RUC Referrals to CPT Editoral Panel - Outstanding Issues

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
20985	**Computer-assisted surgical navigational procedure for musculoskeletal procedures, image-less (List separately in addition to code for primary procedure)**	High Volume Growth10	September 2024	AAOS	February 2025

Background: In September 2024 the RUC recommended that this issue be referred to CPT. The specialty society would like to modify the descriptor and address any overlap with codes 0054T and 0055T. It is expected that revising code 20985 will result in a decrease of the reporting of the T codes.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
22210	**Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; cervical**	CMS Request - Final Rule for 2025	January 2025	AANS, AAOS, CNS, NASS	September 2025

Background: In the NPRM for 2025, CPT codes 22210, 22212, 22214 and 22216 were nominated as potentially misvalued services for the following reasons (1) incorrect global period; (2) incorrect inpatient days; (3) incorrect intra-service work description; (4) overvalued intra-service times; (5) changed surgical practice; and (6) incorrect use of posterior osteotomy codes. CMS notes that these services were last reviewed in 1995 and all but CPT code 22216 did not have a description of work or vignettes describing the typical patient. CMS also noted that there may be the need for potential bundling of these services, such as CPT code 22210 and 22600 Arthrodesis, posterior or posterolateral technique, single interspace; cervical below C2 segment. The nominator suggested two options to address this concern: (1) developing add-on codes to differentiate between the number of vertebral segments involved in the osteotomy procedure and whether it occurs in the cervical, thoracic, or lumbar regions; and (2) removing the current posterior osteotomy codes and incorporating osteotomies into new deformity fusion codes, both with and without osteotomy. CMS is proposed to consider this code family as potentially misvalued. The RUC considered these services at the January 2025 RUC meeting. The specialty societies submitted a detailed letter on why they disagreed with issues identified by the nominator. The specialties indicated that there is no evidence that these services have an incorrect global period. They also noted that the nominator did not provide a comprehensive list of literature to support the claim that incorrect inpatient days are represented in these services, provided no evidence that the intra-service time is incorrect or that these services have changed in adults. The specialty societies did not conduct a survey of these codes and requested that the RUC refer this issue to the CPT Editorial Panel for revision. The specialties will consult with pediatric spine surgeons specializing in scoliosis surgery to submit a CPT Code Change Application (CCA). The RUC recommends that CPT codes 22210-22216 be referred to the September 2025 CPT Editorial Panel meeting for the CPT 2027 cycle.

The specialty societies submitted a detailed letter on why they disagreed with issues identified by the nominator. The specialties indicated that there is no evidence that these services have an incorrect global period. They also noted that the nominator did not provide a comprehensive list of literature to support the claim that incorrect inpatient days are represented in these services, provided no evidence that the intra-service time is incorrect or that these services have changed in adults. The specialty societies did not conduct a survey of these codes and requested that the RUC refer this issue to the CPT Editorial Panel for revision. The specialties will consult with pediatric spine surgeons specializing in scoliosis surgery to submit a CPT Code Change Application (CCA). The RUC recommends that CPT codes 22210-22216 be referred to the September 2025 CPT Editorial Panel meeting for the CPT 2027 cycle.

22214	**Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; lumbar**	CMS Fastest Growing / CMS Request - Final Rule for 2025	January 2025	AANS, AAOS, CNS, NASS	September 2025

Background: In the NPRM for 2025, CPT codes 22210, 22212, 22214 and 22216 were nominated as potentially misvalued services for the following reasons (1) incorrect global period; (2) incorrect inpatient days; (3) incorrect intra-service work description; (4) overvalued intra-service times; (5) changed surgical practice; and (6) incorrect use of posterior osteotomy codes. CMS notes that these services were last reviewed in 1995 and all but CPT code 22216 did not have a description of work or vignettes describing the typical patient. CMS also noted that there may be the need for potential bundling of these services, such as CPT code 22210 and 22600 Arthrodesis, posterior or posterolateral technique, single interspace; cervical below C2 segment. The nominator suggested two options to address this concern: (1) developing add-on codes to differentiate between the number of vertebral segments involved in the osteotomy procedure and whether it occurs in the cervical, thoracic, or lumbar regions; and (2) removing the current posterior osteotomy codes and incorporating osteotomies into new deformity fusion codes, both with and without osteotomy. CMS is proposed to consider this code family as potentially misvalued. The RUC considered these services at the January 2025 RUC meeting. The specialty societies submitted a detailed letter on why they disagreed with issues identified by the nominator. The specialties indicated that there is no evidence that these services have an incorrect global period. They also noted that the nominator did not provide a comprehensive list of literature to support the claim that incorrect inpatient days are represented in these services, provided no evidence that the intra-service time is incorrect or that these services have changed in adults. The specialty societies did not conduct a survey of these codes and requested that the RUC refer this issue to the CPT Editorial Panel for revision. The specialties will consult with pediatric spine surgeons specializing in scoliosis surgery to submit a CPT Code Change Application (CCA). The RUC recommends that CPT codes 22210-22216 be referred to the September 2025 CPT Editorial Panel meeting for the CPT 2027 cycle.

