Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**

34812 MPC	4.13	0.103	40				40	
+37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

36905 KRS	9.00	0.106	126	22	4	5	75	20
36253 KRS	7.30	0.100	121	23	3	5	60	30
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
36906 KRS	10.42	0.104	141	22	4	5	90	20
61645 KRS	15.00	0.121	241	40	3	15	100	83

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37255	**3.00**	**0.100**	**30**				**30**

				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60

34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #1 Overview of Recommended Values

The codes surveyed in the first abbreviated survey include the remaining codes in the iliac territory (37257-37261) and the remaining codes in the femoral/popliteal territory (37263-37266 and 37270-37279). Codes 37257-37261 represent iliac angioplasty and iliac stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37220-37223. Codes 37263-37266 and 37270-37279 represent femoral/popliteal angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37224-37227, however, they also represent new work as there are no codes for additional intervention in the femoral/popliteal territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #1 (37257-37261, 37263-37266, and 37271-37279) which describe intervention in the remaining iliac and femoral/popliteal territory codes were surveyed in conjunction with the core codes survey. As such, there were compared to the survey respondent's responses for the core surveyed codes and not compared to a reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The following five MPC codes bracket the recommendation for the 000-day global codes surveyed in abbreviated survey #1:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
52353 MPC	7.50	0.101	133	33	5	15	60	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37260	**14.24**	**0.109**	**185**	**30**	**3**	**5**	**117**	**30**
37273	**15.03**	**0.115**	**186**	**30**	**3**	**5**	**118**	**30**
37277	**15.55**	**0.115**	**191**	**30**	**3**	**5**	**123**	**30**

The following six MPC codes bracket the recommendations for the ZZZ addon codes surveyed by the abbreviated survey #1:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*

- MPC 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for abbreviated survey #1 ZZZ addon codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Abbreviated Survey #1 Additional Rationale for Specific Codes:

Iliac Territory:

+37257 Iliac angioplasty, additional vessel, complex:
The specialty societies recommend the 25th percentile survey value of 3.89 RVW. This represents an ***increase of 4.3%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. MPC codes 63048 and 34812 bracket +37257 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the 25th percentile survey value for +37257.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
63048 MPC	3.47	0.077	45				45	
+37257	**3.89**	**0.108**	**36**				**36**	
+34812 MPC	4.13	0.103	40				40	

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37222	+ Iliac angioplasty, addl	3.73	2977	**11,104**
New				
37255	+ Iliac, angioplasty, addl, SF	3.00	2530	7,590
37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

37258 Iliac angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 10.3%*** from current value of 9.75 RVWs for existing CPT code 37221.

37260 Iliac angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents an ***increase of 46.1%*** from current value of 9.75 RVWs for existing CPT code 37221.

The existing CPT code 37221, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37258 and 37260 splitting it into straightforward and complex interventions. MPC codes 52356 and 36905 bracket 37258 and MPC code 37244 brackets the lower range for 37260 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the 25th percentile survey value for 37258 and the crosswalk value for 37260.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
52356 MPC	8.00	0.110	133	33	5	15	60	20
37258	**8.75**	**0.104**	**143**	**30**	**3**	**5**	**75**	**30**

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37244 MPC	13.75	0.135	166	23	3	5	90	45
37260	**14.24**	**0.109**	**185**	**30**	**3**	**5**	**117**	**30**

When looking at the RVWs for 37258 and 37260 combined, the overall budget neutrality for existing CPT code 37221 is a ***decrease of 1.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37221	Iliac angioplasty, stent, init	9.75	25,781	**251,365**
New				
37258	Iliac, angioplasty stent, init, SF	8.75	21,914	191,748

				246,814
				-1.8%

+37259 Iliac angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW. This represents an ***decrease of 6%*** from current value of 4.25 RVWs for existing CPT code 37223.

+37261 Iliac angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 22328 value of 4.60 RVW. This represents an ***increase of 8.2%*** from current value of 4.25 RVWs for existing CPT code 37223.

The existing CPT code 37223, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37259 and +37261 splitting it into straightforward and complex interventions. MPC codes 63048 and 34812 bracket +37259 and MPC codes 34812 and 22632 bracket +37261 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the 25th percentile survey value for +37259 and the crosswalk value for +37261.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				355,699
				-2.1%

Femoral/popliteal Territory:

37263 Femoral/popliteal angioplasty, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 52356 for a value of 8.00 RVW. This represents a ***decrease of 9.4%*** from current value of 8.75 RVWs for existing CPT code 37224.

37265 Femoral/popliteal angioplasty, initial vessel, complex:
The specialty societies recommend the median survey value of 12.00 RVW. This represents an ***increase of 37.1%*** from current value of 8.75 RVWs for existing CPT code 37224.

The existing CPT code 37224, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty,* will be replaced by 37263 and 37265 splitting it into straightforward and complex interventions. MPC codes 52353 and 36905 bracket 37263 and MPC codes 36906 and 37244 bracket 37265 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the crosswalk value for 37263 and the median survey value for 37265.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
52353 MPC	7.50	0.101	133	33	5	15	60	20

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37263 and 37265 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 5.1%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37224	Fem-pop, angioplasty	8.75	27,252	**238,455**
New				
37263	Fem-pop, angioplasty, init, SF	8.00	19,076	152,608
37265	Fem-pop, angioplasty, init, CX	12.00	8176	98,112
				250,720
				5.1%

+37264 Femoral/popliteal angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

+37266 Femoral/popliteal angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 44128 for a value of 4.44 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37264 captures the work of angioplasty of an additional fem/pop vessel that is straightforward and +37266 is for complex. MPC codes 36476 and 63048 bracket +37264 and MPC codes 34812 and 22632 bracket +37266 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for +37264 and crosswalk value for +37266.

+37264 and +37266 represent new work, therefore budget neutrality does not apply.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37264	**3.00**	**0.100**	**30**				**30**	
+63048 MPC	3.47	0.077	45				45

+37266	**4.44**	**0.111**	**40**				**40**	
+22632 MPC	5.22	0.087	60				60	

+37270 Femoral/popliteal angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34715 for a value of 6.00 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37270 captures the work of angioplasty and stenting of an additional fem/pop vessel that is complex. MPC codes 22632 and 34709 bracket +37270 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the crosswalk value for +37270.

+37270 represents new work, therefore budget neutrality does not apply.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+22632 MPC	5.22	0.087	60				60	
+37270	**6.00**	**0.115**	**52**				**52**	
+34709 MPC	6.50	0.108	60				60	

37271 Femoral/popliteal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.00 RVW. This represents a ***decrease of 23.4%*** from current value of 11.75 RVWs for existing CPT code 37225.

37273 Femoral/popliteal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 15.03 RVW. This represents an ***increase of 27.9%*** from current value of 11.75 RVWs for existing CPT code 37225.

The existing CPT code 37225, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37271 and 37273 splitting it into straightforward and complex interventions. MPC codes 52356 and 36906 bracket 37271 and MPC code 37244 brackets 37273 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37271 and the median survey value for 37273.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37275	Fem-pop, angioplasty ather stent, init, SF	11.00	13,766	151,426
37277	Fem-pop, angioplasty ather stent, init, CX	15.55	5900	91,745
				243,171
				-13.2%

+37276 Femoral/popliteal angioplasty, stent, atherectomy, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 37237 for a value of 4.25 RVW for this new service.

+37278 Femoral/popliteal angioplasty, stent, atherectomy, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34820 for a value of 7.00 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37276 captures the work of angioplasty, stent, and atherectomy of an additional fem/pop vessel that is straightforward and +37278 is for complex. MPC codes 34812 and 22632 bracket +37276 and MPC codes 34709 and 22634 bracket +37278 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for crosswalk values for +37276 and +37278.

+37276 and +37278 represent new work, therefore budget neutrality does not apply.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37276	**4.25**	**0.094**	**45**				**45**

+22634 MPC	7.96	0.123	65				65	

+37279 Femoral/popliteal, intravascular lithotripsy:

The specialty societies recommend the median survey value of 4.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37279 is a ZZZ addon code created to capture the additional work of performing femoral/popliteal IVL. MPC codes 63048 and 34812 bracket +37279 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the median survey value for +37279.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Abbreviated Survey #1 Summary

The 19 codes surveyed in abbreviated survey #1 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the iliac and femoral/popliteal territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #1 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37278 in conjunction with 37277)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:37279 Tracking Number P26 Original Specialty Recommended RVU: **4.00**
Presented Recommended RVU: **4.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **4.00**

CPT Descriptor: Intravascular lithotripsy(ies), femoral and popliteal vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 70-year-old male with diabetes mellitus who has a long smoking history and with a highly calcified right superficial femoral artery occlusion and preserved runoff, after a separately reported treatment with a wire and catheter and multiple balloon inflations that do not restore the lumen, the decision is made to treat the calcification with intravascular lithotripsy. [Note: This is an add-on service. Only consider the additional work related to treating the calcification with intravascular lithotripsy.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The lesion in the superficial femoral artery has already been crossed and treated as inherent components of the primary procedure (reported separately). The work of this code begins after diagnostic imaging confirms failure of balloon angioplasty. The lesion is measured in length and diameter with multiple views. Intravascular lithotripsy balloon is selected. Sheaths and wires are exchanged to accommodate lithotripsy balloon delivery. The lithotripsy balloon is advanced under fluoroscopic guidance to the lesion and inflated to profile. The lithotripsy is delivered according to manufacturer specifications. The balloon is deflated, and blood flow is restored. Multiple additional lithotripsy applications are applied as needed throughout the diseased segment. Once completion angiography confirms vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection, the lithotripsy balloon delivery system is removed under fluoroscopic guidance.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual

code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey
respondent's answers from the anchor codes populated into the abbreviated survey table
to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time
Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**	
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**	

Experience	How many times have you personally performed these procedures in the past 12 months?

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal

intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
36908 KRS	4.25	0.106	40				40

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				9.5%

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and

37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #1 Overview of Recommended Values

The codes surveyed in the first abbreviated survey include the remaining codes in the iliac territory (37257-37261) and the remaining codes in the femoral/popliteal territory (37263-37266 and 37270-37279). Codes 37257-37261 represent iliac angioplasty and iliac stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37220-37223. Codes 37263-37266 and 37270-37279 represent femoral/popliteal angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37224-37227, however, they also represent new work as there are no codes for additional intervention in the femoral/popliteal territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #1 (37257-37261, 37263-37266, and 37271-37279) which describe intervention in the remaining iliac and femoral/popliteal territory codes were surveyed in conjunction with the core codes survey. As such, there were compared to the survey respondent's responses for the core surveyed codes and not compared to a reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The following five MPC codes bracket the recommendation for the 000-day global codes surveyed in abbreviated survey #1:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
52353 MPC	7.50	0.101	133	33	5	15	60	20
37263	**8.00**	**0.109**	**128**	**30**	**3**	**5**	**60**	**30**

37258	**8.75**	**0.104**	**143**	**30**	**3**	**5**	**75**	**30**
37271	**9.00**	**0.084**	**158**	**30**	**3**	**5**	**90**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37275	**11.00**	**0.083**	**183**	**30**	**3**	**5**	**115**	**30**
37265	**12.00**	**0.117**	**158**	**30**	**3**	**5**	**90**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37260	**14.24**	**0.109**	**185**	**30**	**3**	**5**	**117**	**30**
37273	**15.03**	**0.115**	**186**	**30**	**3**	**5**	**118**	**30**
37277	**15.55**	**0.115**	**191**	**30**	**3**	**5**	**123**	**30**

The following six MPC codes bracket the recommendations for the ZZZ addon codes surveyed by the abbreviated survey #1:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*

- MPC 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for abbreviated survey #1 ZZZ addon codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Abbreviated Survey #1 Additional Rationale for Specific Codes:

Iliac Territory:

+37257 Iliac angioplasty, additional vessel, complex:
The specialty societies recommend the 25th percentile survey value of 3.89 RVW. This represents an ***increase of 4.3%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. MPC codes 63048 and 34812 bracket +37257 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the 25th percentile survey value for +37257.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
63048 MPC	3.47	0.077	45				45	
+37257	**3.89**	**0.108**	**36**				**36**	
+34812 MPC	4.13	0.103	40				40	

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37222	+ Iliac angioplasty, addl	3.73	2977	**11,104**
New				
37255	+ Iliac, angioplasty, addl, SF	3.00	2530	7,590
37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

37258 Iliac angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 10.3%*** from current value of 9.75 RVWs for existing CPT code 37221.

37260 Iliac angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents an ***increase of 46.1%*** from current value of 9.75 RVWs for existing CPT code 37221.

The existing CPT code 37221, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37258 and 37260 splitting it into straightforward and complex interventions. MPC codes 52356 and 36905 bracket 37258 and MPC code 37244 brackets the lower range for 37260 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the 25th percentile survey value for 37258 and the crosswalk value for 37260.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
52356 MPC	8.00	0.110	133	33	5	15	60	20
37258	**8.75**	**0.104**	**143**	**30**	**3**	**5**	**75**	**30**

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37244 MPC	13.75	0.135	166	23	3	5	90	45
37260	**14.24**	**0.109**	**185**	**30**	**3**	**5**	**117**	**30**

When looking at the RVWs for 37258 and 37260 combined, the overall budget neutrality for existing CPT code 37221 is a ***decrease of 1.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37221	Iliac angioplasty, stent, init	9.75	25,781	**251,365**
New				
37258	Iliac, angioplasty stent, init, SF	8.75	21,914	191,748
37260	Iliac, angioplasty stent, init, CX	14.24	3867	55,066
				246,814
				-1.8%

+37259 Iliac angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW. This represents an ***decrease of 6%*** from current value of 4.25 RVWs for existing CPT code 37223.

