anesthesia codes (01935/01936) that would now be reported with codes 01941 and 01942. The society identified 22513 and 22514 as the most frequently reported underlying procedure with 01941 and 01942.

These procedures require a more complex anesthetic technique to protect the patients while in the prone position. This position takes extra care prior to the start of the procedure to ensure the airway is properly secured. During the procedure, the patient is unable to protect their own airway, causing the potential for significant complications and requires constant monitoring. Additionally, spinal procedures performed in the prone position cause additional pressure points for the anesthetist to monitor throughout the procedure. These risks and added complexities exist for procedures performed on the upper and lower regions of the spine.

The complexity of the service, the added comorbidities of the typical patient, and the required constant monitoring of the patient in the prone position support 6 base unit recommendation for CPT code 01942.

Budget Neutrality

In drafting recommendations for this code family, the specialty society considered the impact of the recommendation on budget neutrality. Based on the presented base unit recommendations and utilization, there is a resulting negative impact on total base units (-0.47%) across the entire family.

The pattern of base units proposed provides the best balance between the survey responses, expert panel opinion regarding rank order within the family, and budget neutrality.

- Pre-Anesthesia
  - *Evaluation:* 13 minutes
  - *Equipment/Drug/Supple preparation:* 7 minutes
- Intra-op
  - *Induction:* 8 minutes
  - *Post-induction:* 20 minutes
- *Post-induction:* 10 minutes

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this new/revised code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this new/revised code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 01935 and 01936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Physician Anesthesiologists How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 141,535
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Analysis of Medicare 5% Carrier File (2019) and RUC database (2020, V.2)

Specialty Anesthesiology Frequency 141,535 Percentage 100%

Specialty Frequency Percentage

Specialty Frequency Percentage

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 47,178 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Analysis of Medicare 5% Carrier File (2019) and RUC database (2020, V.2)

Specialty Anesthesiology Frequency 47,178 Percentage 100.00%

Specialty Frequency Percentage

Specialty Frequency Percentage

Do many physicians perform this service across the United States? Yes

Build Block Methodology Calculations and Anesthesia Reference Service Comparison

ISSUE: Anesthesia Services for Image-Guided Spinal Procedures

TAB: 4

						Pre-Anesthesia Period				
						1A. Evaluation of the patient prior to the beginning of reportable anesthesia time				
			NOTE: The **Anesthesia Base Unit Value** comes from the 2019 Medicare Physician Fee Schedule; the **Building Block (BB) Value** is calculated using the methodology approved by the Anesthesia Workgroup and the RUC. At the request of the Anesthesia Workgroup this value was calculated with PIPPA (methdology approved by the RUC) and without PIPPA.							
Survey Date	**Source**	**CPT**	**Descriptor**	**Anesthesia Base Unit**	**BB Value w/ PIPPA***	**Min**	**25th**	**Median**	**75th**	**Max**
Apr-19	RUC	00812	Anesthesia for lower intestinal endoscopic procedures, endoscope introduced distal to duodenum; screening colonoscopy	3	**1.735**	1	6	8	10	30

PRESENTER(S): Gordon Morewood, MD, Richard Rosenquist MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
01937	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; cervical or thoracic	XXX
01938	Anesthesia for percutaneous image guided injection, drainage or aspiration procedures on the spine or spinal cord; lumbar or sacral	XXX
01939	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; cervical or thoracic	XXX
01940	Anesthesia for percutaneous image guided destruction procedures by neurolytic agent on the spine or spinal cord; lumbar or sacral	XXX
01941	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; cervical or thoracic	XXX
01942	Anesthesia for percutaneous image guided neuromodulation or intravertebral procedures (eg. kyphoplasty, vertebroplasty) on the spine or spinal cord; lumbar or sacral	XXX

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
01937	A 67-year-old female has chronic neck pain radiating toward her right shoulder. An MRI demonstrated facet arthropathy at C4-C5 and multilevel degenerative disc disease. Diagnostic testing with cervical facet blocks under fluoroscopic guidance on the right at the C4-C5 level is indicated.
01938	A 71-year-old male presents with recurrent right leg pain, the ability to stand for only 10 minutes and walk less than one block, and minimal problems sitting. The patient's history includes a previous laminectomy at L4-L5; MRI with contrast material, showing a small recurrent herniation between L4-L5 with scar tissue; and neurodiagnostic studies compatible with L5 radiculopathy. He undergoes a transforaminal epidural injection of an anesthetic and/or anti-inflammatory agent at the L5-SI level.
01939	A 65-year-old female with constant neck pain caused by degenerative disc disease and cervical spondylosis received insufficient relief with conservative treatments. Previous trials of cervical medial branch nerve blocks proved beneficial (separately reported). Radiofrequency neurotomy is performed on two medial branch nerves innervating the unilateral symptomatic facet joint.
01940	A 65-year-old male with constant low back pain due to degenerative disc disease and facet arthropathy received insufficient relief with conservative treatments. Previous trials of lumbar medial branch nerve blocks proved beneficial (separately reported). He undergoes radiofrequency neurotomy of the two medial branch nerves innervating the unilateral symptomatic facet joint.
01941	A 75-year-old female develops sudden, severe mid-back pain after lifting her grandchild. Plain radiographs reveal an acute compression fracture with severe anterior wedging involving T10 and consequent new kyphosis. Pain persists despite a period of conservative care. After referral, percutaneous thoracic vertebral augmentation (and bone biopsy, if indicated) is performed.
01942	A 75-year-old female presents with severe, persistent low back pain and progressive spinal deformity secondary to osteoporotic vertebral collapse. Plain radiographs reveal an acute

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

	compression fracture of L3. Despite conservative medical management, pain persists. Percutaneous lumbar vertebral augmentation (and bone biopsy, if indicated) is performed.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

We are requesting the standard anesthesia PE package. *CMS requested the PERC discuss the appropriateness of direct practice expense of clinical labor employed by the physician as a cost in the facility setting. The PERC carefully discussed the recommendation by the American Society of Anesthesiologists of 11 minutes and agreed that this was a direct practice expense; however, 8 minutes of clinical labor time was more appropriate. The PERC recommends 8 minutes of clinical labor time for all anesthesia codes consisting of 3 minutes of anesthesia scheduling and 5 minutes of case assignment, scheduling coordination, and completion of forms.*

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

01935 and 01936

3. Is this code(s) typically reported with an E/M service?
Is this code(s) typically reported with the E/M service in the nonfacility?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

No

4. What specialty is the dominant provider in the nonfacility?
What percent of the time does the dominant provider provide the service(s) in the nonfacility?
Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

N/A

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

N/A

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

N/A

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

3 minutes – anesthesia scheduling ***5 minutes – case assignment, scheduling coordination, and completion of forms***

   b. Service period (includes pre, intra and post):

   c. Post-service period:

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

16. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

19. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

N/A

20. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

21. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

N/A

22. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

23. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

3 minutes – anesthesia scheduling
5 minutes – case assignment, scheduling coordination, and completion of forms

   b. Service period (includes pre, intra and post):

   c. Post-service period:

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

N/A

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

15. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute (*please see fifth worksheet in PE spreadsheet workbook*):

N/A

16. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

17. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

N/A

18. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

19. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Closed Treatment of Nasal Bone Fracture – Tab 5

In October 2020, the CPT Editorial Panel deleted code 21310 and revised two codes to add "with manipulation" to their CPT long descriptors and added a parenthetical to report the appropriate Evaluation and Management (E/M) code for closed treatment of nasal bone fracture without manipulation.

Compelling Evidence
The RUC reviewed and agreed that there is compelling evidence to recommend an increase in value for CPT codes 21315 *Closed treatment of nasal bone fracture with manipulation; without stabilization* and 21320 *Closed treatment of nasal bone fracture with manipulation; with stabilization* based on evidence that flawed methodology was used in the previous valuation and there was a change in the dominant specialty performing these services. Specifically, based on the 1991 Federal Register, these codes were assigned work values based on "physician work value[s] established by HCFA. It may have been a refinement of a Harvard value, or a gap fill for a code for which Harvard did not provide a value. These include codes reviewed by carrier medical directors." This may explain why code 21315 currently has a negative IWPUT and demonstrates that a flawed methodology was used in the previous valuation as there is a discrepancy between this information and data provided by the AMA which indicates a Harvard phase 4 study was done for each code, resulting in 19 responses for code 21315 and 103 responses for code 21320. The RUC agreed that compelling evidence is met from a flawed methodology used in the previous valuation. Additionally, for codes 21315 and 21320, there has been a change in specialty from oral maxillofacial surgery to now otolaryngology and plastic surgery. **The RUC agreed that there is compelling evidence that there has been a change in the dominant specialty as well as evidence that flawed methodology was used in the previous valuation of these services.**

Change in Global Period
It is no longer typical to see the patient within 10 days post-procedure. There is little to be gained by examination prior to that given the degree of swelling which can often obscure the final result. For code 21320, the splint can either be removed after 10 days or removed by the patient at home, again not requiring a visit within 10 days post-procedure. The RUC agreed with the global period change from 010-day to 000-day global.

21315 *Closed treatment of nasal bone fracture with manipulation; without stabilization*
The RUC reviewed the survey results from 191 otolaryngologists and plastic surgeons and determined that the survey 25th percentile work RVU of 2.00 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 30 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 15 minutes of intra-service time, and 10 minutes of immediate post-service time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared the survey code to the second top key reference code 31574 *Laryngoscopy, flexible; with injection(s) for augmentation (eg, percutaneous, transoral), unilateral* (work RVU= 2.43, intra-service time of 15 minutes and total time of 55 minutes) and noted that both codes have identical intra-service time and should be valued similarly however, the survey code has 13 more minutes of total time. Many survey respondents (44%) that selected code 31574 rated the survey code more intense/complex than the second top key reference service, further warranting the recommended work value. Additionally, the RUC compared the survey code to code 15040 *Harvest of skin for tissue cultured skin autograft, 100 sq cm or less* (work RVU= 2.00, intra-service time of 15 minutes and total time of 60 minutes) and noted that both codes require the same intra-service time and similar total time justifying the recommended survey 25th percentile work value of 2.00. **The RUC recommends a work RVU of 2.00 for CPT code 21315.**

21320 *Closed treatment of nasal bone fracture with manipulation; with stabilization*
The RUC reviewed the survey results from 219 otolaryngologists and plastic surgeons and determined that the survey 25th percentile work RVU of 2.33 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 30 minutes of pre-service evaluation time, 3 minutes of pre-service positioning time, 10 minutes of pre-service scrub/dress/wait time, 20 minutes of intra-service time, and 12 minutes of immediate post-service time.

The RUC compared the survey code to the top key reference code 43191 *Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed (separate procedure)* (work RVU= 2.49, intra-service time of 20 minutes and total time of 86 minutes) and noted that both codes have identical intra-service time. Although the top key reference code has 11 more minutes of total time, most survey respondents (68%) that selected this top key reference code also rated the survey code more intense/complex than the top key reference service. Additionally, the RUC compared the survey code to code 43204 *Esophagoscopy, flexible, transoral; with injection sclerosis of esophageal varices* (work RVU= 2.33 and intra-service time of 20 minutes) and agreed that both codes require the same intra-service time and amount of physician work. **The RUC recommends a work RVU of 2.33 for CPT code 21320.**

Practice Expense
The Practice Expense Subcommittee removed SG066 *packing, gauze w-petrolatum, 0.5in (6yd uou)* and CA014 *Confirm order, protocol exam* as it was determined that, while the code is done with imaging present, imaging is not being done at that time. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21315 Tracking Number Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **2.00**
Global Period: 000 Current Work RVU: **1.83** RUC Recommended RVU: **2.00**

CPT Descriptor: Closed treatment of nasal bone fracture with manipulation; without stabilization

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male who sustained a closed, displaced nasal fracture undergoes closed reduction of the nasal fracture.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Radiologic examinations are reviewed. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the anesthetic plan and the approximate length of the case. Review and obtain informed consent. Review pre-operative photographs of the external nose prior to the injury. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned. Pledgets soaked with topical decongestant are placed and adequate time is given to allow for decongestant to take place. Pledgets are then removed and injection with local anesthesia with vasoconstrictors is performed. Pledgets soaked with topical decongestant are then placed again. The surgeon scrubs, gowns and preps the patient for the procedure.

Description of Intra-Service Work: The physician carefully places nasal instruments (ie Goldman elevator) into the nose and realigns the fractured nasal bones into correct anatomic position. Comparisons are made between the patients' pre-injury appearance and the reduced nasal fracture. This typically requires multiple manipulations to ensure adequate cosmesis and nasal airflow. The nasal cavity is repacked with cottonoids soaked in topical decongestant to ensure hemostasis. Once hemostasis is achieved, the cottonoids are removed.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders, medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	7%	25%	42%	26%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	23%	65%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	14%	35%	51%
Physical effort required	5%	47%	48%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	22%	76%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	12%	44%	40%	4%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	28%	40%	32%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	16%	64%	20%
Physical effort required	12%	44%	44%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	32%	56%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
In October 2020, the Academy brought forward a Code Change Application requesting revisions to the nasal fracture family of CPT codes (21315 and 21320). The Panel approved these changes and requested that the codes be surveyed following the CPT meeting, based on the fact that they had never been RUC surveyed. These changes will be published in the 2022 edition of the CPT Book.

Change in global for these codes:
In preparation for the RUC survey, our specialties reviewed the global for these codes and determined that there was great variability in the timing of the performance of the post-operative visit. Furthermore, it became clear that the post-operative visit rarely takes place within the first 10 days after surgery. In order to allow for a more accurate reflection of the actual post-operative work, we submitted the request to CMS to modify the prior global of 010, to a 000 global going forward.

Survey Sample and Process:
A survey request was sent to a targeted, random selection of members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated as one or more of the following sub-specialties: General Otolaryngology, or Facial Plastics. Additionally, the American Society of Plastic Surgeons surveyed a random sampling of 1598 members.

Key Reference Code: Respondents for both specialties selected the same key reference codes for 21315, reference code 43191 Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed (separate procedure) and 31574 Laryngoscopy, flexible; with injection(s) for augmentation (eg, percutaneous, transoral), unilateral.

Recommendation (Work and Intra Time):
We are recommending a work RVU of **2.00 and 15 minutes of intra service time**, based on our survey's 25th percentile.

Compelling evidence: We recognize that our requested RVW of 2.00 is above existing value for this code and therefore, requires compelling evidence.

1. Based on the 1991 Federal Register, these codes were assigned RVUs based on "Source 2" information. This is defined as "Physician work value[s] established by HCFA. It may have been a refinement of a Harvard value, or a gap fill for a code for which Harvard did not provide a value. These include codes reviewed by carrier medical directors." This assignment of values based on "Source 2" information means the code was never ***surveyed by Harvard.*** This may explain why CPT 21315 currently has a negative IWPUT. We believe this speaks to compelling evidence and demonstrates a **flawed methodology was used in the previous valuation** as there is a discrepancy between this information and data provided by the AMA staff which indicates a Harvard phase 4 study was done for each code, resulting in 19 responses for 21315 and 103 for 21320. Given that it is unclear whether existing valuation is based on a Harvard survey or Source 2 data, we feel compelling evidence of "flawed methodology used in the previous valuation" is met.

2. Additionally, for both codes, there has been a **change in specialty** from Oral Maxillofacial Surgeons to Otolaryngology and Plastic Surgery. This is supported based on the database information that indicates these codes were valued using input from Oral Maxillofacial Surgeons, not Otolaryngologists or Plastic Surgeons.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3-FAC (Straightforward Patient/Difficult Procedure)
Evaluation Time – We are recommending 30 minutes of evaluation time which is a decrease of 3 minutes from the pre-service package time based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is a decrease of 2 minutes from the median survey time, but consistent with the pre-service package time for this activity.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is a decrease of 5 minutes from the selected pre-service package time, based on our survey median.

This results in a total recommended pre time of 43 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A (General Anesthesia or Complex Regional Block/ Straightforward Procedure)
Recommended time has been reduced to 10 minutes which is a decrease of 20 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 10 minutes, taking the lesser of surveyed time or the pre-service package time.***

Supporting Reference Codes for the Recommended Value

This list was developed using the following search parameters in the RUC database: 000 globals that have been RUC reviewed, with intra time of 15 minutes, and total time between 40 and 60 minutes. Codes were then removed that had not been RUC reviewed more recently than 2005.

CPT Code	Long Desc	Global	IWPUT	Work RVU	Pre Eval Time	Pre Positioning Time	Pre Scrub, Dress, Wait Time	Intra Time	Immediate Post Time	Total Time	Most Recent RUC Review
15275	Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area	000	0.0829	1.83	13	1.0	6.0	15	10	45	2011-04
47537	Removal of biliary drainage catheter, percutaneous, requiring fluoroscopic guidance (eg, with concurrent indwelling biliary stents), including diagnostic cholangiography when performed, imaging guidance (eg, fluoroscopy), and all associated radiological supervision and interpretation	000	0.0731	1.84	18	3.0	6.0	15	10	52	2015-10
62324	Injection(s), including indwelling catheter placement, continuous infusion or intermittent bolus, of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, interlaminar epidural or subarachnoid, cervical or thoracic; without imaging guidance	000	0.089	1.89	10	3.0	5.0	15	10	43	2015-10

Intensity of Work

Review of IWPUT demonstrated that 21315 is similar to both our KRS Codes and MPC codes with a wRVU at the 25th percentile. In fact, respondents indicated this procedure is the same or more intense and complex than both KRS codes, however, the recommendation of the WRVU at the 25th percentile results in a lower IWPUT than both of the selected KRS services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21315

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Sometimes

Specialty Plastic Surgery How often? Sometimes

Specialty Emergency Medicine How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1572
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the 2019 Medicare RUC database utilization.

Specialty Otolaryngology Frequency 880 Percentage 55.97 %

Specialty Plastic Surgery Frequency 251 Percentage 15.96 %

Specialty Emergency Medicine Frequency 251 Percentage 15.96 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 572
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2019 volume for the service per the RUC database.

Specialty Otolaryngology Frequency 320 Percentage 55.94 %

Specialty Plastic Surgery Frequency 92 Percentage 16.08 %

Specialty Emergency Medicine Frequency 92 Percentage 16.08 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 21315

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:21320 Tracking Number Original Specialty Recommended RVU: **2.33**
Presented Recommended RVU: **2.33**
Global Period: 000 Current Work RVU: **1.88** RUC Recommended RVU: **2.33**

CPT Descriptor: Closed treatment of nasal bone fracture with manipulation; with stabilization

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 20-year-old male who sustained a closed, displaced nasal fracture undergoes closed reduction of the nasal fracture.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Radiologic examinations are reviewed. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the anesthetic plan and the approximate length of the case. Review and obtain informed consent. Review pre-operative photographs of the external nose prior to the injury. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned. Pledgets soaked with topical decongestant are placed and adequate time is given to allow for decongestant to take place. Pledgets are then removed and injection with local anesthesia with vasoconstrictors is performed. Pledgets soaked with topical decongestant are then placed again. The surgeon scrubs, gowns and preps the patient for the procedure.

Description of Intra-Service Work: The physician carefully places nasal instruments (ie Goldman elevator) into the nose and realigns the fractured nasal bones into correct anatomic position. Comparisons are made between the patients' pre-injury appearance and the reduced nasal fracture. This typically requires multiple manipulations to ensure adequate cosmesis and nasal airflow. The nasal cavity is repacked with cottonoids soaked in topical decongestant to ensure hemostasis. Once hemostasis is achieved, the cottonoids are removed. The nasal cavity is then packed with gauze in order to provide internal support. The nasal skin is cleaned with an alcohol wipe. Adhesive is applied to the patients' skin and steri-strips are placed to protect the skin. An external splint is shaped to conform to the patients' external nose and placed. This is then further secured to the patients' skin with tape.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders, medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2021

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
43191	000	2.49	**RUC Time**

CPT Descriptor Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed (separate procedure)

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31574	000	2.43	**RUC Time**

CPT Descriptor Laryngoscopy, flexible; with injection(s) for augmentation (eg, percutaneous, transoral), unilateral

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
64479	000	2.29	**RUC Time**	7,531,319

CPT Descriptor 1 Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, single level

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36514	000	1.81	**RUC Time**	3,128,673

CPT Descriptor 2 Therapeutic apheresis; for plasma pheresis

Other Reference CPT Code	Global	Work RVU	Time Source
43204	000	2.33	**RUC Time**

CPT Descriptor Esophagoscopy, flexible, transoral; with injection sclerosis of esophageal varices

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 87 **% of respondents:** 39.7 **%**

Number of respondents who choose 2nd Key Reference Code: 20 **% of respondents:** 9.1 **%**

TIME ESTIMATES (Median)

	CPT Code: 21320	Top Key Reference CPT Code: 43191	2nd Key Reference CPT Code: **31574**

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	4%	28%	44%	24%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	37%	55%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	12%	37%	51%
Physical effort required	6%	41%	53%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	22%	73%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	55%	25%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	5%	60%	35%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	20%	55%	25%
Physical effort required	5%	50%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	35%	60%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:
In October 2020, the Academy brought forward a Code Change Application requesting revisions to the nasal fracture family of CPT codes (21315 and 21320). The Panel approved these changes and requested that the codes be surveyed following the CPT meeting, based on the fact that they had never been RUC surveyed. These changes will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:
A survey request was sent to a targeted, random selection of members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated as one or more of the following sub-specialties: General Otolaryngology, or Facial Plastics. Additionally, the American Society of Plastic Surgeons surveyed a random sampling of 1598 members.

Change in global for these codes:
In preparation for the RUC survey, our specialties reviewed the global for these codes and determined that there was great variability in the timing of the performance of the post-operative visit. Furthermore, it became clear that the post-operative visit rarely takes place within the first 10 days after surgery. In order to allow for a more accurate reflection of the actual post-operative work, we submitted the request to CMS to modify the prior global of 010, to a 000 global going forward.

Key Reference Code: Respondents for both specialties selected the same key reference codes for 21320, reference code 43191 Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed (separate procedure) and 31574 Laryngoscopy, flexible; with injection(s) for augmentation (eg, percutaneous, transoral), unilateral.

Recommendation (Work and Intra Time):
We are recommending a work RVU of **2.33 and 20 minutes of intra service time**, based on our survey's 25th percentile.

Compelling evidence: We recognize that our requested RVW of 2.33 is above existing value for this code and therefore, requires compelling evidence.

1. Based on the 1991 Federal Register, these codes were assigned RVUs based on "Source 2" information. This is defined as "Physician work value[s] established by HCFA. It may have been a refinement of a Harvard value, or a gap fill for a code for which Harvard did not provide a value. These include codes reviewed by carrier medical directors." This assignment of values based on "Source 2" information means the code was never ***surveyed by Harvard.*** This may explain why CPT 21315 currently has a negative IWPUT. We believe this speaks to compelling evidence and demonstrates a **flawed methodology was used in the previous valuation** as there is a discrepancy between this information and data provided by the AMA staff which indicates a Harvard phase 4 study was done for each code, resulting in 19 responses for 21315 and 103 for 21320. Given that it is unclear whether existing valuation is based on a Harvard survey or Source 2 data, we feel compelling evidence of "flawed methodology used in the previous valuation" is met.
2. Additionally, for both codes, there has been a **change in specialty** from Oral Maxillofacial Surgeons to Otolaryngology and Plastic Surgery. This is supported based on the database information that indicates these codes were valued using input from Oral Maxillofacial Surgeons, not Otolaryngologists or Plastic Surgeons.

Time package selection: We have selected pre-time package 3 and post-time package 9A due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia.

Pre-time Package 3-FAC (Straightforward Patient/Difficult Procedure)
Evaluation Time – We are recommending 30 minutes of evaluation time which is a decrease of 3 minutes from the pre-service package time based on our survey median.

Positioning Time – We are recommending 3 minutes of positioning time which is a decrease of 2 minutes from the median survey time, but consistent with the pre-service package time for this activity.

Scrub, Dress, Wait Time – We are recommending 10 minutes of scrub, dress and wait time which is a decrease of 5 minutes from the selected pre-service package time, based on our survey median.

This results in a total recommended pre time of 43 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 9A (General Anesthesia or Complex Regional Block/ Straightforward Procedure)
Recommended time has been reduced to 12 minutes which is a decrease of 18 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 12 minutes, taking the lesser of surveyed time or the pre-service package time.***

Supporting Reference Codes for the Recommended Value

This list was developed using the following search parameters in the RUC database: 000 globals that have been RUC reviewed, with intra time of 20 minutes, and total time between 70 and 80 minutes. All codes that have not been RUC reviewed prior to 2000 were removed.

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	Top_Specialty	2019 Medicare Utilization
36512	Therapeutic apheresis; for red blood cells	000	0.0384	2.00	20	75	2017-01	PATHOLOGY	2896
31240	Nasal/sinus endoscopy, surgical; with concha bullosa resection	000	0.0783	2.61	20	73	2017-01	OTOLARYNGOLOGY	6458
30140	Submucous resection inferior turbinate, partial or complete, any method	000	0.0922	3.00	20	78	2016-10	OTOLARYNGOLOGY	49954
32551	Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open (separate procedure)	000	0.0998	3.04	20	73	2012-04	GENERAL SURGERY	33044
93644	Electrophysiologic evaluation of subcutaneous implantable defibrillator (includes defibrillation threshold evaluation, induction of arrhythmia, evaluation of sensing for arrhythmia termination, and programming or reprogramming of sensing or therapeutic parameters)	000	0.0951	3.04	20	74	2014-04	CARDIAC ELECTROPHYSIOLOGY	56
16035	Escharotomy; initial incision	000	0.131	3.74	20	70	2000-04	GENERAL PRACTICE	381

Intensity of Work

Review of IWPUT demonstrated that 21320 is similar to both our KRS Codes and MPC codes with a wRVU at the 25th percentile. In fact, respondents indicated this procedure is the same or more intense and complex than both KRS codes, however, the recommendation of the WRVU at the 25th percentile results in a lower IWPUT than both of the selected KRS services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 21320

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Commonly

Specialty Plastic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5910
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the 2019 Medicare RUC database utilization.

Specialty Otolaryngology Frequency 4373 Percentage 73.99 %

Specialty Plastic Surgery Frequency 1063 Percentage 17.98 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,970
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2019 volume for the service per the RUC database.

Specialty Otolaryngology Frequency 1458 Percentage 74.01 %

Specialty Plastic Surgery Frequency 355 Percentage 18.02 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Minor procedure

BETOS Sub-classification Level II:
Musculoskeletal

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 21320

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

FACILITY DIRECT PE INPUTS

CPT CODE(S): 21315 21320
SPECIALTY SOCIETY(IES): AAO-HNS, ASPS
PRESENTER(S): R. Peter Manes, MD (AAO-HNS) & Jeffrey Kozlow, MD (ASPS)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
21315	Closed treatment of nasal bone fracture with manipulation; without stabilization	000

CPT Code	Long Descriptor	Global Period
21320	Closed treatment of nasal bone fracture with manipulation; with stabilization	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
21315	A 20-year-old male who sustained a closed, displaced nasal fracture undergoes closed reduction of the nasal fracture.

CPT Code	Vignette
21320	A 23-year-old male who sustained a closed displaced nasal fracture undergoes closed reduction of the nasal fracture with stabilization.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of general otolaryngology, facial plastics, and plastic surgery. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   21315 and 21320

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   We are recommending the standard for "minimal use of staff" for 000 globals for both codes in this family, when performed in the facility setting. This is not above the prior inputs for clinical staff

time, however, it is reflective of necessary staff activities to schedule space, provide education and consent to the patient, complete referral forms, and coordinate referral paperwork. The overall time for clinical staff activities for these codes has been dramatically reduced from prior inputs.

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

We are not recommending an increase in cost for clinical staff time for either code.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

Previously, all clinical activities were rolled into three inputs: Pre: CA008, Intra CA021, Post: CA038. Within our recommendations we have properly itemized the clinical staff activities in accordance with PE subcommittee standards and guidelines.

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Typical staff activities when performed in the facility are: schedule space, provide education and consent to the patient, complete referral forms, and coordinate referral paperwork.

   b. Service period (includes pre, intra and post):

None when performed in the facility – changed to a 000 global

   c. Post-service period:

None when performed in the facility – changed to a 000 global

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

    N/A when done in the facility – 000 global

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

    N/A when done in the facility – 000 global

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

    N/A when done in the facility – 000 global

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

    N/A when done in the facility – 000 global

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

    N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

    N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

FACILITY DIRECT PE INPUTS

CPT CODE(S): 21315 21320
SPECIALTY SOCIETY(IES): AAO-HNS, ASPS
PRESENTER(S): R. Peter Manes, MD (AAO-HNS) & Jeffrey Kozlow, MD (ASPS)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

These codes were previously 010 globals, therefore, they historically had time in the post-operative period for a follow up visit when performed in the facility. We have converted them to 000 globals, therefore, any clinical staff time, supplies or equipment that would have been used in the post-operative visits has been removed. Additionally, as mentioned above, previous PE inputs were all rolled into a single line item within the pre/intra/post period. We have broken those individual activities out, and assigned them the PE Subcommittee approved standard times for each applicable clinical staff activity in the pre-service.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialties formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisors and multiple clinical experts who practice in the areas of general otolaryngology, facial plastics, and plastic surgery. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   21315 and 21320

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the nonfacility?
   (Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

   No

4. What specialty is the dominant provider in the nonfacility?
   What percent of the time does the dominant provider provide the service(s) in the nonfacility?

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Is the dominant provider in the nonfacility different than for the global?
(Please see provided data titled *Medicare Same Day NF EM Billed Together - NF Dom Spec* in the RUC Review Resource Materials)

Otolaryngology 76%,
No, that is the dominant specialty overall.

5. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

We are not requesting any time above PE subcommittee standards for any clinical activities.

6. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

We are not requesting any increased cost for clinical staff time over prior inputs, however, we are asking for increased pre time based on our request for the standard PE subcommittee times for "extensive use of clinical staff" for these 000 global procedures. Additionally, for 21320 only, our intra clinical staff time is increased by one minute over prior times, as a result of our intraservice survey time for the procedure of 20 minutes.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

8. How much time was allocated to clinical activity, *obtain vital signs* (CA010) prior to CMS increasing the clinical activity to 5 minutes for calendar year 2018? The standard for clinical activity, obtains vital signs remains 0, 3 and 5 based on the number of vital signs taken. Please provide a rationale for the clinical staff time that you are requesting for obtain vital signs here:

We are requesting 5 minutes for this activity, based on the staff taking the following vitals: Temperature, heart rate, blood pressure, oxygen saturation, and respiration rate.

9. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Staff complete pre-service referral forms, coordinate pre-procedure services, provide education and consent, and make follow up phone calls and prescriptions.

   b. Service period (includes pre, intra and post):

During the intra period the staff:
Greet the patient, gown them, ensure medical records are available, obtain five vitals listed above, prepare the room and equipment, and conduct a protocol exam, support the physician in the application of sedation/anesthesia, assist the physician throughout the entire procedure, monitor the patient for approximately 15 minutes post procedure, clean the room and equipment, clean the instruments used during the procedure, and check dressings. While checking the dressing they check the gauze dressing underneath the wound, confirm there is no epistaxis. For 21320, they also ensure the splint stays on and there is no bleeding. They then review home care instructions, including: encouraging them to safeguard their nose, try to limit blowing their nose, keep their head elevated, ice regularly, and use Afrin if they experience bleeding.

   c. Post-service period:

After the procedure the staff makes a phone call to the patient to confirm they are doing well and to answer any questions they may have.

10. Please provide granular detail regarding what the clinical staff is doing during the intra-service (of service period) clinical activity, *assist physician or other qualified healthcare professional---directly related to physician work time* or *Perform procedure/service---NOT directly related to physician work time:*

N/A

11. If you have used a percentage of the physician intra-service work time other then 100 or 67 percent for the intra-service (of service period) clinical activity, please indicate the percentage and explain why the alternate percentage is needed and how it was derived.

N/A

12. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

13. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

14. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

15. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

18. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

N/A

19. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

No

20. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

EQ234 ENT SMR cabinet – Default formula chosen
EQ170 Fiberoptic head light – Default formula chosen
EF008 exam chair – Default formula chosen
EQ137 basic instrument pack – Instrument pack formula chosen

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

21. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

22. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

These codes were previously 010 globals, therefore, they historically had time in the post-operative period for a follow up visit when performed in the facility. We have converted them to 000 globals, therefore, any clinical staff time, supplies or equipment that would have been used in the post-operative visits has been removed. Additionally, as mentioned above, previous PE inputs were all rolled into a single line item within the pre/intra/post period. We have broken those individual activities out, and assigned them the PE Subcommittee approved standard times for each applicable clinical staff activity in the pre-service. Other changes include: Replacing several individual supply line items with packs that comprised the majority of those materials. Specifically, removing lines 103, 104, 106-108, and 116; and replacing them with an injection pack (line 125) and a pack for cleaning surgical instruments (line 126).

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

We removed bacitracin from 21320 and reduced the tape to 6 inches from 12, and gauze to 1 for each code since it is a pack of 10. We also removed line 115 gauze with petroleum jelly for code 21320.

We also added in six new supplies: 4% lidocaine which is needed to numb the nose and surrounding area, two packs (described above), Atomizer tips and shield, Mastisol, and Steri Strips. The atomizer tip and shield are used to spray the nasal cavity with topical decongestant and anesthesia. Steri Strips are used on the skin to protect the skin under the splint. Mastisol is used to help secure the sterile strips to the skin.

We also added in one new piece of equipment: The basic instrument pack. The instruments in this pack are nasal speculum, bayonet forceps, and a Goldman elevator. The Goldman elevator is used to realign the fractured nasal bones into correct anatomic positions. The nasal speculum is used to open the nares for visualization and placement if instruments. The bayonet forceps are used to hold and place pledgets used for topical decongestant and anesthesia.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Arthrodesis Decompression – Tab 6

In October 2020, the CPT Editorial Panel approved the revision of four codes describing arthrodesis, addition of two codes to report laminectomy, facetectomy, or foraminotomy during posterior interbody arthrodesis, lumbar to more appropriately identify the decompression that may be separately reported. A coding change application (CCA) was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure. The coding confusion stemmed from language ("other than for decompression") included in the descriptors for CPT codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and 63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to several codes to consistently use the term "interspace" instead of "level" or "segment."

In January 2021, the specialty societies surveyed the two new codes and indicated the existing code changes were editorial. The RUC expressed concern that the base codes were not surveyed with the two new add-on codes. Two of the codes (22630 and 22632) are from 1995 and the other two codes were last RUC reviewed in 2011 (22633 and 22634). The RUC could not accept the specialties' justification for only surveying the new codes. They questioned how, without the base codes being surveyed, do we have assurance the respondents followed instruction to only consider the work of the add-on codes. Moreover, CMS has made it clear that the Agency expects the base codes and add-on codes to be reviewed at the same time. **The RUC recommends that the entire family (CPT codes 22630, 22632, 22633, 22634, 63052 and 63053) be resurveyed for review at the April 2021 RUC meeting and that interim values be established for CPT codes 63052 and 63053.**

63052 ***Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 141 neurosurgeons and orthopaedic surgeons and determined that the survey 25th percentile work RVU of 5.55 appropriately accounts for the physician work involved in this add-on service. The RUC recommends 40 minutes intra-service time.

To justify a work RVU of 5.55, the RUC compared the survey code to the second key reference service code 22552 *Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)* (work RVU = 6.50 and 45 minutes intra-service time) and noted that the reference code has slightly higher intensity as anticipated for a surgical procedure as compared with a lumbar procedure. The RUC also compared the survey code to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13 and 40 minutes intra-service time) and noted that the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

MPC code involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal abdominal aortic aneurysm (AAA). In comparison, exposure and closure for the survey code are performed as part of the primary arthrodesis code and the intra-service time includes bony and soft tissue resection (typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. Therefore, although both codes require the same time, the physician work and intensity of 63052 is greater than 34812.

For additional support, the RUC agreed that CPT code 63052 is appropriately bracketed by comparator codes 33924 *Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)* (work RVU = 5.49 and 30 minutes intra-service time) and 22614 *Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)* (work RVU = 6.43 and 40 minutes intra-service time). CPT code 33924 takes less time but is significantly more intense than 63052, while the time and physician work for CPT code 22614 is like 63052. The RUC concluded that CPT code 63052 should be valued at the 25th percentile work RVU as supported by the survey. **The RUC recommends an interim work RVU of 5.55 for CPT code 63052.**

63053 ***Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 141 neurosurgeons and orthopaedic surgeons and determined that a direct work RVU crosswalk to CPT code 33572 *Coronary endarterectomy, open, any method, of left anterior descending, circumflex, or right coronary artery performed in conjunction with coronary artery bypass graft procedure, each vessel (List separately in addition to primary procedure)* (work RVU = 4.44 and 30 minutes intra-service time) accurately reflects the physician work necessary for this add-on service and falls below the survey 25th percentile. The RUC acknowledged the robust survey results yet questioned the 25th percentile value given the time for CPT code 63053 is three-fourths that of the 63052 code.

The RUC compared the survey code to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU = 4.13 and 40 minutes intra-service time) and noted that the MPC code involves more intra-service time and the physician work and intensity are greater for the survey code.

For additional support, the RUC agreed that CPT code 63053 is appropriately bracketed by comparator codes 32674 *Thoracoscopy, surgical; with mediastinal and regional lymphadenectomy (List separately in addition to code for primary procedure)* (work RVU = 4.12 and 30 minutes intra-service time) and 33924 *Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)* (work RVU = 5.49 and 30 minutes intra-service time). CPT code 32674 is a minimally invasive procedure to identify and remove lymph nodes in conjunction with a single lobe lobectomy. The technical skill and mental effort/judgment for 63053 is greater due to the involvement and protection of spinal cord and neural elements. CPT code 33924 requires the same amount of time but is more intense than 63053.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC concluded that CPT code 63053 should be valued based on a direct crosswalk to CPT code 33572 with 30 minutes intra-service time as supported by both the crosswalk and the survey. **The RUC recommends an interim work RVU of 4.44 for CPT code 63053.**

Practice Expense
No direct practice expense inputs are recommended for CPT codes 63052 and 63053 as they are facility-based add-on services.

RUC Database Flag
The RUC recommends to flag CPT codes 63052 and 63053 as "Do Not Use to Validate for Physician Work" since the values are being assigned on an interim basis.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Arthrodesis **Posterior, Posterolateral or Lateral Transverse Process Technique** *To report instrumentation procedures, see 22840-22855, 22859. (Report in addition to code[s] for the definitive procedure[s].) Do not append modifier 62 to spinal instrumentation codes 22840-22848, 22850, 22852, 22853, 22854, 22859.* *To report bone graft procedures, see 20930-20938. (Report in addition to code[s] for the definitive procedure[s].) Do not append modifier 62 to bone graft codes 20900-20938.* **Corpectomy** identifies removal of a vertebral body during spinal surgery. **Facetectomy** is the excision of the facet joint between two vertebral bodies. There are two facet joints at each vertebral segment (see below) **Foraminotomy** is the excision of bone to widen the intervertebral foramen. The intervertebral foramen is bordered by the superior notch of the adjacent vertebra, the inferior notch of the vertebra, the facet joint and the intervertebral disc. **Hemilaminectomy** is removal of a portion of a vertebral lamina, usually performed for exploration of, access to, or decompression of the intraspinal contents. **Lamina** pertains to the vertebral arch, the flattened posterior portion of the vertebral arch extending between the pedicles and the midline, forming the dorsal wall of the vertebral foramen, and from the midline junction of which the spinous process extends. **Laminectomy** is excision of a vertebral lamina; commonly used to denote removal of the posterior arch. **Laminotomy** is excision of a portion of the vertebral lamina, resulting in enlargement of the intervertebral foramen for the purpose of relieving pressure ~~in~~ on a spinal nerve root.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

A vertebral segment describes the basic constituent part into which the spine may be divided. It represents a single complete vertebral bone with its associated articular processes and laminae. A vertebral interspace is the nonbony compartment between two adjacent vertebral bodies which contains the intervertebral disc, and includes the nucleus pulposus, annulus fibrosus, and two cartilaginous endplates. Decompression performed on the same vertebral segment(s) and/or interspace[s] as posterior lumbar interbody fusion that includes laminectomy, facetectomy, and/or foraminotomy may be separately reported using 63052, 63053. Decompression solely to prepare the interspace for fusion is not separately reported.				
(e)22600	-	Arthrodesis, posterior or posterolateral technique, single ~~level~~ interspace; cervical below C2 segment	090	17.40 (No Change)

		nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)		

Nervous System
Posterior Extradural Laminotomy or Laminectomy for Exploration/Decompression of Neural Elements or Excision of Herniated Intervertebral Discs

Definitions

For purposes of CPT coding . . .

63020 *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc; 1 interspace, cervical*

(For bilateral procedure, report 63020 with modifier 50)

63030 *1 interspace, lumbar*
(For bilateral procedure, report 63030 with modifier 50)

+63035 *each additional interspace, cervical or lumbar (List separately in addition to code for primary procedure)*

(Use 63035 in conjunction with 63020-63030)

(Do not report 63030, 63035 in conjunction with 22630, 22632, 22633, 22634 for laminotomy performed to prepare the interspace for fusion on the same spinal interspace)

(To report decompression performed on the same interspace and vertebral segment[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

(For bilateral procedure, report 63035 twice. Do not report modifier 50 in conjunction with 63035)

(For percutaneous endoscopic approach, see 0274T, 0275T)

63040 *Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disc, reexploration, single interspace; cervical*

63042 *lumbar*
(For bilateral procedure, report 63042 with modifier 50)

+63043 *each additional cervical interspace (List separately in addition to code for primary procedure)*
(Use 63043 in conjunction with 63040)
(For bilateral procedure, report 63043 twice. Do not report modifier 50 in conjunction with 63043)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Ê63044 *each additional lumbar interspace (List separately in addition to code for primary procedure)*

(Use 63044 in conjunction with 63042)

(Do not report 63040, 63042, 63043, 63044, in conjunction with 22630, 22632, 22633, 22634 for laminotomy to prepare the interspace for fusion on the same interspace and vertebral segment[s])

(To report decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

(For bilateral procedure, report 63044 twice. Do not report modifier 50 in conjunction with 63044)

Decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, facetectomy, or foraminotomy may be separately reported using 63052.