36557	**Insertion of tunneled centrally inserted central venous catheter, without subcutaneous port or pump; younger than 5 years of age**	Site of Service Anomaly - 2023	January 2024	ACR, ACS, APSA, OEIS, SIR, SVS	February 2025

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 36558 via the site of service anomaly screen, for services with Medicare utilization over 10,000 in 2019-2021 that are typically performed in the inpatient hospital setting, yet only include a half discharge day management visit (99238). The RAW reviewed the action plan in September 2023, and agreed with the specialty societies that the entire family of services (36557-36566) be surveyed for the January 2024 RUC meeting. The specialty societies also requested changing the global period from a 010-day to a 000-day to account for variability in site of service based on the patient presentation and specialty performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the codes through the CPT process prior to surveying. The specialty societies noted that the ages listed within some of the current code descriptors do not accurately reflect the variation of physician work (e.g., babies versus infants versus children versus adults). Additionally, some of the code descriptors are antiquated and include outdated practices and techniques technology that no longer exist or are incorrectly described, which may cause incorrect reporting. For example, patients are receiving central lines at multiple points in time with no way to accurately and appropriately capture work based on the current code family structure. Finding an access location in a patient in which access issues have become harder, takes more time, includes more risk, and potentially requires additional interventions. The RUC recommends that CPT codes 36557, 36558, 36560, 36561, 36563, 36565, and 36566 be referred to the May 2024 CPT Editorial Panel meeting for revision. In September 2024 the applicants withdrew the CCA citing that the specialties that most frequently use these codes were not involved in development of the code structure. The applicants requested a workgroup to be formed to develop a unified code structure.

55705	**Biopsy, prostate, any approach, nonimaging-guided**	Codes Reported Together 75% or More-Part5	September 2024	ACR, AUA, OEIS, SIR	February 2025; May 2024 (Tab 15)

Background: In September 2024, the RUC recommended to refer this entire code family to the CPT Editorial Panel for restructuring in the CPT 2027 cycle. Specifically, to ensure that the long descriptor language and related guidelines appropriately describe the services and number of biopsies performed per service. Additionally, the language of “first targeted lesion” was not clear to RUC members and the survey respondents as indicated by the identical intra-service times for services were few biopsies were obtained and services were numerous biopsies were obtained. Another RUC member noted that the language “Biopsy” and “Biopsies” was confusing as well. Additionally, the add-on code was thought to present a potential issue for improper coding due to lack of clarity on the number of biopsies performed, per service. The societies informed the RUC that they have a Coding Change Application prepared for the February 2025 CPT Editorial Panel meeting for the CPT 2027 cycle.

CMS High Expenditure Procedural Codes2 / Codes Reported Together 75% or More-Part5	April 2024	ACR, ASNR, SIR	February 2025

Background: In April 2022, the Relativity Assessment Workgroup identified services performed by the same physician on the same date of service 75% of the time or more. Only groups that totaled allowed charges of $5 million or more were included. As with previous iterations, any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The Workgroup requested action plans for September 2022 to determine if specific codes bundling solutions should occur for 70547 and 70544. In September 2022, the Workgroup recommended review in 2 years (2021-2022 data) after practice patterns in the inpatient and outpatient setting go back to how it was prior to the pandemic. (Note: 2019 reported together data was 66%). In April 2024, the RAW noted that the rate these services are reported together continues to increase (2020=77%, 2021=79% and 2022=81%). The specialty societies recommended, and the Workgroup agreed that 70547 and 70544 be referred to the CPT Editorial Panel (Feb 2025) to create a code bundling solution.