+37261 Iliac angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 22328 value of 4.60 RVW. This represents an ***increase of 8.2%*** from current value of 4.25 RVWs for existing CPT code 37223.

The existing CPT code 37223, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37259 and +37261 splitting it into straightforward and complex interventions. MPC codes 63048 and 34812 bracket +37259 and MPC codes 34812 and 22632 bracket +37261 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the 25th percentile survey value for +37259 and the crosswalk value for +37261.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45

Femoral/popliteal Territory:

37263 Femoral/popliteal angioplasty, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 52356 for a value of 8.00 RVW. This represents a ***decrease of 9.4%*** from current value of 8.75 RVWs for existing CPT code 37224.

37265 Femoral/popliteal angioplasty, initial vessel, complex:
The specialty societies recommend the median survey value of 12.00 RVW. This represents an ***increase of 37.1%*** from current value of 8.75 RVWs for existing CPT code 37224.

The existing CPT code 37224, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty,* will be replaced by 37263 and 37265 splitting it into straightforward and complex interventions. MPC codes 52353 and 36905 bracket 37263 and MPC codes 36906 and 37244 bracket 37265 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the crosswalk value for 37263 and the median survey value for 37265.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
52353 MPC	7.50	0.101	133	33	5	15	60	20

36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37265	**12.00**	**0.117**	**158**	**30**	**3**	**5**	**90**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37263 and 37265 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 5.1%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37224	Fem-pop, angioplasty	8.75	27,252	**238,455**
New				
37263	Fem-pop, angioplasty, init, SF	8.00	19,076	152,608
37265	Fem-pop, angioplasty, init, CX	12.00	8176	98,112
				250,720
				5.1%

+37264 Femoral/popliteal angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

+37266 Femoral/popliteal angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 44128 for a value of 4.44 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37264 captures the work of angioplasty of an additional fem/pop vessel that is straightforward and +37266 is for complex. MPC codes 36476 and 63048 bracket +37264 and MPC codes 34812 and 22632 bracket +37266 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for +37264 and crosswalk value for +37266.

+37264 and +37266 represent new work, therefore budget neutrality does not apply.

+22632 MPC	5.22	0.087	60				60	

+37270 Femoral/popliteal angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34715 for a value of 6.00 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37270 captures the work of angioplasty and stenting of an additional fem/pop vessel that is complex. MPC codes 22632 and 34709 bracket +37270 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the crosswalk value for +37270.

+37270 represents new work, therefore budget neutrality does not apply.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+22632 MPC	5.22	0.087	60				60	
+37270	**6.00**	**0.115**	**52**				**52**	
+34709 MPC	6.50	0.108	60				60	

37271 Femoral/popliteal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.00 RVW. This represents a ***decrease of 23.4%*** from current value of 11.75 RVWs for existing CPT code 37225.

37273 Femoral/popliteal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 15.03 RVW. This represents an ***increase of 27.9%*** from current value of 11.75 RVWs for existing CPT code 37225.

The existing CPT code 37225, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37271 and 37273 splitting it into straightforward and complex interventions. MPC codes 52356 and 36906 bracket 37271 and MPC code 37244 brackets 37273 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37271 and the median survey value for 37273.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				243,171
				-13.2%

+37276 Femoral/popliteal angioplasty, stent, atherectomy, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 37237 for a value of 4.25 RVW for this new service.

+37278 Femoral/popliteal angioplasty, stent, atherectomy, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34820 for a value of 7.00 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37276 captures the work of angioplasty, stent, and atherectomy of an additional fem/pop vessel that is straightforward and +37278 is for complex. MPC codes 34812 and 22632 bracket +37276 and MPC codes 34709 and 22634 bracket +37278 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for crosswalk values for +37276 and +37278.

+37276 and +37278 represent new work, therefore budget neutrality does not apply.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37276	**4.25**	**0.094**	**45**				**45**

+22634 MPC	7.96	0.123	65				65	

+37279 Femoral/popliteal, intravascular lithotripsy:

The specialty societies recommend the median survey value of 4.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37279 is a ZZZ addon code created to capture the additional work of performing femoral/popliteal IVL. MPC codes 63048 and 34812 bracket +37279 providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendation for the median survey value for +37279.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37279	**4.00**	**0.100**	**40**				**40**	
+34812 MPC	4.13	0.103	40				40	

Overall Femoral/popliteal Territory Budget Neutrality:

Using our assumptions regarding utilization projections for the new code family and censoring the new services of femoral/popliteal IVL and femoral/popliteal additional vessels, the projected budget neutrality for the femoral/popliteal territory is a ***decrease of 4.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW

Abbreviated Survey #1 Summary

The 19 codes surveyed in abbreviated survey #1 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the iliac and femoral/popliteal territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #1 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37279 in conjunction with 37263-37278)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37226

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37280 Tracking Number P27 Original Specialty Recommended RVU: **9.80**
Presented Recommended RVU: **9.80**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **9.80**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year-old male with diabetes mellitus and a long smoking history is evaluated for a nonhealing left fifth toe ulcer. Diagnostic testing reveals a severe tibial disease with a flow limiting stenosis of the left posterior tibial artery that is treated with balloon angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased posterior tibial artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of stenosis with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and dilation of the lesion is performed by inflating appropriate pressure and time for dilating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if a flow limiting dissection has occurred. An appropriately sized balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is then inflated and left in place for 2-3 minutes based on manufacturer specifications. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s). Once completion angiography confirms vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection, remove the wire and

sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**

34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and

37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				1,499
				-5.4%

+37291 Tibial angioplasty, atherectomy, additional vessel, complex:
The specialty societies recommend maintaining a crosswalk to CPT code 34820 for a value of 7.00 RVW. This represents an ***increase of 7.7%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. MPC codes 34812 and 22634 bracket +37291 providing relativity across the

database. Comparison to the core survey code and MPCs favorably support the recommendation for crosswalk value for +37291.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34715 MPC	6.00	0.100	60				60	
+37291	**7.00**	**1.117**	**60**				**60**	
+22634 MPC	7.96	0.123	65				65	

When looking at the RVWs for +37289 and +37291 combined, the overall budget neutrality for existing CPT code 37233 is a ***decrease of 9.6%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37233	+ Tibial, angioplasty, ather, addl	6.50	9179	**59,664**
New				
37289	+ Tibial, angioplasty ather, addl, SF	4.75	4590	21,803
37291	+ Tibial, angioplasty ather, addl, CX	7.00	4590	32,130
				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

When looking at the RVWs for 37292 and 37294 combined, the overall budget neutrality for existing CPT code 37231 is an ***increase of 9.3%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37231	Tibial, angioplasty, ather, stent	14.75	3076	**45,371**

New				
37292	Tibial, angioplasty ather stent, init, SF	14.24	1538	21,901

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37228

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37228

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37281 Tracking Number P28 Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **3.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of an 88-year-old male with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty of a stenosis in the right common anterior tibial artery, an additional angioplasty of a stenosis of the right posterior tibial artery is performed. [Note: This is an add-on service. Only consider the additional work related to the angioplasty of the stenosis of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtaining access to the popliteal artery is inherent in the primary procedure. The work of this service starts with selectively catheterizing the posterior tibial artery and crossing the area of stenosis in the posterior tibial with a guidewire. Next, advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Perform angiography and obtain road- mapping images for vessel sizing and to confirm anatomy. Advance and position an appropriately sized angioplasty balloon to the area of stenosis using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the stenosis has been adequately treated. An appropriately sized balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is then inflated and left in place for 2-3 minutes based on manufacturer specifications. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s). Completion angiography is performed for assessment of position, patency, distal embolization, and dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX
37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX
37271	Fem-pop, angioplasty ather, init, SF

37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF

37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	
+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	
+37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
36905 KRS	9.00	0.106	126	22	4	5	75	20
36253 KRS	7.30	0.100	121	23	3	5	60	30
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
36906 KRS	10.42	0.104	141	22	4	5	90	20
61645 KRS	15.00	0.121	241	40	3	15	100	83

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37281	**3.00**	**0.100**	**30**				**30**	
+37285	**3.34**	**0.095**	**35**				**35**

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37281 in conjunction with 37280, 37282, 37284, 37286, 37288, 37290, 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37232

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37232

SUMMARY OF RECOMMENDATION

CPT Code:37282 Tracking Number P29 Original Specialty Recommended RVU: **13.75**
Presented Recommended RVU: **12.31**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **12.31**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 90-year-old male with diabetes mellitus and a long smoking history is evaluated for critical limb ischemia and rest pain of the left foot. Diagnostic testing reveals a severe tibial disease with an occlusion of the left posterior tibial artery which reconstitutes at the ankle that is treated with balloon angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased posterior tibial artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Advanced maneuvers are typically needed to cross the area of occlusion with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and dilation of the lesion is performed by inflating appropriate pressure and time for dilating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if a flow limiting dissection has occurred. An appropriately sized balloon is inflated and left in place for 2-3 minutes based on manufactures' specifications. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s). Once completion angiography confirms vessel patency, a satisfactory treatment result, and absence of extravasation,

embolization, or flow-limiting dissection, remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37255	**3.00**	**0.100**	**30**				**30**

37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
36908 KRS	4.25	0.106	40				40	
37247 KRS	3.50	0.117	30				30	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+22634 MPC	7.96	0.123	65				65	
+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37230 is a ***decrease of 10.5%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW

				25,185
				-10.5%

+37285 Tibial angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 35686 for a value of 3.34 RVW. This represents a ***decrease of 39.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

+37287 Tibial angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34711 for a value of 6.00 RVW. This represents an ***increase of 8.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

The existing CPT code 37234, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37285 and +37287 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37285 and MPC codes 34812 and 22632 bracket +37287 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for a crosswalk value for +37285 and crosswalk value for +37287.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37228

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37228

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37283 Tracking Number P30 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **4.26**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of an 88-year-old male with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty of an occlusion of the right anterior tibial artery, an additional angioplasty of an occlusion of the right posterior tibial artery is performed. [Note: This is an add-on service. Only consider the additional work related to the angioplasty of the occlusion of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtaining access to the popliteal artery is inherent in the primary procedure. The work of this service starts with selectively catheterizing the posterior tibial artery and crossing the area of occlusion with a guidewire. Advanced endovascular techniques are typically required to cross the complex lesion. Next, advance a sheath to or through the occlusion. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Advance and position an appropriately sized angioplasty balloon to the area of occlusion using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the occlusion has been adequately treated. An appropriately sized balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is inflated and left in place for 2-3 minutes based on manufacturer specifications. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s). The distal embolic protection device is removed. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**	
37262	**3.00**	**0.100**	**30**				**30**

37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
37289	**4.75**	**0.106**	**45**				**45**	
37186 KRS	4.92	0.082	60				60	
34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

36906 MPC	10.42	0.104	141	22	4	5	90	20
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60

+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37296 Inframalleolar angioplasty, initial vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 11.00 RVW for this new service.

The most selected key reference services for 37296 were KRS 36906 and 61645. MPC codes 36906 and 37244 bracket 37296 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendation of the 25th percentile survey value for 37296.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

Overall Tibial Territory Budget Neutrality:

Using our assumptions regarding utilization projections for the new code family, the projected budget neutrality for the tibial territory is an ***increase of 2.3%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37283 in conjunction with 37282, 37284, 37286, 37288, 37290, 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37232

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37232

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37284 Tracking Number P31 Original Specialty Recommended RVU: **10.00**
Presented Recommended RVU: **10.00**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **10.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 77-year-old male with a history of multiple lower extremity interventions is evaluated for a nonhealing left second toe amputation site. Diagnostic testing reveals a severe tibial disease and a stenosis of the left posterior tibial artery that is treated with balloon angioplasty and placement of a stent.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased posterior tibial using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of stenosis with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the stenosis has been adequately treated. After diagnostic imaging confirms failure of balloon angioplasty, the lesion is measured in length and diameter with multiple views. A drug eluting stent is selected as the next therapy and the appropriately sized stent is selected. Sheaths and wires may be exchanged out to accommodate stent delivery. It may be appropriate to place a distal embolic protection device. The stent is advanced under fluoroscopic guidance to the lesion and

deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization and dissection. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s) and stent(s). Once completion angiography confirms vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection, remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX

37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX
37271	Fem-pop, angioplasty ather, init, SF
37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF
37286	Tibial, angioplasty stent, init, CX
37287	+ Tibial, angioplasty stent, addl, CX
37291	+ Tibial, angioplasty ather, addl, CX
37292	Tibial, angioplasty ather stent, init, SF
37293	+ Tibial, angioplasty ather stent, addl, SF
37294	Tibial, angioplasty ather stent, init, CX
37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**