Codes 63052, 63053 may only be reported for decompression at the same anatomic site(s) when posterior interbody fusion (eg, 22630) requires decompression beyond preparation of the interspace(s) for fusion.

63045 *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; cervical*

63046 *thoracic*

63047 *lumbar*

✚▲63048 each additional vertebral segment, cervical, thoracic or lumbar (List separately in addition to code for primary procedure

(Use 63048 in conjunction with 63045-63047)

(Do not report 63047, 63048 in conjunction with 22630, 22632, 22633, 22634 for laminectomy performed to prepare the interspace for fusion on the same vertebral segments and/or interspace[s])

(To report decompression performed on the same vertebral segments and/or interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, and/or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

✎●63052	J5	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	ZZZ	5.55 (Interim RUC Recommendation) (Resurvey for April 2021)
+●63053	J6	each additional segment (List separately in addition to code for primary procedure) (Use 63053 in conjunction with 63052) (Use 63052, 63053 in conjunction with 22630, 22632, 22633, 22634)	ZZZ	4.44 (Interim RUC Recommendation) (Resurvey for April 2021)

63050 *Laminoplasty, cervical, with decompression of the spinal cord, 2 or more vertebral segments;*

63051 *with reconstruction of the posterior bony elements (including the application of bridging bone graft and non-segmental fixation devices [eg, wire, suture, mini-plates], when performed)*

Transpedicular or Costovertebral Approach for Posterolateral Extradural Exploration/Decompression

63055 *Transpedicular approach with decompression of spinal cord, equine and/or nerve root(s) (eg, herniated intervertebral disc), single segment; thoracic*

63056 *lumbar (including transfacet, or lateral extraforaminal approach) (eg, far lateral herniated intervertebral disc)*

+63057 *each additional segment, thoracic or lumbar (List separately in addition to code for primary procedure*

(Use 63057 in conjunction with 63055, 63056)

(Do not report 63056, 63057 for a herniated disc, in conjunction with 22630, 22632, 22633, 22634 for decompression-to prepare the interspace on the same interspace[s])

(To report decompression performed on the same interspace[s] as posterior interbody fusion that includes laminectomy, removal of facets, or opening/widening of the foramen for decompression of nerves or spinal components such as spinal cord, cauda equina, or nerve roots, see 63052, 63053)

December 11, 2020

Peter K. Smith, MD
Chair, AMA/Specialty Society RVS Update Committee
AMA Plaza
330 N Wabash Avenue, Suite 39300
Chicago, IL 60611-5885

Dear Dr. Smith,

A coding change application (CCA) was submitted to assist with coding confusion for reporting decompression with posterior/posterolateral fusion procedures. To clarify correct coding, two new add-on codes (63052 and 63053) were established to report decompression when performed in conjunction with posterior interbody arthrodesis. Many editorial changes were also made to guidelines, parenthetical instructions, and the terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined. Editorial code descriptor changes allowed for consistent use of the term "interspace" instead of "level" or "segment."

The LOI from the CPT meeting identified the two new add-on codes and codes 22630-22634 for survey. The American Academy of Orthopaedic Surgeons (AAOS), the American Association of Neurosurgeons (AANS), the Congress of Neurological Surgeons (CNS), the North American Spine Society (NASS), and the International Society for Advancement of Spine Surgery (ISASS) surveyed the new add-on codes 630XX and 630X1 but did not survey 22630-22634. The only change made to the descriptors for these codes was to editorially delete the words “and segment” after "interspace" in code 22633. This editorial change did not change the work of the code.

Codes 22630 and 22632 are legacy CPT codes (pre-1990). The work has not changed since the last time the RUC reviewed these codes. Codes 22633 and 22634 also represent legacy CPT codes that were revised for CPT 2012 to bundle work. The work has not changed since the last time the RUC reviewed these codes. The stakeholder societies do not agree that the expense and time for a survey of established procedures with an editorial "clean-up" of a single term are justified.

Thank you for considering our comments regarding the editorial changes made by the CPT Panel to codes 22630-22634.

Sincerely,

William R. Creevy, MD

Peter K. Smith, MD
Chair, AMA/Specialty Society RVS Update Committee
AMA Plaza
330 N Wabash Avenue, Suite 39300
Chicago, IL 60611-5885

Dear Dr. Smith,

This letter responds to a request from AMA staff on January 11, 2021, asking that we add the current time and visit data to our Tab 6 Survey Summary Spreadsheet for four codes included in the Tab 6 LOI. We disagree that it is appropriate to place anything on our survey summary Excel spreadsheet other than the summary data from the survey we conducted for the new codes 63052 and 63053. We note that CMS recommended creating add-on codes for this work, and CMS never opined that the decompression work was included in 22630-22634.

We did not express an interest in surveying these codes or making a recommendation regarding work because the minor changes for these codes were editorial. We provided a letter to the RUC on December 12, 2020, that indicated the only difference was to delete the words “and segment” after "interspace" in code 22633 and to update terminology for consistency to replace the term "level" with "interspace" in related parentheticals. These were "clean up" changes proposed by the CPT Panel and not by the societies.

We hope that the RUC agrees that the coding changes to 22630-22634 were editorial. In that case, we respectfully suggest this information should be provided to CMS along with Work and PE recommendations for the two new codes. There are many instances in the RUC database where the RUC rationale sent to CMS states the code changes were editorial and did not change the work described by the code.

Thank you for considering our comments.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:63052 Tracking Number J5 Original Specialty Recommended RVU: **5.55**
Presented Recommended RVU: **5.55**
Global Period: ZZZ Current Work RVU: RUC Recommended RVU: **5.55**

CPT Descriptor: Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)
(Use 63053 in conjunction with 63052)
(Use 63052, 63053 in conjunction with 22630, 22632, 22633, 22634)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During (separately reported) posterior lumbar interbody arthrodesis for L4-5 spondylolisthesis with axial mechanical back pain and worsening neurogenic claudication and/or radiculopathy (extremity symptoms), refractory to nonoperative treatment, a 63-year-old female with advanced imaging that demonstrated central canal and bilateral lateral recess and foraminal stenosis at the L4-5 level, requires bilateral laminectomy with extensive decompression of the cauda equina and/or nerve root[s]. This more extensive decompression is beyond the typical dissection needed to complete the interbody arthrodesis approach and intervention. Note: This is an add-on service. Only consider the additional work related to bilateral laminectomy with decompression of the cauda equina and/or nerve root[s].

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: NA

Description of Intra-Service Work: Following bony and soft tissue resection and exposure of the L4-5 disc space for the interbody access and preparation for interbody arthrodesis, attention is turned to the additional bone and nervous system work required for decompression beyond what is required to access the disc space for the interbody arthrodesis. Additional portions of the laminae at the L4 and L5 vertebral segments are removed with a drill or bone biting instruments, and the inferior and superior facets are resected. The neural foraminae are expanded with bone biting instruments. The ligamentum flavum is dissected off the dura and completely removed, decompressing and mobilizing the neural elements. The neural elements are confirmed to be mobilized and decompressed. The additional work is documented in the medical record.

Description of Post-Service Work: NA

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	22%	48%	30%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	30%	70%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	4%	30%	67%
Physical effort required	19%	26%	56%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	19%	81%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	50%	38%	4%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	67%	25%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	8%	54%	38%
Physical effort required	8%	46%	46%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	25%	54%	21%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – 63052, 63053

A coding change application (CCA) was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure (please see supplemental file with an overview of historical reporting). The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and

63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to a number of codes to consistently use the term "interspace" instead of "level" or "segment."

The AANS, CNS, AAOS, NASS, and ISASS conducted a survey of the new add-on codes for reporting decompression when performed concurrently and at the same interspace with posterior interbody arthrodesis. The societies received a robust response from 141 surgeons with experience performing these procedures. Those few surgeons without experience in the past 12 months indicated experience within the past 5 years.

Recommendation – 63052

We recommend a work RVU of 5.55 for code 63052, which is the survey 25th percentile.

Pre-time and Post-time

The society expert panel did not survey for pre- and/or post-time for this add-on code as pre- and post-work would be performed as part of the primary procedure.

Key Reference Code Comparison

KRS1: Code 22840 may be reported with many procedures but is typically performed in conjunction with (separately reported) arthrodesis. The intensity and time for this procedure are driven by the precise nature of repairing deforming spondylopathies or dorsopathies using non-segmental instrumentation. The 27 respondents who chose 22840 as a reference believed 63052 was more intense/complex than 22840. This is possible given the variable nature of 22840 and the respondents' experience.

KRS2: Code 22552 is reported for each additional interspace anterior interbody arthrodesis for spondylopathies, spondylosis, or other cervical disc disorders. Similar to 63052, code 22552 is additional work to a primary fusion procedure; incisions, dissection, exposure, and closure are included in the primary procedure work. These add-on codes both only include intraoperative effort. The intensity/complexity comparison statistics correctly indicate that 22552 requires similar or slightly more mental effort/judgment, technical skill, and psychological stress when compared with 63052.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22840	Posterior non-segmental instrumentation (eg, Harrington rod technique, pedicle fixation across 1 interspace, atlantoaxial transarticular screw fixation, sublaminar wiring at C1, facet screw fixation) (List separately in addition to code for primary procedure)	12.52	0.209	60	0	60	0
63052	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	5.55	0.139	40	0	40	0
22552	Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)	6.50	0.142	50	5	45	0

MPC Code Comparison

There are only 17 MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound, typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, exposure and closure for 63052 are performed as part of the primary arthrodesis code: Exposure of the contralateral vertebral body elements is routinely completed as part of the primary arthrodesis code. Code 63052 intra-service includes bony and soft tissue resection (typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. Therefore, although both codes require the same time, the intensity of 63052 would be greater than 34812.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34812	Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)	4.13	0.103	40	0	40	0
63052	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	5.55	0.139	40	0	40	0

Other Code Comparison

Codes 33924 and 22614 bracket and offer further support of the recommended wRVU of 5.55 for 63052. Code 33924 takes less time, but is significantly more intense than 63052. The time and work for code 22614 is similar to 63052.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
33924	Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)	5.49	0.183	30	0	30	0
63052	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; single vertebral segment (List separately in addition to code for primary procedure)	5.55	0.139	40	0	40	0
22614	Arthrodesis, posterior or posterolateral technique, single level; each additional vertebral segment (List separately in addition to code for primary procedure)	6.43	0.161	40	0	40	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 63052 may be reported in conjunction with 22630 and 22633

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) There has been no reporting mechanism for this work since 2015. Please see supplemental file with an historical reporting overview.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency data is not avaialable

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
11,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. specialty expert panel estimate

Specialty neurosurgery Frequency 5830 Percentage 53.00 %

Specialty orthopaedic surgery Frequency 5170 Percentage 47.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 63066

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	13%	46%	38%	4%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	75%	17%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	8%	33%	58%
Physical effort required	4%	38%	58%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	17%	54%	29%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	6%	44%	44%	6%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	61%	33%	6%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	33%	61%	6%
Physical effort required	28%	67%	6%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	28%	67%	6%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background – 63052, 63053

A coding change application (CCA) was created to assist with coding confusion for reporting additional decompression performed at the same interspace as a lumbar interbody fusion procedure (please see supplemental file with an overview of historical reporting). The coding confusion stemmed from language ("other than for decompression") included in the descriptors for codes 22630-22634. To clarify correct coding, the CCA created two new add-on codes (63052 and

63053) to report decompression when performed in conjunction with posterior interbody arthrodesis at the same interspace, along with definitions, guidelines, and parenthetical instructions. The terms corpectomy, facetectomy, foraminotomy, hemilaminectomy, lamina, laminectomy, and laminotomy were defined and editorial changes were made to a number of codes to consistently use the term "interspace" instead of "level" or "segment."

The AANS, CNS, AAOS, NASS, and ISASS conducted a survey of the new add-on codes for reporting decompression when performed concurrently and at the same interspace with posterior interbody arthrodesis. The societies received a robust response from 141 surgeons with experience performing these procedures. Those few surgeons without experience in the past 12 months indicated experience within the past 5 years.

Recommendation – 63053

We recommend a work RVU of 4.70 for code 63053, which is the survey 25th percentile.

Pre-time and Post-time

The society expert panel did not survey for pre- and/or post-time for this add-on code as pre- and post-work would be performed as part of the primary procedure.

Key Reference Code Comparison

KRS1: Code 22552 is reported for each additional interspace anterior interbody arthrodesis for spondylopathies, spondylosis, or other cervical disc disorders. Similar to 63053, code 22552 is additional work to a primary fusion procedure; incisions, dissection, exposure, and closure are included in the primary procedure work. These add-on codes both only include intraoperative effort. The intensity/complexity comparison statistics correctly indicate that 22552 requires similar mental effort/judgment and psychological stress when compared with 63053. Technical skill and physical effort are greater for 63053.

KRS2: Code 22208 is reported for osteotomies that go through all three columns of the spine via a posterior approach in conjunction with other procedures to address scoliosis and kyphosis. This add-on procedure includes extending the incision of the primary procedure and additional dissection along the spinous process, lamina, and transverse processes before osteotomies are performed, this work which is typically performed bilaterally is tedious and takes a significant amount of time.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
22552	Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure)	6.50	0.142	50	5	45	0
63053	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)	4.70	0.157	30	0	30	0
22208	Osteotomy of spine, posterior or posterolateral approach, 3 columns, 1 vertebral segment (eg, pedicle/vertebral body subtraction); each additional vertebral segment (List separately in addition to code for primary procedure)	9.66	0.078	135	0	120	15

MPC Code Comparison

There are only 17 MPC codes with a ZZZ global assignment which makes finding appropriate MPC codes with similar intensity/complexity difficult. MPC code 34812 (with the highest wRVU) involves open femoral artery exposure by groin incision and closure of the wound typically for separately reported delivery of an endovascular prosthesis for an asymptomatic infrarenal AAA. In comparison, exposure and closure for 63053 is performed as part of the primary arthrodesis code: Exposure of the contralateral vertebral body elements is routinely completed as part of the primary arthrodesis code. Code 63053 intra-service includes bony and soft tissue resection (typically pathologic and not normal in nature) and decompression of neural elements in immediate high-risk proximity of the pathologic anatomy. This would account for a higher intensity for 63053 when compared with 34812.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
34812	Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)	4.13	0.103	40	0	40	0
63053	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)	4.70	0.157	30	0	30	0

Other Code Comparison

Codes 33924 and 32674 bracket and offer further support of the recommended wRVU of 4.70 for 63053. Code 32674 is a minimally invasive procedure to identify and remove lymph nodes in conjunction with a single lobe lobectomy. The technical skill and mental effort/judgment for 63053 is greater due to the involvement and protection of spinal cord and neural elements. Code 33924 requires the same amount of time, but is more intense than 63053.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	PRE	INTRA	POST
32674	Thoracoscopy, surgical; with mediastinal and regional lymphadenectomy (List separately in addition to code for primary procedure)	4.12	0.137	30	0	30	0
63053	Laminectomy, facetectomy, or foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s] [eg, spinal or lateral recess stenosis]), during posterior interbody arthrodesis, lumbar; each additional segment (List separately in addition to code for primary procedure)	4.70	0.157	30	0	30	0
33924	Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure)	5.49	0.183	30	0	30	0

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 63053 is reported in conjunction with 22632 and 22634

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) There has been no reporting mechanism for this work since 2015. Please see supplemental file with an historical reporting overview.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty orthopaedic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency data is not avaialable

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. specialty expert panel estimate

Specialty neurosurgery Frequency 2120 Percentage 53.00 %

Specialty orthopaedic surgery Frequency 1880 Percentage 47.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Explor/Decompr/Excis disc

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 63066

+63052 and +63053: Historical Reporting Overview

Coding History

In the 1990's, the work for arthrodesis and decompression was typically performed jointly by an orthopedic surgeon who would perform the arthrodesis and a neurosurgeon who would perform the decompression. Perhaps the single most important aspect of this coding was that the decompression and arthrodesis was being coded at the same spinal level. The codes were surveyed in that manner, and wRVUs were based on each surgeon's work.

In 1998, an AMA CPT workgroup that convened to discuss reporting correct coding for spine procedures via an anterior approach, also reviewed the lumbar interbody fusion code (22630) and decompression code (63047) and determined that each code may be separately and discretely performed and that there was no overlap in intra-service work. The workgroup also agreed that each code was valued based on the specific work of each code (ie, interbody fusion versus decompression). For CPT 2000, the CPT Panel introduced language into code 22630 which made this point clear: “minimal laminectomy and/or discectomy to prepare the interspace.” The spirit of that language continues to this day in the parenthetical “other than for decompression.” That particular position was reinforced in the January 2001 *CPT Assistant* where a case illustration of a patient requiring a decompression and an interbody fusion was presented and the statement made, “63047-51 should be reported in addition to the code 22630.”

In 2012, in recognition that posterolateral fusions were commonly performed along with interbody fusions, a new bundled code (22633) was established to include the work of interbody fusions (22630) and posterolateral fusions (22612) being bundled together into 22633. It is important to note that the decompression element of the operation (63047) remained a separate entity as intended by the initial valuation of that code and the inclusion of ("other than for decompression") in the code descriptor.

In 2014, confusion, both at education seminars and in print, about correct coding of the additional work of laminectomy persisted, with societies not agreeing on appropriate coding for the additional work of decompression performed concurrently with interbody fusion.

In January 2015, due to misinformed educational materials, CMS took a drastic departure from the application of the CPT codes that had been in place for decades; specifically, the evolution of the codes, the validated surveys for each of the separate codes, and valuation of separate work, by establishing NCCI edits: *"CMS payment policy does not allow separate payment for CPT codes 63042 (laminotomy…; lumbar) or 63047 (laminectomy…; lumbar) with CPT codes 22630 or 22633 (arthrodesis; lumbar) when performed at the same interspace. If the two procedures are performed at different interspaces, the two codes of an edit pair may be reported with modifier 59 appended to CPT code 63042 or 63047."* [Chapter 4 of the NCCI manual]

In September 2015, the stakeholder societies conducted discussions with NCCI (CMS) about the history and valuation of codes 22630-22634. NCCI staff communicated that CMS had no intention to modify its position on these code pairs and instead recommended proposing an add-on code for use with arthrodesis codes that would describe additional decompression when performed.

Overview of CPT Assistant

After the coding changes for CPT 2000, the following CPT Assistant article was published that describes correct reporting of 22630 and 63047 for the same interspace.

January 2001 page 12
Coding Consultation
Musculoskeletal System, Surgery, 22554, 22630, 63001-63048, 63075-63078 (Q&A)

Question: The descriptors of codes 22554 and 22630 describe anterior (22554) or posterior (22630) interbody technique arthrodeses to include laminectomy, and/or diskectomy to prepare the interspace (other than for decompression). In what procedural circumstance would the 63001-63048 code(s) be reported in addition to code 22630? Similarly, in what procedural circumstance would code(s) 63075-63078 be reported in addition to code 22554?

AMA Comment
For both codes 22554 and 22630…

To report code 22554…

To report code 22630, *Arthrodesis, posterior interbody technique, including laminectomy and/or diskectomy to prepare interspace (other than for decompression), single interspace; lumbar*, in addition to code 63047-51, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar*, again additional procedure(s) must have been performed. For example, in spinal procedures performed on patients having lateral lumbar stenosis, the surgeon may need to perform additional work above and beyond that described by the PLIF, including facetectomy(ies) and/or foraminotomy(ies), to adequately decompress the nerve roots. For the purpose of this example, code 63047-51 should be reported in addition to code 22630.

Regarding the issue of laterality…

To further clarify, code 22630 may also require the additional performance of a posterior fusion, which involves bone grafting and placement of posterior instrumentation. These procedures should be additionally reported. If the surgeon uses a threaded bone dowel or prosthetic device in the disk space, then code +22851 should be reported. If any other type of bone graft is performed, the appropriate bone graft code should be reported.

The anterior fusion procedure described by code 22554…

In 2016, AMA CPTA staff drafted a FAQ based on the NCCI edit that was established. The stakeholder societies were not contacted about this FAQ. If we had been contacted, we would have informed AMA staff that we were in the process of discussions with CMS about coding misinformation.

October 2016 page 11
Frequently Asked Questions: Surgery: Nervous System

Question: The procedures described in code 63047 was performed for decompression, which was documented in the operative note. In addition, the procedure described in code 22633 was also performed at the same interspace. How should this be reported?

Answer: Codes 63047 and 22633 cannot be reported for the same interspace. However, it is appropriate to report codes 63047, Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar, and 22633, Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should be appended to indicate that these are two distinct procedures.

The October 2016 FAQ added considerable coding confusion and after much effort by the stakeholder societies, including presentation of the historical information in this document, CPTA published a coding correction.

> **May 2018 page 9**
> **Coding Correction: Reporting Codes 22633 and 63047**
>
> In the Frequently Asked Questions (FAQ) section (page 11) of the October 2016 issue of CPT® Assistant, the Surgery: Nervous System answer incorrectly stated that codes 22633, Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace and segment; lumbar, and 63047, Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; lumbar, may not be reported for the same interspace. On further analysis of this issue, it was demonstrated that this recommendation was inconsistent with previously published CPT® Assistant advice, which is that codes 22633 and 63047 may be reported for the same interspace when additional work is required to complete a decompression at a single spinal level. It is also appropriate to report codes 22633 and 63047, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should then be appended to indicate that these are two distinct procedures.
>
> This correction aligns the coding advice with historical precedent published prior to the incorrect revisions in advice given in the October 2016 FAQ.
>
> The following is the corrected coding advice:
>
> *Surgery: Nervous System*
> Question: The procedure described in code 63047 was performed for decompression, which was documented in the operative note. In addition, the procedure described in code 22633 was also performed at the same interspace. How should this be reported?
>
> Answer: Codes 22633 and 63047 may be reported for the same interspace when additional work is required to complete a decompression at a single spinal level. It is also appropriate to report codes 22633 and 63047, if the two procedures are performed at different interspaces. Modifier 59, Distinct Procedural Service, should then be appended to indicate that these are two distinct procedures.

We appreciate that CPT recognized and corrected an errant FAQ.

Summary

Since the establishment of the CCI edits in 2015, surgeons have not been allowed to report 63047 with 22630-22634 for the same interspace. **This document is meant to explain why the current utilization for decompression at the same interspace is "zero."**

The new add-on codes respond to CMS's direction (via NCCI correspondence) that recommends establishing an add-on code for use with arthrodesis codes that would describe additional decompression when performed.

In addition to creation of the add-on codes, numerous new definitions and two instructional guidelines specify when 63052 and 63053 correctly apply:

> Decompression performed on the same vertebral segment(s) and/or interspace[s] as posterior lumbar interbody fusion that includes laminectomy, facetectomy, and/or foraminotomy may be separately reported using 63052, 63053.
>
> Decompression solely to prepare the interspace for fusion is not separately reported.

Percutaneous Cerebral Embolic Protection – Tab 7

In October 2020, the CPT Editorial Panel created a new add-on code to report transcatheter placement and subsequent removal of cerebral embolic protection device(s) and added instructions to report the new code in the Aortic Valve guidelines.

33370 ***Transcatheter placement and subsequent removal of cerebral embolic protection device(s), including arterial access, catheterization, imaging, and radiological supervision and interpretation, percutaneous (List separately in addition to code for primary procedure)***
The RUC reviewed survey results from 35 interventional cardiologists and agreed that the survey respondents, with a 25th percentile work value of 3.43, overvalued the physician work involved in performing this service. The RUC determined that a direct work RVU crosswalk to CPT code 34713 *Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)* (work RVU= 2.50, intra-service and total time of 20 minutes) would be appropriate, as both add-on services typically involve an identical amount of time and physician work intensity to perform. The RUC recommends 20 minutes of intra-service time.

The specialties noted that this new CPT code represents new technology enabling the capture and removal of debris that can dislodge during TAVR procedures. During the TAVR procedure, dislodged embolic debris may include pieces of arterial wall, valve tissue, calcified and foreign material, and both acute and organizing thrombus. Even small pieces can block blood flow to middle cerebral arteries and more distal tributaries in the brain, potentially leading to peri-procedural (≤ 72 hours) stroke or other neurological impairments, with devastating long-term consequences. Code 33370 includes percutaneous arterial (eg, right radial or femoral) access, placement of a guiding catheter, and delivery of the embolic protection filter(s) prior to the procedure. Placement of additional/multiple filters is not separately reportable. Code 33370 includes removal of the filter(s) and debris, removal of the arterial sheath, and closure of the arteriotomy by pressure and application of an arterial closure device or standard closure of the puncture by suture, as well as all imaging guidance and radiological supervision and interpretation associated with performing the service.

The specialties noted that unlike the underlying TAVR procedure that would be performed by a co-surgeon team (an interventional cardiologist and a cardiac surgeon), the transcatheter placement and subsequent removal of a cerebral embolic protection device would only be performed and reported by one provider, the interventional cardiologist. Therefore, this service would not be reported with the 62 co-surgeon CPT modifier.

The specialties also noted, and the RUC concurred, that this is an intense service to perform. The specialties noted that positioning and deploying the filters and retrieving them under fluoroscopy is very intense work for the interventional cardiologist as, during this time, trauma from the device itself could potentially dislodge debris causing stroke which it was intended to prevent.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Furthermore, the specialties confirmed that placement of additional/multiple filters is not separately reportable.

For additional support for a work value of 2.50, the RUC compared the survey code to MPC code 36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)* (work RVU= 2.09 and intra-service time of 15 minutes) and noted that the survey code involves 5 more minutes of intra-service time and both services involve similar intensity. **The RUC recommends a work RVU of 2.50 for CPT code 33370.**

Affirmation of RUC Recommendations
CPT codes 33361, 33362, 33363, 33364, 33365 and 33366 were surveyed in April 2018 and approved by CMS for the CPT 2020 cycle. Add-on codes 33367, 33368 and 33369 were surveyed in February 2012 and approved by CMS for the CPT 2013 cycle; these three services had their values affirmed by the RUC and CMS for the CPT 2020 cycle. The specialties noted that the new cerebral embolic protection service does not alter the underlying work of the TAVR. The RUC noted that the times, work values and direct PE inputs for these existing services continue to be appropriate. **The RUC affirms the work RVU of 22.47 for CPT code 33361, the work RVU of 24.54 for CPT code 33362, the work RVU of 25.47 for CPT code 33363, the work RVU of 25.97 for CPT code 33364, the work RVU of 26.59 for CPT code 33365, the work RVU of 29.35 for CPT code 33366, the work RVU of 11.88 for CPT code 33367, the work RVU of 14.39 for CPT code 33368 and the work RVU of 19.00 for CPT code 33369.**

Practice Expense
The RUC affirms the direct practice expense inputs for CPT codes 33361-33369. No direct practice expense inputs are recommended for CPT code 33370 as it is a facility-based add-on service.

New Technology/New Service
The RUC recommends that 33370 be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Cardiovascular System** **Heart and Pericardium** **Cardiac Valves** **Aortic Valve**				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes 33361, 33362, 33363, 33364, 33365, 33366 are used to report transcatheter aortic valve replacement (TAVR)/transcatheter aortic valve implantation (TAVI). TAVR/TAVI requires two physician operators and all components of the procedure are reported using modifier 62.

Codes 33361, 33362, 33363, 33364, 33365, 33366 include the work, when performed, of percutaneous access, placing the access sheath, balloon aortic valvuloplasty, advancing the valve delivery system into position, repositioning the valve as needed, deploying the valve, temporary pacemaker insertion for rapid pacing (33210), and closure of the arteriotomy when performed. Codes 33361, 33362, 33363, 33364, 33365, 33366 include open arterial or cardiac approach.

Angiography, radiological supervision, and interpretation performed to guide TAVR/TAVI (eg, guiding valve placement, documenting completion of the intervention, assessing the vascular access site for closure) are included in these codes.

Add-on code 33370 may be reported for cerebral embolic protection in conjunction with TAVR/TAVI codes 33361, 33362, 33363, 33364, 33365, 33366. Code 33370 includes percutaneous arterial (eg, right radial or femoral) access, placement of a guiding catheter, and delivery of the embolic protection filter(s) prior to the procedure. Placement of additional/multiple filters is not separately reportable. Code 33370 includes removal of the filter(s) and debris, removal of the arterial sheath, and closure of the arteriotomy by pressure and application of an arterial closure device or standard closure of the puncture by suture. Extensive repair or replacement of an artery may be additionally reported. Code 33370 includes all imaging guidance and radiological supervision and interpretation associated with performing cerebral embolic protection (eg, 75600, 75710, 76937).

Diagnostic left heart catheterization codes (93452, 93453, 93458-93461) and the supravalvular aortography code (93567) should not be used with TAVR/TAVI services (33361, 33362, 33363, 33364, 33365, 33366) to report.

(f)33361	K1	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach	000	22.47 (Affirmed April 2018 RUC Recommendation)

Presented Recommended RVU: **3.43**
Global Period: ZZZ Current Work RVU: **N/A** RUC Recommended RVU: **2.50**

CPT Descriptor: Transcatheter placement and subsequent removal of cerebral embolic protection device(s), including arterial access, catheterization, imaging, and radiological supervision and interpretation, percutaneous (list separately in addition to code for primary procedure) (Use 33370 in conjunction with 33361, 33362, 33363, 33364, 33365, 33366)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a TAVR/TAVI procedure, a 76-year-old male with prior transient ischemic attack (TIA)/cerebrovascular accident (CVA) and critical aortic valve stenosis also requires the addition of a cerebral embolic protection device to be placed prior to the tavr/tavi and removed after the TAVR/TAVI procedure. Note: This is an add-on service. only consider the additional work related to the cerebral embolic protection device.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Assess stroke risk and baseline neurologic status of patient. Assessment of technical difficulty and risk. Review CTA to evaluate patient specific anatomy of brachiocephalic artery, Aortic Arch and origin and course of Left Common Carotid Artery. Evaluate for plaque and calcium burden of great vessel, another origin. Insertion of radial artery sheath. Insertion of CEP device: naviagate brachial, axillary and brachiocephalic arteries. Position guide wire in the ascending aorta. Deploy proximal filter in Brachiocephalic artery. Flex articulation of distal segment of the device and direct guide wire into the Left Common Carotid artery. Advance and deploy distal filter. Removal of device: Both filters are withdrawn into the device to capture the embolic debris. Withdraw device from vasculature. Removal of radial sheath, place TR band for hemostasis. Ensure adequacy of hand circulation. Evaluate efficacy of device: Flush filters and evaluate captured debris. Neurocognitive assessment. Access site evaluation.

Description of Post-Service Work:

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	17%	33%	50%
Physical effort required	33%	66%	0%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	33%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History Background

In October 2020, the ACC and SCAI presented a code change application to the CPT Editorial Panel on code 33370. A new Category I CPT code was needed to capture the additional physician work associated with delivering and retrieving

cerebral embolic protection used during TAVR. New technology allows for the capture and removal of debris that can dislodge during TAVR procedures. During the TAVR procedure, dislodged embolic debris may include pieces of arterial wall, valve tissue, calcified and foreign material, and both acute and organizing thrombus. Even small pieces can block blood flow to middle cerebral arteries and more distal tributaries in the brain, potentially leading to peri-procedural (≤ 72 hours) stroke or other neurological impairments, with devastating long-term consequences.

Add-on code 33370 may be reported for cerebral embolic protection in conjunction with TAVR/TAVI codes 33361, 33362, 33363, 33364, 33365, 33366. Code 33370 includes percutaneous arterial (eg, right radial or femoral) access, placement of a guiding catheter, and delivery of the embolic protection filter(s) prior to the procedure. Placement of additional/multiple filters is not separately reportable. Code 33370 includes removal of the filter(s) and debris, removal of the arterial sheath, and closure of the arteriotomy by pressure and application of an arterial closure device or standard closure of the puncture by suture. Extensive repair or replacement of an artery may be additionally reported. Code 33370 includes all imaging guidance and radiological supervision and interpretation associated with performing cerebral embolic protection (eg, 75600, 75710, 76937).

The ACC and SCAI randomly surveyed cardiac interventionalists and as designated by membership rolls, on the newly created code. The ZZZ-global day survey was completed by physicians who have experience with the service.

The key reference code is 36228 for selective catheter placement. It was selected by approximately 63% of respondents. 63% of the respondents indicated that 33370 was more complex. The second reference code was 93462 for left heart catheterization. It was selected by approximately 17 % of respondents. About 17% of the respondents indicated that 33370 was more intense/complex overall.

Recommendation

Therefore, for code 33370 the **societies recommend the survey median RVW of 3.43 with 20 minutes intraservice time**. This value is lower than the KRS, but still correctly produces a higher IWPUT based on those respondents intensity/complexity comparison. It is also higher than another percutaneous code that also has 20 minutes intraservice, 34713 for access and closure of femoral artery. 33370 requires establishing a new arterial access via the right radial artery and there is no guide catheter directing the device to the appropriate position, further supporting the value.

Reaffirmation

Finally, TAVR codes 33361-33369 were included in the survey packet for Tab 7. The main TAVR code, 33361, and its other percutaneous siblings 33362-33363 were reviewed by the RUC after great deliberation about the use of extant data at the April 2018 meeting. Bypass TAVR codes 33367-33369 remain miniscule in utilization and were originally reviewed in 2012. The societies recommend reaffirmation of these values. Cerebral embolic protection does not alter the underlying work of the TAVR.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and

accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Sometimes

Specialty Cardiac Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 30000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Double the 2019 Medicare utilization below, which would include MA plans and also some commercial insurance now that TAVR is performed in low-risk patients.

Specialty Cardiology Frequency 28500 Percentage 95.00 %

Specialty Cardiac Surgery Frequency 1500 Percentage 5.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. As retrieved by Medicare SAF file data, in 2018 the cerebral embolic protection procedure was performed in 39 states across the US, in approximately 137 hospitals. In 2019, this procedure was used in 47 states in 256 facilities. This estimate is roughly one third of TAVRs perfomred in 2019, as roughly one third of facilities used the device in 2019.

Specialty Cardiology Frequency 14250 Percentage 95.00 %

Specialty Cardiac Surgery Frequency 750 Percentage 5.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

RE: Tab 8 Percutaneous Cerebral Embolic Protection

Dear Dr. Manaker:

Tab 7 on the January 2021 RUC agenda addresses one new ZZZ code, which describe Percutaneous Cerebral Embolic Protection procedures performed in conjunction with heart valve repair and replacement procedures. As such, we recommend no direct practice expense inputs for Tab 7.

Thank you for your consideration of this information as you prepare for the meeting. Please contact Wayne Powell at wpowell@scai.org or Claudia Vasquez at cvasquez@acc.org if you have any questions.

Sincerely,

/s/

AMA/Specialty Society RVS Update Committee Summary of Recommendations
New Technology/New Services

April 2018

Transcatheter Aortic Valve Replacement (TAVR)

In 2005, the RUC began the process of flagging services that represent new technology or new services as they were presented to the Committee. In October 2016, the Relativity Assessment Workgroup reviewed codes that were flagged October 2011 – April 2012, with 3 years of available Medicare claims data (2013, 2014 and preliminary 2015 data). The Workgroup determined that the technology for these transcatheter aortic valve replacement (TAVR) services is evolving, as 400 cardiology centers now provide these services and have shifted from being provided in academic centers to now private centers. The RUC recommended that CPT codes 33361-33366 be resurveyed for physician work and practice expense. The RUC did not believe there would be a change in physician work or practice expense for the add-on services and recommends that CPT codes 33367, 33368 and 33369 be removed from the new technology list as there is no demonstrated diffusion.

At the October 2017 RUC meeting, the specialty societies requested that this item be tabled and sent to the Research Subcommittee to develop a methodology that can be used to help value this unique set of codes which mandates the participation of two physicians and modifier 62 for the procedure. The specialties outlined their concerns with valuing these codes using the current methodology during the discussion with the pre-facilitation committee and the RUC. These are currently the only codes in the fee schedule where the -62 co-surgeon modifier is required 100 percent of the time. As each co-surgeon receives 62.5% of the work value and also each of them is performing the service and post-operative visit concurrently, the specialties noted this requirement has a direct impact on accurate valuation and interpretation of code components (various types of work per unit time; time spent by each provider) which makes valuing them difficult. Furthermore, the specialties noted that the Research Subcommittee and the RUC had previously approved the TVT registry as an extant data source and it was unclear to them how specifically these data points would be used in conjunction with the RUC survey data.

The RUC agreed to take no action on these codes at the October 2017 meeting and table their review until the April 2018 RUC meeting to provide the specialties and the Research Subcommittee sufficient time to resolve these methodologic issues. During the RUC's other business discussion, the RUC agreed that specialties should provide both median and mean for extant data sources as these summary data would provide the RUC with a more complete picture of central tendency. Providing both median and mean would provide information as to whether the dataset is negatively or positively skewed and to what degree.

Prior to the January 2018 RUC meeting, the specialty societies submitted a letter with a series of questions to be discussed by the Research Subcommittee. At the January 2018 Research Subcommittee meeting, the Subcommittee had a discussion with presenters from the Society of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Thoracic Surgeons (STS), American College of Cardiology (ACC), American Association for Thoracic Surgery (AATS) and the Society for Cardiovascular Angiography and Interventions (SCAI) addressing their questions.

The Research Subcommittee made the Following Recommendations/Decisions at the January 2018 meeting:

- The Research Subcommittee did not approve any modification to the survey instrument or the survey data to simulate the payment adjustment created by the 62 co-surgeon modifier. The Subcommittee did note that that after following the standard RUC survey process the specialty societies may provide additional rationale to support their recommendation.

- The Research Subcommittee recommends the RUC continue to require a RUC survey and presentation of survey data from RUC-approved extant databases. The Subcommittee noted that data from the RUC-approved extant database may be used to support the advisory committees' recommendation.

- The Research Subcommittee recommends the RUC continue requiring both the mean and the median physician times from RUC-approved extant databases. The Subcommittee noted that the specialty societies may provide rationale on why one value is preferable to another on a case-by-case basis. The Subcommittee clarified that it is not within their purview to indicate how the RUC will use these data.

000-day Global Major Surgical Procedures

Although the six TAVR procedures have a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 3 – 6 days (per data from the STS/ACC TVT Registry). As with other major surgical procedures that have a 000-day global (include several ECMO codes (starting at CPT code 33951) and thoracoscopy codes (starting at CPT code 32601)), the multispecialty team care of the patient will vary significantly by patient and institution and the 000-day global allows for appropriate care from multiple specialties without overlap in physician work or payment. All six of the codes in this family typically require a same-day post-procedure critical care visit.

Same Day Post-Procedure Visit for CPT codes 33361-33366

The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-operative care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs, are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Any TAVR performed via a peripheral artery access (CPT codes 33361, 33362, 33363 and 33364) will necessitate a detailed assessment of distal arterial perfusion and vascular integrity of the artery. In addition, the vascular access wounds associated with CPT codes 33361, 33362, 33363 and 33364 will be assessed as part of standard wound care. The median sternotomy wound associated with CPT code 33365 will be evaluated for abnormal drainage, sternal instability, etc. Chest tubes placed prior to closure of the sternotomy wound will be assessed for excessive blood loss and air leaks. Post procedure chest x-ray is reviewed for post-operative pneumothorax. Similarly, the thoracotomy wound associated with CPT code 33366 is assessed for stability of the chest wall, abnormal drainage, etc. Chest tubes placed prior to closure of the thoracotomy wound are assessed for excessive blood loss and air leaks. Post procedure chest x-ray is reviewed for post-operative pneumothorax. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives.

33361 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach***
The RUC reviewed the survey results from 36 co-surgeon teams (one interventional cardiologist and one cardiac surgeon each) completing for their concurrent times. The custom survey instrument, which had been approved by the Research Subcommittee, specifically instructed the survey respondents to "estimate the time and work involved in performing these procedures as a team, not as two individuals working separately." The RUC recommends the following concurrent physician times: pre-service evaluation of 50 minutes, pre-service positioning of 15 minutes, pre-service scrub/dress/wait of 20 minutes, intra-service time of 90 minutes, 30 minutes of immediate post-service time and one 99291 post-operative critical care visit on the day of the procedure. The RUC referenced the median TVT intra-service time was 92 minutes, noting the similarity to the median survey time, although the survey had been completed more recently than date range sourced from the registry. For the immediate post-service time, the specialty societies are applying a reduction of 3 minutes from the standard package time for a total of 30 minutes as supported by the survey. The RUC agreed with the specialty that this was appropriate since this procedure includes a percutaneous approach, which does not require the same post procedure wound management necessary for the other procedures with open approaches.

The RUC reviewed the survey 25th percentile work RVU of 25.00 and agreed that this value somewhat overstates the amount of physician work involved. To determine an appropriate work RVU, the RUC, Research Subcommittee and presenting specialties exhaustively explored several potential methods spanning three RUC meetings (October 2017, January 2018 and April 2018) to come to an appropriate valuation and were unable to find an appropriate direct crosswalk to an individual code (including when the search was expanded to 010-day and 090-day services) due to a very limited number of comparable codes. To arrive at an appropriate valuation, the specialty societies proposed and the RUC agreed to add the time and value of a critical care visit to another 000-day code which describes a major cardiothoracic procedure. The RUC reviewed CPT codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU=17.97, intra-service time of 90 minutes, total time of 208 minutes) and 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50, total time of 70 minutes), which aggregate to form a potential crosswalk value of 22.47 work RVUs and would represent a total time of 278 minutes. The RUC compared the survey code to the 93591/99291 pairing, and agreed that a value of 22.47 would also

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

be appropriate for the survey code. CPT code 93591 is also a 000-day major surgical procedure performed by interventional cardiology using a percutaneous approach and adding one critical care visit would bridge the gap between directly comparing these two services. Therefore, the RUC recommends a direct work RVU crosswalk from CPT code 33361 to the pairing of 93591 and 99291 (22.47 work RVUs). The RUC also reviewed CPT codes 93580 *Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant* (work RVU= 17.97, intra-service time of 120 minutes and total time of 210) and 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50, total time of 70 minutes), which also aggregate to form 22.47 work RVUs and would support a similar valuation for the survey code. When accounting for the application of the -62 co-surgeon modifier, the adjusted IWPUT for an individual physician would be 0.081 which is lower than the IWPUT of the key reference codes selected by the survey respondents. **The RUC recommends a work RVU of 22.47 for CPT code 33361.**

33362 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach***
The RUC reviewed the survey results from 35 co-surgeon teams (one interventional cardiologist and one cardiac surgeon each) completing for their concurrent times. The custom survey instrument, which had been approved by the Research Subcommittee, specifically instructed the survey respondents to "estimate the time and work involved in performing these procedures as a team, not as two individuals working separately." The RUC recommends the following concurrent physician times: pre-service evaluation of 50 minutes, pre-service positioning of 15 minutes, pre-service scrub/dress/wait of 20 minutes, intra-service time of 103 minutes, 45 minutes of immediate post-service time and one 99291 post-operative critical care visit on the day of the procedure. The RUC compared the median survey time of 90 minutes and the median TVT intra-service time was 103 minutes, and agreed that assigning identical intra-service times for CPT codes 33361 and 33362 (of 90 minutes) would create a rank-order anomaly since an open approach entails more time and work relative to a percutaneous approach. Therefore, for this service, the RUC agreed that using the median registry skin-to-skin time of 103 minutes would be more appropriate. The RUC agreed with the specialty that an immediate post-service time of 45 minutes is appropriate since this procedure includes an open approach, which requires additional post procedure wound management necessary relative to CPT code 33361, which involves a percutaneous approach.