70547 **Magnetic resonance angiography, neck; without contrast material(s)**

Screen	RUC Meeting	Specialty Society:	CPT Meeting
CMS High Expenditure Procedural Codes2 / Codes Reported Together 75% or More-Part5	April 2024	ACR, ASNR, SIR	February 2025

Background: In April 2022, the Relativity Assessment Workgroup identified services performed by the same physician on the same date of service 75% of the time or more. Only groups that totaled allowed charges of $5 million or more were included. As with previous iterations, any code pairs in which one of the codes was either below 1,000 in 2020 Medicare claims data and/or contained at least one ZZZ global service were removed. The Workgroup requested action plans for September 2022 to determine if specific codes bundling solutions should occur for 70547 and 70544. In September 2022, the Workgroup recommended review in 2 years (2021-2022 data) after practice patterns in the inpatient and outpatient setting go back to how it was prior to the pandemic. (Note: 2019 reported together data was 66%). In April 2024, the RAW noted that the rate these services are reported together continues to increase (2020=77%, 2021=79% and 2022=81%). The specialty societies recommended, and the Workgroup agreed that 70547 and 70544 be referred to the CPT Editorial Panel (Feb 2025) to create a code bundling solution.

90901	**Biofeedback training by any modality**	High Volume Growth9	April 2024	ACOG, APTA, AUA	February 2025; Sep 2024

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 90901 via the high volume growth screen with 2021 Medicare utilization of 10,000 or more than increased by at least 100% from 2016 through 2021. In September 2023, the Workgroup reviewed the action plan for CPT code 90901 and agreed with the specialty societies that 90901, along with the other services in this code family (90912 and 90913) be surveyed for the April 2024 RUC meeting. The specialty society also requested changing the global period from 010-day to a 000-day global period to account for variability in the site of service based on the patient presentation and specialty societies performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the code family through the CPT process before surveying. The specialty societies noted that the current code descriptor for CPT code 90901 is not well understood based on their review of past RUC rationales for valuation, claims data, and the vignettes used for review in 1995 and 1996 by the RUC and HCPAC. In the 1995 RUC rationale, the vignette described 45–60-minute sessions (and brief 30-minute sessions) and included information about psychiatrists and psychologists, though it is unclear who was surveyed. However, the 1996 RUC rationale of the HCPAC review is based on a different vignette, considered a CMD five-year-review comment, and was surveyed by physical therapists, which led to a reduction of the work RVU from 0.89 to 0.41 based on comparison to a time-based therapy code, CPT code 97110. The specialty societies note that although 90901 is not time-based, the comparison for the current value was to a 15-minute time-based code despite the current intra-service time being 45 minutes. In their letter to request a referral to CPT for this code family, the specialty societies proposed revising the code descriptor for CPT code 90901 to be consistent with other physical therapy time-based and modality codes, as well as similar to other biofeedback training codes. Additionally, code descriptor clarification may resolve the continued confusion about the intent and correct coding for 90901. The RUC recommends that CPT codes 90901, 90902 and 90903 be referred to the September 2024 CPT Editorial Panel meeting for revision. In September 2024, the CPT Editorial Panel postponed this issue and indicated clarifications necessary for the submitters to address prior to the next submission.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
90912	**Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry, when performed; initial 15 minutes of one-on-one physician or other qualified health care professional contact with the patient**	Negative IWPUT	April 2024	ACOG, APTA, AUA	February 2025; Sep 2024; Feb 2019-EC

Background: In April 2023, the Relativity Assessment Workgroup (RAW) identified CPT code 90901 via the high volume growth screen with 2021 Medicare utilization of 10,000 or more than increased by at least 100% from 2016 through 2021. In September 2023, the Workgroup reviewed the action plan for CPT code 90901 and agreed with the specialty societies that 90901, along with the other services in this code family (90912 and 90913) be surveyed for the April 2024 RUC meeting. The specialty society also requested changing the global period from 010-day to a 000-day global period to account for variability in the site of service based on the patient presentation and specialty societies performing the procedure. However, when the specialty societies were preparing to survey the services, they determined they could not proceed and instead requested to revise the code family through the CPT process before surveying. The specialty societies noted that the current code descriptor for CPT code 90901 is not well understood based on their review of past RUC rationales for valuation, claims data, and the vignettes used for review in 1995 and 1996 by the RUC and HCPAC. 95800	**Sleep study, unattended, simultaneous recording; heart rate, oxygen saturation, respiratory analysis (eg, by airflow or peripheral arterial tone), and sleep time**	CMS Fastest Growing / High Volume Growth10	September 2024	AAN, ACCP/ATS, AASM	February 2025

Background: In April 2024, this service was identified via the high volume growth screen, with Medicare utilization of 10,000 or more that has increased by at least 100% from 2017 through 2022. The Workgroup requests that the specialty societies submit an action plan for codes for September 2024. In September 2024, the RUC recommended referral to CPT. The specialty societies submitted a CCA for Sept 2024 CPT meeting to delete the current code family and replace it with a set of codes that more accurately reflect current medical practice and technologies. However, this tab was withdrawn at CPT due to the many issues identified by the Panel reviewers. The specialty societies indicated that they have drafted a new CCA and plan to submit it for the February 2025 CPT meeting.