37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37230

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37230

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37285 Tracking Number P32 Original Specialty Recommended RVU: **3.34**
Presented Recommended RVU: **3.34**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **3.34**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement to treat a short segment stenosis of the right anterior tibial artery, an additional angioplasty and stent placement for treatment of a stenosis of the right posterior tibial artery is performed. [Note: This is an add-on service. Only consider the additional work related to the angioplasty and stent placement of the stenosis of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtaining access to the popliteal artery is inherent in the primary procedure. The work of this service starts with selectively catheterizing the posterior tibial artery using fluoroscopic guidance and crossing the area of stenosis with a guidewire. Next, advance a sheath to or through the stenosis. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the stenosis has been adequately treated. After diagnostic imaging confirms failure of balloon angioplasty, the lesion is measured in length and diameter with multiple views. A drug eluting stent is selected as the next therapy and the appropriately sized stent is selected. Sheaths and wires may be exchanged out to accommodate stent delivery. The stent is advanced under fluoroscopic guidance to the lesion and deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s) and stent(s). Completion angiography is perfomred to confirm vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

+37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**

34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and

37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				1,499
				-5.4%

+37291 Tibial angioplasty, atherectomy, additional vessel, complex:
The specialty societies recommend maintaining a crosswalk to CPT code 34820 for a value of 7.00 RVW. This represents an ***increase of 7.7%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. MPC codes 34812 and 22634 bracket +37291 providing relativity across the

database. Comparison to the core survey code and MPCs favorably support the recommendation for crosswalk value for +37291.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34715 MPC	6.00	0.100	60				60	
+37291	**7.00**	**1.117**	**60**				**60**	
+22634 MPC	7.96	0.123	65				65	

When looking at the RVWs for +37289 and +37291 combined, the overall budget neutrality for existing CPT code 37233 is a ***decrease of 9.6%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37233	+ Tibial, angioplasty, ather, addl	6.50	9179	**59,664**
New				
37289	+ Tibial, angioplasty ather, addl, SF	4.75	4590	21,803
37291	+ Tibial, angioplasty ather, addl, CX	7.00	4590	32,130
				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**

+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37285 in conjunction with 37284, 37286, 37288, 37290, 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37234

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Rarely

Specialty Radiology How often? Rarely

Specialty Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37234

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37286 Tracking Number P33 Original Specialty Recommended RVU: **13.55**
Presented Recommended RVU: **14.24**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **13.46**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 87-year-old male with a history of multiple lower extremity interventions is evaluated for critical limb ischemia and rest pain of the left foot. Diagnostic testing reveals severe tibial disease and an occlusion of the left posterior tibial artery with constitution in the midcalf. The plantar arch is intact. He is treated with balloon angioplasty and placement of a stent.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Commmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased posterior tibial using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Advanced maneuvers are typically required to cross the area of occlusion with a guidewire and advance a sheath to or through the occlusion. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of occlusion using fluoroscopic guidance, and then inflate it to the appropriate pressure and time to treat the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the occlusion has been adequately treated. After diagnostic imaging confirms failure of balloon angioplasty, the lesion is measured in length and diameter with multiple views. Drug eluting stent is selected as the next therapy and the appropriately sized stent is selected. Sheaths and wires may be exchanged out to

accommodate stent delivery. The stent is advanced under fluoroscopic guidance to the lesion and deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization and dissection. Allsegments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s) and stent(s). Once completion angiography confirms vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection, remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX

37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX
37271	Fem-pop, angioplasty ather, init, SF
37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF

37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**

+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	
+37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60

+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37281	**3.00**	**0.100**	**30**				**30**	
+37285	**3.34**	**0.095**	**35**				**35**	
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	
+34812 MPC	4.13	0.103	40				40	
+37283	**5.00**	**0.111**	**45**				**45**	
+37299	**5.00**	**0.111**	**45**				**45**

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37230 is a ***decrease of 10.5%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37230	Tibial, angioplasty, stent	13.55	2077	**28,143**
New				
37284	Tibial, angioplasty stent, init, SF	10.00	1039	10,390

37286	Tibial, angioplasty stent, init, CX	14.24	1039	14,795
				25,185
				-10.5%

+37285 Tibial angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 35686 for a value of 3.34 RVW. This represents a ***decrease of 39.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

+37287 Tibial angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34711 for a value of 6.00 RVW. This represents an ***increase of 8.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

The existing CPT code 37234, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37285 and +37287 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37285 and MPC codes 34812 and 22632 bracket +37287 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for a crosswalk value for +37285 and crosswalk value for +37287.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37285	**3.34**	**0.095**	**35**				**35**

				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**

+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37230

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

SUMMARY OF RECOMMENDATION

CPT Code:37287 Tracking Number P34 Original Specialty Recommended RVU: **5.50**
Presented Recommended RVU: **6.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **5.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement to treat an occlusion of the right anterior tibial artery, an additional angioplasty and stent placement to treat an occlusion of the right posterior tibial artery is performed. [Note: This is an add-on service. Only consider the additional work related to the angioplasty and stent placement of the occlusion of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Obtaining access to the popliteal artery is inherent in the primary procedure. The work of this service starts with selectively catheterizing the posterior tibial artery using fluoroscopic guidance. Advanced maneuvers are typically required to cross the area of occlusion with a guidewire and advance a sheath to or through the occlusion. Advance and position an appropriately sized angioplasty balloon catheter to the area of occlusion using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the occlusion has been adequately treated. After diagnostic imaging confirms failure of balloon angioplasty, the lesion is measured in length and diameter with multiple views. Drug eluting stent is selected as the next therapy and the appropriately sized stent is selected. Sheaths and wires may be exchanged out to accommodate stent delivery. The stent is advanced under fluoroscopic guidance to the lesion and deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same femoral-popliteal artery segment are treated with appropriate-sized balloon(s) and stent(s). Completion angiography is performed to confirm vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37255	**3.00**	**0.100**	**30**				**30**	
37247 KRS	3.50	0.117	30				30

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
36908 KRS	4.25	0.106	40				40

+37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37230 is a ***decrease of 10.5%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW

				25,185
				-10.5%

+37285 Tibial angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 35686 for a value of 3.34 RVW. This represents a ***decrease of 39.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

+37287 Tibial angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34711 for a value of 6.00 RVW. This represents an ***increase of 8.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

The existing CPT code 37234, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37285 and +37287 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37285 and MPC codes 34812 and 22632 bracket +37287 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for a crosswalk value for +37285 and crosswalk value for +37287.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**

+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37287 in conjunction with 37286, 37288, 37290, 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37234

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Rarely

Specialty Radiology How often? Rarely

Specialty Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment
Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37234

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37288 Tracking Number P35 Original Specialty Recommended RVU: **13.50**
Presented Recommended RVU: **13.50**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **13.50**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female with diabetes mellitus presents with rest pain of the right foot. Diagnostic studies reveal a severe tibial disease and a stenosis of the anterior tibial artery that is treated with balloon angioplasty and atherectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 60% , In the ASC 3%, In the office 36%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 64% , Overnight stay-less than 24 hours 24% , Overnight stay-more than 24 hours 13%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased anterior using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of stenosis with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. Sheaths and wires may be exchanged out to accommodate device delivery. The atherectomy device is advanced under fluoroscopic guidance to the stenosis and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. Post-atherectomy balloon angioplasty is performed. An appropriately sized balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is then inflated and left in place for 2-3 minutes based on manufactures' specifications. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same

posterior tibial artery segment are treated with appropriate- sized balloon(s) and atherectomy devices. Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	6%	25%	31%	38%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	19%	81%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	19%	19%	63%
Physical effort required	13%	31%	56%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	25%	13%	63%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	8%	75%	17%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	17%	83%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	33%	67%
Physical effort required	0%	17%	83%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	8%	8%	83%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high-cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high-cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall

Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey
respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post-packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW; however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, and femoral/popliteal additional vessel interventions) are removed, the result is a net increase of 2.3%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity.

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
36253 KRS	7.30	0.100	121	23	3	5	60	30

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

MPC								

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40

34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

When looking at the RVWs for 37288 and 37290 combined, the overall budget neutrality for existing CPT code 37229 is an ***increase of 9.5%***

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List*

separately in addition to code for primary procedure), will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and 37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

When looking at the RVWs for +37289 and +37291 combined, the overall budget neutrality for existing CPT code 37233 is a ***decrease of 13.5%***

				51,638
				-13.5%

37296 Inframalleolar angioplasty, initial vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 11.00 RVW for this new service.

The most selected key reference services for 37296 were KRS 36906 and 61645. MPC codes 36906 and 37244 bracket 37296 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendation of the 25th percentile survey value for 37296.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37229

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37229

SUMMARY OF RECOMMENDATION

CPT Code:37289 Tracking Number P36 Original Specialty Recommended RVU: **4.75**
Presented Recommended RVU: **4.75**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **4.75**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot and a plantar arch that is not intact, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and atherectomy is performed to treat a severe stenosis of the right anterior tibial artery, an additional angioplasty and atherectomy is performed to treat a stenosis of the right posterior tibial artery. [Note: This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the stenosis of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Manipulate a catheter and guidewire into the diseased posterior tibial artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of stenosis with a guidewire and advance a sheath to or through the stenosis. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. The atherectomy device is advanced under fluoroscopic guidance to the stenosis and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. Post-atherectomy balloon angioplasty is performed. An appropriately sized balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is then inflated and left in place for 2-3 minutes based on manufactures' specifications. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s) and atherectomy devices. Completion angiography is performed to confirm vessel patency, a satisfactory treatment result, and absence of extravasation, embolization and flow-limiting dissection.

Description of Post-Service Work: N/A

Technical skill required	11%	22%	67%
Physical effort required	11%	56%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	33%	56%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high-cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high-cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall

Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey
respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post-packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX
37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX

37271	Fem-pop, angioplasty ather, init, SF
37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF
37286	Tibial, angioplasty stent, init, CX
37287	+ Tibial, angioplasty stent, addl, CX
37291	+ Tibial, angioplasty ather, addl, CX
37292	Tibial, angioplasty ather stent, init, SF
37293	+ Tibial, angioplasty ather stent, addl, SF
37294	Tibial, angioplasty ather stent, init, CX
37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW; however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, and femoral/popliteal additional vessel interventions) are removed, the result is a net increase of 2.3%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity.

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

KRS								
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**

37186 KRS	4.92	0.082	60				60	
34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
37255	**3.00**	**0.100**	**30**				**30**

37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
36905 KRS	9.00	0.106	126	22	4	5	75	20
36253 KRS	7.30	0.100	121	23	3	5	60	30
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
36906 KRS	10.42	0.104	141	22	4	5	90	20
61645 KRS	15.00	0.121	241	40	3	15	100	83

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

When looking at the RVWs for 37288 and 37290 combined, the overall budget neutrality for existing CPT code 37229 is an ***increase of 9.5%***

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List*

separately in addition to code for primary procedure), will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and 37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

When looking at the RVWs for +37289 and +37291 combined, the overall budget neutrality for existing CPT code 37233 is a ***decrease of 13.5%***

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37289 in conjunction with 37288, 37290, 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37233

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37233

Presented Recommended RVU: **17.00**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **17.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 88-year-old female with diabetes mellitus and congestive heart failure presents with critical limb ischemia and rest pain of her left foot. She is not a candidate for surgical reconstruction. Diagnostic studies reveal severe tibial disease and an occlusion of the anterior tibial artery that is treated with balloon angioplasty and atherectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 66% , In the ASC 1%, In the office 33%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 62% , Overnight stay-less than 24 hours 22% , Overnight stay-more than 24 hours 17%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased anterior tibial using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Advanced maneuvers are typically needed to cross the area of occlusion with a guidewire and advance a sheath to or through the occlusion. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. Sheaths and wires may be exchanged out to accommodate device delivery. It may be appropriate to place a distal embolic protection device. The atherectomy device is advanced under fluoroscopic guidance to the stenosis and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. An appropriately sized balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is then inflated and left in place for 2-3 minutes based on manufactures' specifications. Repeat balloon inflations as required, or potentially use additional balloons with larger or

smaller diameters as indicated by anatomic review of the images obtained. All segments of disease within the same anterior tibial segment are treated with appropriate-sized balloon(s). The distal embolic protection device is removed. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same anterior tibial artery segment are treated with appropriate-sized balloon(s) and atherectomy devices. Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high-cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high-cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post-packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time
Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**	

Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW; however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).

9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, and femoral/popliteal additional vessel interventions) are removed, the result is a net increase of 2.3%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity.