The RUC reviewed the survey 25th percentile work RVU of 28.00 and agreed that this value somewhat overstates the amount of physician work involved. To determine an appropriate work RVU, the RUC, Research Subcommittee and presenting specialty societies exhaustively explored several potential methods spanning three RUC meetings (October 2017, January 2018 and April 2018) to come to an appropriate valuation and were unable to find an appropriate direct crosswalk to an individual code (including when the search was expanded to 010-day and 090-day services) due to a very limited number of comparable codes. To arrive at an appropriate valuation, the specialties proposed and the RUC agreed to add the time and value of a critical care visit and an open approach code to another 000-day code which describes a major cardiothoracic procedure. The RUC agreed that the same foundational crosswalk of CPT code 93591 should be used for all six TAVR codes to maintain appropriate relativity. In addition, as the addition of the approach code would only represent the work differential between performing an open approach of the femoral artery versus a percutaneous approach of the femoral artery, the RUC agreed that a 50 percent reduction should be applied to the proxy approach code, even though the 50 percent payment reduction does not apply to add-on codes (e.g. -51 modifier reduction). The RUC reviewed CPT codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU=17.97,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intra-service time of 90 minutes, total time of 208 minutes), one half of open femoral artery approach code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 2.07 (50% of 4.13), intra-service time of 20 minutes (50% of 40)) and 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50, total time of 70 minutes) (17.97 + 2.07 + 4.50 = 24.54), which aggregate to form a potential crosswalk value of 24.54 work RVUs and would represent a total time of 298 minutes. The RUC compared the survey code to the 93591/99291/half of 34812 grouping, and agreed that a value of 24.54 would also be appropriate for the survey code. CPT code 93591 is also a 000-day major surgical procedure performed by interventional cardiology – including 50 percent of the value of the code describing an open approach of the femoral artery and adding one critical care visit would bridge the gap between directly comparing these two services. Therefore, the RUC recommends a direct work RVU crosswalk from CPT code 33361 to the grouping of 93591, one half of 34812 and 99291 (24.54 work RVUs). When accounting for the application of the -62 co-surgeon modifier, the adjusted IWPUT for an individual physician would be 0.080 which is lower than the IWPUT of the key reference codes selected by the survey respondents. **The RUC recommends a work RVU of 24.54 for CPT code 33362.**

33363 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach***
The RUC reviewed the survey results from 31 co-surgeon teams (one interventional cardiologist and one cardiac surgeon each) completing for their concurrent times. The custom survey instrument, which had been approved by the Research Subcommittee, specifically instructed the survey respondents to "estimate the time and work involved in performing these procedures as a team, not as two individuals working separately." The RUC recommends the following concurrent physician times: pre-service evaluation of 50 minutes, pre-service positioning of 15 minutes, pre-service scrub/dress/wait of 20 minutes, intra-service time of 100 minutes, 45 minutes of immediate post-service time and one 99291 post-operative critical care visit on the day of the procedure. The specialty societies noted that this rarely performed service did not have enough utilization in the TVT registry to reach the 95 percent confidence interval necessary for the time data to be considered representative; therefore, the intra-service time for this service was not referenced. The RUC agreed with the specialty that an immediate post-service time of 45 minutes is appropriate since this procedure includes an open approach, which requires additional post procedure wound management necessary relative to CPT code 33361 which involves a percutaneous approach.

The RUC reviewed the survey 25th percentile work RVU of 28.25 and agreed that this value somewhat overstates the amount of physician work involved. To determine an appropriate work RVU, the RUC, Research Subcommittee and presenting specialty societies exhaustively explored several potential methods spanning three RUC meetings (October 2017, January 2018 and April 2018) to come to an appropriate valuation and were unable to find an appropriate direct crosswalk to an individual code (including when the search was expanded to 010-day and 090-day services) due to a very limited number of comparable codes. To arrive at an appropriate valuation, the specialties proposed and the RUC agreed to add the time and value of a critical care visit and an open approach code to another 000-day code which describes a major cardiothoracic procedure. The RUC agreed that the same foundational crosswalk of CPT code 93591 should be used for all six TAVR codes to maintain appropriate relativity. In addition, as the addition of the approach code would only represent the work differential between performing using an open axillary artery approach versus a percutaneous approach of the femoral artery for CPT code 33361, the RUC agreed that a 50 percent

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

reduction should be applied to the proxy approach code, even though the 50 percent payment reduction does not apply to add-on codes (e.g. -51 modifier reduction). The RUC reviewed CPT codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU=17.97, intra-service time of 90 minutes, total time of 208 minutes), one half of open axillary artery approach code 34715 *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 3.00 (50% of 6.00), intra-service time of 30 minutes (50% of 60)) and 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50, total time of 70 minutes), (17.97 + 3.00 + 4.50 = 25.47), which aggregate to form a potential crosswalk value of 25.47 work RVUs and would represent a total time of 308 minutes. The RUC compared the survey code to the 93591/99291/half of 34715 grouping, and agreed that a value of 25.47 would also be appropriate for the survey code. CPT code 93591 is also a 000-day major surgical procedure performed by interventional cardiology – including 50 percent of the value of the code describing an open approach of the axillary artery and adding one critical care visit would bridge the gap between directly comparing these two services. Therefore, the RUC recommends a direct work RVU crosswalk from CPT code 33361 to the grouping of 93591, one half of 34715 and 99291 (25.47 work RVUs). When accounting for the application of the-62 co-surgeon modifier, the adjusted IWPUT for an individual physician would be 0.088 which is lower than the IWPUT of the key reference codes selected by the survey respondents. **The RUC recommends a work RVU of 25.47 for CPT code 33363.**

33364 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach***
The RUC reviewed the survey results from 28 co-surgeon teams (one interventional cardiologist and one cardiac surgeon each) completing for their concurrent times. CPT code 33364 did not reach 30 survey responses and will be re-reviewed in three years by the Relativity Assessment Workgroup. Specialty societies will submit an action plan indicating whether this service should either be resurveyed or referred to the CPT Editorial Panel for subsequent deletion or revision to a Category III code. The custom survey instrument, which had been approved by the Research Subcommittee, specifically instructed the survey respondents to "estimate the time and work involved in performing these procedures as a team, not as two individuals working separately." The RUC recommends the following concurrent physician times: pre-service evaluation of 50 minutes, pre-service positioning of 15 minutes, pre-service scrub/dress/wait of 20 minutes, intra-service time of 94 minutes, 45 minutes of immediate post-service time and one 99291 post-operative critical care visit on the day of the procedure. The specialty noted that this rarely performed service did not have enough utilization in the TVT registry to reach the 95 percent confidence interval necessary for the time data to be considered representative; therefore, the intra-service time for this service was not referenced. The RUC agreed with the specialty societies that an immediate post-service time of 45 minutes is appropriate since this procedure includes an open approach, which requires additional post procedure wound management necessary relative to CPT code 33361 which involves a percutaneous approach.

The RUC reviewed the survey 25th percentile work RVU of 28.75 and agreed that this value somewhat overstates the amount of physician work involved. To determine an appropriate work RVU, the RUC, Research Subcommittee and presenting specialties exhaustively explored several potential methods spanning three RUC meetings (October 2017, January 2018 and April 2018) to come to an appropriate valuation and were unable to find an appropriate direct crosswalk to an individual code (including when the search was expanded to 010-day and 090-day services) due to a very limited number of comparable codes. To arrive at an appropriate valuation, the specialties proposed and the RUC agreed to add the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

time and value of a critical care visit and an open approach code to another 000-day code which describes a major cardiothoracic procedure. The RUC agreed that the same foundational crosswalk to CPT code 93591 should be used for all six TAVR codes to maintain appropriate relativity. In addition, as the addition of the approach code would only represent the work differential between performing using an open iliac artery approach versus a percutaneous approach of the femoral artery for CPT code 33361, the RUC agreed that a 50 percent reduction should be applied to the proxy approach code, even though the 50 percent payment reduction does not apply to add-on codes (e.g. -51 modifier reduction). The RUC reviewed CPT codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU=17.97, intra-service time of 90 minutes, total time of 208 minutes), one half of open iliac artery approach code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 3.50 (50% of 7.00), intra-service time of 30 minutes (50% of 60)) and 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50, total time of 70 minutes) (17.97 + 3.50 + 4.50 = 25.97), which aggregate to form a potential crosswalk value of 25.97 work RVUs and would represent a total time of 308 minutes. The RUC compared the survey code to the 93591/99291/half of 34820 grouping, and agreed that a value of 25.97 would also be appropriate for the survey code. CPT code 93591 is also 000-day major surgical procedure performed by interventional cardiology – including 50 percent of the value of the code describing an open approach of the iliac artery and adding one critical care visit would bridge the gap between directly comparing these two services. Therefore, the RUC recommends a direct work RVU crosswalk from CPT code 33361 to the grouping of 93591, one half of 34820 and 99291 (25.97 work RVUs). When accounting for the application of the -62 co-surgeon modifier, the adjusted IWPUT for an individual physician would be 0.097 which is lower than the IWPUT of the key reference codes selected by the survey respondents. **The RUC recommends a work RVU of 25.97 for CPT code 33364.**

33365 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)***

The RUC reviewed the survey results from 31 co-surgeon teams (one interventional cardiologist and one cardiac surgeon each) completing for their concurrent times. The custom survey instrument, which had been approved by the Research Subcommittee, specifically instructed the survey respondents to "estimate the time and work involved in performing these procedures as a team, not as two individuals working separately." The RUC recommends the following concurrent physician times: pre-service evaluation of 50 minutes, pre-service positioning of 15 minutes, pre-service scrub/dress/wait of 20 minutes, intra-service time of 120 minutes, 45 minutes of immediate post-service time and one 99291 post-operative critical care visit on the day of the procedure. The specialty noted that this rarely performed service did not have enough utilization in the TVT registry to reach the 95 percent confidence interval necessary for the time data to be considered representative; therefore, the intra-service time for this service was not referenced. The RUC agreed with the specialty that an immediate post-service time of 45 minutes is appropriate since this procedure includes an open approach, which requires additional post procedure wound management necessary relative to CPT code 33361 which involves a percutaneous approach.

The RUC reviewed the survey 25th percentile work RVU of 34.00 and agreed that this value somewhat overstates the amount of physician work involved. To determine an appropriate work RVU, the RUC, Research Subcommittee and presenting specialties exhaustively explored several

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

potential methods spanning three RUC meetings (October 2017, January 2018 and April 2018) to come to an appropriate valuation and were unable to find an appropriate direct crosswalk to an individual code (including when the search was expanded to 010-day and 090-day services) due to a very limited number of comparable codes. To arrive at an appropriate valuation for the open approach TAVR services, the specialties proposed and the RUC agreed to add the time and value of a critical care visit and an open approach code to another 000-day code which describes a major cardiothoracic procedure. However, there is no transaortic approach code to use as a proxy for the valuation of CPT code 33365, so the RUC reviewed the existing value differential between CPT codes 33366 and 33365 of 2.76 work RVUs. The RUC deducted this amount from its recommended work RVU for code 33366 to arrive at a work RVU of 26.59 (29.35 minus 2.76). The RUC noted that this value would have appropriate rank order with its other recommended work RVUs. When accounting for the application of the -62 co-surgeon modifier, the adjusted IWPUT for an individual physician would be 0.079 which is lower than the IWPUT of the key reference codes selected by the survey respondents. **The RUC recommends a work RVU of 26.59 for CPT code 33365.**

33366 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)***
The RUC reviewed the survey results from 31 co-surgeon teams (one interventional cardiologist and one cardiac surgeon each) completing for their concurrent times. The custom survey instrument, which had been approved by the Research Subcommittee, specifically instructed the survey respondents to "estimate the time and work involved in performing these procedures as a team, not as two individuals working separately." The RUC recommends the following concurrent physician times: pre-service evaluation of 50 minutes, pre-service positioning of 15 minutes, pre-service scrub/dress/wait of 20 minutes, intra-service time of 120 minutes, 45 minutes of immediate post-service time and one 99291 post-operative critical care visit on the day of the procedure. The specialty noted that this rarely performed service did not have enough utilization in the TVT registry to reach the 95 percent confidence interval necessary for the time data to be considered representative; therefore, the intra-service time for this service was not referenced. The RUC agreed with the specialty that an immediate post-service time of 45 minutes is appropriate since this procedure includes an open approach, which requires additional post procedure wound management necessary relative to 33361 which involves a percutaneous approach.

The RUC reviewed the survey 25th percentile work RVU of 34.50 and agreed that this value somewhat overstates the amount of physician work involved. To determine an appropriate work RVU, the RUC, Research Subcommittee and presenting specialties exhaustively explored several potential methods spanning three RUC meetings (October 2017, January 2018 and April 2018) to come to an appropriate valuation and were unable to find an appropriate direct crosswalk to an individual code (including when the search was expanded to 010-day and 090-day services) due to a very limited number of comparable codes. In order to arrive at an appropriate valuation, the specialties proposed and the RUC agreed to add the time and value of a critical care visit and an open approach code to another 000-day code which describes a major cardiothoracic procedure. The RUC agreed that the same foundational crosswalk to CPT code 93591 should be used for all six TAVR codes to maintain appropriate relativity. The RUC reviewed CPT codes 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU=17.97, intra-service time of 90 minutes, total time of 208 minutes), one half of thoracotomy exposure code 32100 Thoracotomy; with exploration (work RVU= 6.88 (50% of 13.75 as -51 modifier would apply to this service)) and 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50, total time of 70 minutes) (17.97

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

+ 6.88 + 4.50 = 29.35), which aggregate to form a potential crosswalk value of 29.35 work RVUs. The RUC compared the survey code to the 93591/99291/half of 32100 grouping, and agreed that a value of 29.35 would also be appropriate for the survey code. CPT code 93591 is also a 000-day major surgical procedure performed by interventional cardiology – including 50 percent of the value of the code describing a thoracotomy and adding one critical care visit would bridge the gap between directly comparing these two services. Therefore, the RUC recommends a direct work RVU crosswalk from CPT code 33366 to the grouping of CPT code 93591, one half of 34200 and 99291 (29.35 work RVUs). When accounting for the application of the -62 co-surgeon modifier, the adjusted IWPUT for an individual physician would be 0.093 which is lower than the IWPUT of the key reference codes selected by the survey respondents. **The RUC recommends a work RVU of 29.35 for CPT code 33366.**

Practice Expense
The RUC recommends the direct practice expense inputs as approved by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

New Technology
CPT codes 33361, 33362, 33363, 33364, 33365 and 33366 will remain on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

RAW Flag for Service with Less than 30 Survey Responses
CPT code 33364 did not reach 30 survey responses and will be re-reviewed in three years by the Relativity Assessment Workgroup. Specialty societies will submit an action plan indicating whether this service should either be resurveyed or referred to the CPT Editorial Panel for subsequent deletion or revision to a Category III code.

Do Not Use to Validate for Physician Work
The RUC agreed that CPT codes 33361-33366 should continue to be labeled in the RUC database with a flag that they should not be used to validate physician work. These unique services which are required to be performed by co-surgeons were valued using an unconventional methodology which would not be appropriate to compare the relativity for other codes.

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 81-year-old male presents with symptomatic aortic stenosis, hypertension, Class III-IV heart failure with an STS Risk Score of 7.5. The aortic stenosis is characterized as life-limiting with a documented aortic valve area of 0.6 cm2. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who recommends percutaneous transcatheter aortic valve replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 6% , Overnight stay-more than 24 hours 94%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 50%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary angiogram, and transthoracic echocardiogram are reviewed and measurements are confirmed. This includes a review of the primary CT and angiographic images from clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is considered and if appropriate, initiated or continued. Additional pre-procedure functions include writing orders for adequate sedation and patient support and reviewing study arrangements and procedures with the technical, nursing, and other assisting personnel. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed. The procedure is reviewed with the patient and the patient's family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table and attached to cardiac electrodes and an oxygen saturation monitor. Appropriate anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. Pre-procedural echocardiography is performed. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are present. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiographer, and echocardiography technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive. A surgical "time out" is performed during which confirmation of critical information is ensured, such as the patient's identity, the planned procedure, the access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances that might influence the procedure.

Description of Intra-Service Work: After establishing femoral venous access, a temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture. Arterial access (e.g., femoral, radial,

or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guidewire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. The contralateral iliac artery is wired and a catheter placed for angiography to access the vessel in the appropriate area. Femoral access is obtained and a sheath is placed. Two Perclose devices are deployed in a preclose fashion for later vessel closure. A long wire is placed then past the sheath from the contralateral catheter for vessel protection.

Using fluoroscopic guidance, a standard guidewire is advanced to the descending aorta and exchanged for a stiff guidewire with an angiographic catheter. Over the stiff guidewire, the arterial puncture site is progressively enlarged with dilators, and a large-bore vessel introducer sheath is inserted and advanced. The guidewire is removed and antithrombotic therapy is administered to achieve therapeutic anticoagulation levels.

Under fluoroscopic guidance, the native aortic valve is crossed using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the guidewire into the left ventricle. Over a guidewire, this catheter is exchanged for a pigtail and simultaneous aortic and left ventricular pressure is recorded. A stiff guidewire is then placed in the left ventricule. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained and require repositioning. A large balloon catheter is passed over the guidewire and positioned across the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma or perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus. (If performed, TEE is separately reported.) Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing. After confirming satisfactory position and function of the valve (with echocardiography and angiography), as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guidewire, and sheath are removed from the patient. The opening of the access artery is closed, using the previously placed percutaneous sutures. A post closure angiography is performed to ensure adequate hemostasis and distal perfusion. The access site is monitored for adequate hemostasis. A sterile dressing is applied to the entry site.

Description of Post-Service Work: The physicians confirm the patient's hemodynamic status, including systemic arterial pressure, pulmonary artery pressure, and the patient's heart rhythm prior to removing the patient from the operating room and committing the patient to transfer to the intensive care unit. A focused vascular examination of the at-risk extremities is performed to assess for adequate limb perfusion. The patient is also assessed for possible early embolic complications such as stroke requiring a detailed neurologic examination as well as a focused physical examination for possible intra-abdominal catastrophe such as mesenteric ischemia. Postoperative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, and revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the postoperative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory transcathether aortic valve replacement therapy (TAVR) registry by the two procedural physicians.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

This family of codes was identified for review by the RAW New Technology Screen. Utilization has grown appropriately for these services as the technology and procedure diffused.

An Expert Panel with representatives from the American College of Cardiology (ACC), Society of Thoracic Surgeons (STS), American Association for Thoracic Surgery (AATS) and the Society for Cardiac Angiography and Interventions (SCAI) was convened to review the RUC survey results and TVT Registry data and finalize the recommendations.

SUMMARY

RUC SURVEY METHODOLOGY

At the April 2017 RUC meeting, the Research Subcommittee reviewed and the RUC approved use of a modified survey methodology using the current survey instrument with modifications similar to the 2012 TAVR survey allowing for the survey to be completed jointly by the co-operators who provide these services at their institutions. The Surveys were sent to 2,535 physicians (1535 STS members who self-identify as adult cardiac surgeons and 1000 interventional cardiologist). A Research Subcommittee reviewed and approved RSL was used for the survey and has been submitted as an exhibit.

STS/ACC TVT REGISTRY™

The TVT-R collects data on all US patients which have had TAVR resulting in 100% participation in the database. The TVT-R was queried for aggregate data since the Registry's inception (Q3 2013-Q3 2016) as well as for each individual year from Q3 – Q3 for 2014, 2105 and 2016. The data set included 50,991 patients for 3 years (2013 – 2016) and 32,146 patients for 2016 for codes 33361 and 33362. Data extraction included only those records that could be unequivocally and exclusively matched to CPT code 33361 or 33362. Patients were excluded if other procedures were performed simultaneously.

At the April 2017 RUC meeting, the RUC Research Subcommittee reviewed and the RUC approved the STS/ACC TVT Registry™ (TVT-R) as a database that meets the RUC's extant database criteria. The RUC also approved use of the *STS/CTS Alternate Five Year Review Methodology* that was used in the 2005 5-year review using a direct intensity survey which included a Research Subcommittee reviewed and approved RSL. This methodology relies on the intraservice mean time to derive a recommended work RVU through an intensity survey and reverse building block calculation. Per the established criterion, the TVT-R data was evaluated by the TVT-R staff for each individual code to determine if the data met the 95th/5% criterion (95th percentile confidence interval with a +-5% variability). There are two codes in the TVT-R that currently meet the 95th/5% criterion, which are 33361 (percutaneous femoral TAVR) and 33362 (open femoral TAVR).

After developing recommendations for 33361 and 33362 based on this alternate methodology for the October 2017 RUC meeting and raising concerns about the relativity of codes for which the application of cosurgery modifier 62 is required by CPT instruction and CMS Coverage Policy, the societies sought, and the RUC granted, a delay to regroup with the Research Subcommittee. At the January 2018 RUC meeting, societies and the Subcommittee discussed mechanisms for valuing these unique codes and confirmed that both the mean and median database intraservice time would be provided despite that fact that the mean has been identified as the central tendency of this data set, making the median an invalid measurement for this exercise. A key result of this discussion that is helpful to remember is that the RUC standard for extant data no longer allows that data to be used in the reverse building block formula that STS used for prior valuations; extant data can only be an additional data point for recommendations developed by RUC survey. As such, our recommendations are based on RUC survey data.

RATIONALE

DATA PROVIDED

The specialty societies have provided the following data for consideration by the RUC:

- RUC Summary Spreadsheet which contains survey data for each code, the median and mean intraservice times from the TVT-R data for codes 33361 and 33362 that met the 95th/5% criterion, the recommended inputs for each code, a line that shows the impact of modifier 62 (125% work RVU, 200% times), and two lines showing similar information for the RUC's 2012 recommendations that CMS later reduced.
- SORs for each code
- TAVR Databook for 33361 and 33362
- PE Summary Spreadsheet
- PE SOR

JOINT OPERATORS FOR THE PROCEDURES

There are six codes that represent the various approaches and insertion of the transcatheter aortic valve replacement (TAVR) procedures. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon that jointly perform TAVR procedures at their institutions. For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure. This aligns with the CPT language that requires modifier 62 for these codes.

> *Codes 33361, 33362, 33363, 33364, 33365, 33366 are used to report transcatheter aortic valve replacement (TAVR)/transcatheter aortic valve implantation (TAVI). TAVR/TAVI requires two physician operators and all components of the procedure are reported using modifier 62. (CPT 2018, page 210)*

In addition, all TAVR Services must be reported to the TVT-R. Medicare's National Coverage Decision, and the joint statements of the societies mandate the performance of these procedures by two physicians. The relevant section of the NCD is as follows:

The heart team's interventional cardiologist(s) and cardiac surgeon(s) must jointly participate in the intra-operative technical aspects of TAVR.

By CPT instruction and Medicare coverage, modifier 62 **is required** for all six codes (33361 – 33366) and results in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes.

This joint operator paradigm aligns with the heart team approach used for these procedures. Both physicians do, in fact, execute each service aspect completely and independently. Both evaluate the patient independently before the procedure, obtain consent from the patient, are present and participate in the positioning of the patient, are scrubbed, present and actively participate in the procedure for the entire intra-operative period through the immediate post service time, and visit the patient separately, providing critical care services respective to their aspect of the surgical care after the procedure the same day.

COMPELLING EVIDENCE

The societies believe compelling evidence exists that the current values inappropriately value the physician work for this family. The current values—and a few of the preservice times—were assigned by CMS during rulemaking. The work RVUs for each code in the family were lowered by CMS from the 2012 survey median work RVU to the 25th-percentile work RVU. The RUC's 2012 recommendations are included in the summary spreadsheet and labeled "2012 REC."

The joint surveys performed in 2012 were of a targeted list of operators at sites that participated in the pivotal clinical trial of the first approved valve. Since then, additional manufactures have entered the marketplace. Subsequent generations of devices have been approved; smaller iterations of the device represent a change in technology. The technology diffused from dozens of trial sites to roughly 500 sites across the country. By deflating the work RVUs for this new, life-saving therapy in the initial years of TAVR's introduction, CMS pre-empted the ability of societies to identify future savings. The specialties argue that the RUC recommended values from 2012 are the appropriate values to use to compare the current recommendations independent of the CMS decision because the values were based on the same survey process and the same decision-making process for both survey periods.

This presentation is based on random surveys of interventional cardiologists and cardiac surgeons after five years of diffusion. It accurately represents the current state in terms of physician work. For these reasons, we request the RUC agree compelling evidence exists that the current values are inappropriate.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all six TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation, the Expert Panel is recommending an increase of 10 minutes over the package for a total evaluation time of 50 minutes for all codes in the family. This is supported by the survey data for each code. The expert panel feels that work associated with the evaluation for this family of services is the same regardless of the final approach used to accomplish the procedure and recommend that the preservice evaluation time be standardized throughout the family for consistency. We attribute some of the variability in the pre-service times in the survey to the fact that the same individuals did not necessarily respond to all six codes, as well as the survey response near the 30-response minimum. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. Risks of the procedure, including alternatives such as cardiopulmonary bypass, alternative valve replacement technique, or discontinuation of the procedure would be discussed during the consent conversation. In preparation for the procedure, each physician will independently review the patient's laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram and primary CT and angiographic images from prior studies. The physicians determine appropriate antiplatelet and other pharmacologic therapy. The physician's must also coordiante with each other prior to the procedure to determine the final operative stratagey for the procedure. The Expert Panel felt that adding additional evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians as discussed above.

Code	Descriptor	pre-time pkg	pre-eval time Cur	pre-eval time Rec	global
33361	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach	4	45 mins	50 mins	000
33362	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach	4	45 mins	50 mins	000
33363	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach	4	45 mins	50 mins	000
33364	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach	4	45 mins	50 mins	000
33365	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)	4	50 mins	50 mins	000
33366	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)	4	50 mins	50 mins	000

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case for a total of 15 minutes. This is the current positioning time for these codes and the time is also supported by the survey data. The codes represent hybrid procedures each with the possibility of emergency cardiopulmonary bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient must be positioned for all the approaches plus the induction of cardiopulmonary bypass for each of the cardiopulmonary bypass procedures.

Code	Descriptor	pre-time pkg	Posit time Cur	Posit time Rec	global
33361	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach	4	15 mins	15 mins	000
33362	Transcatheter aortic valve replacement	4	15 mins	15 mins	000

	(TAVR/TAVI) with prosthetic valve; open femoral artery approach				
33363	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach	4	15 mins	15 mins	000
33364	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach	4	15 mins	15 mins	000
33365	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)	4	15 mins	15 mins	000
33366	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)	4	15 mins	15 mins	000

SAME DAY IMMEDIATE POST TIME

Post service time package 9B General Anesthesia/Complex Patient was selected for all six codes. For code 33361 the survey supported 30 minutes of immediate post time and for codes 33362, 33364, 33365 and 33366 the survey supported 45 minutes of immediate post time. We also applied the current time of 45 minutes to code 33363 which is consistent with the codes deeper in the family and missed being the median by one response when responses were arrayed to identify the median. For the codes where the survey supported 45 minutes of post-time, which is the current amount of time associated with the codes, the specialties are requesting an increase of 12 minutes over the package time for a total time of 45 minutes, which is the current post time for the procedures. There are numerous examples in the RUC database supporting this time. For code 33361, the specialties are applying a reduction of 3 minutes from the package time for a total of 30 minutes as supported by the survey. The specialties felt that this was appropriate for this procedure since it includes a percutaneous approach, which does not require the same post procedure wound management necessary for the other procedures with open approaches.

Code	**Descriptor**	**Post-time pkg**	**Post time Cur**	**Post time Rec**	**global**
33361	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach	9B	45 mins	30 mins	000

33366	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)	9B	45 mins	45 mins	000

SAME DAY POST PROCEDURE VISIT

Although the six TAVR procedures have a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 3 – 6 days (TVT-R). As with other major surgical procedures that have a 000-day global (e.g. ECMO), the multispecialty team care of the patient will vary significantly by patient and

institution and the 000-day global allows for appropriate care from multiple specialties without overlap in work or reimbursement. The survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery was typical. That is consistent with the current valuation as well. The survey respondents indicated that a same-day critical care hospital visit is typical. The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-op care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Any TAVR performed via a peripheral artery access (33361,33362,33363,33364) will necessitate a detailed assessment of distal arterial perfusion and vascular integrity of the artery. In addition, the vascular access wounds associated with 33361,33362,33363,33364 will be assessed as part of standard wound care. The median sternotomy wound associated with 33365 will be evaluated for abnormal drainage, sternal instability, etc. Chest tubes placed prior to closure of the sternotomy wound will be assessed for excessive blood loss and air leaks. Post procedure chest x-ray is reviewed for post-operative pneumothorax. Similarly, the thoracotomy wound associated with 33366 is assessed for stability of the chest wall, abnormal drainage, etc. Chest tubes placed prior to closure of the thoracotomy wound are assessed for excessive blood loss and air leaks. Post procedure chest x-ray is reviewed for post-operative pneumothorax. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives. The survey supported a single critical care visit and the Expert Panel agreed. Other 000 codes with same-day visits include several ECMO codes (starting at 33951) and thoracoscopy codes (starting at 32601).

Code	Descriptor	Same Day PO Visit	Current code	Rec Code	global
33361	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach	Yes	99291	99291	000
33362	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach	Yes	99291	99291	000

33364	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach	Yes	99291	99291	000
33365	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)	Yes	99291	99291	000
33366	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)	Yes	99291	99291	000

33361

Code 33361 in this family is percutaneous transcatheter placement of a prosthetic aortic valve. The expert panel **recommends the survey 25th-percentile value of 25.00 work RVUs for 33361, with 50 minutes preservice time as discussed above, 90 minutes intraservice time from the survey median, 30 minutes postservice time as discussed above, and one same-day 99291.** This represents a decrease in time and RVU from the RUC's 2012 recommendations. The decrease in time is driven by the ability to more quickly manipulate a smaller, 3rd generation prosthetic valve through the vasculature to the heart; once that step has been completed, the work to correctly position and deploy the valve is unchanged and remains highly intense.

In addition to reliance on a random survey of providers familiar with this diffused technology, the societies suggest two supporting rationales the RUC could use to validate this recommendation. The first is a building block and magnitude estimation exercise. Second, although the RUC has indicated that they won't correct for the payment policy impact of modifier 62, the recommendations do not correlate to the fee schedule without some consideration of the joint survey and the requirement for joint operators for the procedures. As such, the second method begs the RUC's indulgence to consider the payment policy impact of modifier 62.

For the first, a supporting rationale would be similar to the one the RUC used when it first valued this code in 2012. Percutaneous ASD closure code 93580 has a work RVU of 17.97, intraservice time of 120, and total time of 210 with an IWPUT of 0.133. The addition of 4.50 RVUs from the performance of 99291 brings that number to 22.47. The difference between the work RVU recommendation based on the survey 25th-percentile of 25.00 and this building block calculation can be appropriately explained by the increased intensity of TAVR by magnitude estimation.

For the second, consider that the impact of the mandatory 62 modifier is 125% of this recommended RVU and 200% of the recommended times. That calculation is included in the summary spreadsheet and labeled "REC MOD 62 Impact." A code with a work RVU of 31.25, intra time of 180 minutes and total time of 550 minutes begins to look like a 90-day global code. Comparisons could be made between the 62-modifier value and times to transcatheter mitral valve repair code 33418. It has an identical intraservice time, slightly higher total time, slightly higher work RVU of 32.25, and an appropriately higher IWPUT. Similar comparisons could also be made to surgical AVR code 33405 that is longer in all time components, has a higher value, but still comes out with an IWPUT within 10% of 33361.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33361

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty interventional cardiology How often? Sometimes

Specialty cardiothoracic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 45000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. These patients are almost universally Medicare age. With roughly a third of Medicare beneficiaries in MA plans, the 45,000 in this estimate adds 50% to our FFS estimate below.

Specialty interventional cardiology Frequency 22500 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 22500 Percentage 50.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Utilization has grown since the first devices came to market in 2011. 2017 utilization could approach the level of prior peaks of surgical AVR, over 30,000. The specialties estimate utilization split evenly as services must be billed using cosurgery modifier 62.

Specialty interventional cardiology Frequency 15000 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 15000 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33361

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 81-year-old male presents with symptomatic aortic stenosis, hypertension, Class III-IV heart failure and an STS Risk score of 8.0. The aortic stenosis is characterized as life-limiting with a documented aortic valve area of 0.6 cm2. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who recommend percutaneous transcatheter aortic valve replacement. The femoral vessels are unsuitable for percutaneous cannulation. An open femoral approach is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 6% , Overnight stay-more than 24 hours 94%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 54%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary angiogram, and transthoracic echocardiogram are reviewed and measurements are confirmed. This includes a review of the primary CT and angiographic images from prior studies. A physical examination is conducted. A clinical note is generated that summarizes the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is considered and if appropriate, initiated or continued. Additional pre-procedure functions include writing orders for adequate sedation and patient support and reviewing study arrangements and procedures with the technical, nursing, and other assisting personnel. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed. The procedure is reviewed with the patient and the patient's family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational The patient is positioned on the procedural table and attached to cardiac electrodes and an oxygen saturation monitor. Appropriate anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. Pre-procedural echocardiography is performed. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are present. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiographer, and echocardiography technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive. A surgical "time Out" is performed during which confirmation of critical information is ensured, such as the patient's identity, the planned procedure, the access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances that might influence the procedure.

Description of Intra-Service Work: After establishing femoral venous access, a temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture. Arterial access (e.g., femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guidewire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. A skin incision is made in the inguinal region. The subcutaneous tissue is dissected until the common femoral artery is isolated. Care is taken to avoid injury to the femoral nerve and vein that lie in close proximity. The common, superficial, and deep femoral arteries are dissected and captured in vessel loops. The distal external iliac artery is typically included in the dissection. This approach facilitates introduction of the very large diameter sheath required for delivery of the transcatheter aortic valve especially in diseased arteries. It also serves to apply countertraction and temporarily reduce tortuosity of the iliac arteries as the sheath is advanced. The anterior surface of the common femoral or distal-most external iliac artery is accessed. If necessary, an end-side prosthetic graft is sewn in place to facilitate catheter delivery and/or preserve distal leg perfusion. Antithrombotic therapy (weight-based dose of heparin) is begun. Using fluoroscopic guidance, a standard guidewire is advanced to the descending aorta and exchanged for a stiff guidewire with an angiographic catheter. Over the stiff guidewire, a large-bore vessel introducer sheath is inserted and advanced to a level that is inferior to the renal arteries.

Under fluoroscopic guidance, the native aortic valve is crossed using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle, and the guidewire is exchanged for a stiff guidewire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained and require repositioning. A large balloon catheter is passed over the guidewire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus. (If performed, TEE is separately reported.) Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guidewire, and sheath are removed from the patient. The femoral arteriotomy is repaired with sutures. Hemostasis is achieved, the wound is irrigated, and the soft tissue is reapproximated in several layers. Skin closure is performed with staples or sutures. A sterile dressing is applied to the entry site.

Description of Post-Service Work: The physicians confirm the patient's hemodynamic status, including systemic arterial pressure, pulmonary artery pressure, and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to transfer to the intensive care unit. A focused vascular examination of the at-risk extremities is performed to assess for adequate limb perfusion. The patient is also assessed for possible early embolic complications such as stroke requiring a detailed neurologic examination as well as a focused physical examination for possible intra-abdominal catastrophe such as mesenteric ischemia. Postoperative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, and revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post-operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory transcathether aortic valve replacement therapy (TAVR) registry by the two procedural physicians.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 33362 describes the open femoral approach for transcatheter placement of an aortic valve replacement prosthesis. As previously described, surveys were sent to 2,535 physicians (1535 STS members who self-identify as adult cardiac surgeons and 1000 interventional cardiologist). An Expert Panel with representatives from the American College of Cardiology (ACC), Society of Thoracic Surgeons (STS), American Association for Thoracic Surgery (AATS) and the Society

for Cardiac Angiography and Interventions (SCAI) was convened to review the RUC survey results and TVT Registry data and finalize the recommendations.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient.

ADDITIONAL EVALUATION TIME

For the evaluation, the Expert Panel is recommending an increase of 10 minutes over the package for a total evaluation time of 50 minutes for all codes in the family. This is supported by the survey data. Risks of the procedure, including alternatives such as cardiopulmonary bypass, alternative valve replacement technique, or discontinuation of the procedure would be discussed during the consent conversation. In preparation for the procedure, each physician will independently review the patient's laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram and primary CT and angiographic images from prior studies. The physicians determine appropriate antiplatelet and other pharmacologic therapy. The physician's must also coordiante with each other prior to the procedure to determine the final operative stratagey for the procedure. The Expert Panel felt that adding additional evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians as discussed above.

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case for a total of 15 minutes. This is the current positioning time for these codes and the time is also supported by the survey data. The codes represent hybrid procedures each with the possibility of emergency cardiopulmonary bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient must be positioned for all the approaches plus the induction of cardiopulmonary bypass for each of the cardiopulmonary bypass procedures.

SAME DAY IMMEDIATE POST TIME

Post service time package 9B General Anesthesia/Complex Patient was selected for all six codes. The 33362 survey supported 45 minutes of immediate post time. The specialties are recommending an increase of 12 minutes over the package time for a total time of 45 minutes, which is the current post time for the procedure. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

Although 33362 is a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 4 – 6 days (TVT-R). As with other major surgical procedures that have a 000-day global (e.g. ECMO), the multispecialty team care of the patient will vary significantly by patient and institution and the 000-day global allows for appropriate care from multiple specialties without overlap in work or reimbursement. The survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery was typical. That is consistent with the current valuation as well. The survey respondents indicated that a same-day critical care hospital visit is typical. The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-op care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully

evaluated by observation and physical exam, correlating findings with invasive monitoring results. Any TAVR performed via a peripheral artery access necessitates a detailed assessment of distal arterial perfusion and vascular integrity of the artery. In addition, the vascular access wounds will be assessed as part of standard wound care. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives. The survey supported a single critical care visit and the Expert Panel agreed. Other 000 codes with same-day visits include several ECMO codes (starting at 33951) and thoracoscopy codes (starting at 32601).

33362

Code 33362 in this family is open femoral transcatheter placement of a prosthetic aortic valve. The expert panel **recommends the survey 25th-percentile value of 28.00 work RVUs for 33362, with 50 minutes preservice time, 90 minutes intraservice time from the survey median, 45 minutes postservice time, and one same-day 99291.** This represents a decrease in time and RVU from the RUC's 2012 recommendations. We note that the mean database times for this service were 27 minutes longer than survey respondents indicated which would support a higher value than 33361. This increase also does a fair job of incorporating some value for the open femoral access, in comparison to code 34812 for open femoral artery exposure with a work RVU of 4.13 and time of 40 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33362

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty interventional cardiology How often? Sometimes

Specialty cardiothoracic surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4650
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. These patients are almost universally Medicare age. With roughly a third of Medicare beneficiaries in MA plans, the 4650 in this estimate adds 50% to our FFS estimate below.

Specialty interventional cardiology Frequency 2325 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 2325 Percentage 50.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. FFS utilization grew then declined last year. This estimate is similar to 2016 utilization. Specialty estimates split utilization evenly as services must be billed using cosurgery modifier 62.

Specialty interventional cardiology Frequency 1550 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 1550 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33362

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 77-year-old male presents with symptomatic aortic stenosis, hypertension, peripheral artery disease, Class III-IV heart failure and an STS Risk score of 7.6. The aortic stenosis is life-limiting with a documented aortic valve orifice area of 0.6 cm2. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who recommend percutaneous transcatheter aortic valve replacement. Severe aortoiliac occlusive disease precludes both a percutaneous and/or open femoral or iliac arterial approach for prosthesis delivery. A direct, open surgical approach to the axillary artery for TAVR prosthesis delivery is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 61%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary angiogram, and transthoracic echocardiogram are reviewed and measurements are confirmed. This includes a review of the primary CT and angiographic images from prior studies. A physical examination is conducted. A clinical note is generated that summarizes the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is considered and if appropriate, initiated or continued. Additional pre-procedure functions include writing orders for adequate sedation and patient support and reviewing study arrangements and procedures with the technical, nursing, and other assisting personnel. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed. The procedure is reviewed with the patient and the patient's family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table and attached to cardiac electrodes and an oxygen saturation monitor. Appropriate anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. Pre-procedural echocardiography is performed. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are present. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiographer, and echocardiography technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive. A surgical "Time out" is performed during which confirmation of critical information is ensured, such as the patient's identity, the planned procedure, the access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances that might influence the procedure.