		Screen	RUC Meeting	Specialty Society:	CPT Meeting
95921	**Testing of autonomic nervous system function; cardiovagal innervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breathing with recorded R-R interval, Valsalva ratio, and 30:15 ratio**	Different Performing Specialty from Survey / Codes Reported Together 75% or More-Part1 / Different Performing Specialty from Survey3 / Codes Reported Together 75% or More-Part7	September 2024	AAFP, AAN, AANEM, ACP	February 2025

Background: For code pair 95921/95922, the Relativity Assessment Workgroup acknowledged that the rationale for increased utilization remains unclear. Thus, the dominant specialties for these two codes (Family Medicine and Internal Medicine) were requested to provide the following information regarding 95921 and 95922: What are the clinically appropriate scenarios for reporting each service? What is the description of service? What are the clinically appropriate scenarios when these servic AAFP and ACP indicated that they do not have an explanation for the increased utilization as their physicians indicated that they do not typically perform these services. In 2008, a CPT Assistant article was published to correct inappropriate reporting by clarifying that a tilt table is required in the provision of the service. However, Medicare claims data indicate that the attempted coding education was not effective. In April 2011, the RUC recommended this code be referred to CPT to revise the descriptor to include the use of a tilt table and refer those who do not use a tilt table in autonomic testing to use an unlisted code, which was addressed at the February 2012 (Tab 17) CPT meeting. In January 2020, the RUC recommended to refer codes 95921-95924 to CPT Assistant in 2020 to clarify correct coding on how to report these services. The RAW would review the specialty mix again in 3 years of those reporting the services (Sept 2023). In September 2023, the specialty societies indicated that the article included correct coding for autonomic testing services when a tilt table was used, clarity on terminology used in the code descriptor language of the code set, and clinical examples for each code. The intent of the article was to reduce the occurrence of any miscoding that may be contributing to the total utilization and understand if the shift in dominant specialties was now typical. The Workgroup examined these services and indicated that the decrease in utilization in 2020 may not be attributable to the CPT article but to due to the COVID-19 pandemic. The RUC noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured. In September 2024, the Relativity Assessment Workgroup identified 95921 and 95923 as via the Codes Reported Together 75% or more screen. In September 2024, the RUC recommended referral to CPT. The specialty societies noted that they submitted a CCA for the Sept 2024 CPT meeting with revisions to the current autonomic function testing code set and the creation of a new Category I code to more accurately reflect current clinical practice and technologies. However, this issue was withdrawn from CPT based on feedback from specialty society comments and Editorial Panel reviewers. The specialty societies will revise the CCA to address concerns with reported together utilization The specialty societies will resubmit a CCA for the February 2025 CPT meeting.

95924	**Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt**	Codes Reported Together 75% or More-Part1	September 2023	AAFP, AAN, AANEM, ACP	February 2025

Background: CPT Feb 2012 the CPT Editorial Panel established two new codes with instructional guidelines to report autonomic function testing. In April 2012, The RUC determined that the survey results for 95924 was too low (26 responses). There was also confusion about what is described in 95924 which may have resulted in invalid physician time for this service. The RUC recommended an interim value for 95924. In January 2020, the RUC recommended to refer codes 95921-95924 to CPT Assistant in 2020 to clarify correct coding on how to report these services. The RAW would review the specialty mix again in 3 years of those reporting the services (Sept 2023). In September 2023, the specialty societies indicated that the article included correct coding for autonomic testing services when a tilt table was used, clarity on terminology used in the code descriptor language of the code set, and clinical examples for each code. The intent of the article was to reduce the occurrence of any miscoding that may be contributing to the total utilization and understand if the shift in dominant specialties was now typical. The Workgroup examined these services and indicated that the decrease in utilization in 2020 may not be attributable to the CPT article but to due to the COVID-19 pandemic. The Workgroup noted that these services are typically reported with one another and the code family should be referred to CPT to be restructured.