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
36253 KRS	7.30	0.100	121	23	3	5	60	30
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 KRS	9.00	0.106	126	22	4	5	75	20

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

MPC								

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40

34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

When looking at the RVWs for 37288 and 37290 combined, the overall budget neutrality for existing CPT code 37229 is an ***increase of 9.5%***

				9.5%

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List*

separately in addition to code for primary procedure), will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and 37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

When looking at the RVWs for +37289 and +37291 combined, the overall budget neutrality for existing CPT code 37233 is a ***decrease of 13.5%***

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37229

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37229

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37291 Tracking Number P38 Original Specialty Recommended RVU: **6.50**
Presented Recommended RVU: **7.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **6.50**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot and a plantar arch that is not intact, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and atherectomy is performed to treat an occlusion of the right anterior tibial artery, an additional angioplasty and atherectomy is performed to treat an occlusion of the right posterior tibial artery. [Note: This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the occlusion of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Manipulate a catheter and guidewire into the diseased posterior tibial artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of occlusion with a guidewire and advance a sheath to or through the occlusion. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Atherectomy is selected as therapy and the appropriately sized atherectomy device is selected. The atherectomy device is advanced under fluoroscopic guidance to the stenosis and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. An appropriate balloon is then selected based on review of the anatomic images and advanced across the previously treated area. The balloon is then inflated and left in place for 2-3 minutes based on manufactures' specifications. Repeat balloon inflations as required, or potentially use additional balloons with larger or smaller diameters as indicated by anatomic review of the images obtained. All segments of disease within the same anterior tibial segment are treated with appropriate-sized balloon(s). The distal embolic protection device is removed. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**

+37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

36906 KRS	10.42	0.104	141	22	4	5	90	20
61645 KRS	15.00	0.121	241	40	3	15	100	83

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**

+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37291 in conjunction with 37290, 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37233

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37233

SUMMARY OF RECOMMENDATION

CPT Code:37292 Tracking Number P39 Original Specialty Recommended RVU: **15.00**
Presented Recommended RVU: **14.24**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **15.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 78-year-old male with diabetes mellitus presents with a non-healing left second toe amputation. Diagnostic studies reveal severe tibial disease and a long segment stenosis of the left posterior tibial artery that is treated with balloon angioplasty, atherectomy, and placement of a stent.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased posterior tibial using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of stenosis with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. Sheaths and wires may be exchanged out to accommodate device delivery. It may be appropriate to place a distal embolic protection device. The atherectomy device is advanced under fluoroscopic guidance to the stenosis and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. Post-atherectomy balloon angioplasty is performed. Based on the angiographic appearance of the lesion post-treatment it is determined that stent placement is the most appropriate therapy. A drug-eluting stent is selected, advanced to the treatment area, and deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated.

Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s), atherectomy, and stent(s). The distal embolic protection device is removed. Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2025

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60

63048 MPC	3.47	0.077	45				45	
+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

				578,250
				9.5%

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and

37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

When looking at the RVWs for 37292 and 37294 combined, the overall budget neutrality for existing CPT code 37231 is an ***increase of 9.3%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37231	Tibial, angioplasty, ather, stent	14.75	3076	**45,371**

New				
37292	Tibial, angioplasty ather stent, init, SF	14.24	1538	21,901
37294	Tibial, angioplasty ather stent, init, CX	18.00	1538	27,684
				49,585
				9.3%

+37293 Tibial angioplasty, stent, atherectomy, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 6.50 RVW. This represents a ***decrease of 16.7%*** from current value of 7.80 RVWs for existing CPT code 37235.

+37295 Tibial angioplasty, stent, atherectomy, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 22858 for a value of 8.40 RVW. This represents an ***increase of 7.7%*** from current value of 7.80 RVWs for existing CPT code 37235.

The existing CPT code 37235, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37293 and +37295 splitting it into straightforward and complex interventions. MPC codes 34715 and 22634 bracket +37293 and MPC code 22634 brackets +37295 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile value for +37293 and the crosswalk value for +37295.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34715 MPC	6.00	0.100	60				60	
+37293	**6.50**	**0.108**	**60**				**60**	
+22634 MPC	7.96	0.123	65				65	
+37295	**8.40**	**0.112**	**90**				**90**	

When looking at the RVWs for +37293 and +37295 combined, the overall budget neutrality for existing CPT code 37235 is an ***increase of 0.4%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37235	+ Tibial, angioplasty, ather, stent, addl	7.80	304	**2,371**
New				
37293	+ Tibial, angioplasty ather stent, addl, SF	6.50	91	592
37295	+ Tibial, angioplasty ather stent, addl, CX	8.40	213	1,789
				2,381
				6.1%

Overall Tibial Territory Budget Neutrality:

Using our assumptions regarding utilization projections for the new code family, the projected budget neutrality for the tibial territory is an ***increase of 2.3%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37231

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37231

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37293 Tracking Number P40 Original Specialty Recommended RVU: **6.50**
Presented Recommended RVU: **6.50**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **6.50**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of an 88-year-old female with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty, atherectomy, and stent placement is performed to treat a stenosis of the right anterior tibial artery, an additional angioplasty, atherectomy, and stent placement is performed to treat a stenosis of the right posterior tibial artery. [Note: This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement of the stenosis of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Cross the area of stenosis in the posterior tibial artery with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. The atherectomy device is advanced under fluoroscopic guidance to the stenosis and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. Post-atherectomy balloon angioplasty is performed. Based on the angiographic appearance of the lesion post-treatment it is determined that stent placement is the most appropriate therapy. A drug-eluting stent is selected, advanced to the treatment area, and deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s), atherectomy, and stent(s). Completion angiography is performed for assessment of position, patency, distal embolization, and dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX
37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX
37271	Fem-pop, angioplasty ather, init, SF

37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF
37286	Tibial, angioplasty stent, init, CX
37287	+ Tibial, angioplasty stent, addl, CX
37291	+ Tibial, angioplasty ather, addl, CX
37292	Tibial, angioplasty ather stent, init, SF
37293	+ Tibial, angioplasty ather stent, addl, SF
37294	Tibial, angioplasty ather stent, init, CX
37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37281	**3.00**	**0.100**	**30**				**30**	
+37285	**3.34**	**0.095**	**35**				**35**	
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	
+34812 MPC	4.13	0.103	40				40	
+37283	**5.00**	**0.111**	**45**				**45**	
+37299	**5.00**	**0.111**	**45**				**45**

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

37281	+ Tibial, angioplasty, addl, SF	3.00	5,550	16,500
37283	+ Tibial, angioplasty, addl, CX	5.00	5,500	27,500
				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37293 in conjunction with 37292, 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37235

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Rarely

Specialty Radiology How often? Rarely

Specialty Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37294 Tracking Number P41 Original Specialty Recommended RVU: **18.00**
Presented Recommended RVU: **18.00**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **18.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 90-year-old male with diabetes mellitus presents with a critical limb ischemia and rest pain of his left foot. Diagnostic studies reveal severe tibial disease including an occlusion of the left anterior tibial artery that is treated with balloon angioplasty, atherectomy, and placement of a stent.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased anterior tibial using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Advanced maneuvers are typically needed to cross the area of occlusion with a guidewire and advance a sheath to or through the occlusion. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. Sheaths and wires may be exchanged out to accommodate device delivery. It may be appropriate to place a distal embolic protection device. The atherectomy device is advanced under fluoroscopic guidance to the occlusion and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. Post-atherectomy balloon angioplasty is performed. Based on the angiographic appearance of the lesion post-treatment it is determined that stent placement is the most appropriate therapy. A drug eluting stent is selected, advanced to the treatment area, and deployed. The stent delivery system is removed under fluoroscopic guidance.

A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same anterior tibial artery segment are treated with appropriate- sized balloon(s), atherectomy, and drug eluting stent(s). The distal embolic protection device is removed. Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
36908 KRS	4.25	0.106	40				40

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

36906 MPC	10.42	0.104	141	22	4	5	90	20
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
63048 MPC	3.47	0.077	45				45	
+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				578,250
				9.5%

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and

37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37291	**7.00**	**0.117**	**60**				**60**	
+22634 MPC	7.96	0.123	65				65	
+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				-10.5%

+37285 Tibial angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 35686 for a value of 3.34 RVW. This represents a ***decrease of 39.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

+37287 Tibial angioplasty, stent, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 34711 for a value of 6.00 RVW. This represents an ***increase of 8.3%*** from current value of 5.50 RVWs for existing CPT code 37234.

The existing CPT code 37234, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37285 and +37287 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37285 and MPC codes 34812 and 22632 bracket +37287 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for a crosswalk value for +37285 and crosswalk value for +37287.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37285	**3.34**	**0.095**	**35**				**35**

				-5.4%

+37291 Tibial angioplasty, atherectomy, additional vessel, complex:
The specialty societies recommend maintaining a crosswalk to CPT code 34820 for a value of 7.00 RVW. This represents an ***increase of 7.7%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. MPC codes 34812 and 22634 bracket +37291 providing relativity across the

database. Comparison to the core survey code and MPCs favorably support the recommendation for crosswalk value for +37291.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45

+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37231

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37231

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37295 Tracking Number P42 Original Specialty Recommended RVU: **9.03**
Presented Recommended RVU: **8.40**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **8.16**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 98-year-old male with diabetes mellitus, with a extensive ischemia wounds on his right foot, and who is not a candidate for open surgical reconstruction presents. after a separately reported angioplasty, atherectomy, and stent placement is performed to treat an occlusion of the right anterior tibial artery, an additional angioplasty, atherectomy, and stent placement is performed to treat an occlusion of the right posterior tibial artery. [Note: This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement of the occlusion of the right posterior tibial artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Advanced maneuvers are typically needed to cross the area of occlusion in the posterior tibial artery with a guidewire and advance a sheath to or through the occlusion. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. An embolic protection device may have already been placed. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Atherectomy is selected as the best therapy and the appropriately sized atherectomy device is selected. The atherectomy device is advanced under fluoroscopic guidance to the occlusion and atherectomy of the lesion is performed. The device is removed under fluoroscopic guidance. Post-atherectomy balloon angioplasty is performed. Based on the angiographic appearance of the lesion post-treatment it is determined that stent placement is the most appropriate therapy. A drug eluting stent is selected, advanced to the treatment area, and deployed. The stent delivery system is removed under fluoroscopic guidance. A post-stent balloon is inflated. Completion angiography is performed for assessment of position, patency, distal embolization, and dissection. All segments of disease within the same posterior tibial artery segment are treated with appropriate-sized balloon(s), atherectomy, and drug eluting stent(s). Completion angiography is performed for assessment of position, patency, distal embolization, and dissection.

Description of Post-Service Work: N/A

RELATIONSHIP OF CODE BEING REVIEWED TO TOP TWO KEY REFERENCE SERVICES:
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by percent distribution) of the service you are rating to the top two chosen key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Top Key Reference Code: 46 **% of respondents:** 100.0 **%**

Number of respondents who choose 2nd Key Reference Code: 0 **% of respondents:** 0.0 **%**

TIME ESTIMATES (Median)

	CPT Code: 37295	**Top Key Reference CPT Code:** 37289	**2nd Key Reference CPT Code:**
Median Pre-Service Time	0.00	0.00	0.00
Median Intra-Service Time	75.00	45.00	0.00
Median Immediate Post-service Time	0.00	0.00	0.00
Median Critical Care Time	0.0	0.00	0.00
Median Other Hospital Visit Time	0.0	0.00	0.00
Median Discharge Day Management Time	0.0	0.00	0.00
Median Office Visit Time	0.0	0.00	0.00
Median Total Time	**75.00**	**45.00**	**0.00**
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	2%	5%	24%	34%	34%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed			

• Urgency of medical decision making	

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required			
Physical effort required			

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome			

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity					

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making			

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome			

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX
37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX
37271	Fem-pop, angioplasty ather, init, SF

37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX

37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**	
37262	**3.00**	**0.100**	**30**				**30**

37289	**4.75**	**0.106**	**45**				**45**	
37186 KRS	4.92	0.082	60				60	
34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30

37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
63048 MPC	3.47	0.077	45				45	
+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+36476 MPC	2.65	0.088	30				30	
+37281	**3.00**	**0.100**	**30**				**30**	
+37285	**3.34**	**0.095**	**35**				**35**	
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	
+34812 MPC	4.13	0.103	40				40	
+37283	**5.00**	**0.111**	**45**				**45**	
+37299	**5.00**	**0.111**	**45**				**45**

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

MPC								

When looking at the RVWs for +37281 and +37283 combined, the overall budget neutrality for existing CPT code 37232 is essentially unchanged ***(0%)***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37232	+ Tibial, angioplasty, addl	4.00	12,223	48,892
	-10% attribution to Inframalleolar angioplasty			**44,003**
New				
37281	+ Tibial, angioplasty, addl, SF	3.00	5,550	16,500
37283	+ Tibial, angioplasty, addl, CX	5.00	5,500	27,500
				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37295 in conjunction with 37294)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37235

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Rarely

Specialty Radiology How often? Rarely

Specialty Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37235

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37296 Tracking Number P43 Original Specialty Recommended RVU: **11.00**
Presented Recommended RVU: **11.00**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **11.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 79-year-old male with diabetes mellitus who is not a candidate for open surgical reconstruction presents with extensive ischemic wounds on his right third and fourth toes. Diagnostic studies reveal an occlusion of the dorsalis pedis that is treated with balloon angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 64% , In the ASC 2%, In the office 34%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 62% , Overnight stay-less than 24 hours 21% , Overnight stay-more than 24 hours 17%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased dorsalis pedis artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Establish sheath access that is stable in an infrapopliteal vessel to cross the area of stenosis with a guidewire. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and dilation of the lesion is performed by inflating appropriate pressure and time for dilating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if a flow limiting dissection has occurred. All segments of disease within the same dorsalis pedis segment are treated with appropriate-sized balloon(s). Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	8%	15%	38%	15%	23%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	17%	17%	67%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	23%	23%	54%
Physical effort required	15%	31%	54%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	15%	31%	54%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	11%	0%	11%	56%	22%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	11%	0%	89%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	0%	100%
Physical effort required	0%	0%	100%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	11%	0%	89%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high-cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high-cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall

Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey
respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post-packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX
37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX

37271	Fem-pop, angioplasty ather, init, SF
37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF
37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF
37286	Tibial, angioplasty stent, init, CX
37287	+ Tibial, angioplasty stent, addl, CX
37291	+ Tibial, angioplasty ather, addl, CX
37292	Tibial, angioplasty ather stent, init, SF
37293	+ Tibial, angioplasty ather stent, addl, SF
37294	Tibial, angioplasty ather stent, init, CX
37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW; however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, and femoral/popliteal additional vessel interventions) are removed, the result is a net increase of 2.3%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity.