Description of Intra-Service Work: After establishing femoral venous access, a temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture. Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guidewire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. A subclavicular incision is made, and the subcutaneous tissue is dissected until the axillary artery is located. Care is taken to avoid injury to the brachial plexus and axillary vein that lie in close proximity. Once the axillary artery is adequately exposed , proximal and distal control, relative to the intended vessel entry point, is secured with vessel loops. Intravenous antithrombotic therapy is begun. Proximal and distal vascular clamps are applied. A longitudinal arteriotomy is made. If necessary, a graft conduit (a large diameter tubular segment of synthetic bypass graft) is brought into the field, tailored to appropriate size, and an end-to-side anastomosis of conduit to the axillary artery is performed with a running polypropylene suture. The conduit is clamped and vascular clamps are removed. The suture line is checked for hemostasis and additional sutures are applied as required. A guidewire is advanced into the conduit and then, subsequently, into the ascending aorta. A small sheath is placed over the guidewire.

Under fluoroscopic guidance, the native aortic valve is crossed using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle, and the wire is exchanged for a stiff guidewire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained and require repositioning. At that time, the small sheath in the axillary artery is removed over the wire and the axillary artery is serially dilated to accommodate the large-bore sheath. This is done over the stiff guidewire positioned in the left ventricule, under continuous fluoroscopic imaging to avoid wire movement. The large-bore sheath is advanced into the ascending aorta under fluoroscopic guidance. A large balloon catheter is passed over the guidewire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus. (If performed, TEE is separately reported.) Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guidewire, and sheath are removed from the patient. The axillary artery is then repaired with sutures. Hemostasis is achieved and protamine is given for reversal. The wound is irrigated and closed in layers. A sterile dressing is applied to the entry site.

Description of Post-Service Work: The physicians confirm the patient's hemodynamic status, including systemic arterial pressure, pulmonary artery pressure, and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to transfer to the intensive care unit. A focused vascular examination of the at-risk extremities is performed to assess for adequate limb perfusion. The patient is also assessed for possible early embolic complications such as stroke requiring a detailed neurologic examination as well as a focused physical examination for possible intra-abdominal catastrophe such as mesenteric ischemia. Postoperative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, and revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the postoperative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory transcathether aortic valve replacement therapy (TAVR) registry by the two procedural physicians.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 33363 describes the open axillary approach for transcatheter placement of an aortic valve replacement prosthesis. As previously described, surveys were sent to 2,535 physicians (1535 STS members who self-identify as adult cardiac surgeons and 1000 interventional cardiologist). An Expert Panel with representatives from the American College of Cardiology (ACC), Society of Thoracic Surgeons (STS), American Association for Thoracic Surgery (AATS) and the Society

for Cardiac Angiography and Interventions (SCAI) was convened to review the RUC survey results and TVT Registry data and finalize the recommendations.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient.

ADDITIONAL EVALUATION TIME

For the evaluation, the Expert Panel is recommending an increase of 10 minutes over the package for a total evaluation time of 50 minutes for all codes in the family. This is supported by the survey data. Risks of the procedure, including alternatives such as cardiopulmonary bypass, alternative valve replacement technique, or discontinuation of the procedure would be discussed during the consent conversation. In preparation for the procedure, each physician will independently review the patient's laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram and primary CT and angiographic images from prior studies. The physicians determine appropriate antiplatelet and other pharmacologic therapy. The physician's must also coordiante with each other prior to the procedure to determine the final operative stratagey for the procedure. The Expert Panel felt that adding additional evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians as discussed above.

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case for a total of 15 minutes. This is the current positioning time for these codes and the time is also supported by the survey data. The codes represent hybrid procedures each with the possibility of emergency cardiopulmonary bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient must be positioned for all the approaches plus the induction of cardiopulmonary bypass for each of the cardiopulmonary bypass procedures.

SAME DAY IMMEDIATE POST TIME

Post service time package 9B General Anesthesia/Complex Patient was selected for all six codes. The 33363 survey median post time was 30 minutes. However, one response from the median the immediate post-service time was 45 minutes. This 45 minutes would be more consistent with the other open codes in the family. The specialties are recommending an increase of 12 minutes over the package time for a total time of 45 minutes, which is the current post time for the procedure. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

Although 33363 is a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 4 – 6 days (TVT-R). As with other major surgical procedures that have a 000-day global (e.g. ECMO), the multispecialty team care of the patient will vary significantly by patient and institution and the 000-day global allows for appropriate care from multiple specialties without overlap in work or reimbursement. The survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery was typical. That is consistent with the current valuation as well. The survey respondents indicated that a same-day critical care hospital visit is typical. The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-op care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and

minimize adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully evaluated by observation and physical exam, correlating findings with invasive monitoring results. Any TAVR performed via a peripheral artery access necessitates a detailed assessment of distal arterial perfusion and vascular integrity of the artery. In addition, the vascular access wounds will be assessed as part of standard wound care. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives. The survey supported a single critical care visit and the Expert Panel agreed. Other 000 codes with same-day visits include several ECMO codes (starting at 33951) and thoracoscopy codes (starting at 32601).

33363

Code 33363 in this family is open axillary transcatheter placement of a prosthetic aortic valve. The expert panel **recommends the survey 25th-percentile value of 28.25 work RVUs for 33363, with 50 minutes preservice time, 100 minutes intraservice time from the survey median, 45 minutes postservice time, and one same-day 99291.** This small increase in rank order represents a decrease in time and RVU from the RUC's 2012 recommendations. It also builds a correct rank order from the prior code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33363

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty interventional cardiology How often? Rarely

Specialty cardiothoracic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1350

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. These patients are almost universally Medicare age. With roughly a third of Medicare beneficiaries in MA plans, the 1350 in this estimate adds 50% to our FFS estimate below.

Specialty interventional cardiology Frequency 675 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 675 Percentage 50.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 900
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. FFS utilization has grown but remained in the hundreds since the first devices came to market in 2011. This estimate assumes similar growth from 2016 to 2017 as from 2015 to 2016.

Specialty interventional cardiology Frequency 450 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 450 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33363

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 82-year-old female presents with symptomatic aortic stenosis, hypertension, peripheral artery disease, Class III-IV heart failure and an STS Risk score of 7.6. The aortic stenosis is life-limiting with a documented aortic valve orifice area of 0.6 cm2. She is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who recommend percutaneous transcatheter aortic valve replacement. Severe peripheral vascular disease of bilateral femoral arteries precludes percutaneous or open surgical approach to either artery. An open surgical approach to the patient's iliac artery for device delivery is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 68%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary angiogram, and transthoracic echocardiogram are reviewed and measurements are confirmed. This includes a review of the primary CT and angiographic images from prior studies. A physical examination is conducted. A clinical note is generated that summarizes the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is considered and if appropriate, initiated or continued. Additional preprocedure functions include writing orders for adequate sedation and patient support and reviewing study arrangements and procedures with the technical, nursing, and other assisting personnel. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed. The procedure is reviewed with the patient and the patient's family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table and attached to cardiac electrodes and an oxygen saturation monitor. Appropriate anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. Pre-procedural echocardiography is performed. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are present. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiographer, and echocardiography technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive. A surgical "time Out" is performed during which confirmation of critical information is ensured, such as the patient's identity, the planned procedure, the access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances that might influence the procedure.

Description of Intra-Service Work: After establishing femoral venous access, a temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture. Arterial access (e.g., femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guidewire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

A transverse suprainguinal skin incision is made and a retroperitoneal dissection plane is developed. The dissection is continued deep into the pelvis until the iliac artery is located. Care is taken to avoid injury to the nerves, veins, and ureter that lie in close proximity. The common, internal, and external iliac arteries are dissected and isolated with vessel loops. Intravenous antithrombotic therapy is administered. A longitudinal arteriotomy is made. A graft conduit (a large diameter tubular segment of synthetic bypass graft) is brought onto the field, tailored to appropriate size, and an end-to-side anastomosis of conduit to common iliac artery is performed with a running polypropylene suture . The conduit is clamped and vascular clamps are removed. The suture line is checked for hemostasis and additional sutures are applied as required. Using fluoroscopic guidance, a standard guidewire is advanced to the descending aorta and exchanged for a stiff guidewire with an angiographic catheter. Over the stiff guidewire, a large-bore vessel introducer sheath is inserted and advanced to a level that is inferior to the renal arteries.

Under fluoroscopic guidance, the native aortic valve is crossed using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle, and the wire is exchanged for a stiff guidewire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained and require repositioning. A large balloon catheter is passed over the guidewire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus. (If performed, TEE is separately reported.) Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guidewire, and sheath are removed from the patient. The iliac arterial graft site is then clamped with a partial occlusion clamp to isolate the graft, which is excised, leaving a 5- to 6-mm cuff. The graft stump is de-aired and oversewn in two layers with a running polypropylene suture, and the clamp removed. Hemostasis is achieved and protamine is given for reversal. The wound is irrigated and closed in layers. A sterile dressing is applied to the entry site.

Description of Post-Service Work: The physicians confirm the patient's hemodynamic status, including systemic arterial pressure, pulmonary artery pressure, and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to transfer to the intensive care unit. A focused vascular examination of the at-risk extremities is performed to assess for adequate limb perfusion. The patient is also assessed for possible early embolic complications such as stroke requiring a detailed neurologic examination as well as a focused physical examination for possible intra-abdominal catastrophe such as mesenteric ischemia. Postoperative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, and revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the postoperative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory transcathether aortic valve replacement therapy (TAVR) registry by the two procedural physicians.

SURVEY DATA

Technical skill required	0%	43%	57%
Physical effort required	14%	29%	57%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	43%	57%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 33364 describes the open iliac approach for transcatheter placement of an aortic valve replacement prosthesis. As previously described, surveys were sent to 2,535 physicians (1535 STS members who self-identify as adult cardiac surgeons and 1000 interventional cardiologist). An Expert Panel with representatives from the American College of Cardiology (ACC), Society of Thoracic Surgeons (STS), American Association for Thoracic Surgery (AATS) and the Society

for Cardiac Angiography and Interventions (SCAI) was convened to review the RUC survey results and TVT Registry data and finalize the recommendations.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient.

ADDITIONAL EVALUATION TIME

For the evaluation, the Expert Panel is recommending an increase of 10 minutes over the package for a total evaluation time of 50 minutes for all codes in the family. This is supported by the survey data. Risks of the procedure, including alternatives such as cardiopulmonary bypass, alternative valve replacement technique, or discontinuation of the procedure would be discussed during the consent conversation. In preparation for the procedure, each physician will independently review the patient's laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram and primary CT and angiographic images from prior studies. The physicians determine appropriate antiplatelet and other pharmacologic therapy. The physician's must also coordiante with each other prior to the procedure to determine the final operative stratagey for the procedure. The Expert Panel felt that adding additional evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians as discussed above.

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case for a total of 15 minutes. This is the current positioning time for these codes and the time is also supported by the survey data. The codes represent hybrid procedures each with the possibility of emergency cardiopulmonary bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient must be positioned for all the approaches plus the induction of cardiopulmonary bypass for each of the cardiopulmonary bypass procedures.

SAME DAY IMMEDIATE POST TIME

Post service time package 9B General Anesthesia/Complex Patient was selected for all six codes. The 33364 survey supported 45 minutes of immediate post time. The specialties are recommending an increase of 12 minutes over the package time for a total time of 45 minutes, which is the current post time for the procedure. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

Although 33364 is a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 4 – 6 days (TVT-R). As with other major surgical procedures that have a 000-day global (e.g. ECMO), the multispecialty team care of the patient will vary significantly by patient and institution and the 000-day global allows for appropriate care from multiple specialties without overlap in work or reimbursement. The survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery was typical. That is consistent with the current valuation as well. The survey respondents indicated that a same-day critical care hospital visit is typical. The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-op care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully

evaluated by observation and physical exam, correlating findings with invasive monitoring results. Any TAVR performed via a peripheral artery access necessitates a detailed assessment of distal arterial perfusion and vascular integrity of the artery. In addition, the vascular access wounds will be assessed as part of standard wound care. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives. The survey supported a single critical care visit and the Expert Panel agreed. Other 000 codes with same-day visits include several ECMO codes (starting at 33951) and thoracoscopy codes (starting at 32601).

33364

Code 33364 in this family is open iliac transcatheter placement of a prosthetic aortic valve. The expert panel **recommends the survey 25th-percentile value of 28.75 work RVUs for 33364, with 50 minutes preservice time, 94 minutes intraservice time from the survey median, 45 minutes postservice time, and one same-day 99291.** This represents a decrease in time and RVU from the RUC's 2012 recommendations. Despite the small drop in time from the prior code, this code was correctly assessed by respondents to be more intense and have a slightly higher value than 33363. In part that would be due to the rarity of this service—only 33 were performed in 2016 PFS data.

Finally, with this code, we recommend the RUC waive its normal requirement for 30 survey responses. Repeated attempts to encourage survey completion did not produce that number of responses. The response pool only barely had an experience of 1 with this service. We do not predict resurvey would be any more likely to attain 30 responses or to produce a meaningfully different result for this low volume service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33364

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty interventional cardiology How often? Rarely

Specialty cardiothoracic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 48
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. These patients are almost universally Medicare age. WIth roughly a third of Medicare beneficiaries in MA plans, the 48 in this estimate adds 50% to our FFS estimate below.

Specialty interventional cardiology Frequency 24 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 24 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 32 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. FFS utilization started small and has declined since the first devices came to market in 2011. This estimate is similar to 2016 utilization. Specialty estimates split utilization evenly as services must be billed using cosurgery modifier 62.

Specialty interventional cardiology Frequency 15000 Percentage 46,875.00 %

Specialty cardiothoracic surgery Frequency 15000 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33364

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 82-year-old female presents with symptomatic aortic stenosis, hypertension, peripheral artery disease, Class III-IV heart failure and an STS Risk score of 7.6. The aortic stenosis is life-limiting with a documented aortic valve orifice area of 0.6 cm2. She is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who recommend percutaneous transcatheter aortic valve replacement. However, because of severe peripheral vascular disease, including severe aortoiliac, femoral and axillary artery disease, percutaneous or direct approach to these vessels for device delivery is impossible. Significant pulmonary disease precludes the apical left ventricular approach via left thoracotomy is. A direct aortic approach via either median sternotomy or mediastinotomy is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 65%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary angiogram, and transthoracic echocardiogram, are reviewed and measurements are confirmed. This includes a review of the primary CT and angiographic images from prior studies. A physical examination is conducted. A clinical note is generated that summarizes the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is considered and if appropriate, initiated or continued.. Additional pre-procedure functions include writing orders for adequate sedation and patient support and reviewing study arrangements and procedures with the technical, nursing, and other assisting personnel. Appropriate communication is conducted with the patient and the patient's family as well as with other medical professionals as needed. The procedure is reviewed with the patient and the patient's family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table and attached to cardiac electrodes and an oxygen saturation monitor. Appropriate anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. Pre-procedural echocardiography is performed. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are present. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiographer, and echocardiography technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive. A surgical "Time Out" is performed during which confirmation of critical information is ensured, such as the patient's identity, the planned procedure, the access route,

allergies, signed consent, availability of proper equipment, and any unusual circumstances that might influence the procedure.

Description of Intra-Service Work: After establishing femoral venous access, a temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture. Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guidewire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

A full or partial median sternotomy incision is performed. Dissection of the thymic fat pad reveals the pericardium, which is opened vertically. Sutures are used to retract and expose the ascending aorta. Alternatively, an anterior mediastinotomy is performed to provide access to the ascending aorta. Antithromotic therapy is begun. Epiaortic ultrasonic scanning is performed to identify a disease-free site for sheath delivery. A pledgeted double pursestring suture is placed in the mid ascending aorta, and the adventia is locally dissected within the pursestring. The aorta is opened with a knife, the large-bore vascular sheath is introduced, and the pursestring suture is tightened to achieve hemostasis.

Under fluoroscopic guidance, the native aortic valve is crossed using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle, and the wire is exchanged for a stiff guidewire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained and require repositioning. A large balloon catheter is passed over the guidewire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus. (If performed, TEE is separately reported.) Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter and guidewire are removed from the patient. The sheath is removed from the ascending aorta and the aortic double pursestring suture is tied. Additional sutures may be required for hemostasis. The pericardium is closed over a single drain. Protamine is given for reversal. Appropriate mediastinal chest tubes are placed and brought out through the skin, inferior to the incision. After achieving satisfactory hemostasis, the sternum is reapproximated with stainless steel wires. The wound is irrigated and closed in layers. A sterile dressing is applied.

Description of Post-Service Work: The physicians confirm the patient's hemodynamic status, including systemic arterial pressure, pulmonary artery pressure, and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to transfer to the intensive care unit. The patient is assessed for possible early embolic complications such as stroke requiring a detailed neurologic examination as well as a focused physical examination for possible limb ischemia or intra-abdominal catastrophe such as mesenteric ischemia. The stability of the sternal closure is assessed and the patency of the chest tubes is ensured. Postoperative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, and revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post-operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory transcathether aortic valve replacement therapy (TAVR) registry by the two procedural physicians.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	18%	36%	9%	36%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	36%	55%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	18%	36%	46%
Physical effort required	0%	55%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	45%	55%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	17%	50%	33%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	100%	0%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	33%	50%
Physical effort required	17%	50%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	33%	67%	0%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 33365 describes the transaortic approach through a sternotomy for transcatheter placement of an aortic valve replacement prosthesis. As previously described, surveys were sent to 2,535 physicians (1535 STS members who self-identify as adult cardiac surgeons and 1000 interventional cardiologist). An Expert Panel with representatives from the American College of Cardiology (ACC), Society of Thoracic Surgeons (STS), American Association for Thoracic Surgery

(AATS) and the Society for Cardiac Angiography and Interventions (SCAI) was convened to review the RUC survey results and TVT Registry data and finalize the recommendations.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel recommends increases in time for the evaluation of the patient and for the positioning of the patient.

ADDITIONAL EVALUATION TIME

For the evaluation, the Expert Panel recommends an increase of 10 minutes over the package for a total evaluation time of 50 minutes for all codes in the family. This is supported by the survey data. Risks of the procedure, including alternatives such as cardiopulmonary bypass, alternative valve replacement technique, or discontinuation of the procedure would be discussed during the consent conversation. In preparation for the procedure, each physician will independently review the patient's laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram and primary CT and angiographic images from prior studies. The physicians determine appropriate antiplatelet and other pharmacologic therapy. The physician's must also coordiante with each other prior to the procedure to determine the final operative stratagey for the procedure. The Expert Panel felt that adding additional evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians as discussed above.

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case for a total of 15 minutes. This is the current positioning time for these codes and the time is also supported by the survey data. The codes represent hybrid procedures each with the possibility of emergency cardiopulmonary bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient must be positioned for all the approaches plus the induction of cardiopulmonary bypass for each of the cardiopulmonary bypass procedures.

SAME DAY IMMEDIATE POST TIME

Post service time package 9B General Anesthesia/Complex Patient was selected for all six codes. The 33365 survey supported 45 minutes of immediate post time. The specialties are recommending an increase of 12 minutes over the package time for a total time of 45 minutes, which is the current post time for the procedure. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

Although 33365 is a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 4 – 6 days (TVT-R). As with other major surgical procedures that have a 000-day global (e.g. ECMO), the multispecialty team care of the patient will vary significantly by patient and institution and the 000-day global allows for appropriate care from multiple specialties without overlap in work or reimbursement. The survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery was typical. That is consistent with the current valuation as well. The survey respondents indicated that a same-day critical care hospital visit is typical. The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-op care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully

evaluated by observation and physical exam, correlating findings with invasive monitoring results. The median sternotomy wound associated with 33365 will be evaluated for abnormal drainage, sternal instability, etc. Chest tubes placed prior to closure of the sternotomy wound will be assessed for excessive blood loss and air leaks. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives. The survey supported a single critical care visit and the Expert Panel agreed. Other 000 codes with same-day visits include several ECMO codes (starting at 33951) and thoracoscopy codes (starting at 32601).

33365

Code 33365 in this family is transaortic transcatheter placement of a prosthetic aortic valve through a sternotomy. The expert panel **recommends the survey 25th-percentile value of 34.00 work RVUs for 33365, with 50 minutes preservice time, 120 minutes intraservice time from the survey median, 45 minutes postservice time, and one same-day 99291.** This represents a decrease in time and RVU from the RUC's 2012 recommendations. It also builds correctly off 33364 by allowing an increment for moving from an open artery approach to a sternotomy approach.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33365

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty interventional cardiology How often? Rarely

Specialty cardiothoracic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 600

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. These patients are almost universally Medicare age. With roughly a third of Medicare beneficiaries in MA plans, the 600 in this estimate adds 50% to our FFS estimate below.

Specialty interventional cardiology Frequency 300 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 300 Percentage 50.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 400
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. FFS tilization grew then declined since first devices came to market in 2011. This estimate is comparable to 2016 utilization. Specialty estimates split utilization evenly as services must be billed using cosurgery modifier 62.

Specialty interventional cardiology Frequency 200 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 200 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33365

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Global Period: 000 Current Work RVU: **35.88** RUC Recommended RVU: **29.35**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical exposure (eg, left thoracotomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 83-year-old female presents with symptomatic aortic stenosis, hypertension, peripheral artery disease, Class III-IV heart failure and an STS Risk score of 10.4. The aortic stenosis is life-limiting with a documented aortic valve orifice area of 0.6 cm2. She is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who recommends percutaneous transcatheter aortic valve replacement. Because of severe peripheral vascular disease, including severe aortoiliac, femoral, and axillary artery disease, neither a percutaneous or open approach to these vessels was possible for safe prosthesis delivery. In addition, the presence of a “porcelain” aorta precludes a direct approach to the aorta via median sternotomy. A trans apical approach through limited thoracotomy is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 61%

Description of Pre-Service Work: The patient's history, records, and laboratory and diagnostic tests, including CT angiogram, coronary angiogram, and transthoracic echocardiogram, are reviewed and measurements are confirmed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is considered and if appropriate, initiated or continued.. Additional pre-procedure functions include writing orders for adequate sedation and patient support and a review of study arrangements and procedures with technical, nursing, and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals, as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments, and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table and attached to cardiac electrodes and an oxygen saturation monitor. Appropriate anesthesia is induced by the anesthesiology team. The patient is intubated with a double-lumen endotracheal tube. External defibrillator pads are placed on the anterior and posterior chest. Pre-procedural echocardiography is performed. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments and supplies are present. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists, are also positioned at the operative field. In addition, all other personnel, including anesthesiologists, circulating nurses, respiratory therapists, echocardiographer, and echo technicians, are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive .A "time out" occurs during which confirmation of critical information

is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances that might influence the procedure.

Description of Intra-Service Work: After establishing femoral venous access, a temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

The heart is exposed through a left anterior thoracotomy in the fifth or sixth intercostal space . Single lung ventilation is initiated, and the left lung is collapsed. A pericardiotomy is performed and pacing wires are affixed to the ventricular muscle. Two circumferential pledgeted purse-string sutures are placed in the apex of the left ventricle. Anticoagulant therapy is administered to achieve therapeutic anticoagulation levels. A large-bore sheath is introduced into the left ventricle and a pigtail catheter advanced over a guide wire into the ascending aorta using fluoroscopy.

Under fluoroscopic guidance, the native aortic valve is crossed using a guide wire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guide wire is across the aortic valve and positioned in the aorta, a small catheter is advanced over the wire, and the wire is exchanged for a stiff guide wire. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement, and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated, and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guide wire while maintaining access across the native aortic valve. The delivery catheter is advanced across the native aortic valve annulus to the aortic root and positioned under fluoroscopic guidance. In addition, transesophageal echocardiography (TEE) may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or the presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter and guide wire are removed from the patient.

The left ventricular apical sheath is removed, and the purse-string sutures are tied and reinforced if necessary. Hemostasis is assured. Protamine is given to reverse the heparin. Chest tube(s) is placed. Double lung ventilation is resumed. The incision is closed in layers and dressings are placed.

Description of Post-Service Work: The physicians confirm the patient’s hemodynamic status, including systemic arterial pressure, pulmonary artery pressure, and heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. The patient is assessed for possible early embolic complications such as stroke requiring a detailed neurologic examination as well as a focused physical examination for possible limb ischemia or intra-abdominal catastrophe such as mesenteric ischemia. The patency of the post thoracotomy chest tube(s) is ensured. Proper position of the chest tube(s) is confirmed by chest x-ray as is the absence of post operative pneumothorax. Postoperative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, and revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the postoperative caregivers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	38%	38%	25%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	25%	57%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	38%	62%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	50%	50%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	33%	17%	50%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	33%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	33%	67%
Physical effort required	0%	50%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	33%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Code 33366 describes the transapical approach through a thoracotomy for transcatheter placement of an aortic valve replacement prosthesis. As previously described, surveys were sent to 2,535 physicians (1535 STS members who self-identify as adult cardiac surgeons and 1000 interventional cardiologist). An Expert Panel with representatives from the American College of Cardiology (ACC), Society of Thoracic Surgeons (STS), American Association for Thoracic Surgery

(AATS) and the Society for Cardiac Angiography and Interventions (SCAI) was convened to review the RUC survey results and TVT Registry data and finalize the recommendations.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel recommends increases in time for the evaluation of the patient and for the positioning of the patient.

ADDITIONAL EVALUATION TIME

For the evaluation, the Expert Panel recommends an increase of 10 minutes over the package for a total evaluation time of 50 minutes for all codes in the family. This is supported by the survey data. Risks of the procedure, including alternatives such as cardiopulmonary bypass, alternative valve replacement technique, or discontinuation of the procedure would be discussed during the consent conversation. In preparation for the procedure, each physician will independently review the patient's laboratory and diagnostic tests, including computed tomographic (CT) angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram and primary CT and angiographic images from prior studies. The physicians determine appropriate antiplatelet and other pharmacologic therapy. The physician's must also coordiante with each other prior to the procedure to determine the final operative stratagey for the procedure. The Expert Panel felt that adding additional evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians as discussed above.

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case for a total of 15 minutes. This is the current positioning time for these codes and the time is also supported by the survey data. The codes represent hybrid procedures each with the possibility of emergency cardiopulmonary bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient must be positioned for all the approaches plus the induction of cardiopulmonary bypass for each of the cardiopulmonary bypass procedures.

SAME DAY IMMEDIATE POST TIME

Post service time package 9B General Anesthesia/Complex Patient was selected for all six codes. The 33366 survey supported 45 minutes of immediate post time. The specialties are recommending an increase of 12 minutes over the package time for a total time of 45 minutes, which is the current post time for the procedure. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

Although 33366 is a 000-day global, the procedure is considered a major cardiac procedure where the patients will typically stay in the hospital for 4 – 6 days (TVT-R). As with other major surgical procedures that have a 000-day global (e.g. ECMO), the multispecialty team care of the patient will vary significantly by patient and institution and the 000-day global allows for appropriate care from multiple specialties without overlap in work or reimbursement. The survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery was typical. That is consistent with the current valuation as well. The survey respondents indicated that a same-day critical care hospital visit is typical. The initial postoperative course following TAVR is similar to other postoperative cardiac surgery procedures involving a heart valve. Post-op care involves monitoring of the patient's hemodynamic condition, including cardiac rhythm, rate and conduction abnormalities. Cardiac arrhythmias are assessed. Atrial extrasystoles, either isolated or in prolonged runs are differentiated from ventricular extrasystoles or runs which are correlated with operative events and hemodynamic effects; antiarrhythmic therapy (treatment or prophylaxis) is considered. The 12-lead EKG is evaluated for signs of ischemia or injury and compared to the preoperative tracing. Blood pressure, central venous pressure, pulmonary artery pressures, and cardiac output and index are assessed as appropriate based on monitoring lines that are utilized for each patient. Filling pressures (central venous pressure, pulmonary artery diastolic pressure and left atrial ("wedge" pressure) are correlated at baseline and waveforms are assessed. Crystalloid fluids or blood products are administered depending on cardiac index, mixed venous oxygen saturation, hemoglobin, and central filling pressures. Inotropic and vasoactive agents given by continuous infusion are adjusted to optimize oxygen delivery and minimize adverse end-organ effects. Peripheral perfusion, with special emphasis on end-organ perfusion, is carefully

evaluated by observation and physical exam, correlating findings with invasive monitoring results. The thoracotomy wound associated with 33366 is assessed for stability of the chest wall, abnormal drainage, etc. Chest tubes placed prior to closure of the thoracotomy wound are assessed for excessive blood loss and air leaks. Post procedure chest x-ray is reviewed for post-operative pneumothorax. The critical care visit covers the time that both physicians independently spend with the patient directly related to the procedure providing critical care services the same day after the procedure. The services provided do not overlap and are not duplicative with each physician managing and evaluating the patient from different post-operative perspectives. The survey supported a single critical care visit and the Expert Panel agreed. Other 000 codes with same-day visits include several ECMO codes (starting at 33951) and thoracoscopy codes (starting at 32601).

33366

Code 33366 in this family is transapical transcatheter placement of a prosthetic aortic valve through a thoracotomy. The expert panel **recommends the survey 25th-percentile value of 34.50 work RVUs for 33366, with 50 minutes preservice time, 120 minutes intraservice time from the survey median, 45 minutes postservice time, and one same-day 99291.** This represents a decrease in time and RVU from the RUC's 2012 recommendations. also builds correctly off 33364 by allowing an increment for moving from an open artery approach to a thoracotomy approach. This increment is slightly greater than for the previous code for transaortic placement through a sternotomy.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33366

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty interventional cardiology How often? Rarely

Specialty cardiothoracic surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 925
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. These patients are almost universally Medicare age. With roughly a third of Medicare beneficiaries in MA plans, the 925 in this estimate adds 50% to our FFS estimate below.

Specialty interventional cardiology Frequency 463 Percentage 50.05 %

Specialty cardiothoracic surgery Frequency 462 Percentage 49.94 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 650
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. FFS utilization declined since the first devices came to market in 2011. This estimate is comparable to 2016 utilization. Specialty estimates split utilization evenly as services must be billed using cosurgery modifier 62.

Specialty interventional cardiology Frequency 325 Percentage 50.00 %

Specialty cardiothoracic surgery Frequency 325 Percentage 50.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33366

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.
Hide columns and rows that do not contain data.
1st REF = Top Key Reference code data
2st REF = Second Highest Key Reference code data
CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.
SVY = Survey data - as it appears on the Summary of Recommendation form.
REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:
33361- Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach
33362- open femoral artery approach
33363- open axillary artery approach
33364- open iliac artery approach
33365- transaortic approach (eg, median sternotomy, mediastinotomy)
33366- transapical approach (eg, left thoracotomy)

Global Period: 000 Meeting Date: April 2018

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A joint RVS Committee representing the four societies utilized a consensus panel to develop recommended inputs.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: Each of the codes' reference code is the current code and inputs. Prior reference code 33980 is also provided for comparison.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: The standard for 0-day global codes is 0 minutes clinical staff time. TAVR services are exclusively performed in the facility setting and require office staff time typical of 90-day global procedures performed in the facility setting. The TAVR procedures are performed under general anesthesia and the patients typically have an inpatient hospital stay of up 5 or more days. The main reason these codes were assigned a 000 day global period instead of 90 days is to accommodate the post-operative multispecialty care that is shared by the cardiologist and the cardiothoracic surgeon. The existing clinical staff PE inputs were derived from comparison to 33980 for VAD removal. 33980 is an XXX global procedure that was reviewed by the RUC and the Practice Expense Subcommittee at the February of 2011 RUC meeting. 33980 is a procedure that is performed in the facility setting 100% of the time and requires office staff time that would be typical of a 90-day global procedure performed in the facility setting.

The TAVR codes represent procedures that are performed in the facility 100% of the time under general anesthesia and require office staff time that would be typical for a 90-day global procedure performed in the facility setting. The main difference between the TAVR codes and the reference code is that the TAVR codes will be done jointly with the cardiologist and cardiovascular surgeon and requires additional scheduling and coordination of services because the cardiology office and the cardiovascular surgery office must both coordinate with the other specialists involved in the procedure which at a minimum include radiology, perfusionist and a specialized anesthesiologist. In addition, the procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment all of which must be ordered and coordinated by each physician's clinical staff. . Since the codes were jointly surveyed involving cardiology and cardiac surgeons, the specialty societies are recommending CMS Code L037D with a blended staff type of RN/ LP/ MTA rather than the RN staff type typical to the cardiothoracic surgery codes.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: The clinical staff from both offices complete pre-service diagnostic and referral forms. They call the hospital to schedule space and equipment needed in the facility. They will also coordinate with specialized anesthesiologist, the perfusionist, radiology and any other physician offices to set up the case. The clinical staff will also coordinate with the hospital to schedule the OR and the specialized equipment for the procedure. The operating room coordinating requires ensuring the needed hybrid equipment including the catheter-based equipment for the valve deployment, any instrumentation needed for an open approach or conversion to an open approach and cardiopulmonary bypass equipment as well as supporting imaging equipment for the procedure. The clinical staff will educate the patient on what they need to do to prepare for surgery. The staff ensures the patient and family fully understands the procedure and the recovery afterwards and obtains the operative consent. They make follow-up phone calls to the patient and the office of referring physicians and call in needed prescriptions.

CA002 (coordinate pre-surgery services): there are typically three physicians involved in a TAVR procedure, the cardiothoracic surgeon, an interventional cardiologist and an echocardiography physician who will perform the TEE which is separately billed. Additional specialists that are involved with TAVR include anesthesiologists, perfusionist and radiologists at a minimum. Additionally, pulmonary function testing and left heart catheterization may need to be arranged. Preoperative labs must be ordered and collated and imaging of the chest is often required to be scheduled prior to the procedure.

CA003 (schedule space and equipment in facility): In addition to coordinating all of the specialists involved, the specialized room and equipment must also be coordinated and scheduled. This involves ensuring that the hybrid OR suite and equipment are secured. Specialized equipment includes the catheter-based equipment for the valve deployment, instrumentation for conversion to an open approach, cardiopulmonary bypass equipment, the correct valve for the patient.

CA004 (provide education/obtain consent): The patient and their family will be educated and provide consent to both the cardiothoracic surgeon and the interventional cardiologist for this procedure. The staff from each office will meet with the patient and family independently to provide education and obtain consent for the procedure. The education from each specialty is distinct with the interventional cardiologist staff providing education on the transcatheter approach and delivery of the valve and the cardiothoracic surgeons staff focusing on the open aspects of the procedure and any covering contingencies for conversion to an open procedure or the need for placing the patient on cardiopulmonary bypass in an emergent situation if necessary. The consent is obtained in a visit with the patient, it is not obtained over the phone.

CA005 (complete pre-procedure phone calls and prescriptions): The patient and family are reminded of the scheduled procedure, given last minute instructions for prep and reporting for the procedure

Intra-Service Clinical Labor Activities: n/a

Post-Service Clinical Labor Activities: n/a

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Transcatheter Aortic Valve Replacement

In February 2012, the CPT Editorial Panel deleted four Category III code (0256T-0259T) and approved nine codes to report transcatheter aortic valve replacement procedures.

The RUC thoroughly discussed the unique nature of these services to understand and assign the appropriate valuation for these services. First, the members noted these services require two physicians, an interventional cardiologist and a cardiothoracic surgeon, be actively working on the patient during these procedures. Each operator has distinctly required work, which are specific to the operator's skill set, and are not duplicative between the two. For these reasons, the CMS National Coverage Determination (NCD) mandates that two physicians be present for this procedure to be completed. Second, the RUC recognized the intense nature of these procedures. Patients eligible for these procedures have previously been turned down for aortic valve replacement surgery and are receiving these procedures as a last resort. The NCD further mandates this patient population and there are currently no indications that these procedure will be approved for otherwise operable patients in the future. Finally, the RUC noted that the recommendations made by the Committee will value the total work of the service. Physician time includes the clock time of the procedure and does not constitute the addition of each physician's time. Payment policy issues, related to the co-surgery modifier and resulting payment modifications, were not determined, as it is outside the purview of the RUC. The RUC understands that CMS will consider these issues.

Prior to surveying, the specialty societies obtained approval from the Research Subcommittee to conduct an alternative methodology for surveying these services. To ensure the complete work of both physicians was captured, each survey was conducted concurrently by a thoracic surgeon and an interventional cardiologist.

33361 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach***
The RUC reviewed the survey data from 33 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 135 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. The RUC agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 29.50, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33361 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33361, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. Finally, the RUC conducted the following methodology to ensure the recommended work value is relative to similar services. The Committee took CPT code 92986 *Percutaneous balloon valvuloplasty; aortic valve* (work RVU= 22.85, intra-service time= 113 minutes) and backed out the post-operative visits (remaining work RVU= 17.90) to ensure the comparison is based on a 000 day global equivalent. The difference between the two intra-service times (22 minutes) was multiplied by the IWPUT (0.16) and came to a value of 3.52. The value of 3.52 and 4.50 (the work RVU of 99291) were added to the base 17.90 work RVU of the balloon valvuloplasty code to arrive at a value of 25.92. The committee recognized that the surveyed code 33361 is a much more intense and complicated procedure compared to the balloon valvuloplasty service. **The RUC recommends a work RVU of 29.50 for CPT code 33361.**

33362 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach***
The RUC reviewed the survey data from 38 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 150 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 32.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33362 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33362, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. Finally, the RUC reviewed 33362 in comparison to 33361 and agreed that the increase complexity due to the open approach was accurately reflected with the increase work RVU of 2.50 and increased time of 15 minutes. **The RUC recommends a work RVU of 32.00 for CPT code 33362.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33363 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach***
The RUC reviewed the survey data from 33 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 180 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 33.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33363 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33363, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. Finally, the RUC reviewed 33363 in comparison to 33361 and agreed that the increase complexity due to the open approach was accurately reflected with the increase work RVU of 3.50 and increased time of 45 minutes. **The RUC recommends a work RVU of 33.00 for CPT code 33363.**

33364 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach***
The RUC reviewed the survey data from 31 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 180 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 34.87, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33364 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33364, as described above, is a unique

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 33364 in comparison to 33361 and agreed that the increase complexity due to the open approach was accurately reflected with the increase work RVU of 5.37 and increased time of 45 minutes. The RUC noted that while 33364 and 33363 have the same intra-service times, 33364 is a more intense procedure due to the transplant incision and longer closure times. **The RUC recommends a work RVU of 34.87 for CPT code 33364.**

33365 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)***
The RUC reviewed the survey data from 30 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 180 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 37.50, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33979 *Insertion of ventricular assist device, implantable intracorporeal, single ventricle* (work RVU= 37.50) and agreed that while 33979 has more intra-service time compared to the surveyed code, both services should be valued similarly given that 33365 is a more intense procedure, as seen in the intensity complexity measures. The RUC also reviewed CPT code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33365 is a much more intense procedure. In addition, 33365, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 33365 in comparison to 33361 and agreed that the increase complexity was accurately reflected with the increase work RVU of 8.00 and increased time of 45 minutes. The RUC noted that while 33365 and 33364 have the same intra-service times, 33364 is a more intense procedure due to complexities opening the chest via median sternotomy. **The RUC recommends a work RVU of 37.50 for CPT code 33365.**

0318T ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)***
The RUC reviewed the survey data from 31 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 195 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 40.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33979 *Insertion of ventricular assist device, implantable intracorporeal, single ventricle* (work RVU= 37.50) and agreed that while 33979 has more intra-service time compared to the surveyed code, 0318T should be valued slightly higher due to greater intensity, as seen in the intensity complexity measures. The RUC also reviewed CPT code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 0318T is a much more intense procedure. In addition, 0318T, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 0318T in comparison to 33361 and agreed that the increase complexity was accurately reflected with the increase work RVU of 10.50 and increased time of 60 minutes. **The RUC recommends a work RVU of 40.00 for CPT code 0318T.**

Add-On Services
The RUC noted that the three add-on cardiopulmonary bypass support services (33367-X9) are only reported by the thoracic surgeon and not performed by two physicians. These procedures are performed during standard transcatheter aortic valve replacement services upon the patient becoming hemodynamically unstable and cannot be stabilized by any standard medical means.

33367 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with percutaneous peripheral arterial and venous cannulation (eg, femoral vessels)***
The RUC reviewed the survey results from 35 cardiothoracic surgeons and agreed with the specialties that the appropriate intra-service time for this ZZZ global service is 90 minutes. The RUC reviewed the survey respondents' estimated physician work value and agreed with the specialties that a work RVU of 11.88 (the survey's 25th percentile) accurately reflects the physician work involved in this procedure. To justify this value, the RUC reviewed the key reference code 37223 *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 4.25) and agreed that the surveyed code has double the intra-service time and is a more intense procedure. Given this, 33367 should be valued much higher. In addition, CPT code 22845 *Anterior instrumentation; 2 to 3 vertebral segments* (work RVU= 11.94) was compared to 33367 and the RUC noted that the two services have identical intra-service time, 90 minutes, with comparable physician work, and should be valued similarly. **The RUC recommends a work RVU of 11.88 for CPT code 33367.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33368 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with open peripheral arterial and venous cannulation (eg, femoral, iliac, axillary vessels)***
The RUC reviewed the survey results from 34 cardiothoracic surgeons and agreed with the specialties that the appropriate intra-service time for this ZZZ global service is 120 minutes. The RUC reviewed the survey respondents' estimated physician work value and agreed with the specialties that a work RVU of 14.39 (the survey's 25th percentile) accurately reflects the physician work involved in this procedure. To justify this value, the RUC reviewed the key reference code 33960 *Prolonged extracorporeal circulation for cardiopulmonary insufficiency; initial day* (work RVU= 10.59, valued as a ZZZ global service) and agreed that while the reference code has slightly greater intra-service time, 13 minutes, compared to 33368, the surveyed code is a more intense procedure and should be valued higher. In addition, the RUC reviewed CPT code 22843 *Posterior segmental instrumentation (eg, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 7 to 12 vertebral segments* (work RVU= 13.44, intra-time= 120 minutes) and agreed that with identical intra-service time the surveyed code should be valued slightly higher due to greater intensity. **The RUC recommends a work RVU of 14.39 for CPT code 33368.**

33369 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with central arterial and venous cannulation (eg, aorta, right atrium, pulmonary artery)***
The RUC reviewed the survey results from 35 cardiothoracic surgeons and agreed with the specialties that the appropriate intra-service time for this ZZZ global service is 160 minutes. The RUC reviewed the survey respondents' estimated physician work value and agreed with the specialties that a work RVU of 19.00 (the survey's 25th percentile) accurately reflects the physician work involved in this procedure. To justify this value, the RUC reviewed the key reference code 33305 Repair of cardiac wound; with cardiopulmonary bypass (work RVU= 29.60, valued as a ZZZ global period) and agreed that while the surveyed code is a more intense procedure, the reference code should be valued higher due to greater intra-service time, 296 minutes compared to 160 minutes. In addition, the RUC reviewed CPT code 22844 *Posterior segmental instrumentation (eg, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 13 or more vertebral segments* (work RVU= 16.42, intra-service time= 150 minutes) and agreed that since the surveyed code has greater intra-service time and a higher intensity the value should be higher for 33369. **The RUC recommends a work RVU of 19.00 for CPT code 33369.**

Practice Expense: The TAVR codes represent procedures that will be performed in the facility 100% of the time and will require office staff time that would be typical for a 90-day global procedure performed in the facility setting. The TAVR codes will be done jointly with the cardiologist and cardiovascular surgeon and requires additional scheduling and coordination of services because the cardiology office and the cardiovascular surgery office must both coordinate with the other specialists involved in the procedure which at a minimum include radiology, perfusionist and a specialized anesthesiologist. In addition the procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment. Since the codes were jointly surveyed involving cardiology and cardiac surgeons, the specialty societies are recommending CMS Code L037D with a blended staff type of RN/ LP/ MTA rather then the RN staff type typical to the cardiothoracic surgery codes. The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology: These services will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

RUC Database: These services will be flagged in the RUC database so they are not used to validate the physician work of other services in the RBRVS.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes 33361-33365, 0318T are used to report transcatheter aortic valve replacement (TAVR)/transcatheter aortic valve implantation (TAVI). TAVR/TAVI requires two physician operators and all components of the procedure are coded using modifier 62.