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**	
37262	**3.00**	**0.100**	**30**				**30**	
37247 KRS	3.50	0.117	30				30

37186 KRS	4.92	0.082	60				60	
34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
37255	**3.00**	**0.100**	**30**				**30**	
37262	**3.00**	**0.100**	**30**				**30**	
63048 MPC	3.47	0.077	45				45	
37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	
37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
36905 KRS	9.00	0.106	126	22	4	5	75	20
36253 KRS	7.30	0.100	121	23	3	5	60	30
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
36906 KRS	10.42	0.104	141	22	4	5	90	20
61645 KRS	15.00	0.121	241	40	3	15	100	83

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37268	**3.73**	**0.107**	**35**				**35**

34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

When looking at the RVWs for 37288 and 37290 combined, the overall budget neutrality for existing CPT code 37229 is an ***increase of 9.5%***

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:

SUMMARY OF RECOMMENDATION

CPT Code:37297 Tracking Number P44 Original Specialty Recommended RVU: **4.00**
Presented Recommended RVU: **4.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **4.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 79-year-old male with diabetes mellitus, who has extensive ischemic wounds on his right third and fourth toes, and who is not a candidate for open surgical reconstruction, is found to have stenoses of the dorsalis pedis and the posterior tibial artery below the ankle contributing to a patent pedal arch. After a separately reported angioplasty of the posterior tibial artery stenosis, an additional angioplasty of a stenosis of the dorsalis pedis is performed. [Note: This is an add-on service. Only consider the additional work related to angioplasty of a stenosis of the dorsalis pedis.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Sheath access that is stable in an infrapopliteal vessel has already been established. The work of this procedure begins with manipulation of a catheter and guidewire into the diseased dorsalis pedis artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and dilation of the lesion is performed by inflating appropriate pressure and time for dilating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if a flow limiting dissection has occurred. All segments of disease within the same dorsalis pedis arterial segment are treated with appropriate-sized balloon(s). Completion angiography is performed to confirm vessel patency, a satisfactory treatment result and absence of extravasation, embolization or flow-limiting dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**	
37262	**3.00**	**0.100**	**30**				**30**	
37247 KRS	3.50	0.117	30				30	
37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
37289	**4.75**	**0.106**	**45**				**45**	
37186 KRS	4.92	0.082	60				60	
34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52356 MPC	8.00	0.110	133	33	5	15	60	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

36906 MPC	10.42	0.104	141	22	4	5	90	20
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60

+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37296 Inframalleolar angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 11.00 RVW for this new service.

The most selected key reference services for 37296 were KRS 36906 and 61645. MPC codes 36906 and 37244 bracket 37296 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendation of the 25th percentile survey value for 37296.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

				44,000
				0%

37284 Tibial angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 10.00 RVW. This represents a ***decrease of 26.2%*** from current value of 13.55 RVWs for existing CPT code 37230.

37286 Tibial angioplasty, stent, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT 11005 for a value of 14.24 RVW. This represents an ***increase of 5.1%*** from current value of 13.55 RVWs for existing CPT code 37230.

The existing CPT code 37230, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed,* will be replaced by 37284 and 37286 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37284 and MPC codes 36906 and 37244 bracket 37286 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37284 and crosswalk value for 37286.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45	
+37297	**4.00**	**0.100**	**40**				**40**	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+34812 MPC	4.13	0.103	40				40	
+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37297 in conjunction with 37296, 37298)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Sometimes

Specialty Radiology How often? Sometimes

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37229

SUMMARY OF RECOMMENDATION

CPT Code:37298 Tracking Number P45 Original Specialty Recommended RVU: **15.00**
Presented Recommended RVU: **14.24**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **13.70**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 79-year-old male with diabetes mellitus who is not a candidate for open surgical reconstruction presents with extensive ischemic wounds on his right third and fourth toes. Diagnostic studies reveal an occlusion of the dorsalis pedis in the midfoot with reconstitution into a patent pedal arch that is treated with balloon angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the occluded dorsalis pedis artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Establish sheath access that is stable within an infrapopliteal vessel to cross the area of occlusion with a guidewire. Advanced techniques are typically required to cross the occlusion. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and dilation of the lesion is performed by inflating appropriate pressure and time for dilating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if a flow limiting dissection has occurred. All segments of occlusion within the same dorsalis pedis segment are treated with appropriate-sized balloon(s). Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of

the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual

code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey
respondent's answers from the anchor codes populated into the abbreviated survey table
to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL
37267	Fem-Pop, angioplasty stent, init, SF
37268	+ Fem-Pop, angioplasty stent, addl, SF
37269	Fem-Pop, angioplasty ather, init, CX
37288	Tibial, angioplasty ather, init, SF
37289	+ Tibial, angioplasty ather, addl, SF
37290	Tibial, angioplasty ather, init, CX
37296	Inframalleolar, angioplasty, init, SF

Research-Approved Abbreviated Survey Groupings:
Abbreviated Survey Group 1:

37257	+ Iliac, angioplasty, addl, CX
37258	Iliac, angioplasty stent, init, SF
37259	+ Iliac, angioplasty stent, addl, SF
37260	Iliac, angioplasty stent, init, CX
37261	+ Iliac, angioplasty stent, addl, CX
37263	Fem-pop, angioplasty, init, SF
37264	+ Fem-pop, angioplasty, addl, SF
37265	Fem-pop, angioplasty, init, CX
37266	+ Fem-pop, angioplasty, addl, CX
37270	+ Fem-pop, angioplasty stent, addl, CX
37271	Fem-pop, angioplasty ather, init, SF
37272	+ Fem-pop, angioplasty ather, addl, SF
37273	Fem-pop, angioplasty ather, init, CX
37274	+ Fem-pop, angioplasty ather, addl, CX
37275	Fem-pop, angioplasty ather stent, init, SF
37276	+ Fem-pop, angioplasty ather stent, addl, SF

37277	Fem-pop, angioplasty ather stent, init, CX
37278	+ Fem-pop, angioplasty ather stent, addl, CX
37279	+ Fem-pop IVL

Abbreviated Survey Group 2:

37280	Tibial, angioplasty, init, SF
37281	+ Tibial, angioplasty, addl, SF
37282	Tibial, angioplasty, init, CX
37283	+ Tibial, angioplasty, addl, CX
37284	Tibial, angioplasty stent, init, SF
37285	+ Tibial, angioplasty stent, addl, SF
37286	Tibial, angioplasty stent, init, CX
37287	+ Tibial, angioplasty stent, addl, CX
37291	+ Tibial, angioplasty ather, addl, CX
37292	Tibial, angioplasty ather stent, init, SF
37293	+ Tibial, angioplasty ather stent, addl, SF
37294	Tibial, angioplasty ather stent, init, CX
37295	+ Tibial, angioplasty ather stent, addl, CX
37297	+ Inframalleolar, angioplasty, addl, SF
37298	Inframalleolar, angioplasty, init, CX
37299	+ Inframalleolar, angioplasty, addl, CX

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time
Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**	
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**	

Experience	How many times have you personally performed these procedures in the past 12 months?

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal

intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

KRS								
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30	
+37255	**3.00**	**0.100**	**30**				**30**	
+37262	**3.00**	**0.100**	**30**				**30**

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW

				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+63048 MPC	3.47	0.077	45				45

+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Rarely

Specialty Radiology How often? Rarely

Specialty Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37229

SUMMARY OF RECOMMENDATION

CPT Code:37299 Tracking Number P46 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **5.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment of a 79-year-old male with diabetes mellitus who has extensive ischemic wounds on his right third and fourth toes and who is not a candidate for open surgical reconstruction, presents with occlusions of the dorsalis pedis and medial plantar branch of the posterior tibial in the midfoot with reconstitution into a patent pedal arch. After a separately reported angioplasty of an occlusion of the dorsalis pedis, an additional angioplasty of an occlusion in the medial plantar branch of the posterior tibial artery is performed. [Note: This is an add-on service. Only consider the additional work related to treat the occlusion in the medial plantar artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Sheath access that is stable in an infrapopliteal vessel has already been established. The work of this procedure begins with manipulation of a catheter and guidewire into the diseased medial plantar artery using fluoroscopic guidance. Advanced techniques are typically required to cross the occlusion. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and dilation of the lesion is performed by inflating appropriate pressure and time for dilating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if a flow limiting dissection has occurred. All segments of occlusion within the same medial plantar segment are treated with appropriate-sized balloon(s). Completion angiography is performed to confirm vessel patency, a satisfactory treatment result, and absence of extravasation, embolization and flow-limiting dissection.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post- packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time

Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**
Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW, however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy

- 30% to 70% for angioplasty, stent, atherectomy

8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).
9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, femoral/popliteal additional vessel interventions, and Inframalleolar interventions) are removed, the result is a net increase of 0.85%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

KRS								
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37255	**3.00**	**0.100**	**30**				**30**

34709 KRS	6.50	0.108	60				60	

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**
52353 MPC	7.50	0.101	133	33	5	15	60	20
52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

+37289	**4.75**	**0.106**	**45**				**45**	
22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37220	Iliac angioplasty, init	7.90	10,830	**85,557**
New				
37254	Iliac, angioplasty, init, SF	7.30	9206	67,204
37256	Iliac, angioplasty, init, CX	10.75	1625	17,469
				84,673
				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37257	+ Iliac, angioplasty, addl, CX	3.89	447	1,739
				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37262	**3.00**	**0.100**	**30**				**30**

63048 MPC	3.47	0.077	45				45	

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37226	Fem-pop, angioplasty, stent	10.24	17,660	**180,838**
New				
37267	Fem-Pop, angioplasty stent, init, SF	8.75	12,362	108,168
37269	Fem-Pop, angioplasty ather, init, CX	14.75	5298	78,146
				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
+37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
63048 MPC	3.47	0.077	45				45	
+37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

				578,250
				9.5%

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and

37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

Abbreviated Survey #2 Overview of Recommended Values

The codes surveyed in the second abbreviated survey include the remaining codes in the tibial territory (37280-37287 and 37291-37295) and the remaining codes in the inframalleolar territory (37297-37299). Codes 37280-37287 and 37291-37295 represent tibia angioplasty, stenting, atherectomy, and atherectomy and stenting, initial and additional vessels, split into straightforward and complex. These codes are adaptations of existing CPT codes 37228-37235. Codes 37297-37299 report inframalleolar angioplasty, initial and additional vessels, straightforward and complex. Thes codes represent new work as there are no codes for the inframalleolar territory in the current code family.

Comparison with Key Reference Services

Abbreviated survey #2 (37280-37287, 37291-37295, and 37297-37299) which describe intervention in the remaining tibial and inframalleolar territories were surveyed in conjunction with the core survey codes. As such, there were compared to the survey respondent's responses for the core codes and not compared to the reference service list. Thus, there are no key reference services for these codes surveyed by abbreviated survey.

Comparison to MPC codes

The specialty societies offer the following three MPC codes as brackets for the abbreviated survey #2 000-day global recommendations:

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
37284	**10.00**	**0.085**	**168**	**30**	**3**	**5**	**100**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20

37244 MPC	13.75	0.135	166	23	3	5	90	45
37286	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37298	**14.24**	**0.107**	**188**	**30**	**3**	**5**	**120**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

The specialty societies offer the following six MPC codes as brackets for the abbreviated survey #2 ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 22634, *Arthrodesis, combined posterior or posterolateral technique with posterior interbody technique including laminectomy and/or discectomy sufficient to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34715, *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates our recommended RVW for core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37295	**8.40**	**0.112**	**90**				**90**	

Abbreviated Survey #2 Additional Rationale for Specific Codes:

Tibial Territory:

37280 Tibial angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 9.80 RVW. This represents a ***decrease of 8.7%*** from current value of 10.75 RVWs for existing CPT code 37228.

37282 Tibial angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 92943 for a value of 12.31 RVW. This represents an ***increase of 14.5%*** from current value of 10.75 RVWs for existing CPT code 37228.

The existing CPT code 37228, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty,* will be replaced by 37280 and 37282 splitting it into straightforward and complex interventions. MPC codes 36905 and 36906 bracket 37280 and MPC codes 36906 and 37244 bracket 37282 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile survey value for 37280 and the crosswalk value for 37282.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36905 MPC	9.00	0.106	126	22	4	5	75	20
37280	**9.80**	**0.093**	**158**	**30**	**3**	**5**	**90**	**30**
36906 MPC	10.42	0.104	141	22	4	5	90	20
37282	**12.31**	**0.109**	**168**	**30**	**3**	**5**	**100**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45

When looking at the RVWs for 37280 and 37282 combined, the overall budget neutrality for existing CPT code 37224 is an ***increase of 2.8%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW
37228	Tibial, angioplasty	10.75	27,661	297,356
	-10% attribution to Inframalleolar angioplasty			**267,620**
New				
37280	Tibial, angioplasty, init, SF	9.80	12,447	121,981
37282	Tibial, angioplasty, init, CX	12.31	12,447	153,223
				275,204
				2.8%

+37281 Tibial angioplasty, additional vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 47543 for a value of 3.00 RVW. This represents a ***decrease of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

+37283 Tibial angioplasty, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 67340 for a value of 5.00 RVW. This represents an ***increase of 25%*** from current value of 4.00 RVWs for existing CPT code 37232.

The existing CPT code 37232, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37281 and +37283 splitting it into straightforward and complex interventions. MPC codes 36476 and 63048 bracket +37281 and MPC codes 34812 and 22632 bracket +37283 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for crosswalk values for +37281 and +37283.

37291	+ Tibial, angioplasty ather, addl, CX	7.00	4590	32,130
				53,933
				-9.6%

37292 Tibial angioplasty, stent, atherectomy, initial vessel, straightforward:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW. This represents a ***decrease of 3.5%*** from current value of 14.75 RVWs for existing CPT code 37231.

37294 Tibial angioplasty, stent, atherectomy, initial vessel, complex:
The specialty societies recommend the median survey value of 18.00 RVW. This represents an ***increase of 22%*** from current value of 14.75 RVWs for existing CPT code 37231.

The existing CPT code 37231, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed,* will be replaced by 37292 and 37294 splitting it into straightforward and complex interventions. MPC code 37244 brackets both 37292 and 37294 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the crosswalk value for 37292 and median survey value for 37294.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37244 MPC	13.75	0.135	166	23	3	5	90	45
37292	**14.24**	**0.090**	**210**	**30**	**3**	**5**	**142**	**30**
37294	**18.00**	**0.102**	**200**	**30**	**3**	**5**	**170**	**30**

When looking at the RVWs for 37292 and 37294 combined, the overall budget neutrality for existing CPT code 37231 is an ***increase of 9.3%***

CPT Code Existing	Code Descriptor	RVW	Projected Utilization	Total RVW

				9.3%

+37293 Tibial angioplasty, stent, atherectomy, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 6.50 RVW. This represents a ***decrease of 16.7%*** from current value of 7.80 RVWs for existing CPT code 37235.

+37295 Tibial angioplasty, stent, atherectomy, additional vessel, complex:
The specialty societies recommend a crosswalk to CPT code 22858 for a value of 8.40 RVW. This represents an ***increase of 7.7%*** from current value of 7.80 RVWs for existing CPT code 37235.

The existing CPT code 37235, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*, will be replaced by +37293 and +37295 splitting it into straightforward and complex interventions. MPC codes 34715 and 22634 bracket +37293 and MPC code 22634 brackets +37295 on the lower end providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendation for the 25th percentile value for +37293 and the crosswalk value for +37295.

Inframalleolar Territory:

+37297 Inframalleolar angioplasty, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 4.00 RVW for this new service.

+37299 Inframalleolar angioplasty, additional vessel, complex:
The specialty societies recommend the medial survey value of 5.00 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 63048 and 34812 bracket +37297 and MPC codes 34812 and 22632 bracket +37299 providing relativity across the database. Comparison to the core survey codes and MPCs favorably support the recommendations for the 25th percentile value for +37297 and median survey value for +37299.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

+37299	**5.00**	**0.111**	**45**				**45**	
+22632 MPC	5.22	0.087	60				60	

37298 Inframalleolar angioplasty, initial vessel, complex:
The specialty societies recommend a crosswalk to CPT code 11005 for a value of 14.24 RVW for this new service.

CPT codes 37296-37299 describe angioplasty of the inframalleolar arteries, initial and addition vessels, straightforward and complex. These procedures represent new work that was not previous reported with existing CPT codes. MPC codes 37244 brackets 37298 on the lower end providing relativity across the database. Comparison to the core survey code and MPCs favorably support the recommendations for the crosswalk value for 37298.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

Abbreviated Survey #2 Summary

The 16 codes surveyed in abbreviated survey #2 were randomly sent to half of the survey respondents. The survey instrument was approved by the Research subcommittee. This survey contains the remaining codes in the tibial and inframalleolar territories. Each code was compared to the respondent's own core code survey as anchors. Recommendations for all abbreviated survey #2 codes are supported by the core code references and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. (Use 37299 in conjunction with 37298)

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Rarely

Specialty Radiology How often? Rarely

Specialty Cardiology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37229

Femoral and Popliteal: There previously was no specific add-on code for treatment of a distinct lesion in a distinct vessel, which may have been reported using multiple units of the primary procedure and/or not reported/paid. The current code distribution for initial vessel treatment is estimated as 70% SF lesion and 30% CX lesion. In addition, for each type of treatment, a percentage of patients will require an additional distinct treatment in a distinct vessel, as follows: 31% (26% SF and 5% CX) for angioplasty treatment in an additional distinct vessel; 12% (6% SF and 6% CX) for stent treatment in an additional distinct vessel; 19% (9.5% SF and 9.5% CX) for atherectomy treatment in an additional distinct vessel; and 9% (3% SF and 6% CX) for stent & atherectomy treatment in an additional distinct vessel.

Attachment B – Lower Extremity Revascularization Utilization and Distribution Estimates

Tibial/Peronea/Inframalleolar Angioplasty: Distribution is estimated as 90% for tibial / peroneal territory codes and 10% for inframalleolar territory codes. Further, within the tib/per codes, the distribution is estimated at 50% SF and 50% CX. For the inframalleolar codes, the distribution is estimated at 90% SF and 10% CX.

Intravascular lithotripsy treatment in the iliac and fem/pop territories may have been reported with an unlisted CPT code, a HCPCS C-code, or some other payer coding direction. The utilization estimates provide below are for Medicare patients and are based on device sales data and expert panel estimated percentage of Medicare patients compared to all patients.

CPT CODE(S): 37254-37299
SPECIALTY SOCIETY(IES): ACC, ACR, ACS, OEIS, SCAI, SIR, SVS
PRESENTER(S): Curtis Anderson, MD (OEIS), Robert Kennedy, MD (SIR), Andy Moriarity, MD (ACR), Gerald Niedzwiecki, MD (OEIS), Matthew Sideman, MD (SVS), Afnan Tariq, MD (SCAI), Richard Wright, MD (ACC)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 01/2025

CPT Code	Long Descriptor	Global Period
37254	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37255	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37256	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	**000**
37257	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37258	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37259	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37260	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when	**000**

	performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
37261	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel, (List separately in addition to code for primary procedure)	**ZZZ**
37262	Intravascular lithotripsy(ies), iliac vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)	**ZZZ**
37263	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37264	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37265	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	**000**
37266	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37267	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing	**000**

	and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	
37268	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37269	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37270	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37271	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37272	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37273	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all	**000**

	imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
37274	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37275	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37276	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37277	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37278	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37279	Intravascular lithotripsy(ies), femoral and popliteal vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to	**ZZZ**

	perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)	
37280	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37281	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37283	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	**000**
37283	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37284	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37285	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37286	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing	**000**

	and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
37287	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37288	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37289	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37290	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37291	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37292	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and	**000**

	crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	
37293	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37294	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37295	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37296	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37297	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37298	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation	**000**

	necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	
37299	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
37254	A 57-year-old male who smokes presents for right buttock and calf claudication. Diagnostic studies show a focal concentric stenosis of the right common iliac artery which is treated with balloon angioplasty.
37255	During endovascular treatment for right buttock and calf claudication in a 77-year-old male who smokes, after a separately reported balloon angioplasty of a stenosis of the right common iliac artery, an additional 75% stenosis of the left external iliac artery is treated with balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to the balloon angioplasty of the additional stenosis of the left external iliac artery.] A 57-year-old female who smokes presents for nonhealing left foot wound. Diagnostic studies show an occlusion of the left common iliac artery 1-cm distal to the bifurcation that is treated with balloon angioplasty.
37256	During endovascular treatment for a nonhealing left foot wound in a 77-year-old male who smokes, after a separately reported balloon angioplasty of an occlusion of the left common iliac artery, an additional discrete occlusion of the left external iliac artery is treated with balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to the balloon angioplasty of an additional discrete occlusion of the left external iliac artery.]
37257	A 57-year-old male who smokes presents for right thigh and calf claudication. Diagnostic studies show a stenosis of the right external iliac artery that is treated with balloon angioplasty and stent placement.
37258	During endovascular treatment for right thigh and calf claudication in a 77-year-old male who smokes, after a separately reported treatment of a proximal right common iliac stenosis with balloon angioplasty and stent placement, an additional stenosis of the right external iliac artery is treated with balloon angioplasty and stent placement. [**Note:** This is an add-on service. Only consider the additional work related to treatment of the additional stenosis of the right external iliac artery with balloon angioplasty and stent placement.]
37259	A 58-year-old female is evaluated for right leg claudication that develops at two blocks. Diagnostic testing reveals an occlusion of the right common iliac artery that is treated with balloon angioplasty and stent placement.
37260	During endovascular treatment of a 77-year-old female for a non-healing right foot ulcer and absent femoral pulse, after a separately reported treatment of a proximal right common iliac occlusion with stent placement, an additional occlusion of the right external iliac

	artery is treated with balloon angioplasty and placement of a stent. [**Note:** This is an add-on service. Only consider the additional work related to treatment of the occlusion of the right external iliac artery with balloon angioplasty and placement of a stent.]
37261	During endovascular treatment of a 79-year-old female who previously had transaortic valve replacement and has dense calcification of the left common iliac artery, after a separately reported angioplasty of an occlusion in the iliac artery, the decision is made to treat the dense calcification with intravascular lithotripsy. [**Note:** This is an add-on service. Only consider the additional work related to treating the calcification with intravascular lithotripsy.]
37262	A 77-year-old female is evaluated for right leg claudication that develops at one-half block. Diagnostic testing reveals a flow limiting stenosis of the right superficial femoral artery that is treated with balloon angioplasty.
37263	During endovascular treatment of a 58-year-old female with right leg claudication that develops at two blocks, after a separately reported treatment of a stenosis of the right common femoral artery, an additional and more distal stenosis of the right popliteal artery is treated with balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to treat the right popliteal artery with balloon angioplasty.]
37264	A 77-year-old female is evaluated for a nonhealing right transmetatarsal amputation. Diagnostic testing reveals an occlusion of the right superficial femoral artery that is treated with balloon angioplasty.
37265	During endovascular treatment of an 88-year-old female with multiple cardiovascular risk factors and a nonhealing left heel ulcer, after a separately reported treatment of an occlusion of the mid left popliteal artery, an additional occlusion of the common femoral artery is treated with cutting balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to treat the common femoral artery occlusion with cutting balloon angioplasty.]
37266	A 77-year-old male with a history of multiple lower extremity interventions is evaluated for recurrent right leg claudication that develops at one-half block. Diagnostic testing reveals a stenosis of the right superficial femoral artery that is treated with balloon angioplasty.
37267	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement for treatment of a short segment stenosis of the right common femoral artery, an additional angioplasty and stent placement is performed for a stenosis of the right superficial femoral artery. [**Note:** This is an add-on service. Only consider the additional work related to angioplasty and stent placement to treat a stenosis of the right superficial femoral artery.]
37268	A 68-year-old female with diabetes mellitus presents with a nonhealing left great toe amputation. Diagnostic studies reveal an occlusion of the distal left superficial femoral artery and proximal left popliteal artery that is treated with balloon angioplasty and placement of a stent.
37269	During endovascular treatment of a 88-year-old male with diabetes mellitus, with a nonhealing pressure ulcer of the left foot, and who is not a candidate for open surgical revascularization, after separately reported angioplasty and stent placement for an occlusion of the left common femoral artery, an additional angioplasty and stent placement is performed of a more distal occlusion of the left popliteal artery. [**Note:** This is an add-on

	service. Only consider the additional work related to angioplasty and stent placement of a more distal occlusion of the left popliteal artery.]
37270	A 68-year-old female with diabetes mellitus presents with rest pain of the right foot. Diagnostic studies reveal a stenosis of the right superficial femoral artery and the right popliteal artery that is treated with balloon angioplasty and atherectomy.
37271	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported balloon angioplasty and atherectomy for a concentric stenosis in the proximal right common femoral artery is performed, an additional angioplasty and atherectomy is performed to treat a distal concentric stenosis of the right popliteal artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the distal concentric stenosis of the right popliteal artery.]
37272	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported balloon angioplasty and atherectomy for a concentric stenosis in the proximal right common femoral artery is performed, an additional angioplasty and atherectomy is performed to treat a distal concentric stenosis of the right popliteal artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the distal concentric stenosis of the right popliteal artery.]
37273	A 68-year-old man with diabetes mellitus presents with a nonhealing wound to the dorsum of the left foot. Diagnostic studies reveal an occlusion in the mid portion of the left superficial femoral artery that is treated with balloon angioplasty and atherectomy.
37274	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty and atherectomy of an occlusion of the right common femoral artery, an additional angioplasty and atherectomy of an occlusion of the distal right popliteal artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of an occlusion of the distal right popliteal artery.]
37275	A 68-year-old male with diabetes mellitus presents with a non-healing left second toe amputation. Diagnostic studies reveal a stenosis of the left superficial femoral artery that is treated with balloon angioplasty, atherectomy, and stent placement.
37276	During endovascular treatment of a 88-year-old male with diabetes mellitus, a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty, atherectomy, and stent placement for treatment of a stenosis of the right common femoral artery, an additional angioplasty, atherectomy, and stent placement for treatment of a stenosis of the right popliteal artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement for a stenosis of the right popliteal artery.]
37277	A 78-year-old male with diabetes mellitus presents with a nonhealing ulcer of the right foot. Diagnostic studies reveal severe femoral-popliteal disease with an occlusion of his right superficial femoral artery and popliteal artery that is treated with balloon angioplasty, atherectomy, and stent placement.
37278	During endovascular treatment of a 78-year-old male with diabetes mellitus, with a necrotic left forefoot that requires amputation, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty, atherectomy, and stent placement to