Codes 33361–33365, 0318T include the work, when performed, of percutaneous access, placing the access sheath, balloon aortic valvuloplasty, advancing the valve delivery system into position, repositioning the valve as needed, deploying the valve, temporary pacemaker insertion for rapid pacing (33210), and closure of the arteriotomy when performed. Codes 33362–33365, 0318T also include open arterial or cardiac approach.

Angiography, radiological supervision, and interpretation performed to guide TAVR/TAVI (eg, guiding valve placement, documenting completion of the intervention, assessing the vascular access site for closure) are included in these codes.

Diagnostic left heart catheterization codes (93452, 93453, 93458-93461) and the supravalvular aortography code (93567) should ~~NOT~~ **not** be used with TAVR/TAVI services (33361-33365, 0318T) to report:

1. Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the TAVR/TAVI,
2. Aorta/left ventricular outflow tract measurement for the TAVR/TAVI, or
3. Post-TAVR/TAVI aortic or left ventricular angiography, as this work is captured in the TAVR/TAVI services codes (33361-33365, 0318T).

Diagnostic coronary angiography performed at the time of TAVR/TAVI may be separately reportable if:

1. No prior catheter-based coronary angiography study is available and a full diagnostic study is performed, OR
2. A prior study is available, but as documented in the medical record:
    a. The patient's condition with respect to the clinical indication has changed since the prior study, OR
    b. There is inadequate visualization of the anatomy and/or pathology, OR
    c. There is a clinical change during the procedure that requires new evaluation.
    d. For same session/same day diagnostic coronary angiography services, report the appropriate diagnostic cardiac catheterization code(s) appended with modifier 59 indicating separate and distinct procedural service from TAVR/TAVI

Other cardiac catheterization services are reported separately when performed for diagnostic purposes not intrinsic to TAVR/TAVI.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Percutaneous coronary interventional procedures are reported separately, when performed.

When transcatheter ventricular support is required in conjunction with TAVR/TAVI, the appropriate code should be reported with the appropriate ventricular assist device (VAD) procedure code (33990-33993, 33975, 33976, 33999) or balloon pump insertion code (33967, 33970, 33973)

The TAVR/TAVI cardiovascular access and delivery procedures are reported with 33361-33365, 0318T. When cardiopulmonary bypass is performed in conjunction with TAVR/TAVI, codes 33361-33365, 0318T should be reported with the appropriate add-on code for percutaneous peripheral bypass (33367), open peripheral bypass (33368), or central bypass (33369)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33367 Tracking Number GG7 Original Specialty Recommended RVU: **11.88**
Presented Recommended RVU: **11.88**
Global Period: ZZZ RUC Recommended RVU: **11.88**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with percutaneous peripheral arterial and venous cannulation (eg, femoral vessels)
(Use 33367 in conjunction with 33361-33366)
(Do not report 33367 in conjunction with 33368 or 33369)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. Note: This is an add-on service to the TAVR/TAVI which is reported separately.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A patient undergoing TAVR becomes hemodynamically unstable, and cannot be stabilized with inotropic support or any standard medical means. The patient is anticoagulated. The artery and vein are cannulated with sheaths using direct percutaneous access. Guidewires are advanced into the distal abdominal aorta and into the superior vena cava. Dilators are employed to ultimately place a sufficient sized arterial cannula and a multiply ported venous drainage cannula across the right atrium into the superior vena cava. The cannulas are de-aired and connected to a cardiopulmonary bypass circuit. Cardiopulmonary bypass is initiated. Cardiopulmonary bypass with its attendant volume shifts and the activation of the inflammatory system is managed with volume replacement and alpha effector agents. Anticoagulation is maintained. Management continues while the TAVR procedure is completed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are normalized and the patient is weaned from cardiopulmonary bypass. Anticoagulation is reversed. The cannulas are removed percutaneously. Hemostasis is achieved through percutaneous closure devices or, if necessary, open vascular repair (reported separately).

CPT Code: 33367

Description of Post-Service Work: N/A

Post-Service intensity/complexity	4.00	3.14

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were the cardiac surgeon members of teams of co-operators who participated in clinical trials of these new devices.

They evaluated the three add-on, ZZZ codes to report when cardiopulmonary bypass is necessary for the procedure (**33367**, **33368**, **33369**).

The three bypass codes represent different approaches for accomplishing bypass if it becomes necessary during the procedure. The majority of TAVR cases that require bypass will involve an emergent situation that occurs during the procedure due to aortic insufficiency or the patient's inability to withstand rapid pacing or balloon valvuloplasty. There will be a small percentage of cases where bypass is planned as part of the procedure and it will only be applicable to a specific patient population and will not be typical.

The three cardiopulmonary bypass codes were surveyed specifically as they relate to the TAVR procedures. Bypass related to TAVR is not equivalent to any of the existing "with or without" bypass procedure. In addition, the typical TAVR patient is 83 years old with multiple comorbidities, adding to the complexity of the procedure.

The Expert Panel reviewed the survey results and recommends that the 25th percentile RVWs for these codes accurately represents the work involved and results in an appropriate IWPUT (0.132) for this service. This intensity is well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including several codes from the current MPC list. This intensity is frequently observed in add-on codes, and accurately reflects the significant urgent decision making which must be made to select appropriate vascular access sites and accomplish the technical aspects of the procedure in patients with significant diffuse vascular disease. Management of cardiopulmonary bypass and the inherent bleeding risk and inflammatory while continuing the valve replacement procedure adds significant work to the base procedure.

In the context of the entire presentation of **33361**-**33369**, it is important to note that the -62 modifier would not be appended to the codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your

scenario. Code 33367 will be reported in conjunction with one of the new codes 33361- 33366 when applicable.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0259T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; with cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 75
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, of that number it is estimated that approximately 5% will require emergent cardiopulmonary bypas support. There are three bypass codes and it is estimated that the 33367 percutaneouls peripheraial approach will be utilized 30% of the time, that 33368 open peripherial approach will be utilized 30% of the time and that 33369 central access will be used 40% of the time.

Specialty Cardiovascular Surgery Frequency 75 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 71 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiovascular Surgery Frequency 71 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33368 Tracking Number GG8 Original Specialty Recommended RVU: **14.39**
Presented Recommended RVU: **14.39**
Global Period: ZZZ RUC Recommended RVU: **14.39**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with open peripheral arterial and venous cannulation (eg, femoral, iliac, axillary vessels)
(Use 33368 in conjunction with 33361-33366)
(Do not report 33368 in conjunction with 33367 or 33369)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. However, the femoral vessels are not suitable for percutaneous cannulation, therefore an open approach is utilized. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. Note: This is an add-on service to the TAVR/TAVI which is reported separately.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A patient undergoing TAVR becomes hemodynamically unstable, and cannot be stabilized with inotropic support or any standard medical means. The patient is anticoagulated. A new incision is made and the artery and vein are exposed and controlled with vessel loops. The artery is clamped and a transverse arteriotomy performed. A suitably sized arterial cannula is advanced over a guidewire. A pursestring polypropylene suture is place in the vein, and a guidewire inserted through a needle placed within it and advanced into the vena cava under fluoroscopic guidance. A multiply ported venous drainage cannula is passed over the guidewire, across the right atrium and into the vena cava. The cannulas are de-aired and connected to a cardiopulmonary bypass circuit. Cardiopulmonary bypass is initiated. Cardiopulmonary bypass with its attendant volume shifts and the activation of the inflammatory system is managed with volume replacement and alpha effector agents. Anticoagulation is maintained. Management continues while the TAVR procedure is completed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are

normalized and the patient is weaned from cardiopulmonary bypass. The venous cannula is removed and bleeding controlled by tying the previously placed pursestring. The arterial cannula is removed and the arteriotomy is repaired with 6-0 polypropylene sutures. Anticoagulation is reversed, and after assuring hemostasis the wound is closed in layers.

Description of Post-Service Work: N/A

Post-Service intensity/complexity	4.14	4.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally

consistent. All survey respondents were the cardiac surgeon members of teams of co-operators who participated in clinical trials of these new devices.

They evaluated the three add-on, ZZZ codes to report when cardiopulmonary bypass is necessary for the procedure (33367, 33368, 33369).

The three bypass codes represent different approaches for accomplishing bypass if it becomes necessary during the procedure. The majority of TAVR cases that require bypass will involve an emergent situation that occurs during the procedure due to aortic insufficiency or the patient's inability to withstand rapid pacing or balloon valvuloplasty. There will be a small percentage of cases where bypass is planned as part of the procedure and it will only be applicable to a specific patient population and will not be typical.

The three cardiopulmonary bypass codes were surveyed specifically as they relate to the TAVR procedures. Bypass related to TAVR is not equivalent to any of the existing "with or without" bypass procedure. In addition, the typical TAVR patient is 83 years old with multiple comorbidities, adding to the complexity of the procedure.

The Expert Panel reviewed the survey results and recommends that the 25th percentile RVWs for these codes accurately represents the work involved and results in an appropriate IWPUT (0.120) for this service. This intensity is well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including several codes from the current MPC list. This intensity is frequently observed in add-on codes, and accurately reflects the significant urgent decision making which must be made to select appropriate vascular access sites and accomplish the technical aspects of the procedure in patients with significant diffuse vascular disease. Management of cardiopulmonary bypass and the inherent increased bleeding and inflammatory response as well as operative repair of the cannulation sites (not billed separately) adds significant work to the base procedure.

In the context of the entire presentation of 33361-33369, it is important to note that the -62 modifier would not be appended to the codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Code 33368 will be reported in conjunction with one of the new codes 33361-33367 when applicable

---

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0259T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; with cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 75
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, of that number it is estimated that approximately 5% will require emergent cardiopulmonary bypas support. There are three bypass codes and it is estimated that the 33367 percutaneouls peripheraial approach will be utilized 30% of the time, that 33368 open peripherial approach will be utilized 30% of the time and that 33369 central access will be used 40% of the time.

Specialty Cardiovascular Surgery Frequency 75 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 71 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiovascular Surgery Frequency 71 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33369 Tracking Number GG9 Original Specialty Recommended RVU: **19.00**
Presented Recommended RVU: **19.00**
Global Period: ZZZ RUC Recommended RVU: **19.00**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with central arterial and venous cannulation (eg, aorta, right atrium, pulmonary artery)
(Use 33369 in conjunction with 33361-33366)
(Do not report 33369 in conjunction with 33367 or 33368)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. However, because of severe aortoiliac disease, central arterial and venous access is required for institution of safe cardiopulmonary bypass. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. Note: This is an add-on service to the TAVR/TAVI which is reported separately.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A patient undergoing TAVR becomes hemodynamically unstable, and cannot be stabilized with inotropic support or any standard medical means. The patient is anticoagulated. If not already achieved by the TAVR approach, exposure of the great vessels is obtained by rapid median sternotomy and the creation of a pericardial well. The aorta is directly cannulated for arterial inflow and a dual stage venous return cannula is placed through a right atrial incision. Cardiopulmonary bypass is initiated. Pursestrings are then placed about both cannulae and they are secured. Cardiopulmonary bypass with its attendant volume shifts and the activation of the inflammatory system is managed with volume replacement and alpha effector agents. Anticoagulation is maintained. Management continues while the TAVR procedure is completed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are normalized and the patient is weaned from cardiopulmonary bypass. Anticoagulation is reversed, the cannulae removed and hemostasis is achieved by tying the previously placed pursestring sutures. Additional sutures may be required. After assuring

hemostasis, the sternum is reapproximated with stainless steel wires over mediastinal drains. The wound is then irrigated and closed in layers.

Description of Post-Service Work: N/A

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status?

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service?

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
33305	ZZZ	29.60	**RUC Time**

CPT Descriptor Repair of cardiac wound; with cardiopulmonary bypass
*code value was adjusted to ZZZ global from 0900 day global for RSL which was approved by the Research Subcommittee

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 1 see separate MPC table for TAVR codes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
33530	ZZZ	8.08	**RUC Time**

CPT Descriptor Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 15 **% of respondents:** 42.8 **%**

TIME ESTIMATES (Median)	**CPT Code: 33369**	**Key Reference CPT Code:** 33305	**Source of Time RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	160.00	296.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**160.00**	**296.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.87	4.47
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.87	4.27
Urgency of medical decision making	4.73	4.33
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.87	4.80
Physical effort required	4.47	4.40
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.87	4.33
Outcome depends on the skill and judgment of physician	4.73	4.33
Estimated risk of malpractice suit with poor outcome	4.20	3.87

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.80	4.40
Intra-Service intensity/complexity	4.87	4.33
Post-Service intensity/complexity	4.80	4.20

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and

finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were the cardiac surgeon members of teams of co-operators who participated in clinical trials of these new devices.

They evaluated the three add-on, ZZZ codes to report when cardiopulmonary bypass is necessary for the procedure (33367, 33368, 33369).

The three bypass codes represent different approaches for accomplishing bypass if it becomes necessary during the procedure. The majority of TAVR cases that require bypass will involve an emergent situation that occurs during the procedure due to aortic insufficiency or the patient's inability to withstand rapid pacing or balloon valvuloplasty. There will be a small percentage of cases where bypass is planned as part of the procedure and it will only be applicable to a specific patient population and will not be typical.

The three cardiopulmonary bypass codes were surveyed specifically as they relate to the TAVR procedures. Bypass related to TAVR is not equivalent to any of the existing "with or without" bypass procedure. In addition, the typical TAVR patient is 83 years old with multiple comorbidities, adding to the complexity of the procedure.

The Expert Panel reviewed the survey results and recommends that the 25th percentile RVWs for these codes accurately represents the work involved and results in an appropriate IWPUT (0.119) for this service. This intensity is well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including several codes from the current MPC list. This intensity is frequently observed in add-on codes, and accurately reflects the significant urgent decision making which must be made to select appropriate vascular access sites and accomplish the technical aspects of the procedure in patients with significant diffuse vascular disease. Management of cardiopulmonary bypass and the inherent increased bleeding and inflammatory response as well as operative repair of the cannulation sites (not billed separately) adds significant work to the base procedure.

In the context of the entire presentation of 33361-33369, it is important to note that the -62 modifier would not be appended to the codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Code 33369 will be reported in conjunction with one of the new codes 33361-33366 when applicable

---

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0259T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; with cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, of that number it is estimated that approximately 5% will require emergent cardiopulmonary bypas support. There are three bypass codes and it is estimated that the 33367 percutaneouls peripheraial approach will be utilized 30% of the time, that 33368 open peripherial approach will be utilized 30% of the time and that 33369 central access will be used 40% of the time.

Specialty Cardiovascular Surgery Frequency 100 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 95 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiovascular Surgery Frequency 95 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33305

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

Attestation Statement

This form needs to be completed by any **RUC Advisor** whose specialty society is developing a recommendation to be reviewed by the RUC.

As a RUC Advisor, I attest that the integrity of the RUC survey and summary of recommendation forms are based on accurate and complete data to the best of my knowledge. As a RUC advisor, I acknowledge that violations would be addressed by the executive committee (i.e., RUC Chair , AMA Representative and Alternate AMA Representative.)

Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

33361 - Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach
33362 - open femoral artery approach
33363 - open axillary artery approach
33364 - open iliac artery approach
33365 - transaortic approach (eg, median sternotomy, mediastinotomy)
33366 - transapical approach (eg, left thoracotomy)

Global Period: 000 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Codes 33980 - Removal of ventricular assist device, implantable intracorporeal, single ventricle
This code represents an XXX global procedure that was reviewed by the RUC and the Practice Expense Subcommittee at the February of 2011 RUC meeting. 33980 is a procedure that is performed in the facility setting 100% of the time and requires office staff time that would be typical of a 90-day global procedure performed in the facility setting. This code has an approved pre-facility clinical staff time of 60 minutes. Since cardiothoracic offices typically employ PAs, the cardiothoracic codes are typically assigned CMS code L051A and staff type RN.

The TAVR codes also represent procedures that will be performed in the facility 100% of the time and will require office staff time that would be typical for a 90-day global procedure performed in the facility setting. The main difference between the TAVR codes and the reference code is that the TAVR codes will be done jointly with the cardiologist and cardiovascular surgeon and requires additional scheduling and coordination of services because the cardiology office and the cardiovascular surgery office must both coordinate with the other specialists involved in the procedure which at a minimum include radiology, perfusionist and a specialized anesthesiologist. In addition the procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment. Since the codes were jointly surveyed involving cardiology and cardiac surgeons, the specialty societies are recommending CMS Code L037D with a blended staff type of RN/ LP/ MTA rather then the RN staff type typical to the cardiothoracic surgery codes.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff from both offices fill out the pre-service diagnostic and referral forms. They call the hospital

to schedule space and equipment needed in the facility. They will also coordinate with specialized anesthesiologist, the perfusionist, radiology and any other physician offices to set up the case. The clinical staff will also coordinate with the hospital to schedule the OR and the specialized equipment for the procedure. The operating room coordinating requires ensuring the needed hybrid equipment including the catheter-based equipment for the valve deployment, any instrumentation needed for an open approach or conversion to an open approach and cardiopulmonary bypass equipment as well as supporting imaging equipment for the procedure. The clinical staff will educate the patient on what they need to do to prepare for surgery. The staff ensures the patient and family fully understands the procedure and the recovery afterwards and obtains the operative consent. They make follow-up phone calls to the patient and the office of referring physicians and call in needed prescriptions.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Endovascular Repair of Aortic Coarctation – Tab 8

In October 2020, the CPT Editorial Panel created two codes to report endovascular stent repair of coarctation of the thoracic or abdominal aorta and one code to report trans-liminal angioplasty for repair of native or recurrent percutaneous coarctation of the aorta.

33894 ***Endovascular stent repair of coarctation of the ascending, transverse, or descending thoracic or abdominal aorta, involving stent placement; across major side branches***

The RUC reviewed the survey results from 41 interventional and pediatric interventional cardiologists and recommends 60 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 134 minutes of intra-service time and 60 minutes of immediate post-service time. The specialties noted that, unlike codes 33895 and 33897, the pre-service evaluation work for 33894 includes evaluation using a 3D-printed model of the heart which requires additional pre-service evaluation time. The specialties also noted that, relative to adult patients with normal cardiac anatomy, the pre-service evaluation time for pediatric patients with congenital defects includes additional time to discuss a patient's procedure with the parent. Similarly, the post-procedure work includes additional time to explain the pathology of the child to the parent. Furthermore, as a national standard, congenital heart programs are now also required to enter hemodynamic data and other procedural details into national registries such as Improving Pediatric and Adult Congenital Treatments (IMPACT), which can also add significant post procedure work time. In addition, the post-service period time typically includes time to diagram the congenital heart defect in the EHR and complete data submission to the registry.

The RUC reviewed both the survey 25th percentile work RVU of 18.27 and survey median work value of 23.30 and agreed that the appropriate value for this service should be between the 25th percentile and the median value. The RUC agreed that a direct work value crosswalk to CPT code 93590 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, mitral valve* (work RVU= 21.70, intra-service time of 135 minutes, total time of 223 minutes) and noted that both services involve nearly the same amount of intra-service time (134 minutes vs. 135 minutes) and the same overall amount of physician work. The RUC also compared the survey code to top key reference code 93581 *Percutaneous transcatheter closure of a congenital ventricular septal defect with implant* (work RVU= 24.39, intra-service time of 180, total time of 270) and noted that the reference code involves more total time yet less intra-service time. The RUC also noted that 75 percent of the survey respondents that selected the top key reference code had rated the survey code as more intense and complex to perform. A value of 21.70, would appropriately value this survey code at a lower work value, yet somewhat higher intensity than the survey code, given the differences in intra-service time and intensity between the two services. **The RUC recommends a work RVU of 21.70 for CPT code 33894.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33895 ***Endovascular stent repair of coarctation of the ascending, transverse, or descending thoracic or abdominal aorta, involving stent placement; not crossing major side branches***
The RUC reviewed the survey results from 41 interventional and pediatric interventional cardiologists and recommends 50 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time and 60 minutes of immediate post-service time. The specialties noted that, relative to adult patients with normal cardiac anatomy, the pre-service evaluation time for pediatric patients with congenital defects includes additional time to discuss a patient's procedure with the parent. Similarly, the post-procedure work includes additional time to explain the pathology of the child to the parent. Furthermore, as a national standard, congenital heart programs are now also required to enter hemodynamic data and other procedural details into national registries such as Improving Pediatric and Adult Congenital Treatments (IMPACT), which can also add significant post procedure work time. In addition, the post-service period time typically includes time to diagram the congenital heart defect in the EHR and complete data submission to the registry.

The RUC reviewed both the survey 25th percentile work RVU of 15.00 and survey median work value of 20.00 and agreed that the appropriate value for this service should be between the 25th percentile and the median value. The RUC agreed that a direct work value crosswalk to CPT code 93591 *Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve* (work RVU= 17.97, intra-service time of 120 minutes, total time of 208 minutes) and noted that both services involve an identical amount of intra-service time. The RUC also compared the survey code to second key reference code 93580 *Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant* (work RVU= 17.97, intra-service time of 120 minutes, total time of 210 minutes) and noted that both services involve the same amount of intra-service time and the same overall amount of physician work. **The RUC recommends a work RVU of 17.97 for CPT code 33895.**

33897 ***Percutaneous transluminal angioplasty of native or recurrent coarctation of the aorta***
The RUC reviewed the survey results from 41 interventional and pediatric interventional cardiologists and recommends 50 minutes of pre-service evaluation, 15 minutes of pre-service positioning, 15 minutes of pre-service scrub/dress/wait time, 90 minutes of intra-service time and 60 minutes of immediate post-service time. The specialties noted that, relative to adult patients with normal cardiac anatomy, the pre-service evaluation time for pediatric patients with congenital defects includes additional time to discuss a patient's procedure with the parent. Similarly, the post-procedure work includes additional time to explain the pathology of the child to the parent. Furthermore, as a national standard, congenital heart programs are now also required to enter hemodynamic data and other procedural details into national registries such as Improving Pediatric and Adult Congenital Treatments (IMPACT), which can also add significant post procedure work time. In addition, the post-service period time typically includes time to diagram the congenital heart defect in the EHR and complete data submission to the registry.

The RUC reviewed both the survey 25th percentile work RVU of 12.00 and survey median work value of 17.00 and agreed that the appropriate value for this service should be between the 25th percentile and the median value. The RUC agreed that a direct work value crosswalk to CPT code 33340 *Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation* (work RVU= 14.00, intra-service time of 90 minutes, total time of 183 minutes) and noted that both services involve an identical amount of intra-service time and overall amount of physician work. The RUC also compared the survey code to CPT code 33988 *Insertion of left heart vent by thoracic incision (eg, sternotomy, thoracotomy) for ECMO/ECLS* (work RVU= 15.00, intra-service time of 90 minutes, total time of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

250 minutes) and noted that although both services involve an identical amount of intra-service time, the reference code involves 10 more minutes of total time. **The RUC recommends a work RVU of 14.00 for CPT code 33897.**

Practice Expense
No direct practice expense inputs are recommended for CPT codes 33894, 33895 and 33897 as they are facility-only services.

Tracking CPT Code Changes that Will Impact 33894
The RUC noted that its recommendation for CPT code 33894 includes pre-service evaluation work for evaluation using a 3D-printed model of the heart which requires additional pre-service evaluation time. If a CPT code is created in the future which would enable this service to be separately reported, then 33894 should be re-reviewed.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Cardiovascular System** **Heart and Pericardium** **Endovascular Repair of Descending Thoracic Aorta** *Codes 33880-33891 represent a family of procedures to report placement of an endovascular graft for repair of the descending thoracic aorta. These codes include all device introduction, manipulation, positioning, and deployment. All balloon angioplasty and/or stent deployment within the target treatment zone for the endoprosthesis, either before or after endograft deployment, are not separately reportable.* *Open arterial exposure and associated closure of the arteriotomy sites (eg, 34714, 34715, 34716, 34812, 34820, 34833, 34834), introduction of guidewires and catheters (eg, 36140, 36200-36218), and extensive repair or replacement of an artery (eg, 35226, 35286) may be additionally reported. Transposition of subclavian artery to carotid, and carotid-carotid bypass performed in conjunction with endovascular repair of the descending thoracic aorta (eg, 33889, 33891) may be separately reported. The primary codes, 33880 and 33881, include placement of all distal extensions, if required, in the distal thoracic aorta, while proximal extensions, if needed, may be reported separately.* *For fluoroscopic guidance in conjunction with endovascular repair of the thoracic aorta, see codes 75956-75959 as appropriate. Codes 75956 and 75957 include all angiography of the thoracic aorta and its branches for diagnostic imaging prior to deployment of the primary endovascular devices (including all routine components of modular devices), fluoroscopic guidance in the delivery of the endovascular components, and intraprocedural arterial angiography (eg, confirm position, detect endoleak, evaluate runoff). Code 75958 includes the analogous services for placement of each proximal thoracic endovascular extension. Code 75959 includes the analogous services for placement of a distal thoracic endovascular extension(s) placed during a procedure after the primary repair.*			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Other interventional procedures performed at the time of endovascular repair of the descending thoracic aorta should be additionally reported (eg, innominate, carotid, subclavian, visceral, or iliac artery transluminal angioplasty or stenting, arterial embolization, intravascular ultrasound) when performed before or after deployment of the aortic prostheses.

For endovascular stenting or balloon angioplasty of congenital coarctation or postsurgical recoarctation of the ascending, transverse, or descending thoracic or abdominal aorta, see 33894, 33895, 33897.

33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption);involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin*

(For radiological supervision and interpretation, use 75956 in conjunction with 33880)

Endovascular Repair of Congenital Heart and Vascular Defects

Codes 33894, 33895, 33897 describe transcatheter interventions for revascularization or repair for coarctation of the aorta. Code 33897 describes dilation of the coarctation using balloon angioplasty without stent placement. Codes 33894, 33895 describe stent placement to treat the coarctation. The procedure described in 33894 involves stent placement across one or more major side branches of the aorta. For reporting purposes, the major side branches of the thoracic aorta are the brachiocephalic, carotid, and subclavian arteries, and the major side branches of the abdominal aorta are the celiac, superior mesenteric, inferior mesenteric, and renal arteries.

Codes 33894, 33895, 33897 include all fluoroscopic guidance of the intervention, diagnostic congenital left heart catheterization, all catheter and wire introductions and manipulation, and angiography of the target lesion.

Codes 33894, 33895 include stent introduction, manipulation, positioning, and deployment, temporary pacemaker insertion for rapid pacing (33210) to facilitate stent positioning when performed, as well as any additional stent delivery in tandem with the initial stent for extension purposes. Balloon angioplasty within the target treatment zone, either before or after stent deployment, is not separately reportable. For balloon angioplasty of an additional coarctation of the aorta in a segment separate from the treatment zone for the coarctation stent, use 33897.

For balloon angioplasty of the aorta for lesions other than coarctation (eg, atherosclerosis) of the aorta in a segment separate from the coarctation treatment zone, use 37246.

For additional diagnostic right heart catheterization in the same setting as 33894, 33895, see *93X1X, 93X2X.*

Other interventional procedures performed at the time of endovascular repair of coarctation of the aorta (33894, 33895) may be separately reported (eg, innominate, carotid, subclavian, visceral, iliac, or pulmonary artery balloon angioplasty or stenting, arterial or venous embolization), when performed before or after coarctation stent deployment.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●33894	L1	Endovascular stent repair of coarctation of the ascending, transverse, or descending thoracic or abdominal aorta, involving stent placement; across major side branches	000	21.70
●33895	L2	not crossing major side branches (Do not report 33894, 33895 in conjunction with 33210, 34701, 34702, 34703, 34704, 34705, 34706, 36200, 75600, 75605, 75625, 93567, 93595, 93596, 93597) (Do not report 33894, 33895 in conjunction with 37246, 37236, 33897 for balloon angioplasty of the aorta within the coarctation stent treatment zone) (For additional atrial, ventricular, pulmonary, coronary or bypass graft angiography in the same setting, see 93563, 93564, 93565, 93566, 93568) (For angiography of other vascular structures, use the appropriate code from the Radiology/Diagnostic Radiology section) (For additional congenital right heart catheterization at same setting as 33894, 33895, see 93593, 93594)	000	17.97
●33897	L3	Percutaneous transluminal angioplasty of native or recurrent coarctation of the aorta (Do not report 33897 in conjunction with 33210, 34701, 34702, 34703, 34704, 34705, 34706, 36200, 37236, 37246, 75600, 75605, 75625, 93567, 93595, 93596, 93597) (Do not report 33897 in conjunction with 33894, 33895 for balloon angioplasty of the aorta within the coarctation stent treatment zone) (For additional congenital right heart diagnostic catheterization performed in same setting as 33897, see 93593, 93594) (For angioplasty and other transcatheter revascularization interventions of additional upper or lower extremity vessels in same setting, use the appropriate code from the Surgery/Cardiovascular System section)	000	14.00

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33894 Tracking Number L1 Original Specialty Recommended RVU: **23.30**
Presented Recommended RVU: **23.30**
Global Period: 000 Current Work RVU: **N/A** RUC Recommended RVU: **21.70**

CPT Descriptor: Endovascular stent repair of coarctation of the ascending, transverse, or descending thoracic or abdominal aorta, involving stent placement; across major side branches

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 4-year-old male with hypoplastic left heart syndrome and prior history of Norwood arch reconstruction is suspected of having complex transverse arch coarctation of the surgical site. He is brought to the cardiac catheterization lab for further diagnostic evaluation and to identify if it meets criteria for intervention, and possible treatment with percutaneous stent placement.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review of noninvasive work-up including echocardiogram, CXR, EKG, cardiac CT, or cardiac MRI. Use of 3D printed model obtained from prior cardiac MRI to simulate and plan for stent positioning and plan for appropriate equipment (catheters and wires) which will be needed. Evaluate the 3-D volume set to determine optimal projection angles to be used on biplane catheterization lab for stent implant, with particular attention to the position of the subclavian and carotid artery origins. Based on available information, determine all potential components required for the procedure plus contingencies and backups such as available stent sizes and alternatives. Perform and document a complete and/or interval history and physical exam. Provide a description of the procedure and expected results to the parents of the patient, a description of potential hazards and signature of informed consent for the procedure. Acquaint the patient or parents with the catheterization laboratory (this is standard for pediatric population to help parents with the anxiety of the procedure). Supervise the administration of anxiolysis, when necessary. Conduct final procedural coordination with technicians, nurses, and the anesthesiology team. Don surgical scrubs & lead. Position patient and prep, scrub, drape and wait.

Description of Intra-Service Work: Conduct under general anesthesia and under fluoroscopic guidance. Lidocaine is applied for local analgesia. Access is obtained percutaneously, typically into the femoral vein and artery. Additional arterial access is often also obtained in the radial, brachial, or axillary artery for simultaneous pre and post coarctation pressure evaluation during the procedure. A sheath is initially placed in the femoral vein and artery to establish secure access. Intravenous heparin is administered to achieve therapeutic anticoagulation. The activated clotting time is monitored thereafter and additional Heparin administered, as needed. A pacing catheter is passed through the venous sheath and positioned in the right ventricle for purpose of trans-venous pacing during stent delivery. Typically, a Pigtail catheter is introduced through the arterial sheath and manipulated into the descending aorta, ascending aorta, and across the aortic valve into the left ventricle. Baseline pressures may be recorded and blood sampling may be conducted in each of these locations to be used for hemodynamic calculations. Often, the coarctation is so severe; the Pigtail catheter must be exchanged for another end-hole catheter and specialty wire to cross the severe stenosis. Once the wire is across the stenosis, multiple catheter and wire exchanges are required between the end-hole catheter and angiographic catheter to obtain hemodynamic data and perform all necessary angiograms. Multiple angiograms must often be performed to clearly

delineate the lesion, with particular attention paid to the origins of the subclavian and carotid arteries. The procedure may involve stenting across either only select head and neck vessels, or the entire transverse aorta, and careful evaluation of all branches is crucial. Measurements of the lesion as well as healthy vessel are made from the angiograms, which are used for appropriate stent selection. The diagnostic catheter is used to secure wire position with a more rigid interventional guide wire needed to support balloons and stent delivery. Preparation and de-airing of the appropriately sized balloon is performed. The stent is prepared and mounted on the balloon catheter. The short access sheath in the artery is replaced over the wire for a larger and longer sheath, which is advanced across the lesion. The dilator is removed and the sheath allowed to bleed back, and flushed. The balloon with mounted stent is advanced over the wire into position across the coarctation. Repeated angiograms are periodically performed through the side port to evaluate proper positioning and make adjustments. Once in the appropriate position, the sheath is pulled back, fully exposing the stent and balloon. Trans-venous cardiac pacing is initiated to decrease the cardiac output and pulsatility in the aorta. The anesthesiologist is instructed to hold mechanical ventilation temporarily to minimize respiratory variation in the position of the stent on fluoroscopy. The stent is deployed by inflation of the delivery balloon(s). Mechanical ventilation is resumed and cardiac pacing is discontinued. The delivery balloon is removed and another appropriately sized balloon is inserted to fully expand and seat the stent (not additionally reportable). Post procedure angiography is performed to assess post procedural success. Deployment of a second stent to extend the initial stent length may be necessary, requires repeating all the above steps, and is not additionally reportable. All catheters and sheaths are removed and either manual compression or closure device is used to achieve hemostasis prior to transfer to recovery. Adequate circulation distal to the arterial access site is ensured prior to transfer to recovery area.

Description of Post-Service Work: Following catheterization, a brief procedure note is documented in the medical record. Once hemostasis of the catheterization sites has been ensured, the patient is transported to the appropriate recovery area and a verbal report given to the accepting team. Medication reconciliation is performed in the EMR and post procedure orders are placed for nursing care. A detailed report is documented which includes an anatomically correct diagram of the congenital heart defects, detailed description of the procedure performed, calculations and interpretation of all the hemodynamic data obtained, review and radiologic interpretation of the angiograms, and complete listing and discussion of the findings, and recommendations of each. All necessary data is then also entered into the appropriate national registry, as available/appropriate. There is at least one physician bedside visit to assess the patient, including catheterization sites, discuss the findings with the patient and/or family, and go over discharge and follow up instructions prior to discharge, or to communicate any other instructions with the intensive care team, as may be appropriate

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	8%	17%	58%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	33%	59%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	16%	42%	42%
Physical effort required	8%	67%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	17%	83%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	11%	56%	22%	11%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	22%	34%	44%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	44%	34%	22%
Physical effort required	56%	22%	22%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	11%	78%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History and Background

Coarctation of the aorta occurs in 6% to 8% of patients with congenital heart disease and is commonly associated with other intracardiac pathology. When uncorrected, coarctation of the aorta is associated with reduced life expectancy secondary to heart failure, rupture of associated aortic aneurysm or cerebral aneurysm, and infective endocarditis. Coarctation in infancy is usually a catastrophic illness and is associated with congestive heart failure, demanding

immediate and aggressive treatment. there is currently no way in CPT to track patients undergoing endovascular repair of coarctation of the aorta due to the large number of patients treated for other pathologies with any of the existing codes that are used to report this work. In October 2020, the ACC and SCAI presented a code change application to the CPT Editorial Panel: Codes **33894**, 33895 33897. These new codes describe transcatheter interventions for revascularization or repair for coarctation of the aorta. Code 33897 describes dilation of the coarctation using balloon angioplasty without stent placement. Codes 33894, 33895 describe stent placement to treat the coarctation. **The procedure described in 33894 involves stent placement across one or more major side branches of the aorta. For reporting purposes, the major side branches of the thoracic aorta are the brachiocephalic, carotid, and subclavian arteries, and the major side branches of the abdominal aorta are the celiac, superior mesenteric, inferior mesenteric, and renal arteries.**

The ACC and SCAI randomly surveyed interventional pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The 000-global day survey was completed by physicians who have experience with the service. This is the first of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 93581 for percutaneous transcatheter closure of a congenital ventricular septal defect with implant. It was selected by 29% of respondents. Three quarters of the respondents indicated that 33894 was more complex. The second reference code was 33477 for transcatheter pulmonary valve implantation. It was selected by approximately 22% of respondents. About 30% of the respondents indicated that 33894 was more intense/complex overall.

Preservice and Postservice Time

The societies recommend the complete preservice time from the survey, adding 30 minutes to evaluation, 12 minutes for positioning, and reducing the SDW time by 5 minutes comporting with the survey. As explained with other pediatric/congenital percutaneous transcatheter services in recent meetings, additional time beyond the normal adult package is spent reviewing imaging and preparing products/devices for the procedure. With 33894, this includes evaluation using a 3D-printed model of the heart. Time to discuss a patient's procedure with the parent also takes considerably more time as compared to discussing with an adult patient consenting for themselves. This same problem is further involved in the post procedure segment of work in having to explain the pathology of the child to the parent. As a national standard, congenital heart programs are now also required to enter hemodynamic data and other procedural details into national registries such as IMPACT, which can also add significant post procedure work time. Longer positioning time is necessary for pediatric patients.

The societies also recommend the complete post-service time from the survey as we believe it correctly captures additional time that is typically spent to monitor patient recovery/stabilization, speak with the family who are typically parents concerned about their young child, and complete post-operative note. Package 9B with the placement of these additional minutes is presented below.

	9B General Anesthesia or Complex Regional Block/Complex Procedure	
Total Post-Service Time	**60**	
Details:		
Application of Dressing[1]	2	
Transfer of supine patient off table	1	+2
Operative Note	5	
Monitor patient recovery/stabilization	10	
Communication with patient and/or family	5	+10
Written post-operative note	5	+15
Post-Operative Orders and Order Entry	5	

Recommendation

Therefore, for code 338X the **societies recommend an RVW of 23.30 with 100 minutes preservice time, 134 minutes intraservice time from the survey median, and 60 minutes postservice time**. This aligns with the KRS, which survey

respondents felt was less intense than 33894; 93581 has a longer intraservice time, shorter total time than our recommended times for 33894, and lower IWPUT. Finally, this service compares to 93590 for repair of a paravalvular leak, as shown in the summary spreadsheet, which has a nearly identical intraservice time, shorter total time, and lower work RVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799 or 93799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty pediatric interventional cardiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 320
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Coarctation of the aorta comprises 5% to 8% of all congenital heart defects. With an estimated annual birth rate of between 3.8 to 4 million per year, and a rate of congenital heart disease at a fixed 1% of total births, the prevalence of disease can be estimated at between 1900 to 3200 cases per year. Stents with side branches are roughly 10% of these procedures.

Specialty pediatric interventional cardiology Frequency 320 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. should only be pediatric procedures

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93530

CPT Descriptor: Endovascular stent repair of coarctation of the ascending, transverse, or descending thoracic or abdominal aorta, involving stent placement; not crossing major side branches

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 16-year-old male with hypertension is found to have severe native coarctation of the aorta by echocardiography and/or CT angiogram. He is brought to the cardiac catheterization lab for further diagnostic evaluation to identify if it meets criteria for intervention, and possible repair with percutaneous stent placement.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review of noninvasive work-up including echocardiogram, CXR, EKG, cardiac CT or MRI, or any other pertinent studies. Based on available information, determine all potential components required for the procedure plus contingencies and backups. Perform and document a complete and/or interval history and physical exam. Provide a description of the procedure and expected results to the parents of the patient, a description of potential hazards and signature of informed consent for the procedure. Acquaint the patient or parents with the catheterization laboratory. Supervise the administration of anxiolysis, when necessary. Conduct final procedural coordination with technicians, nurses, and the anesthesiology team. Don surgical scrubs & lead. Position patient. Prep, scrub, drape and wait.