	treat an occlusion of the left common femoral artery, an additional angioplasty, atherectomy, and stent placement to treat an occlusion of the left popliteal artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement to treat an occlusion of the left popliteal artery.]
37279	During endovascular treatment of a 70-year-old male with diabetes mellitus who has a long smoking history and with a highly calcified right superficial femoral artery occlusion and preserved runoff, after a separately reported treatment with a wire and catheter and multiple balloon inflations that do not restore the lumen, the decision is made to treat the calcification with intravascular lithotripsy. [**Note:** This is an add-on service. Only consider the additional work related to treating the calcification with intravascular lithotripsy.]
37280	A 58-year-old male with diabetes mellitus and a long smoking history is evaluated for a nonhealing left fifth toe ulcer. Diagnostic testing reveals a severe tibial disease with a flow limiting stenosis of the left posterior tibial artery that is treated with balloon angioplasty.
37281	During endovascular treatment of an 88-year-old male with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty of a stenosis in the right common anterior tibial artery, an additional angioplasty of a stenosis of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty of the stenosis of the right posterior tibial artery.]
37283	A 90-year-old male with diabetes mellitus and a long smoking history is evaluated for critical limb ischemia and rest pain of the left foot. Diagnostic testing reveals a severe tibial disease with an occlusion of the left posterior tibial artery which reconstitutes at the ankle that is treated with balloon angioplasty.
37283	During endovascular treatment of an 88-year-old male with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty of an occlusion of the right anterior tibial artery, an additional angioplasty of an occlusion of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty of the occlusion of the right posterior tibial artery.]
37284	A 77-year-old male with a history of multiple lower extremity interventions is evaluated for a nonhealing left second toe amputation site. Diagnostic testing reveals a severe tibial disease and a stenosis of the left posterior tibial artery that is treated with balloon angioplasty and placement of a stent.
37285	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement to treat a short segment stenosis of the right anterior tibial artery, an additional angioplasty and stent placement for treatment of a stenosis of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and stent placement of the stenosis of the right posterior tibial artery.]
37286	An 87-year-old male with a history of multiple lower extremity interventions is evaluated for critical limb ischemia and rest pain of the left foot. Diagnostic testing reveals severe tibial disease and an occlusion of the left posterior tibial artery with constitution in the midcalf. The plantar arch is intact. He is treated with balloon angioplasty and placement of a stent.

37287	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement to treat an occlusion of the right anterior tibial artery, an additional angioplasty and stent placement to treat an occlusion of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and stent placement of the occlusion of the right posterior tibial artery.]
37288	A 68-year-old female with diabetes mellitus presents with rest pain of the right foot. Diagnostic studies reveal a severe tibial disease and a stenosis of the anterior tibial artery that is treated with balloon angioplasty and atherectomy.
37289	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot and a plantar arch that is not intact, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and atherectomy is performed to treat a severe stenosis of the right anterior tibial artery, an additional angioplasty and atherectomy is performed to treat a stenosis of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the stenosis of the right posterior tibial artery.]
37290	An 88-year-old female with diabetes mellitus and congestive heart failure presents with critical limb ischemia and rest pain of her left foot. She is not a candidate for surgical reconstruction. Diagnostic studies reveal severe tibial disease and an occlusion of the anterior tibial artery that is treated with balloon angioplasty and atherectomy.
37291	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot and a plantar arch that is not intact, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and atherectomy is performed to treat an occlusion of the right anterior tibial artery, an additional angioplasty and atherectomy is performed to treat an occlusion of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the occlusion of the right posterior tibial artery.]
37292	A 78-year-old male with diabetes mellitus presents with a non-healing left second toe amputation. Diagnostic studies reveal severe tibial disease and a long segment stenosis of the left posterior tibial artery that is treated with balloon angioplasty, atherectomy, and placement of a stent.
37293	During endovascular treatment of an 88-year-old female with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty, atherectomy, and stent placement is performed to treat a stenosis of the right anterior tibial artery, an additional angioplasty, atherectomy, and stent placement is performed to treat a stenosis of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement of the stenosis of the right posterior tibial artery.]
37294	A 90-year-old male with diabetes mellitus presents with a critical limb ischemia and rest pain of his left foot. Diagnostic studies reveal severe tibial disease including an occlusion of the left anterior tibial artery that is treated with balloon angioplasty, atherectomy, and placement of a stent.
37295	During endovascular treatment of a 98-year-old male with diabetes mellitus, with a extensive ischemia wounds on his right foot, and who is not a candidate for open surgical

	reconstruction presents. after a separately reported angioplasty, atherectomy, and stent placement is performed to treat an occlusion of the right anterior tibial artery, an additional angioplasty, atherectomy, and stent placement is performed to treat an occlusion of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement of the occlusion of the right posterior tibial artery.]
37296	A 79-year-old male with diabetes mellitus who is not a candidate for open surgical reconstruction presents with extensive ischemic wounds on his right third and fourth toes. Diagnostic studies reveal an occlusion of the dorsalis pedis that is treated with balloon angioplasty.
37297	During endovascular treatment of a 79-year-old male with diabetes mellitus, who has extensive ischemic wounds on his right third and fourth toes, and who is not a candidate for open surgical reconstruction, is found to have stenoses of the dorsalis pedis and the posterior tibial artery below the ankle contributing to a patent pedal arch. After a separately reported angioplasty of the posterior tibial artery stenosis, an additional angioplasty of a stenosis of the dorsalis pedis is performed. [**Note:** This is an add-on service. Only consider the additional work related to angioplasty of a stenosis of the dorsalis pedis.]
37298	A 79-year-old male with diabetes mellitus who is not a candidate for open surgical reconstruction presents with extensive ischemic wounds on his right third and fourth toes. Diagnostic studies reveal an occlusion of the dorsalis pedis in the midfoot with reconstitution into a patent pedal arch that is treated with balloon angioplasty.
37299	During endovascular treatment of a 79-year-old male with diabetes mellitus who has extensive ischemic wounds on his right third and fourth toes and who is not a candidate for open surgical reconstruction, presents with occlusions of the dorsalis pedis and medial plantar branch of the posterior tibial in the midfoot with reconstitution into a patent pedal arch. After a separately reported angioplasty of an occlusion of the dorsalis pedis, an additional angioplasty of an occlusion in the medial plantar branch of the posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to treat the occlusion in the medial plantar artery.]

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty societies convened a multispecialty consensus panel including RUC advisors, providers of LER, including both F and NF providers. The panel developed the direct practice expense recommendations for the new set of LER codes based on best practices and current AMA RUC/PE guidelines.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   CPT Codes 37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery*

and 37237 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery* were selected as reference codes for the LER family. CPT Codes 37236 and 37236 are RUC reviewed interventional procedures, performed in the both the F and NF setting. CPT Code 37236 is '000 service and CPT Code 37236 is a ZZZ service.

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?

   LER Codes 37254-37299 are not typically reported with E/M services (F/NF)

   See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

   N/A

   See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

   N/A

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

   The pre service standard for 000 services is zero. The specialties are recommending 3 minutes for both CA001 complete pre service diagnostic and referral forms and CA003 schedule space and equipment in facility for these LER procedures.

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

   N/A

CPT CODE(S): 37254-37299
SPECIALTY SOCIETY(IES): ACC, ACR, ACS, OEIS, SCAI, SIR, SVS
PRESENTER(S): Curtis Anderson, MD (OEIS), Robert Kennedy, MD (SIR), Andy Moriarity, MD (ACR), Gerald Niedzwiecki, MD (OEIS), Matthew Sideman, MD (SVS), Afnan Tariq, MD (SCAI), Richard Wright, MD (ACC)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

CA001 complete pre service diagnostic and referral forms CA003 schedule space and equipment in facility

   b. Service period (includes pre, intra and post):

N/A

   c. Post-service period:

CA037 Conduct patient communications

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

N/A

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

N/A

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).
    N/A

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:
    N/A

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:
    N/A

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).
    b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
    c. Does the computer include code specific software that is typically used to provide the service(s)?
    N/A

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:
    N/A

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
    (b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?
    N/A

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:
    N/A

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

SPECIALTY SOCIETY(IES): ACC, ACR, ACS, OEIS, SCAI, SIR, SVS
PRESENTER(S): Curtis Anderson, MD (OEIS), Robert Kennedy, MD (SIR), Andy Moriarity, MD (ACR), Gerald Niedzwiecki, MD (OEIS), Matthew Sideman, MD (SVS), Afnan Tariq, MD (SCAI), Richard Wright, MD (ACC)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC) PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 01/2025

CPT Code	Long Descriptor	Global Period
37254	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37255	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37256	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	**000**
37257	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37258	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37259	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37260	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when	**000**

	performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
37261	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel, (List separately in addition to code for primary procedure)	**ZZZ**
37262	Intravascular lithotripsy(ies), iliac vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)	**ZZZ**
37263	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37264	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37265	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	**000**
37266	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37267	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing	**000**

	and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	
37268	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37269	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37270	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37271	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37272	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37273	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all	**000**

	imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
37274	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37275	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37276	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37277	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37278	Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37279	Intravascular lithotripsy(ies), femoral and popliteal vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to	**ZZZ**

	perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)	
37280	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37281	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37282	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	**000**
37283	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37284	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37285	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37286	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing	**000**

	and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	
37287	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37288	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37289	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37290	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37291	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37292	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and	**000**

	crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel	
37293	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37294	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel	**000**
37295	Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37296	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel	**000**
37297	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**
37298	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation	**000**

	necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel	
37299	Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)	**ZZZ**

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
37254	A 57-year-old male who smokes presents for right buttock and calf claudication. Diagnostic studies show a focal concentric stenosis of the right common iliac artery which is treated with balloon angioplasty.
37255	During endovascular treatment for right buttock and calf claudication in a 77-year-old male who smokes, after a separately reported balloon angioplasty of a stenosis of the right common iliac artery, an additional 75% stenosis of the left external iliac artery is treated with balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to the balloon angioplasty of the additional stenosis of the left external iliac artery.]
37256	A 57-year-old female who smokes presents for nonhealing left foot wound. Diagnostic studies show an occlusion of the left common iliac artery 1-cm distal to the bifurcation that is treated with balloon angioplasty.
37257	During endovascular treatment for a nonhealing left foot wound in a 77-year-old male who smokes, after a separately reported balloon angioplasty of an occlusion of the left common iliac artery, an additional discrete occlusion of the left external iliac artery is treated with balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to the balloon angioplasty of an additional discrete occlusion of the left external iliac artery.]
37258	A 57-year-old male who smokes presents for right thigh and calf claudication. Diagnostic studies show a stenosis of the right external iliac artery that is treated with balloon angioplasty and stent placement.
37259	During endovascular treatment for right thigh and calf claudication in a 77-year-old male who smokes, after a separately reported treatment of a proximal right common iliac stenosis with balloon angioplasty and stent placement, an additional stenosis of the right external iliac artery is treated with balloon angioplasty and stent placement. [**Note:** This is an add-on service. Only consider the additional

	work related to treatment of the additional stenosis of the right external iliac artery with balloon angioplasty and stent placement.]
37260	A 58-year-old female is evaluated for right leg claudication that develops at two blocks. Diagnostic testing reveals an occlusion of the right common iliac artery that is treated with balloon angioplasty and stent placement.
37261	During endovascular treatment of a 77-year-old female for a non-healing right foot ulcer and absent femoral pulse, after a separately reported treatment of a proximal right common iliac occlusion with stent placement, an additional occlusion of the right external iliac artery is treated with balloon angioplasty and placement of a stent. [**Note:** This is an add-on service. Only consider the additional work related to treatment of the occlusion of the right external iliac artery with balloon angioplasty and placement of a stent.]
37262	During endovascular treatment of a 79-year-old female who previously had transaortic valve replacement and has dense calcification of the left common iliac artery, after a separately reported angioplasty of an occlusion in the iliac artery, the decision is made to treat the dense calcification with intravascular lithotripsy. [**Note:** This is an add-on service. Only consider the additional work related to treating the calcification with intravascular lithotripsy.]
37263	A 77-year-old female is evaluated for right leg claudication that develops at one-half block. Diagnostic testing reveals a flow limiting stenosis of the right superficial femoral artery that is treated with balloon angioplasty.
37264	During endovascular treatment of a 58-year-old female with right leg claudication that develops at two blocks, after a separately reported treatment of a stenosis of the right common femoral artery, an additional and more distal stenosis of the right popliteal artery is treated with balloon angioplasty. [**Note:** This is an add-on service. Only consider the additional work related to treat the right popliteal artery with balloon angioplasty.]
37265	A 77-year-old female is evaluated for a nonhealing right transmetatarsal amputation. Diagnostic testing reveals an occlusion of the right superficial femoral artery that is treated with balloon angioplasty.
37266	During endovascular treatment of an 88-year-old female with multiple cardiovascular risk factors and a nonhealing left heel ulcer, after a separately reported treatment of an occlusion of the mid left popliteal artery, an additional occlusion of the common femoral artery is treated with cutting balloon angioplasty.

	[**Note:** This is an add-on service. Only consider the additional work related to treat the common femoral artery occlusion with cutting balloon angioplasty.]
37267	A 77-year-old male with a history of multiple lower extremity interventions is evaluated for recurrent right leg claudication that develops at one-half block. Diagnostic testing reveals a stenosis of the right superficial femoral artery that is treated with balloon angioplasty.
37268	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement for treatment of a short segment stenosis of the right common femoral artery, an additional angioplasty and stent placement is performed for a stenosis of the right superficial femoral artery. [**Note:** This is an add-on service. Only consider the additional work related to angioplasty and stent placement to treat a stenosis of the right superficial femoral artery.]
37269	A 68-year-old female with diabetes mellitus presents with a nonhealing left great toe amputation. Diagnostic studies reveal an occlusion of the distal left superficial femoral artery and proximal left popliteal artery that is treated with balloon angioplasty and placement of a stent.
37270	During endovascular treatment of a 88-year-old male with diabetes mellitus, with a nonhealing pressure ulcer of the left foot, and who is not a candidate for open surgical revascularization, after separately reported angioplasty and stent placement for an occlusion of the left common femoral artery, an additional angioplasty and stent placement is performed of a more distal occlusion of the left popliteal artery. [**Note:** This is an add-on service. Only consider the additional work related to angioplasty and stent placement of a more distal occlusion of the left popliteal artery.]
37271	A 68-year-old female with diabetes mellitus presents with rest pain of the right foot. Diagnostic studies reveal a stenosis of the right superficial femoral artery and the right popliteal artery that is treated with balloon angioplasty and atherectomy.
37272	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported balloon angioplasty and atherectomy for a concentric stenosis in the proximal right common femoral artery is performed, an additional angioplasty and atherectomy is performed to treat a distal concentric stenosis of the right popliteal artery. [**Note:** This is an add-on service. Only

	consider the additional work related to the angioplasty and atherectomy of the distal concentric stenosis of the right popliteal artery.]
37273	A 68-year-old man with diabetes mellitus presents with a nonhealing wound to the dorsum of the left foot. Diagnostic studies reveal an occlusion in the mid portion of the left superficial femoral artery that is treated with balloon angioplasty and atherectomy.
37274	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty and atherectomy of an occlusion of the right common femoral artery, an additional angioplasty and atherectomy of an occlusion of the distal right popliteal artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of an occlusion of the distal right popliteal artery.]
37275	A 68-year-old male with diabetes mellitus presents with a non-healing left second toe amputation. Diagnostic studies reveal a stenosis of the left superficial femoral artery that is treated with balloon angioplasty, atherectomy, and stent placement.
37276	During endovascular treatment of a 88-year-old male with diabetes mellitus, a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty, atherectomy, and stent placement for treatment of a stenosis of the right common femoral artery, an additional angioplasty, atherectomy, and stent placement for treatment of a stenosis of the right popliteal artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement for a stenosis of the right popliteal artery.]
37277	A 78-year-old male with diabetes mellitus presents with a nonhealing ulcer of the right foot. Diagnostic studies reveal severe femoral-popliteal disease with an occlusion of his right superficial femoral artery and popliteal artery that is treated with balloon angioplasty, atherectomy, and stent placement.
37278	During endovascular treatment of a 78-year-old male with diabetes mellitus, with a necrotic left forefoot that requires amputation, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty, atherectomy, and stent placement to treat an occlusion of the left common femoral artery, an additional angioplasty, atherectomy, and stent placement to treat an occlusion of the left popliteal artery is performed. [**Note:** This is an add-on service. Only

	consider the additional work related to the angioplasty, atherectomy, and stent placement to treat an occlusion of the left popliteal artery.]
37279	During endovascular treatment of a 70-year-old male with diabetes mellitus who has a long smoking history and with a highly calcified right superficial femoral artery occlusion and preserved runoff, after a separately reported treatment with a wire and catheter and multiple balloon inflations that do not restore the lumen, the decision is made to treat the calcification with intravascular lithotripsy. [**Note:** This is an add-on service. Only consider the additional work related to treating the calcification with intravascular lithotripsy.]
37280	A 58-year-old male with diabetes mellitus and a long smoking history is evaluated for a nonhealing left fifth toe ulcer. Diagnostic testing reveals a severe tibial disease with a flow limiting stenosis of the left posterior tibial artery that is treated with balloon angioplasty.
37281	During endovascular treatment of an 88-year-old male with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty of a stenosis in the right common anterior tibial artery, an additional angioplasty of a stenosis of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty of the stenosis of the right posterior tibial artery.]
37282	A 90-year-old male with diabetes mellitus and a long smoking history is evaluated for critical limb ischemia and rest pain of the left foot. Diagnostic testing reveals a severe tibial disease with an occlusion of the left posterior tibial artery which reconstitutes at the ankle that is treated with balloon angioplasty.
37283	During endovascular treatment of an 88-year-old male with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical reconstruction, after a separately reported angioplasty of an occlusion of the right anterior tibial artery, an additional angioplasty of an occlusion of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty of the occlusion of the right posterior tibial artery.]
37284	A 77-year-old male with a history of multiple lower extremity interventions is evaluated for a nonhealing left second toe amputation site. Diagnostic testing reveals a severe tibial disease and a stenosis of the left posterior tibial artery that is treated with balloon angioplasty and placement of a stent.

37285	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement to treat a short segment stenosis of the right anterior tibial artery, an additional angioplasty and stent placement for treatment of a stenosis of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and stent placement of the stenosis of the right posterior tibial artery.]
37286	An 87-year-old male with a history of multiple lower extremity interventions is evaluated for critical limb ischemia and rest pain of the left foot. Diagnostic testing reveals severe tibial disease and an occlusion of the left posterior tibial artery with constitution in the midcalf. The plantar arch is intact. He is treated with balloon angioplasty and placement of a stent.
37287	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and stent placement to treat an occlusion of the right anterior tibial artery, an additional angioplasty and stent placement to treat an occlusion of the right posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and stent placement of the occlusion of the right posterior tibial artery.]
37288	A 68-year-old female with diabetes mellitus presents with rest pain of the right foot. Diagnostic studies reveal a severe tibial disease and a stenosis of the anterior tibial artery that is treated with balloon angioplasty and atherectomy.
37289	During endovascular treatment of a 98-year-old female with diabetes mellitus, with rest pain of the right foot and a plantar arch that is not intact, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and atherectomy is performed to treat a severe stenosis of the right anterior tibial artery, an additional angioplasty and atherectomy is performed to treat a stenosis of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the stenosis of the right posterior tibial artery.]
37290	An 88-year-old female with diabetes mellitus and congestive heart failure presents with critical limb ischemia and rest pain of her left foot. She is not a candidate for surgical reconstruction. Diagnostic studies reveal severe tibial disease and an

	occlusion of the anterior tibial artery that is treated with balloon angioplasty and atherectomy.
37291	During endovascular treatment of an 88-year-old female with diabetes mellitus, with rest pain of the right foot and a plantar arch that is not intact, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty and atherectomy is performed to treat an occlusion of the right anterior tibial artery, an additional angioplasty and atherectomy is performed to treat an occlusion of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty and atherectomy of the occlusion of the right posterior tibial artery.]
37292	A 78-year-old male with diabetes mellitus presents with a non-healing left second toe amputation. Diagnostic studies reveal severe tibial disease and a long segment stenosis of the left posterior tibial artery that is treated with balloon angioplasty, atherectomy, and placement of a stent.
37293	During endovascular treatment of an 88-year-old female with diabetes mellitus, with a nonhealing ulcer of the right foot, and who is not a candidate for open surgical revascularization, after a separately reported angioplasty, atherectomy, and stent placement is performed to treat a stenosis of the right anterior tibial artery, an additional angioplasty, atherectomy, and stent placement is performed to treat a stenosis of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement of the stenosis of the right posterior tibial artery.]
37294	A 90-year-old male with diabetes mellitus presents with a critical limb ischemia and rest pain of his left foot. Diagnostic studies reveal severe tibial disease including an occlusion of the left anterior tibial artery that is treated with balloon angioplasty, atherectomy, and placement of a stent.
37295	During endovascular treatment of a 98-year-old male with diabetes mellitus, with a extensive ischemia wounds on his right foot, and who is not a candidate for open surgical reconstruction presents. after a separately reported angioplasty, atherectomy, and stent placement is performed to treat an occlusion of the right anterior tibial artery, an additional angioplasty, atherectomy, and stent placement is performed to treat an occlusion of the right posterior tibial artery. [**Note:** This is an add-on service. Only consider the additional work related to the angioplasty, atherectomy, and stent placement of the occlusion of the right posterior tibial artery.]
37296	A 79-year-old male with diabetes mellitus who is not a candidate for open surgical reconstruction presents with extensive ischemic wounds on his right third and

	fourth toes. Diagnostic studies reveal an occlusion of the dorsalis pedis that is treated with balloon angioplasty.
37297	During endovascular treatment of a 79-year-old male with diabetes mellitus, who has extensive ischemic wounds on his right third and fourth toes, and who is not a candidate for open surgical reconstruction, is found to have stenoses of the dorsalis pedis and the posterior tibial artery below the ankle contributing to a patent pedal arch. After a separately reported angioplasty of the posterior tibial artery stenosis, an additional angioplasty of a stenosis of the dorsalis pedis is performed. [**Note:** This is an add-on service. Only consider the additional work related to angioplasty of a stenosis of the dorsalis pedis.]
37298	A 79-year-old male with diabetes mellitus who is not a candidate for open surgical reconstruction presents with extensive ischemic wounds on his right third and fourth toes. Diagnostic studies reveal an occlusion of the dorsalis pedis in the midfoot with reconstitution into a patent pedal arch that is treated with balloon angioplasty.
37299	During endovascular treatment of a 79-year-old male with diabetes mellitus who has extensive ischemic wounds on his right third and fourth toes and who is not a candidate for open surgical reconstruction, presents with occlusions of the dorsalis pedis and medial plantar branch of the posterior tibial in the midfoot with reconstitution into a patent pedal arch. After a separately reported angioplasty of an occlusion of the dorsalis pedis, an additional angioplasty of an occlusion in the medial plantar branch of the posterior tibial artery is performed. [**Note:** This is an add-on service. Only consider the additional work related to treat the occlusion in the medial plantar artery.]

If there is a significantly different patient population in the non-facility setting, a vignette should be provided for the non-facility setting in the PE SOR.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

   The specialty societies convened a multispecialty consensus panel including RUC advisors, providers of LER, including NF LER expertise. The panel developed the direct practice expense recommendations for the new set of LER codes based on best practices and current AMA RUC/PE guidelines.

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

   CPT Codes 37236 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid,*

intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery and 37237 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery* were selected as reference codes for the LER family. CPT Codes 37236 and 37236 are RUC reviewed interventional procedures, performed in the NF setting. CPT Code 37236 is '000 service and CPT Code 37236 is a ZZZ service.

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?
   Is this code(s) typically reported with the E/M service in the non-facility?
   LER Codes 37254-37299 are not typically reported with E/M services (F/NF)
   See the *Billed Together* tab in the RUC Database.

4. A. What specialty is the dominant provider *in the non-facility?* What percent of the time does the dominant provider provide the service(s) in the non-facility? Is the dominant provider in the non-facility different than for the global? Note: When discussing specialties that perform the code, they must perform 51% to be called the "typical" physicians. If no one specialty meets the 51% but is the top specialty with 27% (for example), then they are referred as the top or dominant specialty.

Below is a summary of the dominant specialties by site of service for the predecessor LER codes:

Global	CPT Code	Top_Specialty (All Sites)	Top Specialty NF
000	37220	VASCULAR SURGERY	VASCULAR SURGERY
000	37221	VASCULAR SURGERY	VASCULAR SURGERY
ZZZ	37222	VASCULAR SURGERY	VASCULAR SURGERY
ZZZ	37223	VASCULAR SURGERY	VASCULAR SURGERY
000	37224	VASCULAR SURGERY	VASCULAR SURGERY
000	37225	VASCULAR SURGERY	VASCULAR SURGERY
000	37226	VASCULAR SURGERY	VASCULAR SURGERY

000	37227	VASCULAR SURGERY	VASCULAR SURGERY	
000	37228	VASCULAR SURGERY	VASCULAR SURGERY	
000	37229	VASCULAR SURGERY	VASCULAR SURGERY	
000	37230	VASCULAR SURGERY	CARDIOLOGY	
000	37231	CARDIOLOGY	CARDIOLOGY	
ZZZ	37232	VASCULAR SURGERY	VASCULAR SURGERY	
ZZZ	37233	VASCULAR SURGERY	VASCULAR SURGERY	
ZZZ	37234	VASCULAR SURGERY	CARDIOLOGY	
ZZZ	37235	INTERVENTIONAL RADIOLOGY	CARDIOLOGY	

See the *Claims Data* tab in the RUC Database. Use the *Medicare Specialty (Non-Facility Only)* table.

5. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

We are requesting an increase in the aggregate cost for supplies and equipment over the current cost for the family. We believe there is compelling evidence for the increase based on changes in technique, changes in technology, significant shifts in site of service for the performance of these procedures and a change in population.

The expansion of endovascular techniques for the revascularization of the lower extremities has allowed for the treatment of smaller, more calcified vessels than previously possible. More available training, expanding experience and supporting data has allowed for improving outcomes through the revascularization of more distal vessels with endovascular techniques.