Description of Intra-Service Work: Procedure is conducted under general anesthesia. All steps are performed under fluoroscopic guidance. Lidocaine is administered for local analgesia. Access is obtained percutaneously, typically into the femoral vein and artery. Additional arterial access is often also obtained in the radial, brachial, or axillary artery for simultaneous pre and post coarctation pressure evaluation during the procedure. A sheath is initially placed in the femoral vein and artery to establish secure access. Intravenous heparin is administered to achieve therapeutic anticoagulation. The activated clotting time is monitored thereafter and additional Heparin administered, as needed. A pacing catheter is passed through the venous sheath and positioned in the right ventricle for purpose of temporary trans-venous pacing during stent delivery. Typically a Pigtail catheter is introduced through the arterial sheath and manipulated into the descending aorta, ascending aorta, and across the aortic valve into the left ventricle. Baseline pressures may be recorded and blood sampling may be conducted in each of these locations to be used for hemodynamic calculations. Often, the coarctation is so severe; the Pigtail catheter must be exchanged for another end-hole catheter and specialty wire to cross the severe stenosis. Once the wire is across the stenosis, multiple catheter and wire exchanges are required between the end-hole catheter and angiographic catheter to obtain hemodynamic data and perform all necessary angiograms. Multiple angiograms must often be performed above and below the lesion to identify the complete anatomy. Measurements of the lesion as well as healthy vessel are made from the angiograms, which are used for appropriate stent selection. A diagnostic guide catheter is used to secure wire position with a more rigid interventional guide wire needed to support balloons and stent delivery. Preparation and de-airing of the appropriately sized balloon is performed. The stent is prepared and mounted on the balloon catheter. The short access sheath in the artery is replaced over the wire for a larger and longer sheath, which is advanced across the lesion. The dilator is removed and the sheath allowed to bleed back, and flushed. The balloon with mounted stent is

advanced over the wire into position across the coarctation. Repeated angiograms are performed through the long sheath side port or from an additional arterial access site to evaluate proper positioning and make adjustments, and ensure the stent will not encroach on the origins of any vital side branches. Once in the appropriate position, the sheath is pulled back, fully exposing the stent and balloon. The anesthesiologist is instructed to hold mechanical ventilation to minimize stent position movement on fluoroscopy. Rapid trans-venous cardiac pacing is initiated to reduce aortic pulsatility and cardiac output. The stent is deployed by inflation of the delivery balloon(s). Mechanical ventilation is resumed and cardiac pacing is discontinued. The balloon is deflated and repositioned slightly and a second inflation typically performed. The delivery balloon is removed and another appropriately sized balloon is inserted to fully expand and seat the stent (not additionally reportable). Post procedure angiography is performed to assess post procedural success. Deployment of a second stent to extend the initial stent length may be necessary, requires repeating all the above steps, and is not additionally reportable. All catheters and sheaths are removed and either manual compression or closure device is used to achieve hemostasis prior to transfer to recovery. Adequate circulation distal to the arterial access site is ensured prior to transfer to recovery area.

Description of Post-Service Work: Following catheterization, a brief procedure note is documented in the medical record. Once hemostasis of the catheterization sites has been ensured, the patient is transported to the appropriate recovery area and a verbal report given to the accepting team. Medication reconciliation is performed in the EMR and post procedure orders are placed for nursing care. A detailed report is documented which includes an anatomically correct diagram of the congenital heart defects, detailed description of the procedure performed, calculations and interpretation of all the hemodynamic data obtained, review and radiologic interpretation of the angiograms, and complete listing and discussion of the findings, and recommendations of each. All necessary data is then also entered into the appropriate national registry, as available/appropriate. There is at least one physician bedside visit to assess the patient, including catheterization sites, discuss the findings with the patient and/or family, and go over discharge and follow up instructions prior to discharge, or to communicate any other instructions with the intensive care team, as may be appropriate

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	14%	86%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History and Background

Coarctation of the aorta occurs in 6% to 8% of patients with congenital heart disease and is commonly associated with other intracardiac pathology. When uncorrected, coarctation of the aorta is associated with reduced life expectancy secondary to heart failure, rupture of associated aortic aneurysm or cerebral aneurysm, and infective endocarditis. Coarctation in infancy is usually a catastrophic illness and is associated with congestive heart failure, demanding

immediate and aggressive treatment. there is currently no way in CPT to track patients undergoing endovascular repair of coarctation of the aorta due to the large number of patients treated for other pathologies with any of the existing codes that are used to report this work. In October 2020, the ACC and SCAI presented a code change application to the CPT Editorial Panel: Codes 33894, **33895**, 33897. These new codes describe transcatheter interventions for revascularization or repair for coarctation of the aorta. Codes 33894, **33895** include stent introduction, manipulation, positioning, and deployment, temporary pacemaker insertion for rapid pacing (33210) to facilitate stent positioning when performed, as well as any additional stent delivery in tandem with the initial stent for extension purposes. Balloon angioplasty within the target treatment zone, either before or after stent deployment, is not separately reportable.

Other interventional procedures performed at the time of endovascular repair of coarctation of the aorta (33894, **33895**) may be separately reported (eg, innominate, carotid, subclavian, visceral, iliac, or pulmonary artery balloon angioplasty or stenting, arterial or venous embolization), when performed before or after coarctation stent deployment.

The ACC and SCAI randomly surveyed pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The 000-global day survey was completed by physicians who have experience with the service. This is the second of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 93590 for percutaneous transcatheter closure of paravalvular leak. It was selected by 24% of respondents. 40% respondents indicated that 33895 was more complex. The second reference code was 93580 for Percutaneous transcatheter closure of congenital interatrial communication. It was selected by approximately 17% of respondents. About 86% of the respondents indicated that 33895 was more intense/complex overall.

Preservice and Postservice Time

The societies recommend additional preservice time from the survey, adding 10 minutes to evaluation, 12 minutes for positioning, and reducing the SDW time by 5 minutes comporting with the survey. As explained with other pediatric/congenital percutaneous transcatheter services in recent meetings, additional time beyond the normal adult package is spent reviewing imaging and preparing products/devices for the procedure. Time to discuss a patient's procedure with the parent also takes considerably more time as compared to discussing with an adult patient consenting for themselves. This same problem is further involved in the post procedure segment of work in having to explain the pathology of the child to the parent. As a national standard, congenital heart programs are now also required to enter hemodynamic data and other procedural details into national registries such as IMPACT, which can also add significant post procedure work time. Longer positioning time is necessary for pediatric patients.

The societies recommending the complete post-service time from the survey as we believe it correctly captures additional time that is typically spent to monitor patient recovery/stabilization, speak with the family who are typically parents concerned about their teenager, and complete post-operative note. Package 9B with the placement of these additional minutes is presented below.

	9B General Anesthesia or Complex Regional Block/Complex Procedure	
Total Post-Service Time	**60**	
Details:		
Application of Dressing[1]	2	
Transfer of supine patient off table	1	+2
Operative Note	5	
Monitor patient recovery/stabilization	10	
Communication with patient and/or family	5	+10
Written post-operative note	5	+15
Post-Operative Orders and Order Entry	5	

Recommendation

Therefore, for code 338X the **societies recommend an RVW of 20.00 with 80 minutes preservice time, 120 minutes intraservice time from the survey median, and 60 minutes postservice time**. This aligns with the KRS, which survey respondents felt was close in intensity to 33895; 93590 has a longer intraservice time, shorter total time than our recommended times for 33895, and barely higher IWPUT.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799 or 93799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty pediatric interventional cardiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1920
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Coarctation of the aorta comprises 5% to 8% of all congenital heart defects. With an estimated annual birth rate of between 3.8 to 4 million per year, and a rate of congenital heart disease at a fixed 1% of total births, the prevalence of disease can be estimated at between 1900 to 3200 cases per year. Stents without side branches are roughly 60% of these procedures.

Specialty pediatric interventional cardiologists Frequency 1920 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. should be only pediatric procedures

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

CPT Descriptor: Percutaneous transluminal angioplasty of native or recurrent coarctation of the aorta

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2-year-old female with prior surgical repair of coarctation of the aorta in infancy is suspected to have recurrent coarctation of the aorta by echocardiography and physical exam. She is brought to the cardiac catheterization lab for further diagnostic evaluation to identify if she meets criteria for intervention, and possible percutaneous angioplasty of the aorta.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review of noninvasive work-up including echocardiogram, CXR, EKG, cardiac CT or MRI, or any other pertinent studies. Based on available information, determine all potential components required for the procedure plus contingencies and backups. Perform and document a complete and/or interval history and physical exam. Provide a description of the procedure and expected results to the parents of the patient, a description of potential hazards and signature of informed consent for the procedure. Acquaint the patient or parents with the catheterization laboratory. Supervise the administration of anxiolysis, when necessary. Conduct final procedural coordination with technicians, nurses, and the anesthesiology team. Don surgical scrubs & lead. Position patient. Prep, scrub, drape and wait.

Description of Intra-Service Work: Procedure is conducted under general anesthesia. All steps are performed under fluoroscopic guidance. Local anesthetic is applied to the access site. Access is obtained percutaneously, typically into the femoral artery and vein. Additional arterial monitoring may also be performed from the radial artery for simultaneous pre and post coarctation pressure evaluation. For neonates, this additional access is typically obtained in the common carotid artery. A sheath is initially placed in the vein and artery to establish secure access. Intravenous heparin is administered to achieve therapeutic anticoagulation. The activated clotting time is monitored thereafter and additional Heparin administered, as needed. Venous access is typically obtained for either resuscitation purposes for emergent situations, or for trans-venous ventricular pacing, when performed. Typically a Pigtail catheter is introduced through the arterial sheath and manipulated into the descending aorta, ascending aorta, and across the aortic valve into the left ventricle. Baseline pressures may be recorded and blood sampling may be conducted in each of these locations to be used for hemodynamic calculations. Often, the coarctation is so severe; the Pigtail catheter must be exchanged for another end-hole catheter and specialty wire to cross the severe stenosis. Multiple exchanges are often required between the Pigtail catheter and end-hole catheter to obtain hemodynamic data and perform all necessary angiograms. Multiple angiograms of the aorta must often be performed above and below the lesion to identify the complete anatomy. Measurements of the lesion as well as healthy vessel are made from the angiograms, which are used for appropriate balloon selection. A diagnostic guide catheter is used to secure wire position with a more rigid guide wire needed to support the balloons. Preparation and de-airing of the appropriately sized balloon is performed. The sheath in the artery is exchanged for a larger sheath to accommodate the angioplasty balloon. The balloon is advanced over the wire into position across the coarctation. Once in the appropriate position, the balloon is inflated to the appropriate pressure. The balloon catheter position is often adjusted slightly and a

repeat inflation performed. The balloon is removed and post angioplasty angiograms performed from multiple angles to closely examine for the presence of any vascular injury. Hemodynamic evaluation is repeated to assess post procedural success. It is often necessary to repeat this process with a larger balloon to achieve optimal success, and not additionally reportable. All catheters and sheaths are removed and manual compression is used to achieve hemostasis prior to transfer to recovery. Adequate circulation distal to the arterial access site is ensured prior to transfer to recovery area.

Description of Post-Service Work: Following catheterization, a brief procedure note is documented in the medical record. Once hemostasis of the catheterization sites has been ensured, the patient is transported to the appropriate recovery area and a verbal report given to the accepting team. Medication reconciliation is performed in the EMR and post procedure orders are placed for nursing care. A detailed report is documented which includes an anatomically correct diagram of the congenital heart defects, detailed description of the procedure performed, calculations and interpretation of all the hemodynamic data obtained, review and radiologic interpretation of the angiograms, and complete listing and discussion of the findings, and recommendations of each. All necessary data is then also entered into the appropriate national registry, as available/appropriate. There is at least one physician bedside visit to assess the patient, including catheterization sites, discuss the findings with the patient and/or family, and go over discharge and follow up instructions prior to discharge, or to communicate any other instructions with the intensive care team, as may be appropriate

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	8%	38%	54%	0%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	8%	38%	54%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	23%	54%	23%
Physical effort required	23%	54%	23%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	31%	69%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	20%	40%	20%	0%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	60%	40%	0%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	60%	20%	20%
Physical effort required	60%	20%	20%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	60%	20%	20%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

History and Background

Coarctation of the aorta occurs in 6% to 8% of patients with congenital heart disease and is commonly associated with other intracardiac pathology. When uncorrected, coarctation of the aorta is associated with reduced life expectancy secondary to heart failure, rupture of associated aortic aneurysm or cerebral aneurysm, and infective endocarditis. Coarctation in infancy is usually a catastrophic illness and is associated with congestive heart failure, demanding

immediate and aggressive treatment. there is currently no way in CPT to track patients undergoing endovascular repair of coarctation of the aorta due to the large number of patients treated for other pathologies with any of the existing codes that are used to report this work. In October 2020, the ACC and SCAI presented a code change application to the CPT Editorial Panel: Codes 33894, 33895, **33897.** These new codes describe transcatheter interventions for revascularization or repair for coarctation of the aorta. Code 33897 describes dilation of the coarctation using balloon angioplasty without stent placement. Codes 33894, 33895 describe stent placement to treat the coarctation. **For balloon angioplasty of an additional coarctation of the aorta in a segment separate from the treatment zone for the coarctation stent, use 33897.**

The ACC and SCAI randomly surveyed interventional cardiologists and pediatric interventional cardiologists, as designated by membership rolls, on the newly created codes. The 000-global day survey was completed by physicians who have experience with the service. This is the last of three new codes to report endovascular repair of aortic coarctation.

The key reference code is 93580 for percutaneous transcatheter closure of a congenital interatrial communication. It was selected by approximately 32% of respondents. 54% of the respondents indicated that 33897 was more complex. The second reference code was 93590 for percutaneous transcatheter closure of paravalvular leak. It was selected by approximately 12% of respondents. About 20% of the respondents indicated that 33894 was more intense/complex overall.

Preservice and Postservice Time

The societies recommend additional preservice time from the survey, adding 10 minutes to evaluation, 12 minutes for positioning, and reducing the SDW time by 5 minutes comporting with the survey. As explained with other pediatric/congenital percutaneous transcatheter services in recent meetings, additional time beyond the normal adult package is spent reviewing imaging and preparing products/devices for the procedure. Time to discuss a patient's procedure with the parent also takes considerably more time as compared to discussing with an adult patient consenting for themselves. This same problem is further involved in the post procedure segment of work in having to explain the pathology of the child to the parent. As a national standard, congenital heart programs are now also required to enter hemodynamic data and other procedural details into national registries such as IMPACT, which can also add significant post procedure work time. Longer positioning time is necessary for pediatric patients.

The societies recommending the complete post-service time from the survey as we believe it correctly captures additional time that is typically spent to monitor patient recovery/stabilization, speak with the family who are typically parents concerned about their young child, and complete post-operative note. Package 9B with the placement of these additional minutes is presented below.

	9B General Anesthesia or Complex Regional Block/Complex Procedure	
Total Post-Service Time	**60**	
Details:		
Application of Dressing[1]	2	
Transfer of supine patient off table	1	+2
Operative Note	5	
Monitor patient recovery/stabilization	10	
Communication with patient and/or family	5	+10
Written post-operative note	5	+15
Post-Operative Orders and Order Entry	5	

Recommendation

Therefore, for code 33897 the **societies recommend the survey median RVW of 17.00 with 80 minutes preservice time, 90 minutes intraservice time from the survey median, and 60 minutes postservice time**. This aligns with the KRS,

which survey respondents felt was less intense than 33897; 93580 has a longer intraservice time, shorter total time than our recommended times for 33897, and lower IWPUT.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799 or 93799

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty peditric interventional cardiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 960
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. Coarctation of the aorta comprises 5% to 8% of all congenital heart defects. With an estimated annual birth rate of between 3.8 to 4 million per year, and a rate of congenital heart disease at a fixed 1% of total births, the prevalence of disease can be estimated at between 1900 to 3200 cases per year. Balloon-only cases are roughly 30% of these procedures.

Specialty pediatric interventional cardiology Frequency 960 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. should only be pediatric procedures

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Cardiovascular-Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93530

Scott Manaker, MD
AMA/RVS Update PE Subcommittee
American Medical Association
330 N. Wabash Ave.
Chicago, IL 60611

RE: Tab 8 Endovascular Repair of Aortic Coarctation Practice Expense

Dear Dr. Manaker:

Tab 8 on the January 2021 RUC agenda addresses three new codes, which describe transcatheter interventions for revascularization or repair for coarctation of the aorta. These services are provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 8.

Thank you for your consideration of this information as you prepare for the meeting. Please contact Claudia Vasquez at cvasquez@acc.org if you have any questions.

Sincerely,

Richard Wright, MD
ACC RUC Advisor

Edward Toggart, MD
SCAI RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Harvest of Upper Extremity Artery, Endoscopic and Open – Tab 9

In May 2020, the CPT Editorial Panel created CPT code 33509 harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure, endoscopic to describe endoscopic radial artery harvest via an endoscopic approach and CPT code 35600 *Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure, open* was modified to only include an open approach for the upper extremity harvesting procedure.

At the October 2020 RUC meeting, the specialty societies explained that the rationale for assigning these services an XXX global period instead of a ZZZ, even though the service is almost exclusively performed in conjunction with an arterial coronary artery bypass grafting (CABG) procedure (CPT codes 33533 – 33536), is that an XXX global would allow the individual that performs the harvest of upper extremity artery procedure (often separate from the surgeon performing the base CABG procedure) to report it under their National Provider Identifier (NPI) number. It was noted that it is often a Nurse Practitioner (NP) or Physician's Assistant (PA) who performs the harvest procedure. The RUC agreed that since NPs and PAs were not included in the survey sample for the October 2020 meeting survey process, it would be appropriate to assign 33509 and 35600 interim values and to request for them to be resurveyed for the January 2021 RUC meeting to include these providers who are potentially the dominant providers.

During their January 2021 presentation, the specialty societies noted that the radial artery is typically used in situations where a patient is undergoing a re-operative CABG procedure where the intrathoracic arteries have already been used and/or in patients with limited saphenous vein conduit available due to prior use in peripheral vascular disease operations or use in a previous CABG procedure. Recent studies appear to indicate that use of radial-artery grafts for CABG may result in better postoperative outcomes than the use of saphenous-vein grafts. As a result of these circumstances, use of the radial artery in CABG has been increasing. Originally the radial artery was harvested using an open technique, but with technological advances, it is now possible to harvest the radial artery using an endoscopic technique and this method of harvest, where available, is now the preferred method for harvesting the radial artery.

33509 ***Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure, endoscopic***
The RUC reviewed the specialty societies' recommended work RVU at the survey 25th percentile of 3.75 from 84 cardiothoracic surgeons, cardiothoracic and cardiovascular surgical physician assistants and nurse practitioners, and concurred that the survey respondents appropriately valued the work involved in performing this service. The RUC recommends an intra-service time of 35 minutes for CPT code 33509.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialty societies explained the rationale for assigning this service an XXX global period instead of a ZZZ add-on code, even though the service is almost exclusively performed in conjunction with an arterial CABG procedure (CPT codes 33533 – 33536), is that an XXX global would allow the individual that performs the harvest of upper extremity artery procedure (often separate from the surgeon performing the base CABG procedure) to report it under their NPI number.

To justify a value of 3.75, the RUC compared the survey code to CPT code 36228 *Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure)* (work RVU= 4.25 and intra-service time of 30 minutes) and noted that although the reference code includes less physician time, it is a relatively more intense service to perform, supporting a somewhat lower value for the survey code. The RUC also compared the survey code to CPT code 22512 *Percutaneous vertebroplasty (bone biopsy included when performed), 1 vertebral body, unilateral or bilateral injection, inclusive of all imaging guidance; each additional cervicothoracic or lumbosacral vertebral body (List separately in addition to code for primary procedure)* (work RVU= 4.00, intra-service time of 30 minutes, total time of 32 minutes) and noted that the survey code involves somewhat more intra-service and total time but is slightly less intense to perform, supporting a work value of 3.75 for the survey code. **The RUC recommends a work RVU of 3.75 for CPT code 33509.**

35600 ***Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure, open***
The RUC reviewed the specialty societies' recommended work RVU at the survey 25th percentile of 4.00 from 72 cardiothoracic surgeons, cardiothoracic and cardiovascular surgical physician assistants and nurse practitioners, and concurred that the survey respondents appropriately valued the work involved in performing this service. The RUC recommends intra-service time of 40 minutes for CPT code 35600. The specialties explained that the open approach for harvesting an upper extremity artery involves somewhat more time relative to the endoscopic approach.

The specialty societies explained that the rationale for assigning this service an XXX global period instead of a ZZZ add-on code, even though the service is almost exclusively performed in conjunction with an arterial CABG procedure (CPT codes 33533 – 33536), is that an XXX global would allow the individual that performs the harvest of upper extremity artery procedure (often separate from the surgeon performing the base CABG procedure) to report it under their NPI number.

The RUC compared the survey code to MPC code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 4.13, intra-service and total time of 40 minutes) and noted that both services involve an identical amount of time and are both major surgical procedure add-on services for accessing an artery via an open approach. The RUC also compared the survey code to CPT code 36908 *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service and total time of 40 minutes) and noted that both services involve identical times. **The RUC recommends a work RVU of 4.00 for CPT code 35600.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
No direct practice expense inputs are recommended for CPT codes 33509 and 35600 **as they are facility-only services.**

Modifier-51 Exempt Status
CPT codes 33509 and 35600 are recommended to be placed on the Modifier -51 Exempt list, as these services are performed a large majority of the time with a coronary artery bypass procedure, though typically it is a separate provider (such as an NP or PA) that is performing the harvest of upper extremity artery procedure and therefore would be reporting 33509 or 35600 as a standalone code on a separate claim.

New Technology
CPT codes 33509 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

RUC Database Flag
CPT codes 35600 and 33509 are performed a large majority of the time with a coronary artery bypass procedure, though typically it is a separate provider (such as an NP or PA) that is performing the harvest of upper extremity artery procedure and therefore would be reporting 33509 or 35600 as a standalone code on a separate claim. Due to this, these services were valued like add-on codes, though can be separately reported and may include some physician work related to patient evaluation within the intra-service time. The RUC notes that they should be flagged as "**Do not use to validate for physician work."**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Cardiovascular System** **Heart and Pericardium** **Endoscopy**				
To report endoscopic harvesting of a vein for coronary artery bypass procedure, use 33508 in addition to the code for the associated bypass procedure. To report endoscopic harvesting of an upper extremity artery for a bypass procedure, use 33509. *Surgical vascular endoscopy always includes diagnostic endoscopy.*

Heart and Pericardium
Combined Arterial-Venous Grafting for Coronary Bypass

The following codes …

To report combined arterial-venous …

Procurement of the saphenous vein graft is included in the description of the work for 33517-33523 and should not be reported as a separate service or co-surgery. Procurement of the artery for grafting is included in the description of the work for 33533-33536 and should not be reported as a separate service or co-surgery, except when an upper extremity artery (eg, radial artery) is procured. To report harvesting of an upper extremity artery, use 33509 or 35600 ~~in addition to the bypass procedure~~. To report harvesting of an upper extremity vein, use 35500 in addition to the bypass procedure. To report harvesting of a femoropopliteal vein segment, report 35572 in addition to the bypass procedure. When surgical assistant performs arterial and/or venous graft procurement, add modifier 80 to 33517-33523, 33533-33536, as appropriate. For percutaneous ventricular assist device insertion, removal, repositioning, see *~~33990-33993~~33990, 33991, 33992, 33993, 33995, 33997.*

✚*33517* *Coronary artery bypass, using venous graft(s) and arterial graft(s); single vein graft (List separately in addition to code for primary procedure)*

(Use 33517 in conjunction with 33533-33536)

Arterial Grafting for Coronary Artery Bypass

The following codes …

To report combined …

Procurement of the artery for grafting is included in the description of the work for 33533-33536 and should not be reported as a separate service or co-surgery, except when an upper extremity artery (eg, radial artery) is procured. To report harvesting of an upper extremity artery, use 33509 or 35600 ~~in addition to the bypass procedure~~. To report harvesting of an upper extremity vein, use 35500 in addition to the bypass procedure. To report harvesting of a femoropopliteal vein segment, report 35572 in addition to the bypass procedure. When surgical assistant performs arterial and/or venous graft procurement, add modifier 80 to 33517-33523, 33533-33536, as appropriate. For percutaneous ventricular assist device insertion, removal, repositioning, see *~~33990-33993~~33990, 33991, 33992, 33993, 33995, 33997.*

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33509 Tracking Number B1 Original Specialty Recommended RVU: **3.75**
Presented Recommended RVU: **3.75**
Global Period: XXX Current Work RVU: RUC Recommended RVU: **3.75**

CPT Descriptor: Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure, endoscopic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year-old male presents to the emergency room with unstable angina. He has history of coronary artery bypass graft (CABG). Cardiac catheterization reveals multivessel disease requiring several grafts. He is an acceptable candidate for re-operation CABG. Saphenous vein conduit is limited because of prior CABG and only a small segment available. The right internal mammary artery is available, the left radial artery in this right-handed individual is evaluated and appropriate for endoscopic harvesting and use for coronary artery bypass grafting

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The decision to utilize the radial artery as a conduit for CABG is made by the primary surgeon, typically during the initial visit with the patient. The primary surgeon performing the CABG obtains a history with attention given to conditions which may mitigate against using the radial such as renal failure requiring or likely to require dialysis, severe PVD or history of Reynaud syndrome. The arm and hand are examined and an Allen's test is performed to assess adequacy of the ulnar circulation and the palmar arch. An oxygen saturation monitor is also employed if available to assess the circulation provided by the ulnar artery.

At the time of CABG procedure (reported separately), the radial artery is checked in the operating room by the provider who will be harvesting the artery. An Allen's test utilizing the oxygen saturation monitor is performed to assess adequacy of the ulnar circulation and the palmar arch. Any abnormalities or concerns are discussed with the primary surgeon and a decision is made to proceed with harvest. The radial artery is typically harvested simultaneously while other conduits are also being harvested. The arm is positioned on a surgical arm board, a tourniquet is placed high on the upper arm in anticipation of later inflation. The appropriate endoscopic equipment is set up and tested. A continuous nitroglycerin intravenous infusion is begun to prevent spasm of the radial artery. A 3 cm longitudinal incision is made proximal to the wrist crease over the radial artery. The radial artery is identified by dissection and clamped. Pulse oximetry on the index finger is checked to assess integrity of the arterial palmar arch and the adequacy of ulnar artery flow while the radial artery is clamped. The forearm is then wrapped tightly with an Esmark bandage distal to proximal in order to evacuate the blood. The tourniquet is then inflated to 75-100 mmHg over systolic blood pressure, not exceeding 250 mmHg total, and the Esmark bandage removed. The radial artery is dissected as a pedicle with the accompanying venae comitantes and the endoscope advanced over the anterior pedicle enough to allow insertion of the port. The trocar port is inflated and CO2 is insufflated at a pressure of 10- 12 mmHg with a flow rate of 3-5 L/min creating a working tunnel. The endoscope is advanced to perform the anterior dissection along the pedicle, taking care to secure veins on each side of the radial artery. This is performed while minimizing any contact with the artery, itself. The dissection is continued to the level of the recurrent radial artery or venous plexus in the antecubital fossa being careful to avoid all nerves and larger vessels. The endoscope is withdrawn back to the port, and then advanced posteriorly to the radial artery pedicle. The posterior arterial

branches are dissected to the level of the recurrent radial or venous plexus in the antecubital fossa. The endoscope is again withdrawn to the port and then advanced laterally for similar dissection. Fasciotomy of the brachioradialis muscle is performed to enhance visualization by opening up the working tunnel using sharp dissection and applying energy from an appropriate power supply (electrocautery) to cut the tissue. Extreme caution is used to avoid untoward thermal injury to neural or vascular tissues during bracheoradialis fasciotomy. The fascia is released from the distal forearm to the mid or proximal forearm. With the fasciotomy complete, arterial branches are divided using the power source by working proximal to distal. Pulse oximetry on the thumb is rechecked. Before dividing the radial artery, a soft non-occluding clamp is placed across the dissected but still intact radial artery and palpation of the ulnar artery is performed to be certain that there is adequate blood supply to the hand. Only after adequacy of ulnar artery flow is confirmed, is the radial artery pedicle divided, ligated and then withdrawn in a retrograde fashion externally through the port. The port is withdrawn and the radial artery is divided and ligated at the wrist area using standard technique. The tourniquet is deflated and removed. The wound is carefully inspected for hemostasis. The fascia and subcutaneous tissues at the wrist incision are closed in two layers using absorbable sutures, and the skin is closed by a subcuticular method using monofilament absorbable sutures. The hand is checked for warmth and circulation is assessed with an oxygen saturation monitor. The arm is wrapped and a methylene blue marking pen is used to score the artery on its anterior surface so as maintain orientation of the radial artery conduit without inadvertent twisting. The radial artery is soaked and flushed with papaverine and heparinized patient blood. The entire length of the radial artery is checked while flushing it with the heparinized blood and branches are carefully clipped or tied per routine.

The primary surgeon uses the radial artery to bypass the designated coronary. The primary surgeon evaluates the radial artery harvest site at the end of the procedure.

Description of Post-Service Work:

Technical skill required	8%	38%	54%
Physical effort required	8%	38%	54%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	38%	62%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Tab 9 includes 2 codes that represent harvest of an upper extremity artery, typically the radial artery, that is used as an arterial conduit for coronary artery bypass grafting (CABG). Code 35600 is for harvest of an upper extremity artery using an open technique and the new code 33509 is for harvest of an upper extremity artery using an endoscopic technique. Endoscopic harvest of the upper extremity represents a new technology that is currently reported using the unlisted cardiac surgery code (33999), the unlisted vascular surgery code (37799) or the unlisted vascular endoscopy code (37501).

The radial artery is typically used in situations where a patient is undergoing a re-operative CABG procedure where the intrathoracic arteries have already been used and/or in patients with limited saphenous vein conduit available due to prior use in peripheral vascular disease operations or use in a previous CABG procedure. Recent emerging studies appear to indicate that use of radial-artery grafts for coronary-artery bypass grafting (CABG) may result in better postoperative outcomes than the use of saphenous-vein grafts. As a result of these circumstances, use of the radial artery in CABG has been increasing. Originally the radial artery was harvested using an open technique, but with technological advances, it is now possible to harvest the radial artery using an endoscopic technique and this method of harvest, where available, is now the preferred method for harvesting the radial artery.

Existing code 35600 was originally developed as an add-on code since the radial artery is typically only harvested for use in conjunction with an arterial CABG procedure. Over the years, in order to streamline CABG procedures, the radial artery conduit is typically harvested simultaneously while other conduits are also being harvested. The radial artery harvest may be performed by the surgeon performing the CABG procedure or an assistant at surgery, who may be another physician, an APP *(Advanced Practice Provider – a commonly used nomenclature for Physician Assistant (PA) or Nurse Practitioner (NP)).* The individual harvesting the radial artery may be the 1st assistant at surgery, but more typically it is an MD or APP other than the primary surgeon or 1st assistant at surgery who separately harvests the peripheral arterial and venous conduits for the CABG procedures. Since the upper extremity artery harvest procedures have evolved in this manner, the specialty societies felt that it would be more appropriate to designate the codes as modifier -51 exempt with XXX global periods. This along with surveying the codes as ZZZ global period procedures allows for the codes to be valued only for the intraoperative portion of the work since the procedures are almost exclusively performed in conjunction with an arterial CABG procedure (33533 – 33536). Reclassifying 35600 and assigning code 33509 as XXX global codes (as opposed to its previous ZZZ global classification), with a -51 modifier exempt status and valuing the codes as ZZZ global procedures allows the individual that performs the radial artery harvest to report it under their NPI, which will allow for appropriate tracking and reimbursement for the upper extremity artery harvest procedures. Any preoperative and postoperative care associated with the upper extremity artery harvest is typically included in the global period of the CABG procedure with the primary surgeon providing any associated pre and post-operative care related to the upper extremity artery harvest, including postoperative care of the surgical incision site. The provider that harvests the upper extremity artery is often involved in the patient's overall care as part of the cardiac surgery/heart team. Any associated care related to the upper extremity artery harvest generally falls under the global surgical period associated with the arterial CABG procedure. Based on these factors, the two upper extremity artery harvest codes were assigned an XXX global period, but were surveyed as ZZZ global procedures accounting for only the intra-operative time associated with the procedures. Since the procedures account for the intra-operative time only, there are no direct practice expense inputs for the procedures.

33509

Intensity and complexity of the procedure: 84 surveys were completed by a random sample of U.S. self-identified cardiac surgeons, cardiothoracic and cardiovascular surgical PAs and NPs identified with interest in cardiology and/or surgery on their profiles. Eighteen (21%) respondents selected code 34834 *Open brachial artery exposure for delivery of endovascular prosthesis, unilateral (List separately in addition to code for primary procedure)* as a reference code making it the 1st key reference service (KRS). The expert panel notes that there is a substantial work difference between open exposure of part of an artery for the introduction of an endovascular device and complete endoscopic dissection and resection of a long segment of artery for eventual transposition. That 1st KRS code has a lower value, and a shorter intraservice and total time than the survey code. The survey respondents ranged in their intensity/complexity comparison saying that the survey code 33509 was identical (28%), somewhat more (39%) or much more (22%) for the overall complexity measures and much more complex than the 1st KRS code for all of the intensity/complexity measures with the exception of mental effort and judgement, which ranged from less to more complex. Thirteen (15%) respondents selected code 34716 *Open axillary/subclavian artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)* as a reference code making it the 2nd KRS. This code has a higher value and a higher intraservice and total service time than the survey code. The respondents ranged in their intensity/complexity comparison saying that the overall intensity/complexity of the survey code 33509 is identical (46%), somewhat more (31%), or much more (23%) complex than the 2nd KRS code. For the other intensity/complexity measures the respondents indicated that the survey code was more complex for the technical skill/physical effort and psychological stress measures and identical to more complex for the mental effort and judgement measure than the 2nd KRS code.

Recommended RVW: The survey data for code 33509 (endoscopic upper extremity artery harvest) shows that the median intra-operative time is 35 minutes. The 25th percentile RVW from the survey was 3.75 and the median RVW from the survey was 4.53. The Expert Panel reviewed the survey data and are recommending the 25th percentile RVW of 3.75 and the median intra-service time of 35 minutes and an IWPUT of 0.107. The 1st KRS has a shorter intraservice time and lower RVW than the survey code with an IWPUT of 0.088. The 2nd KRS has a higher RVW and a longer intraservice and total time than the survey code with an IWPUT of 0.100. While the expert panel feels that the endoscopic code should have a longer intraservice time than the open code (35600), the survey data does not support this difference. The Expert Panel assumes that this may be due to the fact that the technology has been around long enough that those practitioners who most commonly perform the procedure are beginning to overcome

the learning curve, which is reflected in lower intra-service times for the procedure. The survey respondents indicated that the survey code was more or much more complex than all of the intensity/complexity measures for the 1st key reference service (KRS) for all but the mental effort and judgement, for which they indicated that the intensity/complexity of the survey code was less or identical to the 1st KRS. The 2nd KRS represents a procedure where the axillary or subclavian artery is exposed and a graft is sewn onto the exposed artery to create a conduit to facilitate cardiopulmonary bypass or delivery of an endovascular prosthesis. At completion of the procedure the graft is resected and the resulting arteriotomy is oversewn. The survey code represents a procedure where a segment of the radial artery is harvested endoscopically. This requires careful consideration to avoid injury of the surrounding neural and vascular tissues. In addition, there are numerous arterial branches that must be identified and clipped to achieve hemostasis after the artery is harvested and prevent catastrophic postoperative bleeding from the implanted conduit. The same considerations are not required for either of the KRS codes since there is no extensive arterial mobilization, dissection or resection involved in those procedures and no surgical maneuvers to ensure branch artery ligation/hemostasis. The survey respondents indicated that the intensity/complexity of the survey code was more complex than the 2nd KRS for most of the measures.

The Expert Panel is recommending the 25th percentile work RVW of 3.75, with a median intra-service time of 35 minutes, and total time of 35 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is valued as an add-on code, but it is desiganged as an XXX global because the procedure is typically performed by an NP or PA (typically from the same practice). The upper extremity artery is harvested by the NP/PA simultaneously with the surgeon performs the sternal approach. There may be another MD/PA/NP that acts as a 1st assistant at surgery for the rest of the case. The follow-up care for the entire procedure, including the post-op care for the upper extremity artery harvest, is provided by the surgeon.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33999, 37501 or 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiothoracic Surgery How often? Commonly

Specialty Physician Assistant How often? Commonly

Specialty Nurse Praticitioner How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 2834
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the 2019 RUC database there were 66,673 arterial CABG procedures performed. A recent report indicates that the rate of use the radial artery for grafting in the United States is 6.5%. A meta-analyis of six radial artery harvest studies was performed indicating that 43.6% of the radial arteries are harvested endoscopically and 56.4% are harvested using an open technique.

It is estimated that 2/3 of the total CABG procedures per year are performed for Medicare patients, so the estimated number of radial artery harvest procedures peformed natinally is 6501. Of those, 3666 will be performed using an open technique and 2834 of them will be perfromed endoscopically

Specialty Cardiothoracic Surgery Frequency 992 Percentage 35.00 %

Specialty Physician Assistant Frequency 993 Percentage 35.03 %

Specialty Nurse Praticitioner Frequency 849 Percentage 29.95 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,890
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the 2019 RUC database there were 66,673 arterial CABG procedures performed. A recent report indicates that the rate of use the radial artery for grafting in the United States is 6.5%. A meta-analyis of six radial artery harvest studies was performed indicating that 43.6% of the radial arteries are harvested endoscopically and 56.4% are harvested using an open technique.

The estimated number of radial artery harvest procedures peformed for Medicare is 4334. Of those, 2444 will be performed using an open technique and 1890 of them will be perfromed endoscopically.

Specialty Cardiothoracic Surgery Frequency 662 Percentage 35.02 %

Specialty Physician Assistant Frequency 663 Percentage 35.07 %

Specialty Nurse Praticitioner Frequency 565 Percentage 29.89 %

Do many physicians perform this service across the United States? Yes

---

CPT Descriptor: Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure, open

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year-old male presents to the emergency room with unstable angina. He has history of CABG. Cardiac catheterization reveals multivessel disease requiring several grafts. He is an acceptable candidate for re-operation CABG. Saphenous vein conduit is limited because of prior CABG and only a small segment available. The right internal mammary artery is available, the left radial artery in this right-handed individual is evaluated and appropriate for open harvesting and use for coronary artery bypass grafting.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The decision to utilize the radial artery as a conduit for CABG is made by the primary surgeon, typically during the initial visit with the patient. The primary surgeon performing the CABG obtains a history with attention given to conditions which may mitigate against using the radial such as renal failure requiring or likely to require dialysis, severe PVD or history of Reynaud syndrome. The arm and hand are examined and an Allen's test is performed to assess adequacy of the ulnar circulation and the palmar arch. An oxygen saturation monitor is also employed if available to assess the circulation provided by the ulnar artery.

At the time of CABG procedure (reported separately), the radial artery is checked in the operating room by the provider who will be harvesting the artery. An Allen's test utilizing the oxygen saturation monitor is performed to assess adequacy of the ulnar circulation and the palmar arch. Any abnormalities or concerns are discussed with the primary surgeon and a decision is made to proceed with harvest. The radial artery is typically harvested simultaneously while other conduits are also being harvested. A continuous intravenous nitroglycerin infusion is begun to prevent spasm of the radial artery. The radial artery is harvested simultaneously by making a curvilinear incision at the edge of the hairline of the left forearm following the brachioradialis muscle lateral to the biceps tendon and down to a midway point between the tendon of the flexor carpi radialis muscle and the radial styloid at the wrist crease. Hemostasis is obtained using a Bovie needle coagulator or a harmonic scalpel and dissection continues being careful to avoid nerves and larger vessels. The fascia between the bellies of the brachioradialis and flexor carpi radialis muscle is then divided. The radial artery is visualized and dissected beginning at the middle of the forearm proximally with the venous vascular pedicle kept intact. The vasa vasorum of the radial artery are then divided posteriorly using the harmonic scalpel or silk sutures proximally and metallic clips distally. As the dissection approaches the wrist, there are usually numerous small vessels that required meticulous identification and separation. Pulse oximetry on the thumb is rechecked. Before dividing the radial artery, a soft non-occluding clamp is placed across the dissected but still intact radial artery and palpation of the ulnar artery is performed to be certain that there is adequate blood supply to the hand. Only after adequacy of ulnar artery flow is confirmed, is the radial artery pedicle ligated and divided. The wound is inspected for hemostasis and the artery is ligated and divided. The fascia and subcutaneous tissues throughout the length of the forearm incision are closed in two layers using absorbable

sutures. The entire forearm skin incision is closed by a subcuticular method using monofilament absorbable sutures. The hand is checked for warmth and circulation is assessed with an oxygen saturation monitor. The arm is wrapped and a methylene blue marking pen is used to score the artery on its anterior surface so as maintain orientation of the radial artery conduit without inadvertent twisting. The radial artery is soaked and flushed with papaverine and heparinized patient blood. The entire length of the radial artery is checked while flushing it with the heparinized blood and branches are carefully clipped or tied per routine.

The primary surgeon uses the radial artery to bypass the designated coronary. The primary surgeon evaluates the radial artery harvest site at the end of the procedure.

Description of Post-Service Work:

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	14%	7%	57%	21%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	21%	29%	50%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	7%	93%
Physical effort required	14%	14%	71%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	50%	43%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	9%	27%	55%	9%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	9%	45%	45%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	0%	100%
Physical effort required	9%	45%	45%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	36%	64%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Tab 9 includes 2 codes that represent harvest of an upper extremity artery, typically the radial artery, that is used as an arterial conduit for coronary artery bypass grafting (CABG). Code 35600 is for harvest of an upper extremity artery using an open technique and the new code 33509 is for harvest of an upper extremity artery using an endoscopic technique. Endoscopic harvest of the upper extremity represents a new technology that is currently reported using the unlisted cardiac surgery code (33999), the unlisted vascular surgery code (37799) or the unlisted vascular endoscopy code (37501).

The radial artery is typically used in situations where a patient is undergoing a re-operative CABG procedure and in patients where the intrathoracic arteries have already been used and/or in patients with limited saphenous vein conduit available due to prior use in peripheral vascular disease operations or use in a previous CABG procedure. Recent emerging studies appear to indicate that use of radial-artery grafts for coronary-artery bypass grafting (CABG) may result in better postoperative outcomes than the use of saphenous-vein grafts. As a result of these circumstances, use of the radial artery in CABG has been increasing. Originally the radial artery was harvested using an open technique, but with technological advances, it is now possible to harvest the radial artery using an endoscopic technique and this method of harvest, where available, is now the preferred method for harvesting the radial artery.

Existing code 35600 was originally developed as an add-on code since the radial artery is typically only harvested for use in conjunction with an arterial CABG procedure. Over the years, in order to streamline CABG procedures, the radial artery conduit is typically harvested simultaneously while other conduits are also being harvested. The radial artery harvest may be performed by the surgeon performing the CABG procedure or an assistant at surgery, who may be another physician or an APP (Advanced Practice Provider – a commonly used nomenclature for Physician Assistant (PA) or Nurse Practitioner (NP)). The individual harvesting the radial artery may be the 1st assistant at surgery, but more typically is an MD or APP other than the primary surgeon or 1st assistant who separately harvests the peripheral arterial and venous conduits for the CABG procedures. Since the upper extremity artery harvest procedures have evolved in this manner, the specialty societies felt that it would be more appropriate to designate the codes as modifier -51 exempt with XXX global periods. This along with surveying the codes as ZZZ global period procedures allows for the codes to be valued only for the intraoperative portion of the work since the procedures are almost exclusively performed in conjunction with an arterial CABG procedure (33533 – 33536). Reclassifying 35600 and assigning code 33509 as XXX global codes (as opposed to its previous ZZZ global classification), with a -51 modifier exempt status and valuing the codes as ZZZ global procedures allows the individual that performs the radial artery harvest to report it under their NPI, which will allow for appropriate tracking and reimbursement for the upper extremity artery harvest procedures. Any preoperative and postoperative care associated with the upper extremity artery harvest is typically included in the global period of the CABG procedure with the primary surgeon providing any associated pre and post-operative care related to the upper extremity artery harvest, including postoperative care of the surgical incision site. The provider that harvests the upper extremity artery is often involved in the patient's overall care as part of the cardiac surgery/heart team. Any associated care related to the upper extremity artery harvest generally falls under the global surgical period associated with the arterial CABG procedure. Based on these factors, the two upper extremity artery harvest codes were assigned an XXX global period, but were surveyed as ZZZ global procedures accounting for only the intra-operative time associated with the procedures. Since the procedures account for the intra-operative time only, there are no direct practice expense inputs for the procedures.

35600

Intensity and complexity of the procedure: 72 surveys were completed by a random sample of U.S. self-identified cardiac surgeons, cardiothoracic and cardiovascular surgical PAs and NPs identified with interest in cardiology and/or surgery on their profiles. Fourteen (19%) respondents selected code 34834 *Open brachial artery exposure for delivery of endovascular prosthesis, unilateral (List separately in addition to code for primary procedure)* as a reference code making it the 1st key reference service (KRS). The expert panel notes that there is a substantial work difference between open exposure of part of an artery for the introduction of an endovascular device and complete dissection and resection of a long segment of artery for eventual transposition. The 1st key reference has a lower value, and a shorter intraservice and total time than the survey code. The survey respondents ranged in their intensity/complexity comparison saying that the overall survey code 35600 was somewhat more (57%) or much more (21%) complex than 1st KRS code, more complex for the other intensity/complexity measures and identical to more for psychological stress. Eleven (15%) respondents selected code 34715 *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)* as a reference code making it the 2nd KRS. This code has a higher value with longer intraservice and total service times then the survey code. The respondents ranged in their overall intensity/complexity comparison saying that the survey code is identical (27%) or somewhat more (55%) complex than the 2nd KRS code more complex for technical skill and psychological stress measures and identical or more complex for the mental effort/judgement and physical effort measures.

Recommended RVW: The survey data for code 35600 (open upper extremity artery harvest) shows that the median intra-operative time is 40 minutes. The current intra-service time for this procedure is 40 minutes. The current RVW for the code is 4.94. The 25th percentile RVW from the survey was 4.00 and the median RVW from the survey was 5.45. The Expert Panel reviewed the data recognizing that there was no change in intra- service work from the current time and determined that there is no compelling evidence to support an increase in the RVW.

Although there is no change in time for the procedure, the Expert Panel recognizes that the fee schedule has changed since the code was last valued in 2000 and as such, to maintain relativity across the fee schedule, the Expert Panel is recommending the current work RVW of 4.94 be reduced to 4.00, which represents the 25th percentile from the survey resulting in a decrease in value for the same intra-service and total time of 40 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is valued as an add-on code, but it is desiganged as an XXX global because the procedure is typically performed by an NP or PA (typically from the same practice). The upper extremity artery is harvested by the NP/PA simultaneously with the surgeon who performs the sternal approach. There may be another MD/PA/NP that acts as a 1st assistant at surgery for the rest of the case. The follow-up care for the entire procedure, including the post-op care for the upper extremity artery harvest, is provided by the surgeon.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35600

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiothoracic Surgery — How often? Commonly

Specialty Physician Assistant — How often? Commonly

Specialty Nurse Praticitioner — How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 3366
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the 2019 RUC database there were 66,673 arterial CABG procedures performed. A recent report indicates that the rate of use the radial artery for grafting in the United States is 6.5%. A meta-analyis of six radial artery harvest studies was performed indicating that 43.6% of the radial arteries are harvested endoscopically and 56.4% are harvested using an open technique.

It is estimated that 2/3 of the total CABG procedures per year are performed for Medicare patients, so the estimated number of radial artery harvest procedures peformed natinally is 6501. Of those, 3666 will be performed using an open technique and 2834 of them will be perfromed endoscopically.

Specialty Cardiothoracic Surgery	Frequency 1178	Percentage 34.99 %
Specialty Physician Assistant	Frequency 1179	Percentage 35.02 %
Specialty Nurse Praticitioner	Frequency 1009	Percentage 29.97 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,444
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the 2019 RUC database there were 66,673 arterial CABG procedures performed. A recent report indicates that the rate of use the radial artery for grafting in the United States is 6.5%. A meta-analyis of six radial artery harvest studies was performed indicating that 43.6% of the radial arteries are harvested endoscopically and 56.4% are harvested using an open technique.

The estimated number of radial artery harvest procedures peformed for Medicare is 4334. Of those, 2444 will be performed using an open technique and 1890 of them will be perfromed endoscopically.

Specialty Cardiothoracic Surgery	Frequency 855	Percentage 34.98 %
Specialty Physician Assistant	Frequency 856	Percentage 35.02 %
Specialty Nurse Praticitioner	Frequency 733	Percentage 29.99 %

Do many physicians perform this service across the United States? Yes

---

Chicago, IL 60611

December 13, 2020

RE: Tab 6 Practice Expense

Dear Dr. Manaker:

Tab 9 on the January 2021 RUC agenda addresses two XXX global codes for open and endoscopic upper extremity artery harvest that were valued as add-on codes. These two codes are typically only performed with arterial CABG procedures. Any pre and postoperative work associated with these procedures are accounted for in the work/ practice expense of the arterial CABG procedures. Both procedures are provided exclusively in the facility setting. As such, we recommend no direct practice expense inputs for Tab 9.

Thank you for your consideration of this information as you prepare for the meeting. Please contact Julie Painter at jpainter@physiciancoding.com if you have any questions.

Sincerely,
James M. Levett, MD
STS RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Drug Induced Sleep Endoscopy (DISE) – Tab 10

In October 2020, the CPT Editorial Panel created one new code to report drug induced sleep endoscopy (DISE) flexible, diagnostic.

42975 Drug induced sleep endoscopy; with dynamic evaluation of velum, pharynx, tongue base, and largynx for evaluation of sleep disordered breathing; flexible, diagnostic

The RUC reviewed the survey results from 148 otolaryngologists and determined that the survey 25th percentile work RVU of 1.90 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 18 minutes of pre-service evaluation time, 1 minute of pre-service positioning time, 6 minutes of pre-service scrub/dress/wait time, 15 minutes of intra-service time, and 28 minutes of immediate post-service time.

To justify the 28 minutes of immediate post-service time, the specialty society explained that the typical patient has significant sleep apnea and has had their airway manipulated. After receiving sedation and scoping of the upper airway, the airway is no longer secure and must be monitored. Often patients must be monitored closely following the procedure until the patient is discharged from the hospital. Nonetheless, physician work continues outside of the immediate post-operative time for potentially increased swelling and/or because the patient's sedation has not worn-off. However, the RUC questioned the ½ discharge day management (99238), resulting from the specialty society using a 000-day global instrument with post-operative visits to value the service. The RUC agreed that the 000-day global survey instrument with post-operative visits is not typical and is dedicated for services that require more significant hospital stay. After thorough discussion, the RUC agreed that a ½ discharge day management (99238) is not necessary for this service. By surveying the incorrect 000-day global survey instrument, survey respondents underestimated the immediate post-service time estimates. The RUC agreed with an immediate post-service time of 28 minutes with the understanding that there is time value related to the ½ discharge day management originally recommended by the specialty society and agreed that post-service time package (8b) of 28 minutes is justified. The RUC requested that this service be valued as interim and be resurveyed for the April 2021 RUC meeting using a standard 000-day global survey instrument (*without* post-operative visits).

The RUC compared the survey code to code 62327 *Injection(s), including indwelling catheter placement, continuous infusion or intermittent bolus, of diagnostic or therapeutic substance(s) (eg, anesthetic, antispasmodic, opioid, steroid, other solution), not including neurolytic substances, interlaminar epidural or subarachnoid, lumbar or sacral (caudal); with imaging guidance (ie, fluoroscopy or CT)* (work RVU= 1.90 and intra-service time of 15 minutes) and noted that both codes have identical intra-service time and should be valued identically. Additionally, the RUC compared the survey code to MPC code 64483 *Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, single level* (work RVU= 1.90 and intra-service time of 15 minutes) and noted that both codes require the same amount of physician work and intra-service time, further warranting a value of 1.90. **The RUC recommends an interim work RVU of 1.90 for CPT code 42975.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RUC Database Flag
The RUC recommends to flag CPT code 42975 as "do not use to validate for physician work" since the RUC is recommending an interim work RVU for this service and will be resurveyed for the April 2021 RUC meeting.

Practice Expense
The RUC recommends the direct practice expense inputs as submitted by the specialty society.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Respiratory System** **Larynx** **Endoscopy**				
31575		*Laryngoscopy, flexible; diagnostic* *(Do not report 31575 in conjunction with 31231, unless performed for a separate condition using a separate endoscope)* (Do not report 31575 in conjunction with 31572, 31573, 31574, 31576, 31577, 31578, 42975, 43197, 43198, 92511, 92612, 92614, 92616)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:42975 Tracking Number Original Specialty Recommended RVU: **2.19**
Presented Recommended RVU: **2.19**
Global Period: 000 Current Work RVU: RUC Recommended RVU: **1.90**

CPT Descriptor: Drug induced sleep endoscopy; with dynamic evaluation of velum, pharynx, tongue base, and largynx for evaluation of sleep disordered breathing; flexible, diagnostic

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year old male with moderate to severe obstructive sleep apnea has been unable to tolerate positive airway pressure therapy, sleep endoscopy is performed to identify anatomic and physiologic factors contributing to his obstructive sleep apnea and the selection of non-continuous positive airway pressure (cpap) treatment options

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 64% , In the ASC 35%, In the office 1%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 81% , Overnight stay-less than 24 hours 18% , Overnight stay-more than 24 hours 1%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 94%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the level of sedation required and the approximate length of the case. Review and obtain informed consent. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned. The surgeon scrubs, gowns and preps the patient for the procedure.

Description of Intra-Service Work: The nasal passages are prepared with application of a decongestant and/or topical anesthesia. Light intravenous sedation is given, which typically is provided by a separate provider, to a point where the patient is non-responsive to verbal stimuli, has snoring or partial upper airway flow limitation, and observed oxygen desaturations. The performing physician then places a flexible endoscope through the nose and advances it to the pharynx. Endoscopic evaluation of the nasopharynx, oropharynx, hypopharynx, and larynx is performed during sleep or sedation over multiple cycles of airway narrowing and/or obstruction. The velopharynx is the term for the distal (no muscular) component of the soft palate and uvula. This is the predominant site of upper pharyngeal collapse. The physician will note the anatomic site of obstruction (velopharynx, oropharynx, tongue, epiglottis), the severity of the obstruction (non, partial, complete), and pattern of obstruction (anteroposterior, circular, lateral).The physician then repositions the patient and/or performs manipulation of the head and neck and repeat endoscopy to determine effect of body position (supine versus lateral); jaw lift, tongue protrusion, or hyoid lift on airway obstruction. A patient’s existing oral appliance (mandibular advancement device) is placed and titrated to optimal effect. In certain cases, a continuous positive airway pressure (CPAP) mask may be applied to determine sites on ongoing obstruction in regular CPAP users who fail to improve with CPAP therapy.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders, medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course,

signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	2%	12%	71%	14%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	2%	31%	66%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	12%	55%	33%
Physical effort required	2%	73%	25%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	2%	29%	69%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	5%	0%	19%	52%	24%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	19%	71%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	5%	52%	43%
Physical effort required	5%	35%	60%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	5%	38%	55%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting new code 42975. The Panel approved the CCA and the code is now being valued by the RUC. The new code will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted, random selection of 3963 members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated as one or more of the following sub-specialties: General Otolaryngology, Sleep Medicine, or Pediatric Otolaryngology.

Recommendation (Work and Intra Time):

We are recommending a work RVU of **1.90 and 15 minutes of intra service time**, based on our survey's 25th percentile RVW.

Time package selection: We have selected pre-time package 2 and post-time package 8B due to this procedure currently being done predominantly in the hospital outpatient setting using conscious sedation.

Pre-time Package 2 Difficult Patient / Straightforward Procedure (No anesthesia care)

Evaluation Time – We are recommending 18 minutes of evaluation time which is identical to the pre-service package time, based on our survey median.

Positioning Time – We are recommending 1 minute of positioning time which is a decrease of 4 minutes from the median survey time, but consistent with the pre-service package time for this activity.

Scrub, Dress, Wait Time – We are recommending 6 minutes of scrub, dress and wait time which is identical to the pre-service package time, based on our survey median.

This results in a total recommended pre time of 25 minutes, taking the lesser of surveyed time or the pre-service package time.

Post-time Package 8B IV Sedation/ Complex Procedure
Recommended time is 28 minutes to account for the survey's immediate post time of 10 minutes indicated by resopndents, but also the survey information that indicated a discharge management visit was typical (19 minutes is the time for a half day discharge management visit). The package post time is 28 minutes, so we felt this was appropriate given the survey post time plus a .5 DM visit would equate to 29 post minutes. All time for post work and patient post procedure monitoring was moved into the immediate post time and ***results in a total recommended immediate post time of 28 minutes, taking the lesser of surveyed time or the pre-service package time.***

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 31599

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 106858
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume predicted below, using the percentages of the three prior codes that were used to report the service.

Specialty Otolaryngology Frequency 106858 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,619 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This takes the percentage estimates of the three codes above which were previously used to report the service and adds the volume together that is anticipated in the new code.

Specialty Otolaryngology Frequency 35619 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Endoscopy

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31573

SPECIALTY SOCIETY(IES): AAO-HNS

PRESENTER(S): R. Peter Manes, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: January 2021

CPT Code	Long Descriptor	Global Period
42975	Drug induced sleep endoscopy, with dynamic evaluation of velum, pharynx, tongue base, and larynx for evaluation of sleep disordered breathing, flexible, diagnostic	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
42975	A 45-year old male with moderate to severe obstructive sleep apnea has been unable to tolerate positive airway pressure therapy, sleep endoscopy is performed to identify anatomic and physiologic factors contributing to his obstructive sleep apnea and the selection of non-continuous positive airway pressure (cpap) treatment options

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   Our specialty formed a panel of experts to develop practice expense recommendations for this family of codes. The panel was comprised of our RUC Advisor and multiple clinical experts who practice in the areas of general otolaryngology, sleep medicine and pediatric otolaryngology. The expert panel members also practice across in settings that vary by size, geography, and represent both private and academic settings.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   42975 is a new CPT code, therefore, reference code 31576 was selected. The reference code was chosen based on the fact that it was recently valued by the RUC by our specialty, and is also a 000 global service that is typically performed in the hospital outpatient setting.

3. Is this code(s) typically reported with an E/M service?

   No, however, a discharge management visit is typical based on the typical site of service being the hospital.

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   We are recommending clinical staff pre-time above the standard for 000 globals of 0 minutes. This represents use of clinical staff of endoscopy per the PE Subcommittee standards and is consistent with what the PE approved in the January 2017 and January 2020 for otolaryngology services typically performed in the hospital setting. The rationale for this time is that staff are essential to scheduling, and completing paperwork necessary, to schedule these procedures in the facility setting. The recommendation for the new code is consistent with these recommendations and includes the standard time for clinical staff activities for endoscopy procedures time in the pre-service.

FACILITY DIRECT PE INPUTS **CPT CODE(S):** 42975

SPECIALTY SOCIETY(IES): AAO-HNS

PRESENTER(S): R. Peter Manes, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

N/A, this is a new code. No new inputs are being requested / invoices provided.

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

N/A

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

During the pre-service period the clinical staff are conducting the typical activities for endoscopy procedures, when performed in the facility setting. Those include: Completing pre-service diagnostic and referral forms Coordinating pre-surgery services (including test results) Scheduling the space and equipment in the facility Providing pre-service education and obtaining consent Completing pre-procedure phone calls and prescriptions

   b. Service period (includes pre, intra and post):

There are no clinical staff activities during the service period.

   c. Post-service period:

During the post-service period the clinical staff call the patient to check in and see how they're doing post-procedure. They also inquire about use of CPAP post procedure.

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

N/A

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

No supplies, only making facility recommendations at this time.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

No supplies, only making facility recommendations at this time.

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

No equipment, only making facility recommendations at this time.

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

No equipment, only making facility recommendations at this time.

17. If there is any other item(s) on your spreadsheet not covered in the categories above that require greater detail/explanation, please include here:

N/A

PROFESSIONAL LIABILITY INSURANCE (PLI) INFORMATION

18. If this is a PE only code please select a crosswalk based on a similar specialty mix:

N/A

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Periurethral Balloon Continence Device Procedures – Tab 11

In October 2020, the CPT Editorial Panel replaced four CPT Category III codes (0548T, 0549T, 0550T, and 0551T) with four new CPT Category I codes (53451, 53452, 53453, 53454) to report periurethral adjustable balloon continence device. The RUC reviewed a letter from the American Urological Association that noted that these codes currently have low utilization and that only 65 physicians have been trained to perform these procedures; only 38 of those physicians have performed them. Given the low utilization and the low survey response rate (four completed survey responses), the specialty society recommended that CMS have the Medicare Administrative Contractors (MACs) contractor price these procedures. **The RUC recommends contractor pricing CPT codes 53451, 53452, 53453, and 53454**.

New Technology
CPT codes 53451, 53452, 53453, and 53454 will be placed on the New Technology list and be re-reviewed by the RUC in two years to ensure correct valuation and utilization assumptions.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery Urinary System Urethra Repair				
●53451	N1	Periurethral transperineal adjustable balloon continence device; bilateral insertion, including cystourethroscopy and imaging guidance (Do not report 53451 in conjunction with 52000, 53452, 53453, 53454, 76000)	010	Contractor Price
●53452	N2	unilateral insertion, including cystourethroscopy and imaging guidance	010	Contractor Price

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

		(Do not report 53452 in conjunction with 52000, 53451, 53453, 53454, 76000)		

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

●53453	N3	removal, each balloon (Do not report 53453 in conjunction with 52000, 53451, 53452, 53454)	000	Contractor Price
●53454	N4	percutaneous adjustment of balloon(s) fluid volume (Do not report 53454 in conjunction with 53451, 53452, 53453) (Report 53454 only once per patient encounter)	000	Contractor Price

RE: Tab 11: Periurethral Balloon Continence Device Procedures

Dear Dr. Smith,

The American Urological Association (AUA) would like to make recommendations based on our survey for the Periurethral Balloon Continence Device Procedures (CPT codes 53451, 53452 53453, and 53454) for the upcoming January RUC meeting. These codes were converted from Category III to Category I codes at the October CPT meeting triggering this survey. Based on this action, these codes will appear in the 2022 CPT book as Category I services.

The survey process has been a challenging one because these are currently Category III codes with low utilization. The manufacturer, Uromedica, estimated that less than 500 of these procedures will be performed in 2021. The RUC's research subcommittee granted the AUA permission to do a targeted survey using the manufacturer's list of 65 physicians who have been trained to do this procedure, of which only 38 physicians have actually performed these procedures. In our survey, we also included a list of 343 subset of AUA members who specialized in these type of procedures.

Despite targeting the survey, we only have received four completed surveys and we needed a total of 30 responses for it to be a valid survey. Therefore, we recommend that CMS have their Medicare Administrative Contractors (MAC) carrier price these procedures.

AMA/Specialty Society RVS Update Committee (RUC) Vendor/Company Attestation Statement

This form needs to be completed by an authorized representative of any Vendor or Company that makes, markets or distributes a product or device utilized in performing the service being surveyed by the AMA/Specialty Society RVS Update Committee (RUC), as part of its CPT® code survey and valuation process, and which has supplied a list of users of such products or devices in connection with the survey and valuation process.

By submitting to the RUC a list of users of the undersigned's product or device as part of the RUC's CPT® code survey and valuation process, I attest that no employee, affiliate, or agent of the undersigned has contacted, and further covenant that they will not contact, any such user in connection with the survey. I hereby represent and warrant that I have the authority to sign this statement on behalf of the undersigned company and that the information herein is true and accurate. I understand that any false or inaccurate information will render the survey invalid, harming both the undersigned and the physicians who use the product or device.

Periurethral Balloon Continence Device Procedures (53451, 53452, 53453, 53454) CPT® Codes

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Intracranial Laser Interstitial Thermal Therapy (LITT) – Tab 12

In October 2020, the CPT Editorial Panel approved the addition of two codes to report laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance (MR) imaging guidance for a single trajectory for 1 simple lesion and multiple trajectories for multiple or complex lesion(s). LITT is a novel procedure that involves multiple steps and movements of the patient through the hospital for different stages of the procedure. The typical facility does not have an interoperative MRI suite (small minority of academic medical centers may), so patient transport is necessary.

61736 ***Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion***
The RUC reviewed the survey results from 48 neurosurgeons and determined that the survey median work RVU of 20.00 appropriately accounts for the physician work required to perform this service. The RUC recommends the physician times as supported by the survey: 113 minutes pre-service time (68 minutes evaluation, 30 minutes positioning, 15 minutes scrub/dress/wait time), 180 minutes intra-service time, and 60 minutes immediate post-service time. Though the median survey post-service time was 40 minutes, the CMS 23-hour stay policy was applied resulting in 60 minutes.

The RUC discussed the CMS 23-Hour Stay Outpatient Surgical Services with Subsequent Hospital Visits Policy as it relates to the post-service time for the survey codes. CMS labels surgical services that are typically performed in the outpatient setting and require a hospital stay of less than 24-hours as 23-hour stay outpatient services. In the CY2011 Final Rule, CMS finalized a policy to no longer allow these codes to include bundle subsequent hospital visits (eg 99231-99233) into the surgical global period. Instead, the Agency permits the allocation of the intra-service portion of the typically performed subsequent hospital visit to the immediate post-service time of the procedure. The RUC noted that the survey codes have 000-day global periods which typically do not allow for an Evaluation and Management (E/M) visit on the same day as the procedure. Per the CMS policy, the intra-service time is reallocated from the same-day E/M code 99232 to the immediate post-service time of the outpatient service (adding 20 minutes of intra-service time from 99232).

The RUC noted that close monitoring during the first 12-24 hours after brain surgery is critical to a successful outcome. One hundred percent of the survey respondents indicated that a visit would be required later the same day of the procedure. The median response for level of visit was 99232. Therefore, the final immediate post-service time recommended is 60 minutes = 33 (post-service time package 9b) + 7 (additional time related to hardware removal and documentation) + 20 (post-operative visit intra-service time).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC also noted that the pre-service time is appropriate due to the imaging that occurs as part of the pre-service evaluation time. Preoperative MRI volumetric planning is performed just prior to the procedure. Planning for the procedure and coordination with the healthcare delivery team add a significant amount of time to the work typically assigned to pre-service time package 4. In addition, the RUC specifically inquired about the transfer time for the MRI that occurs within the intra-service period. This was described as a high intensity, sterile transport within the confines of a surgical procedure, with care to protect the laser assembly and anchor bolt, with the surgeon engaged the entire time.

To justify a work RVU of 20.00, the RUC compared CPT code 61736 to the two key reference service codes 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU = 15.00, 100 minutes intra-service time and 241 minutes total time) and 61640 *Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel* (work RVU = 12.32, 90 minutes intra-service time and 233 minutes total time) and noted that although the codes all require intracranial work, intraoperative imaging and significant postoperative care, the survey code has much greater intra-service and total times. Neither codes 61645 nor 61640 include the significant preoperative evaluation and positioning time required for 61736. The survey code was considered more intense/complex overall by 84% of survey respondents that selected the top key reference code and 100% of respondents who selected the second key reference code. The RUC recognized that the survey was constrained by a dearth of 000-day global codes familiar to neurosurgeons, making comparison using magnitude estimation difficult. Similarly, there are many MPC codes with a 000 global assignment, but none that approach the work required of CPT code 61736.

For additional support, the RUC agreed that 61736 is appropriately bracketed by comparator codes 33891 *Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision* (work RVU = 20.00, 173 minutes intra-service time and 323 minutes total time) and 33977 *Removal of ventricular assist device; extracorporeal, single ventricle* (work RVU = 20.86, 180 minutes intra-service time and 335 minutes total time) and noted that all three codes require significant pre- and post-service work on the day of the procedure and have the same or similar intra-service time and intensity. The RUC concluded that CPT code 61736 should be valued at the median work RVU as supported by the survey. **The RUC recommends a work RVU of 20.00 for CPT code 61736.**

61737 ***Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; multiple trajectories for multiple or complex lesion(s)***

The RUC reviewed the survey results from 44 neurosurgeons and determined that the survey median work RVU of 24.00 appropriately accounts for the physician work required to perform this service. The RUC noted that compared to patients undergoing LITT for a single lesion, the complexity of CPT code 61737 and the level of patient instability and risk is greater. At present, the typical number of "multiple" trajectories is two, thus in many aspects the physician work is doubled. After robust discussion, the RUC recommends the physician times as supported by the survey: 144 minutes pre-service time (93 minutes evaluation, 36 minutes positioning, 15 minutes scrub/dress/wait time), 235 minutes intra-service time, and 40 minutes immediate post-service time and 1-99233 office visit. The RUC noted that these codes have 000-day global periods which typically do not allow for an E/M visit on the same day as the procedure.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

However, unlike code 61736, CPT code 61737 typically involves a full 2-midnight admission, as reflected by the survey respondents, which justifies the same-day E/M visit.

To justify a work RVU of 24.00, the RUC compared CPT code 61737 to the top key reference service code 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU = 15.00, 100 minutes intra-service time and 241 minutes total time) and noted that although both codes require intracranial work, intraoperative imaging and significant postoperative care, the reference code requires less intra-service and total time and less positioning time. However, the key reference code 61645 was chosen most often (75%) by survey respondents and is the highest valued code on the reference service list. There are many MPC codes with a 000 global assignment, but none that approach the work required of 61737.

For additional support, the RUC concurred that 61737 is appropriately bracketed by comparator codes 93656 *Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia including left or right atrial pacing/recording when necessary, right ventricular pacing/recording when necessary, and His bundle recording when necessary with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation* (work RVU = 19.77, 240 minutes intra-service time and 309 minutes total time), typically performed as an outpatient procedure in a catheterization lab, and 33976 *Insertion of ventricular assist device; extracorporeal, biventricular* (work RVU = 30.75, 240 minutes intra-service time and 455 minutes total time) and noted that all three codes require similar intra-service time. The RUC concluded that CPT code 61737 should be valued at the median work RVU as supported by the survey. **The RUC recommends a work RVU of 24.00 for CPT code 61737.**

Practice Expense
The Practice Expense Subcommittee accepted the request of the specialties for standard 90-day global preclinical staff times. **The RUC recommends the direct practice expense inputs as submitted by the specialty societies.**

New Technology
CPT codes 61736 and 61737 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(Do not report 61736, in conjunction with 20660, 61737, 61781, 70551, 70552, 70553, 70557, 70558, 70559, 77021, 77022)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male with a 10-year history of seizures due to an intracranial tumor that was identified on magnetic resonance imaging (MRI) has failed to respond to medication adjustments to control his weekly seizures. An image-guided stereotactic interstitial laser ablation procedure is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 63%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 60% , Overnight stay-more than 24 hours 40%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preoperative lab work-up and imaging are reviewed with particular attention to prior CT, MR, and PET scans and noninvasive and invasive EEG results, as appropriate for pre-procedure planning of an optimal trajectory to the targeted lesion. The surgeon reviews the case with the multiple specialists caring for the patient, as needed, to assist with determination of the area to be targeted. Peri-operative medications are ordered. The surgical procedure, risks, and expected outcome are reviewed with the patient and family, and informed consent is obtained. Verification is made that all necessary surgical instruments, supplies, and specialized devices are available in the operative suite and MR suite. The length and type of anesthesia are reviewed with the anesthesiologist and MR suite staff, including expected changes to positioning and the need to transport the patient to and from the MR suite and operating room. The need for radiation protection of all staff during portions of the procedure is reviewed with the procedure team. The patient is positioned in the MR suite to allow for pre-procedure volumetric planning with attention to creating a trajectory for the laser fiber. After induction of general anesthesia, the patient's head is fixed appropriately, such as with an MR-compatible stereotactic head frame, stereotactic robot, or other frameless navigation systems. The patient is then registered into the chosen targeting system by the method appropriate to the system. This may include attaching a fiducial localizer to the frame base (for a stereotactic frame) and conducting further volumetric MRI or CT scans. The patient is transported from the MR suite to the operating room The patient is positioned in a manner that allows for placing the laser bolt and laser and then affixed to the operating table Frameless registration to the stereotactic robot or neuronavigation system is performed as required. Further stereotactic planning is then performed using the images acquired on the day of surgery. The preoperative and same-day imaging sets are loaded in the planning system and merged. Registration is checked for accuracy. The planned trajectories are verified to ensure that they pass through the appropriate structures to be targeted in a manner that allows the laser energy to lesion the target without spreading to brain areas to be preserved while avoiding cortical and sulcal vasculature and the cerebral ventricles. The chosen targeting system is then used to mark the planned entry site. Once the entry site is determined, the area is minimally clipped and widely prepped. The surgeon scrubs and gowns and conducts a procedural time out.

Description of Intra-Service Work: A sterile stereotactic frame arc is then set to appropriate frame coordinates as needed and is mounted over the sterile draped base ring. Alternately, a sterile frameless navigation arm or robotic instrument

holder is attached to the head holder or the previously draped stereotactic robot, respectively, as appropriate. The scalp over the entry site is injected with local anesthetic; a 2 cm incision is made and the soft tissue is cleared from the skull using monopolar cautery. A drill guide tube is lowered into the incision and braced against the bone. The thickness of the skull along the planned trajectory is measured on the navigation plan and the twist drill depth set to the corresponding length. A twist drill hole is then performed with a twist drill of appropriate diameter for the size of the laser bolt. The guide is replaced with a reducing cannula, and the dura and pia are opened carefully using a long monopolar cautery that has been measured to the appropriate depth. The distance to the target is then obtained from the robot, navigation system, or frame, and a thin stylet is first measured to this distance and then inserted to verify that the pia and dura have been opened and to create a path for the laser. The threaded laser bolt is then screwed into the skull through the chosen targeting device using the correct number of rotations to ensure that it is securely seated. The stereotactic alignment rod is then measured to the target distance and inserted through the anchor bolt and into the brain. Fluoroscopic imaging is used as appropriate to verify the accuracy of the trajectory. The distance to the target from the top of the bolt is calculated. After removing the alignment rod from the anchor bolt, the laser apparatus components are marked at the distance-to-target. These may be slowly and carefully inserted through the anchor bolt either at this point or after transport to MRI, as appropriate.

The drapes are removed, and the patient is carefully detached from the table, making sure to protect the anchor bolt, and laser (if inserted) from both movement and for sterility. The patient is then carefully transported to the MRI suite and placed supine within the magnet with the head turned to situate the treatment side up, to protect the laser assembly and anchor bolt. If necessary, any sterile covering of the anchor bolt is removed, and the laser probe apparatus is then measured to the appropriate length and delivered to the intended target in the brain. A volumetric image is acquired to confirm the placement of the laser tip at the intended target. The image is co-registered with the preoperative imaging in the laser ablation software workstation in the MRI control room. The software is used to identify the intended ablation target boundary(s), and the location of the probe on imaging is verified. Temperature reference points and safety limits are marked on the laser ablation software. Continuous MRI thermometry is initiated and streamed to the workstation, where thermal maps are superimposed over static images of the target area. Laser energy is delivered to the target while continuously monitoring subsequent thermal dose damage contour lines created by program software as tissue is heated to the required temperatures. The laser position is then altered as necessary, and laser energy is delivered to the target while continuously monitoring subsequent thermal dose damage contour lines created by program software as tissue is heated to the required temperatures. This process is repeated as many times as is necessary to create the entire lesion.

Once the intended lesion is created, a final MRI scan is conducted. These images are transferred to the laser workstation and merged with the previous imaging sets. The lesion is compared to the plan and the lesion as estimated by the laser software. Once the lesion is declared complete. The patient is withdrawn from the MRI, the laser applicators and anchor bolts are completely removed and incisions are closed.

Description of Post-Service Work:
End of procedure through discharge from recovery: The stereotactic frame is removed and sterile dressings are applied. The patient is monitored during the reversal of anesthesia. Assistance is provided in the transfer of the patient from the operating table to the gurney. Transport of the patient from the MR room to the recovery room is monitored. Postoperative recovery care is discussed with anesthesia and nursing staff. The procedure and outcome are discussed with the family in the waiting area. A brief operative note is written. An operative report is dictated that includes the documentation of imaging, stereotactic calculations, and operative imaging. When awake, the patient's neurological status is assessed. A postoperative progress note is written in the recovery room. The patient is discharged from the recovery room to the ICU or surgical floor bed, as appropriate. Orders for medication, labs, imaging, and monitoring are written and discussed with the nursing staff. Clinical variables -including hemodynamic, neurologic, and cognitive status, shivering, and postoperative nausea and vomiting- are especially relevant after brain surgery and need to be strictly monitored, often every hour.

Work later on the same day: Interval chart notes with an emphasis on neurological monitoring are reviewed. The patient's neurological status is assessed by the surgeon, including the level of consciousness, Glasgow Coma Scale, motor assessment, sensory assessment, and assessment for neurologic complications, including focal deficits from the lesion, cerebral edema, intracranial hemorrhage, seizures, stroke, pneumocephalus, and cerebrospinal fluid leaks. The patient’s case is discussed as needed with the multidisciplinary team caring for the patient. Orders for consultations from these specialists are written as appropriate. The patient's pain score is assessed. Advanced imaging is ordered as appropriate. Patient and family questions are answered. Orders are written and discussed with the nursing staff. Progress notes are recorded.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	4%	0%	12%	42%	42%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	19%	81%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	4%	42%	54%
Physical effort required	4%	23%	73%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	12%	31%	58%

2nd Key Reference Code

	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	0%	43%	57%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	29%	14%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	29%	29%	43%
Physical effort required	29%	14%	57%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	43%	43%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Recommendation

We recommend the survey median wRVU of 20.00

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Package time of 40 minutes plus an additional 28 minutes (total = 68 minutes). This operation includes atypical additional coordination with multiple healthcare providers, not only for pre-operative planning, but also regarding post-operative care. Preoperative MRI volumetric planning is performed just prior to the procedure. Planning for the procedure and coordination with the healthcare delivery team add a significant amount of time to the work typically assigned to Package 4 – as described in the preoperative work description. In support of 68 minutes (survey median time), please see similar codes 61540 (*Craniotomy with elevation of bone flap; for lobectomy, other than temporal lobe, partial or total, without electrocorticography during surgery*) and code 61566 (*Craniotomy with elevation of bone flap; for selective amygdalohippocampectomy*) that include 75 minutes of preoperative evaluation time. These codes similarly include extensive evaluation and planning for the surgical approach in addition to coordination with other health care providers. In addition, the recommended evaluation time of 68 minutes is the same as the evaluation time for code 33889 (*Open subclavian to carotid artery transposition performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision, unilateral*) which involves similar preoperative evaluation and planning to review MR, CT and CT with 3D reconstructions, along with many other imaging studies.

Positioning time: Package time of 3 minutes plus an additional 27 minutes (total = 30 minutes). Depending on the target area, the patient can be placed supine sitting, lateral, or prone. There is no typical position and dominant is split between supine sitting and prone, but can vary every year based on patient presentation. A significant amount of time is required related to positioning the patient relative to the imaging and laser equipment, along with application of devices to affix the head to the equipment and to the operating table. This additional work is described in more details in the preoperative work description. In support of 30 minutes (survey median time), please see similar codes 61697 (*Surgery of complex intracranial aneurysm, intracranial approach; carotid circulation*) and code 61700 (*Surgery of simple intracranial aneurysm, intracranial approach; carotid circulation*) that include 30 minutes of preoperative positioning for "stabilization of the patient's head in a pin fixation device." In addition, the recommended positioning time of 30 minutes compares well with many other codes that have 25-35 minutes, such as laparoscopy procedures and procedures that include extensive equipment in the surgical field or require intraoperative repositioning.

Scrub, dress, wait time: Subtract 5 minutes (total time = 15 minutes) to be consistent with survey median.

Immediate Post-time

Package 9b is selected with the following modifications: (1) add 7 minutes for additional work related to removal of hardware and additional time for documentation of the procedure; and (2) add 20 minutes per CMS 23-hour stay policy regarding visit(s) on the day of a procedure that is assigned facility outpatient status. One hundred percent of the respondents correctly indicated that a visit would be required later on the same day of the procedure. The median response for level of visit was 99232. Close monitoring during the first 12-24 hours after brain surgery are critical to a successful outcome. The assessment later on the day of the procedure, along with other work as described in the DOW would typically require at least 20 minutes (the intra-service time for 99232). The final total time recommended is 60 minutes = 33 (package time) +7 (add'l time related to hardware removal and documentation) +20 (visit later same day).

Key Reference Code Comparison

KRS 1: Code 61645 requires less total time, intra-time and positioning time. Both codes require intracranial work, intraoperative imaging and significant postoperative care. We note that our survey was constrained by a dearth of 0-day global codes familiar to neurosurgeons. Code 61645 was chosen most often (54%) and is the highest valued code on the reference service list.

KRS 2: Code 61640 requires less total time, intra-time and positioning time. Similar to the statement above, our survey was constrained by a dearth of 0-day global codes familiar to neurosurgeons, making comparison using magnitude estimation difficult.

Neither 61645 or 61640 include the significant preoperative evaluation and positioning required for 61736. All three codes require significant postop work on the day of the procedure.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	IMM POST	99233
61645	Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)	15.00	0.121	241	40	3	15	100	83	
61736	Laser interstitial thermal therapy (LITT)	20.00	0.091	353	68	30	15	180	60	

	of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion									
61640	Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel	12.32	0.095	233	40	3	15	90	30	1

MPC Code Comparison

There are many MPC codes with a 000 global assignment, but none that approach the work required of 61736. This makes finding appropriate MPC codes with similar total work difficult. MPC code 37244 (with the highest wRVU) is an emergent procedure performed in a cath lab to embolize or occlude vessel hemorrhage or lymphatic extravasation. Code 37244 requires significantly less total time, intra-time and pre/post time. Both 37244 and 61736 require intraoperative imaging. The higher IWPUT for 37244 when compared with 61736 may be reflective of the emergent nature of the procedure.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	IMM POST
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	13.75	0.135	166	23	3	5	90	45
61736	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion	20.00	0.091	353	68	30	15	180	60

Other Code Comparison

Codes 33891 and 33977 bracket the recommendation of work and time for 61736. All three codes require significant pre- and post-work on the day of the procedure and have the same or similar intraoperative time and intensity.

CPT	DESCRIPTOR	Glob	RVW	IWPUT	TOTAL TIME	PRE	INTRA	IMM POST
33891	Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision	000	20.00	0.098	323	110	173	40
61736	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion	000	20.00	0.091	353	113	180	60
33977	Removal of ventricular assist device; extracorporeal, single ventricle	XXX	20.86	0.098	335	95	180	60

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1465
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 estimate based on published literature and manufacturer sales records.

Specialty neurosurgery Frequency 1465 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 372
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on specialty estimate: 5% of 2019 utilization for 64999 (5% x 7432)

Specialty neurosurgery Frequency 372 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 25% , Overnight stay-more than 24 hours 75%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preoperative lab work-up and imaging are reviewed with particular attention to prior CT, MR, and PET scans and noninvasive and invasive EEG results, as appropriate for pre-procedure planning of an optimal multiple trajectories to the targeted lesion. The surgeon reviews the case with the multiple specialists caring for the patient, as needed, to assist with determination of the areas to be targeted. Peri-operative medications are ordered. The surgical procedure, risks, and expected outcome are reviewed with the patient and family, and informed consent is obtained. Verification is made that all necessary surgical instruments, supplies, and specialized devices are available in the operative suite and MR suite. The length and type of anesthesia are reviewed with the anesthesiologist and MR suite staff, including expected changes to positioning and the need to transport the patient to and from the MR suite and operating room. The need for radiation protection of all staff during portions of the procedure is reviewed with the procedure team. The patient is positioned in the MR suite to allow for pre-procedure volumetric planning with attention to creating multiple trajectories for multiple laser fibers. After induction of general anesthesia, the patient's head is fixed appropriately, such as with an MR-compatible stereotactic head frame, stereotactic robot, or other frameless navigation systems. The patient is then registered into the chosen targeting system by the method appropriate to the system. This may include attaching a fiducial localizer to the frame base (for a stereotactic frame) and conducting further volumetric MRI or CT scans. The patient is transported from the MR suite to the operating room The patient is positioned in a manner that allows for placing the laser bolt and laser and then affixed to the operating table Frameless registration to the stereotactic robot or neuronavigation system is performed as required. Further stereotactic planning is then performed using the images acquired on the day of surgery. The preoperative and same-day imaging sets are loaded in the planning system and merged. Registration is checked for accuracy. The planned trajectories are verified to ensure that they pass through the appropriate structures to be targeted in a manner that allows the laser energy to lesion the target without spreading to brain areas to be preserved while avoiding cortical and sulcal vasculature and the cerebral ventricles. The chosen targeting system is then used to mark the planned entry sites. Once the entry sites are determined, the areas are minimally clipped and widely prepped. The surgeon scrubs and gowns and conducts a procedural time out.

Description of Intra-Service Work: A sterile stereotactic frame arc is set to appropriate frame coordinates as needed and is mounted over the draped base ring. Alternately a sterile frameless navigation arm or robotic instrument holder is attached to the head holder or the previously draped stereotactic robot, respectively, as appropriate. The scalp over the entry site is injected with local anesthetic; a 2 cm incision is made. The soft tissue is cleared from the skull using monopolar cautery and a drill guide tube is lowered into the incision and braced against the bone. The thickness of the skull along the planned trajectory is measured on the navigation plan and the twist drill depth set to the corresponding length. A twist drill hole is then performed with a twist drill of appropriate diameter for the size of the laser bolt. The guide is replaced with a reducing cannula, and the dura and pia are opened carefully using a long monopolar cautery that has been measured to the appropriate depth. The distance to the target is then obtained from the robot, navigation system, or frame, and a thin stylet is first measured to this distance and then inserted to verify that the pia and dura have been opened and to create a path for the laser. The threaded laser bolt is then screwed into the skull through the chosen targeting device using the correct number of rotations to ensure that it is securely seated. The stereotactic alignment rod is then measured to the target distance and inserted through the anchor bolt and into the brain. Fluoroscopic imagine is used as appropriate to verify the accuracy of the trajectory. The distance to the target from the top of the bolt is calculated. After removing the alignment rod from the anchor bolt, the laser apparatus components are marked at the distance-to-target. These may be slowly and carefully inserted through the anchor bolt either at this point or after transport to the MR suite, as appropriate.

Moving on, the navigation system is then aligned to the next trajectory and to mark the next entry point. Local anesthetic is infiltrated in this region, another incision is made, and the next anchor bolt and laser are inserted in similar fashion to the first. This process is then repeated for each subsequent required laser trajectory.

The drapes are removed, and the patient is carefully detached from the table, making sure to protect the anchor bolt, and laser (if inserted) from both movement and for sterility. After all anchor bolts have been placed, the patient is then carefully transported to the MRI suite and placed supine within the magnet with the head turned to situate the treatment side up, to protect the laser assemblies and anchor bolts. If necessary, any sterile coverings of the anchor bolts are removed, and each laser probe apparatus is then measured to the appropriate length and delivered to the intended target in the brain through the corresponding anchor bolt. A volumetric image is acquired to confirm the placement of each of the laser tips at the intended target. The image is co-registered with the preoperative imaging in the laser ablation software workstation in the MRI control room. The software is used to identify the intended ablation target boundary(ies), and the location of each probe on imaging is verified. The first laser trajectory is then selected and the imaging is aligned to this trajectory. Temperature reference points and safety limits are marked on the laser ablation software. Continuous MRI thermometry is initiated and streamed to the workstation, where thermal maps are superimposed over static images of the target area. Laser energy is delivered to the target while continuously monitoring subsequent thermal dose damage contour lines created by program software as tissue is heated to the required temperatures. The laser position is then altered as necessary, and laser energy is delivered to the target while continuously monitoring subsequent thermal dose damage contour lines created by program software as tissue is heated to the required temperatures. This process is repeated as many times as is necessary to create the entire lesion.

The imaging is then aligned to the next laser trajectory. Temperature reference points and safety limits are marked on the laser ablation software. Continuous MRI thermometry is initiated and streamed to the workstation, where thermal maps are superimposed over static images of the target area. Laser energy is delivered to the target while continuously monitoring subsequent thermal dose damage contour lines created by program software as tissue is heated to the required temperatures. The laser position is then altered as necessary, and laser energy is delivered to the target while continuously monitoring subsequent thermal dose damage contour lines created by program software as tissue is heated to the required temperatures. This process is repeated as many times as is necessary to create the entire lesion. This process is then repeated for each subsequent laser trajectory.

Once all of the intended lesions are created with the multiple laser trajectories, a final MRI scan is conducted. These images are transferred to the laser workstation and merged with the previous imaging sets. The set of lesions are compared to the plan and the estimate from the laser software. Once the set of lesions is declared complete. The patient is withdrawn from the MRI, the laser applicators and anchor bolts are completely removed and incisions are closed.

Description of Post-Service Work:
End of procedure through discharge from recovery: The stereotactic frame is removed and sterile dressings are applied. The patient is monitored during the reversal of anesthesia. Assistance is provided in the transfer of the patient from the operating table to the gurney. Transport of the patient from the MR room to the recovery room is monitored. Postoperative recovery care is discussed with anesthesia and nursing staff. The procedure and outcome are discussed with the family in the waiting area. A brief operative note is written. An operative report is dictated that includes the documentation of

imaging, stereotactic calculations, and operative imaging. When awake, the patient's neurological status is assessed. A postoperative progress note is written in the recovery room. The patient is discharged from the recovery room to the ICU or surgical floor bed, as appropriate. Orders for medication, labs, imaging, and monitoring are written and discussed with the nursing staff. Clinical variables -including hemodynamic, neurologic, and cognitive status, shivering, and postoperative nausea and vomiting- are especially relevant after brain surgery and need to be strictly monitored, often every hour.

Work later on the same day: Interval chart notes with an emphasis on neurological monitoring are reviewed. The patient's neurological status is assessed by the surgeon, including the level of consciousness, Glasgow Coma Scale, motor assessment, sensory assessment, and assessment for neurologic complications, including focal deficits from the lesion, cerebral edema, intracranial hemorrhage, seizures, stroke, pneumocephalus, and cerebrospinal fluid leaks. The patient’s case is discussed as needed with the multidisciplinary team caring for the patient. Orders for consultations from these specialists are written as appropriate. The patient's pain score is assessed. Advanced imaging is ordered as appropriate. Patient and family questions are answered. Orders are written and discussed with the nursing staff. Progress notes are recorded.

Technical skill required	0%	67%	33%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	0%	100%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Recommendation

We recommend the survey median wRVU of 24.00

Pre-time

Package 4 is selected with the following modifications:

Evaluation time: Package time of 40 minutes plus an additional 53 minutes (total = 93 minutes). This operation includes atypical additional coordination with multiple healthcare providers, not only for pre-operative planning, but also regarding post-operative care. Preoperative MRI volumetric planning is performed just prior to the procedure. Planning for the procedure and coordination with the healthcare delivery team add a significant amount of time to the work typically assigned to Package 4 – as described in the preoperative work description. When compared with planning for 61736 (single trajectory for simple lesion), the planning for 61737 (multiple trajectories for multiple or complex lesion[s]) is significantly greater. In support of 93 minutes (survey median time), please see code 33880 (*Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin)* that includes 90 minutes of preoperative evaluation time. This code similarly includes extensive evaluation and planning for the procedure ("*Perform extensive review and measurement of imaging studies (some combination of CT , CT angiogram, CT with 3-D reconstructions, MRI, angiograms) to determine the exact measurements of aorta. Based on measurements, determine all potential components required for repair, plus contingencies and backups"*). In addition, the recommended evaluation time of 93 minutes is slightly less than the 110 minutes of evaluation time for endovascular repair codes 34701, 34703, 34705, 34707, 34710, 34718 that include preoperative planning.

Positioning time: Package time of 3 minutes plus an additional 33 minutes (total = 33 minutes). Depending on the target area(s), the patient can be placed supine sitting, lateral, or prone. There is no typical position and dominant is split between supine sitting and prone, but can vary every year based on patient presentation. A significant amount of time is required related to positioning the patient relative to the imaging and laser equipment, along with application of devices to affix the head to the equipment and to the operating table. This additional work is described in more details in the preoperative work description. In support of 36 minutes (survey median time), please see similar codes 61697 (*Surgery of complex intracranial aneurysm, intracranial approach; carotid circulation*) and code 61700 (*Surgery of simple intracranial aneurysm, intracranial approach; carotid circulation*) that include 30 minutes of preoperative positioning for "stabilization of the patient's head in a pin fixation device." The additional positioning time for 61737 compared with code 61700 and code 61736 relates to the need for additional positioning for more trajectories. In addition, the recommended positioning time of 36 minutes compares well with many other codes that have 30-35 minutes, such as laparoscopy procedures and procedures that include extensive equipment in the surgical field or require intraoperative repositioning.

Scrub, dress, wait time: Subtract 5 minutes (total time = 15 minutes) to be consistent with survey median.

Immediate Post-time

Package 9b is selected with the following modifications: (1) add 7 minutes for additional work related to removal of hardware and additional time for documentation of the procedure

Evaluation and management work later on the day of the procedure.

One hundred percent of the respondents indicated and E/M would be provided later on the same day of the procedure and 75% of the respondents indicated the typical patient will be admitted. The stakeholder societies believe the percentage inpatient admission is likely higher than this survey estimate. Although the E/M work later on the same day is similar to patients undergoing LITT for a single lesion, the complexity of the medical decision making is greater, the time required for the E/M work is greater, and the level of patient instability is greater. The survey median level of E/M visit was 99233.

Key Reference Code Comparison

KRS 1: Code 61645 requires less total time, intra-time and positioning time. Both codes require intracranial work, intraoperative imaging and significant postoperative care. We note that our survey was constrained by a dearth of 0-day global codes familiar to neurosurgeons. Code 61645 was chosen most often (75%) and is the highest valued code on the reference service list.

KRS 2: Code 20982 requires less time in every category. This is not a good reference, but reflects an example of references chosen by 1, 2, or 3 respondents. We note that when this reference was chosen, the wRVU estimate was about three times greater.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	IMM POST	99233
61645	Percutaneous arterial transluminal mechanical thrombectomy and/or	15.00	0.121	241	40	3	15	100	83	

	infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)									
61737	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; multiple trajectories for multiple or complex lesion(s)	24.00	0.077	474	93	36	15	235	40	1
20982	Ablation therapy for reduction or eradication of 1 or more bone tumors (eg, metastasis) including adjacent soft tissue when involved by tumor extension, percutaneous, including imaging guidance when performed; radiofrequency	7.92	0.070	148	13	15	10	80	30	

MPC Code Comparison

There are many MPC codes with a 000 global assignment, but none that approach the work required of 61737. This makes finding appropriate MPC codes with similar total work difficult. MPC code 37244 (with the highest wRVU) is an emergent procedure performed in a cath lab to embolize or occlude vessel hemorrhage or lymphatic extravasation. Code 37244 requires significantly less total time, intra-time and pre/post time. Both 37244 and 61737 require intraoperative imaging. The higher IWPUT for 37244 when compared with 61737 may be reflective of the emergent nature of the procedure.

CPT	DESCRIPTOR	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	IMM POST	99233
37244	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation	13.75	0.135	166	23	3	5	90	45	
61737	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; multiple trajectories for multiple or complex lesion(s)	24.00	0.077	474	93	36	15	235	40	1

Other Code Comparison

Codes 93656 and 33976 bracket the recommendation of work and time for 61737. All three codes require significant intra-time. Code 93656 is typically performed as an outpatient procedure in a cath lab.

CPT	DESCRIPTOR	Glob	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	IMM POST	99233
93656	Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia including left or right atrial pacing/recording when necessary, right ventricular pacing/recording when necessary, and His bundle recording when necessary with intracardiac catheter ablation of atrial fibrillation by pulmonary vein isolation	000	19.77	0.076	309	23	1	5	240	40	
61737	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; multiple trajectories for multiple or complex lesion(s)	000	24.00	0.077	474	93	35	16	235	40	1
33976	Insertion of ventricular assist device; extracorporeal, biventricular	XXX	30.75	0.109	455	60	15	20	240	120	

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty neurosurgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 350
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 2019 estimate based on published literature and manufacturer sales records.

Specialty neurosurgery Frequency 350 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 93 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on specialty estimate: 1.25% of 2019 utilization for 64999 (1.25% x 7432)

Specialty neurosurgery Frequency 93 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

FACILITY DIRECT PE INPUTS **CPT CODE(S):** 61736, 61737

SPECIALTY SOCIETY(IES): AANS, CNS

PRESENTER(S): John Ratliff, MD; Clemens Schirmer, MD; Joshua Rosenow, MD

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 01/2021

CPT Code	Long Descriptor	Global Period
61736	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; single trajectory for 1 simple lesion	000
61737	Laser interstitial thermal therapy (LITT) of lesion, intracranial, including burr hole(s), with magnetic resonance imaging guidance, when performed; multiple trajectories for multiple or complex lesion(s)	000

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
61736	A 45-year-old male with a 10-year history of seizures due to an intracranial tumor that was identified on magnetic resonance imaging (MRI) has failed to respond to medication adjustments to control his weekly seizures. An image-guided stereotactic interstitial laser ablation procedure is performed.
61737	A 25-year-old male with a 15-year history of seizures due to a large complex hypothalamic hamartoma identified on magnetic resonance imaging (MRI) has failed to respond to medication adjustments to control his weekly seizures. An image-guided stereotactic interstitial laser ablation procedure including multiple laser trajectories is performed.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   A joint RVS Committee representing the societies utilized a consensus panel to develop recommended inputs.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code, but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here (*for service reviewed prior to the implementation of clinical activity codes, detail is not provided in the RUC database, please contact Samantha Ashley at samantha.ashley@ama-assn.org for PE spreadsheets for your reference codes*):

   Two reference codes have been provided. One is a 000 global code to support the recommended time for these 000 global codes. The second reference code with a 090 global assignment represents a similar procedure requiring similar pre-service clinical staff work.

3. Is this code(s) typically reported with an E/M service?

   No

4. If you are recommending more minutes than the PE Subcommittee standards for clinical activities you must provide rationale to justify the time:

   The standard for 0-day global codes is 0 minutes clinical staff time. Codes 61736 and 61737 services are exclusively performed in the facility setting and require office clinical staff time typical of 90-day global procedures performed in the facility setting. The LITT procedures are performed under general anesthesia and require specialized supplies and equipment and pre-operative coordination between

multiple specialists and both the OR and MR suites. The main reason these codes were assigned a 000 day global period instead of 90 days is to accommodate the postoperative multispecialty care that is shared (eg, neurosurgeon, neurologist).
The clinical staff PE inputs were derived from comparison to 33361 (TAVR) which represents a procedure performed by a cardiologist and cardiovascular surgeon requiring additional scheduling and coordination of services between cardiology, cardiovascular surgery, radiology, perfusionist and a specialized anesthesiologist. This same coordination with multiple specialists applies to the LITT procedures. In addition, the TAVR procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment all of which must be ordered and coordinated by each physician's clinical staff. Similarly, the LITT procedures require specialized equipment and supplies in both the OR and the MR suites as the patient will have parts of the procedure performed in each setting (please see the work DOW).
The recommended clinical staff PE inputs can also be compared to 61720 as this procedure requires the same coordination of a team and separate rooms (MR and OR suites) in preparation for the procedure.

5. If you are requesting an increase over the aggregate current cost for clinical staff time, equipment and supplies for the **code family**, please provide compelling evidence (please see *PE compelling evidence guidelines*) Please explain if the increase can be entirely accounted for because of an increase in physician time:

n/a

6. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see second worksheet in PE spreadsheet workbook*), please explain the difference here:

n/a

7. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

CA001 (complete pre-service diagnostic and referral forms): The clinical staff will complete pre-service diagnostic and referral forms, including scheduling preoperative clearance and securing insurance prior authorization.

CA002 (coordinate pre-surgery services): Clinical staff coordination communications between the multidisciplinary team caring for this patient in preparation for the procedure. Preoperative labs and imaging and historical imaging are collected for preoperative planning by the neurosurgeon.

CA003 (schedule space and equipment in facility): In addition to coordinating all of the specialists involved, the specialized supplies, devices, and equipment in both the OR and MR are coordinated and scheduled.

CA004 (provide education/obtain consent): The patient and family will be educated about the procedure including the details of affixing the head frame, intraoperative transport and MR positioning, imaging and treatment.

CA005 (complete pre-procedure phone calls and prescriptions): The patient and family are reminded of the scheduled procedure, given last minute instructions for prep and reporting for the procedure and confirmation of any required adjustments to medications.

   b. Service period (includes pre, intra and post):

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

n/a

c. Post-service period:

n/a

8. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see second worksheet in PE spreadsheet workbook*):

n/a

9. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

n/a

INVOICES

10. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

11. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

12. If you wish to include a supply that is not on the list (*please see fourth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

n/a

13. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation. Please include the description, CMS supply code, unit, item quantity and unit price (if available). See documents two and three under PE reference materials on the RUC Collaboration Website for information on the contents of kits, packs and trays.

n/a

14. If you wish to include an equipment item that is not on the list (*please see fifth worksheet in PE spreadsheet workbook*) please provide a paid invoice. Identify and explain the invoice here:

n/a

15. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?

n/a

16. List all the equipment included in your recommendation and the equipment formula chosen *(*please see document titled *Calculating equipment time).* If you have selected "other formula" for any of the equipment please explain here:

n/a

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING

During and immediately following the review of this tab at the PE Subcommittee meeting please revise the PE spreadsheet and summary of recommendation (PE SOR) documents based on modifications made during the meeting. Please submit the revised documents electronically to Samantha Ashley at samantha.ashley@ama-assn.org immediately following the close of business the same day that the tab is reviewed. On the PE spreadsheet, please highlight the cells and/or use red font to show the changes made during the PE Subcommittee meeting (if you have provided any of this highlighting based on changes from the reference code prior to the PE Subcommittee meeting please remove it, so not to be confused with changes made during the meeting). In addition to those revisions please also provide an itemized list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below (e.g. clinical activity CA010 *obtain vital signs* was reduced from 5 minutes to 3 minutes).

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2021

Hypoglossal Nerve Stimulator Services – Tab 13

In October 2020, the CPT Editorial Panel replaced three CPT Category III codes with three new CPT Category I codes to report open implantation, revision or replacement, and removal of hypoglossal nerve stimulator array. In addition, the CPT Editorial Panel made editorial revisions to codes 64568, 64569, 64570, 64575, 64580, and 64581.

64582 ***Open implantation of hypoglossal nerve neruostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array***
The RUC reviewed the survey results from 89 otolaryngologists and determined that the survey median work RVU of 16.00 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 35 minutes of pre-service evaluation time, 20 minutes of pre-service positioning time, 14 minutes of pre-service scrub/dress/wait time, 140 minutes of intra-service time, 20 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213). The RUC agreed that the recommended 20 minutes of positioning time, an increase of 17 minutes from pre-time package 4, is consistent with the survey median time and necessary for this procedure. Specifically, the chest area must be taped down to access the neck and utilize sleds and belts to secure them. There are two specific surgical sites and patients typically have very large/obese (BMI > 30) body habitus. Positioning requires the physician to access and position the patient in an ergonomic fashion and requires extended neck and chest access throughout the procedure. Additionally, the RUC discussed the relationship with drug induced sleep endoscopy (DISE) services and if there is an overlap with work. The specialty addressed and the RUC agreed that DISE *does* need to be performed to determine candidacy for hypoglossal nerve stimulator services (HGN). However, if the physician performs both services, these elective procedures are often separated by months, given the difficulty of scheduling surgeries at sleep medicine practices, and are not done closely together.

In addition, the RUC thoroughly discussed CPT code 64568 *Incision for implantation of cranial nerve (eg,* ***vagus nerve****) neurostimulator electrode array and pulse generator* (work RVU = 9.00, intra-service time of 90 minutes and total time of 275 minutes) which was reported with deleted Category III codes 0466T-0468T and agreed that the use of this vagus nerve code only represents part of the work involved in hypoglossal nerve stimulator services and does not address the distal inspiratory sensor, which is for a completely different site and incision as well as a completely different disease process and patient population. The physician work for hypoglossal nerve stimulator services is different than vagus nerve work. Identifying and placing a nerve stimulator on the trunk of the vagus nerve is different than identifying and placing a nerve stimulator on the distal and wispy branches of the hypoglossal nerve. The physician must find the specific branch that protrudes the tongue and implant it. Additionally, the physician is putting other cranial nerve branches at risk where they dissect to find the hypoglossal nerve. Hypoglossal nerve services are very different than the vagal nerve service in terms of patient population work intensity and risk. The RUC agreed with the specialty that there is evidence for increasing times and intensity for the additional work involved in the hypoglossal nerve stimulator family.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared the survey code to the second key reference code 64911 *Nerve repair; with autogenous vein graft (includes harvest of vein graft), each nerve* (work RVU = 14.00, intra-service time of 110 minutes and total time of 292 minutes) and noted that although both services involve similar total time, the survey code involves 30 minutes more of intra-service time and more total time, supporting a higher value of 16.00. Most survey respondents that selected the second key reference code 64911, also noted that the survey code was more intense/complex (71%), further warranting a work value of 16.00 for the survey code. Additionally, the RUC referenced code 49655 *Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated* (work RVU= 16.84, intra-service time of 150 minutes and total time of 344 minutes) and noted that code 49655 has 10 more minutes of intra-service time and more total time, warranting the higher work value in comparison to the survey code. **The RUC recommends a work RVU of 16.00 for CPT code 64582.**

64583 ***Revision or replacement of hypoglossal nerve neruostimulator array and distal respiratory sensor electrode or electrode array, including connection to an existing pulse generator***
The RUC reviewed the survey results from 67 otolaryngologists and determined that the survey median work RVU of 16.50 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 20 minutes of pre-service positioning time, 14 minutes of pre-service scrub/dress/wait time, 150 minutes of intra-service time, 20 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

The RUC compared the survey code to code 49655 *Laparoscopy, surgical, repair, incisional hernia (includes mesh insertion, when performed); incarcerated or strangulated* (work RVU = 16.84, intra-service time of 150 minutes and total time of 344 minutes) and noted that both services have identical intra-service times; however, reference code 49655 has more total time, warranting the higher work value than the recommended work value of 16.50 for the survey code. Additionally, the RUC compared the survey code to code 15736 *Muscle, myocutaneous, or fasciocutaneous flap; upper extremity* (work RVU= 17.04, intra-service time of 150 minutes and total time of 396 minutes) and noted that both codes have identical intra-service time, however reference code 15736 has a higher value because this service has more total time, supporting the recommended work value of 16.50 for the survey code. **The RUC recommends a work RVU of 16.50 for CPT code 64583.**

64584 ***Removal of hypoglossal nerve neruostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array***
The RUC reviewed the survey results from 64 otolaryngologists and determined that the survey median work RVU of 14.00 accurately reflects the typical physician work necessary to perform this service. The RUC recommends 40 minutes of pre-service evaluation time, 15 minutes of pre-service positioning time, 15 minutes of pre-service scrub/dress/wait time, 120 minutes of intra-service time, 20 minutes of immediate post-service time, ½ discharge day management (99238), and two office visit(s) (2x 99213).

The RUC compared the survey code to code 58674 *Laparoscopy, surgical, ablation of uterine fibroid(s) including intraoperative ultrasound guidance and monitoring, radiofrequency* (work RVU= 14.08, intra-service time of 120 minutes and total time of 266 minutes) and agreed that both codes involve identical intra-service time and similar total time, warranting the recommended work value of 14.00 compared to 14.08 for code 58674. Additionally, the RUC compared the survey code with MPC code 52649 *Laser enucleation of the prostate with morcellation, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)* (work RVU = 14.56, intra-service time of 120 minutes and total time of 279 minutes) and noted that both codes have identical intra-service times and very similar total times. However, MPC code 58674 is

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

slightly more intense and has 0.56 more work RVUs than the survey code, further supporting the work value of 14.00 for the survey code. **The RUC recommends a work RVU of 14.00 for CPT code 64584.**

Practice Expense
The Practice Expense Subcommittee approved the standard 090-day global period direct practice expense inputs for CPT codes 64582, 64583 and 64584. **The RUC recommends the direct practice expense inputs as submitted by the specialty society.**

Implantation Neurostimulator Electrodes, Cranial Nerve (Vagus Nerve Stimulation)

64568-64570

lc - should read "Open implantation . . ."

Implantation of a cranial nerve (eg, vagus nerve) neurostimulator electrode with connection of the electrode to an implanted programmable pulse generator in the infraclavicular area (64568). Revision or replacement of the cranial nerve electrode (64569). Replacement of the cranial nerve pulse generator (61885).

Medicine
Neurology and Neuromuscular Procedures
Neurostimulators, Analysis-Programming

Electronic analysis of an implanted neurostimulator pulse generator/transmitter . . .

Codes 95971, 95972, 95976, 95977, 95983, 95984 are reported . . .

Test stimulations are typically performed during an implantation procedure (43647, 43648, 43881, 43882, 61850, 61860, 61863, 61864, 61867, 61868, 61880, 61885, 61886, 61888, 63650, 63655, 63661, 63662, 63663, 63664, 63685, 63688, 64553, 64555, 64561, 64566, 64568, 64569, 64570, 64575, 64580, 64581, 64582, 64583, 64584, 64585, 64590, 64595) to confirm correct target site placement of the electrode array(s) and/or to confirm the functional status of the system. Test stimulation is not considered electronic analysis or programming of the neurostimulator system (test stimulation is included in the service described by the implantation code) and should not be reported with 95970, 95971, 95972, 95980, 95981, 95982, 95983, 95984. Electronic analysis of a device (95970) is not reported separately at the time of implantation.

(For insertion of neurostimulator pulse generator, see 61885, 61886, 63685, 64568, 64582, 64590)

(For revision or removal of neurostimulator pulse generator or receiver, see 61888, 63688, 64569, 64570, 64583, 64584, 64595)

(For implantation of neurostimulator electrodes, see 43647, 43881, 61850-~~*61870*~~*61868*, 63650, 63655, 64553-64581. For revision or removal of neurostimulator electrodes, see 43648, 43882, 61880, 63661, 63662, 63663, 63664, 64569, 64570, 64583, 64584, 64585)

(For analysis and programming of implanted integrated neurostimulation system, posterior tibial nerve, see 0589T, 0590T)

95970 *Electronic analysis of implanted neurostimulator pulse generator/transmitter (eg, contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with brain, cranial nerve, spinal cord, peripheral nerve, or sacral nerve, neurostimulator pulse generator/transmitter, without programming*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

	(Do not report 95970 in conjunction with 43647, 43648, 43881, 43882, 61850, 61860, 61863, 61864, 61867, 61868, ~~*61870,*~~ 61880, 61885, 61886, 61888, 63650, 63655, 63661, 63662, 63663, 63664, 63685, 63688, 64553, 64555, 64561, 64566, 64568, 64569, 64570, 64575, 64580, 64581, 64582, 64583, 64584, 64585, 64590, 64595, during the same operative session) **Category III Codes**

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64582 Tracking Number Original Specialty Recommended RVU: **16.00**
Presented Recommended RVU: **16.00**
Global Period: 090 Current Work RVU: RUC Recommended RVU: **16.00**

CPT Descriptor: Open implantation of hypoglossal nerve neruostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 46-year old male with moderate to severe obstructive sleep apnea presents after failing positive airway pressure thearpy, examination shows base of tongue airway collapse without complete concentric collapse at the palate.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 80% , In the ASC 20%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 83% , Overnight stay-less than 24 hours 17% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the anesthetic plan and the approximate length of the case. Review and obtain informed consent. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned with care taken to ensure there is adequate exposure of the neck and chest. Given the typical body habitus of the patient undergoing a hypoglossal nerve stimulator, sleds are required in order to tuck both arms and allow for adequate surgical field exposure. The surgeon scrubs and gowns. Recording EMG needle electrodes are placed in the tongue musculature. The planned incision sites in both the neck and chest wall are prepped and draped in sterile fashion, then injected with local anesthetic.

Description of Intra-Service Work: An incision is made in the neck and brought through platysma and deep fascia; subplatysmal flaps are raised and the submandibular gland identified and retracted. The lingual nerve and marginal mandibular nerve are identified and preserved. Care is taken to achieve meticulous hemostasis to avoid injuries to these, as well as the contents of the carotid sheath. The posterior belly of the digastric muscle is identified and the carotid artery is identified through palpation. The hypoglossal nerve is identified by dissection through deep cervical fascia and followed distally until the branch(s) which extrude the tongue only through electrical stimulation are identified. A microscope is typically used to identify these distal branches. The stimulatory array is attached to these distal branch(s). The stimulatory array is secured to the digastric muscle.

• An upper chest incision is made and a pocket is created. The pulse generator is buried in its pocket and sewn to the pectoralis muscle. A tunnel is made between the hypoglossal lead and the upper chest incision. A horizontal incision is made in the lateral chest wall. Incision is taken through skin and subcutaneous tissue until the serratus anterior and pectoralis major muscles are identified. Dissection proceeds between these structures to the 6th intercostal space, identifying external and internal intercostal muscles. Blunt dissection extends between the intercostal muscles, avoiding the neurovascular bundle. A sensor lead is placed between the intercostal muscles and secured with multiple permanent sutures to the fascia overlying the chest wall.

A subcutaneous tunnel is created to connect the sensor lead incision to the generator pocket. The sensor lead is attached to the generator and respiratory sensing is verified. The sensor lead is repositioned if the sensor waveform is not adequate. All sites are irrigated. The surgical incisions are closed in a layered fashion and dressings are applied.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders, medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

Visit 1

A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. Sutures are removed. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. Extensive discussion regarding what to expect at the next visit, including activation of the device, occurs between the patient and the physician. The physician stresses the importance of the patient bringing the remote control with them to the next visit.

Visit 2

A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The device is activated, which includes determining thresholds, impedance levels, sensing waveform, tongue motion, patient comfort, and programming patient control range. The patient is educated on understanding the remote control, practicing therapy use, and extent of the acclimation phase.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	21%	47%	32%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	37%	63%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	21%	79%
Physical effort required	0%	33%	67%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	32%	58%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	29%	41%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	12%	24%	64%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	35%	59%
Physical effort required	6%	41%	53%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	35%	65%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting new codes 64582-84. These new codes represent implantation, revision/replacement, and removal of a hypoglossal nerve stimulator, previously reported using 64568-64570. The existing codes have been retained and now represent the same work when performed on the vagal nerve. Those services will predominantly by Neurosurgery and were not surveyed for this meeting as a

result of their changes being editorial. The Panel approved the CCA and the code is now being valued by the RUC. The new code will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted selection of 362 members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated in sleep medicine as their sub-specialty and are ***have also been trained through the mandatory process by the only company that currently manufactures this device, Inspire. Given that only Inspire trained physicians and facilities can perform this procedure at the time of survey, we did not feel it was appropriate or representative to survey sleep-medicine members who were not certified in these specific procedures.***

Recommendation (Work and Intra Time):

We are recommending a work RVU of **16.00 and 140 minutes of intra service time**, based on our survey's median RVW.

Time package selection: We have selected pre-time package 4 and post-time package 9B due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia and the patients typically have multiple comorbities and being very difficult to position and access during the procedure.

Pre-time Package 4 Difficult Patient/Difficult Procedure

Evaluation Time – We are recommending 35 minutes of evaluation time which is 5 minutes less than the pre-service package time, based on our survey median.

Positioning Time – We are recommending 20 minutes of positioning time which is an increase of 17 minutes from the package time, but consistent with our survey median time and necessary for this procedure. Specifically, you must tape down the chest area to access the neck and utilize sleds and belts to secure them. There are two specific surgical sites and patients typically have a very large body habitus. The procedure requires that you have the ability to access them and position them in ergonomic fashion and requires an extended neck and chest access throughout the procedure.

Scrub, Dress, Wait Time – We are recommending 14 minutes of scrub, dress and wait time which is 6 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 69 minutes, taking the lesser of surveyed time or the pre-service package time with increased time requested for the extensive positioning work required for these procedures.

Post-time Package 9B General Anesthesia or Complex Regional Block/Complex Procedure
Recommended time has been reduced to 20 minutes which is a decrease of 13 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 20 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey supports this, with 59 respondents indicating that a discharge management visit is performed when the patient is discharged within 24 hours which is typical. Based on these results, we have included a **half discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. Both of these visits were indicated as a level three office visit, 99213.

Visit 1 - 99213
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. Sutures are removed. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. Extensive discussion regarding what to expect at the next visit, including activation of the device, occurs between the patient and the physician. The physician stresses the importance of the patient bringing the remote control with them to the next visit.

Visit 2 - 99213
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The device is activated, which includes determining thresholds, impedance levels, sensing waveform, tongue motion, patient comfort, and programming patient control range. The patient is educated on understanding the remote control, practicing therapy use, and extent of the acclimation phase.

Supporting Reference Codes for the Recommended Value

CPT Code	Long Desc	Global	IWPUT	Work RVU	Intra Time	Total Time	Most Recent RUC Review	2019 Medicare Utilization
57265	Combined anteroposterior colporrhaphy, including cystourethroscopy, when performed; with enterocele repair	090	0.0892	15.00	120	271	2017-01	4370

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64568 and 0466T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 990
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 990 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 330
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is 33% of 64568's previous volume which is what we estimate will be transferred over to the new hypoglass nerve code 64582.

Specialty Otolaryngology Frequency 330 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:

Other

Global Period: 090 Current Work RVU: RUC Recommended RVU: **16.50**

CPT Descriptor: Revision or replacement of hypoglossal nerve neruostimulator array and distal respiratory sensor electrode or electrode array, including connection to an existing pulse generator

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year old male who underwent placement of a hypoglossal nerve stimulator devleops a malfunctioning device. He undergoes replacement of the hypoglossal nerve neurostimulator electrode array, pulse generator, and distal respiratory sensor electrode or electrode array.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 75% , In the ASC 24%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 76% , Overnight stay-less than 24 hours 24% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 92%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the anesthetic plan and the approximate length of the case. Review and obtain informed consent. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned with care taken to ensure there is adequate exposure of the neck and chest. Given the typical body habitus of the patient undergoing a hypoglossal nerve stimulator, sleds are required in order to tuck both arms and allow for adequate surgical field exposure. The surgeon scrubs and gowns. Recording EMG needle electrodes are placed in the tongue musculature. The planned incision sites in both the neck and chest wall are prepped and draped in sterile fashion, then injected with local anesthetic.

Description of Intra-Service Work: Incisions are made to access the stimulator array, chest wall sensor, and generator sites. Dissection proceeds to the sensor lead placed between the intercostal muscles. Once identified, the sensor is removed and its lead dissected from its subcutaneous tunnel to the generator pocket. The old sensor lead is detached from the generator and removed. The old generator is removed after it is disconnected from the stimulator array. The stimulator array is dissected free of the hypoglossal nerve carefully and replaced with a new stimulator array that is attached to the distal hypoglossal branches that only protrude the tongue as identified through direct stimulation. A microscope is typically utilized to visualize these distal branches. A new respiratory sensor is placed into the intercostal muscles and a new generator is placed into the previously created generator pocket. Both the new respiratory sensor and new stimulator array are attached to the pulse generator and the system is tested to ensure functional integrity. The wounds are irrigated. The surgical incisions are closed in a layered fashion and dressings are applied.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders, medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course,

signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

Visit 1:
A history is taken to evaluate the patients recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. Sutures are removed. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. Extensive discussion regarding what to expect at the next visit, including activation of the device, occurs between the patient and the physician. While the patient has been through this before, the discussion still occurs to ensure patient understanding. The physician stresses the importance of the patient bringing the remote control with them to the next visit.

Visit 2:
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The device is activated, which includes determining thresholds, impedance levels, sensing waveform, tongue motion, patient comfort, and programming patient control range. The patient is re-educated on understanding the remote control, practicing therapy use, and extent of the acclimation phase.

INTENSITY/COMPLEXITY MEASURES

(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	14%	36%	50%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	7%	29%	65%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	7%	93%
Physical effort required	0%	29%	72%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	21%	72%

2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	10%	20%	50%	20%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	10%	80%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	20%	80%
Physical effort required	0%	10%	90%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	40%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background:

In October 2020, the Academy brought forward a Code Change Application requesting new codes 64582-84. These new codes represent implantation, revision/replacement, and removal of a hypoglossal nerve stimulator, previously reported using 64568-64570. The existing codes have been retained and now represent the same work when performed on the vagal nerve. Those services will predominantly by Neurosurgery and were not surveyed for this meeting as a

result of their changes being editorial. The Panel approved the CCA and the code is now being valued by the RUC. The new code will be published in the 2022 edition of the CPT Book.

Survey Sample and Process:

A survey request was sent to a targeted selection of 362 members from the American Academy of Otolaryngology – Head and Neck Surgery who self-designated in sleep medicine as their sub-specialty and are ***have also been trained through the mandatory process by the only company that currently manufactures this device, Inspire. Given that only Inspire trained physicians and facilities can perform this procedure at the time of survey, we did not feel it was appropriate or representative to survey sleep-medicine members who were not certified in these specific procedures.***

Recommendation (Work and Intra Time):

We are recommending a work RVU of **16.50 and 150 minutes of intra service time**, based on our survey's median RVW.

Time package selection: We have selected pre-time package 4 and post-time package 9B due to this procedure currently being done predominantly in the hospital outpatient setting under general anesthesia and the patients typically have multiple comorbities and being very difficult to position and access during the procedure.

Pre-time Package 4 Difficult Patient/Difficult Procedure

Evaluation Time – We are recommending 40 minutes of evaluation time which is consistent with the pre-service package time, and our survey median.

Positioning Time – We are recommending 20 minutes of positioning time which is an increase of 17 minutes from the package time, but consistent with our survey median time and necessary for this procedure. Specifically, you must tape down the chest area to access the neck and utilize sleds and belts to secure them. There are two specific surgical sites and patients typically have a very large body habitus. The procedure requires that you have the ability to access them and position them in ergonomic fashion and requires an extended neck and chest access throughout the procedure.

Scrub, Dress, Wait Time – We are recommending 14 minutes of scrub, dress and wait time which is 6 minutes less than the pre-service package time, based on our survey median.

This results in a total recommended pre time of 74 minutes, taking the lesser of surveyed time or the pre-service package time with increased time requested for the extensive positioning work required for these procedures.

Post-time Package 9B General Anesthesia or Complex Regional Block/Complex Procedure
Recommended time has been reduced to 20 minutes which is a decrease of 13 minutes from the post package time selected to match our survey time. ***This results in a total recommended post time of 20 minutes, taking the lesser of surveyed time or the pre-service package time.***

Discharge Management / Post-Operative Visits
Given that this procedure is almost exclusively performed in the hospital outpatient or ASC setting, and general anesthesia sedation is utilized, patients must be monitored closely following the procedure. This results in a discharge management visit being performed after the procedure, before the patient is discharged from the hospital. Our survey supports this, with 38 respondents indicating that a discharge management visit is performed when the patient is discharged within 24 hours which is typical. Based on these results, we have included a **half discharge management visit in our recommendations for this CPT code.**

Survey respondents also indicated that two post-operative office visits are typically conducted after the procedure. Both of these visits were indicated as a level three office visit, 99213.

Visit 1 - 99213:
A history is taken to evaluate the patients recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. Sutures are removed. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. Extensive discussion regarding what to expect at the next visit, including activation of the device, occurs between the patient and the physician. While the patient has been through this before, the discussion still occurs to ensure patient understanding. The physician stresses the importance of the patient bringing the remote control with them to the next visit.

Visit 2 - 99213:
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The device is activated, which includes determining thresholds, impedance levels, sensing waveform, tongue motion, patient comfort, and programming patient control range. The patient is re-educated on understanding the remote control, practicing therapy use, and extent of the acclimation phase.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64659 and 0467T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otoloaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 614
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the Medicare volume estimated below.

Specialty Otolaryngology Frequency 614 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 205
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is 33% of 64569's previous volume which is what we estimate will be transferred over to the new hypoglass nerve code 64583.

Specialty Otolaryngology Frequency 205 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Removal of hypoglossal nerve neruostimulator array, pulse generator, and distal respiratory sensor electrode or electrode array

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year old male who underwent placement of a hypoglossal nerve stimulator devleops an intolerance to the system. He undergoes removal of the hypoglossal nerve neurostimulator electrode array, pulse gnerator, and distal respiratory sensor electrode or electrode array.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 75% , In the ASC 25%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 92% , Overnight stay-less than 24 hours 8% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Meet with patients and family to describe and discuss in detail the planned procedure. Review and update the medical history. Perform a current physical exam. Reconcile medications and allergies. Address NPO status and timing. Discuss the patient's expected convalescence and educate the patient and caregivers regarding the signs and symptoms of the most common complications. Discussion with the anesthesiologist regarding the anesthetic plan and the approximate length of the case. Review and obtain informed consent. The availability of all required instruments and supplies is verified. A timeout is performed with entire surgical team, including confirmation of the procedure, locations, allergies, antibiotic prophylaxis, anesthesia and fire risks, expected duration, and any concerns related to the procedure. The patient is positioned with care taken to ensure there is adequate exposure of the neck and chest. Given the typical body habitus of the patient undergoing a hypoglossal nerve stimulator, sleds are required in order to tuck both arms and allow for adequate surgical field exposure. The surgeon scrubs and gowns. Recording EMG needle electrodes are placed in the tongue musculature. The planned incision sites in both the neck and chest wall are prepped and draped in sterile fashion, then injected with local anesthetic.

Description of Intra-Service Work: Incisions are made to access the stimulator array, chest wall sensor, and generator sites. Dissection proceeds to the sensor lead placed between the intercostal muscles. Once identified, the sensor is removed and its lead dissected from its subcutaneous tunnel to the generator pocket. The old sensor lead is detached from the generator and removed. The old generator is removed after it is disconnected from the stimulator array. The stimulator array is dissected free of the hypoglossal nerve carefully. The wounds are irrigated. The surgical incisions are closed in a layered fashion and dressings are applied.

Description of Post-Service Work: The patient is observed during emergence from anesthesia. The procedure is dictated. Discharge medications are reconciled. The prescription drug monitoring database is reviewed. Postoperative orders, medications and instructions are written. There is a discussion with the family and patient regarding the procedure and findings. There is reiteration of the convalescence, precautions, follow up appointments, expected postoperative course, signs and symptoms of complications, and review of the written postoperative instructions. Instructions, appropriate discharge timing, follow up, and precautions are discussed with the postoperative nursing team.

Visit 1:
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. Sutures are removed. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The patient and physician discuss the patients' current sleep history, including snoring, cessation of breathing and restless sleep. The physician inquires about any concerning signs of sleep apnea, including daytime somnolence.

Visit 2:
A history is taken to evaluate the patients' recovery from surgery. The surgical wounds and implantation site are evaluated for any evidence of infection or dehiscense. A cranial nerve exam is performed with careful attention paid to the facial and hypoglossal nerve. The patient and physician discuss the patients' current sleep history, including snoring, cessation of breathing and restless sleep. The physician inquires about any concerning signs of sleep apnea, including daytime somnolence. The physician and the patient discuss further options for the treatment of sleep apnea given the absence of the hypoglossal nerve stimulator.