G0396	**Alcohol and/or substance (other than tobacco) misuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes**	CMS-Other - Utilization over 30,000	January 2018	AAFP, ASA	Time Uncertain

Background: In October 2017, the RAW requested that AMA staff compile a list of CMS/Other codes with Medicare utilization of 30,000 or more. This list resulted in 34 services and the RAW requested action plans to be reviewed at the January 2018 meeting. In January 2018, the RUC recommended to maintain the physician work and refer to CPT to editorially remove "screening" from 99408 and 99409 to "assessment" to mirror G0396. At the February 2018 CPT meeting, the Panel postponed until time uncertain this request to revise codes 99408-99409 to identify assessment of alcohol and/or substance abuse. As a rationale for postponement, the Panel said that the service described in this application did not meet the General Criteria for Category I because the proposed service is not unique or well defined, and does not describe a service that is clearly identified and distinguished from existing services already described in CPT by other codes. The Panel's additional rationale for postponement of this item was to allow the relevant specialty societies an opportunity to submit a new code change application to address the differences between assessment and screening services.

RUC Recommendations to Develop CPT Assistant Articles - Outstanding Issues

60240	**Thyroidectomy, total or complete**	CPT Referral to the RUC	January 2025	Refer to CPT Assistant	AAO-HNS, ACS	

Background: At the October 2021, CPT Editorial Panel meeting, the CPT Executive Committee (EC) referrals were presented to the CPT Editorial Panel. The recommendations of the Executive Committee were accepted through a consent calendar, with the following single extraction: Tab I: Other Business - Issue 2: Tab 28 - Thyroidectomy 60260 Parenthetical Deletion. The Panel Chair provided an overview of the issue, which was derived from a previous CPT Assistant Editorial Board recommendation regarding proper coding for CPT code 60260. Specifically, the Editorial Board was seeking clarity on whether the code referred to removal of a lobe of the thyroid, or to removal of all remaining thyroid tissue. The AAO-HNS attempted to address this issue via a CCA (Tab 28) submitted for the October 2021 meeting. However, based on additional feedback from the ACS Advisors and Panel reviewers, it was withdrawn prior to the meeting. Given the withdraw, the EC, during their deliberations, discussed potential next steps. The Panel discussed precedent for sending something back to the RUC. The EC members noted that while this may be rare, it provided an opportunity for the RUC to potentially address an issue that goes beyond just code structure. Furthermore, having the issue tracked as part of a RUC screen/issue may ensure the issue gets addressed through additional mechanisms for tracking and feedback. The Panel approved the EC recommendation to refer this issue to the RUC to further consider whether CPT codes 60240 and 60260 represent a rank order anomaly. In July 2024, AMA RUC staff were asked the status of this issue and noted that they missed this referral. The Relativity Assessment Workgroup should discuss this issue at the September 2024 meeting to determine how to address it. The Workgroup reviewed this referral and recommends that the specialty societies submit an action plan for the January 2025 meeting for CPT codes 60240 and 60260 on how to address these services. In January 2025, the Workgroup discussed the possible work order anomaly with 60240 and 60260. The specialties explained that there is not a rank order anomaly between 60240 and 60260. The pre/intra/post service times are relatively the same, but the post-operative visits are quite different. CPT code 60260 requires post-operative hospital visits, whereas CPT 60240 does not, which is primary reason for the difference in work RVU. The post-operative hospital visits in CPT code 60260 (1-99231 and 1-99232) are necessary to monitor the patient's calcium levels every few hours. Patient's who have had a previous operation on the neck must be monitored to ensure that the parathyroid glands were not disrupted, in turn disrupting the patient's regulation of calcium levels. Therefore, the patient must stay in the hospital longer to ensure they are stable. The Workgroup agreed with the specialty societies that there is not a rank order anomaly between 60240 and 60260 and will notify the CPT Editorial Panel/CPT Assistant Board and agreed that this issue be referred to CPT Assistant to develop an article that revises the 2010 CPTA Q&A guidance and includes numerous clinical examples to support education about correct coding for thyroidectomy procedures.

Given the withdraw, the EC, during their deliberations, discussed potential next steps. The Panel discussed precedent for sending something back to the RUC. The EC members noted that while this may be rare, it provided an opportunity for the RUC to potentially address an issue that goes beyond just code structure. Furthermore, having the issue tracked as part of a RUC screen/issue may ensure the issue gets addressed through additional mechanisms for tracking and feedback. The Panel approved the EC recommendation to refer this issue to the RUC to further consider whether CPT codes 60240 and 60260 represent a rank order anomaly. In July 2024, AMA RUC staff were asked the status of this issue and noted that they missed this referral. The Relativity Assessment Workgroup should discuss this issue at the September 2024 meeting to determine how to address it. The Workgroup reviewed this referral and recommends that the specialty societies submit an action plan for the January 2025 meeting for CPT codes 60240 and 60260 on how to address these services. In January 2025, the Workgroup discussed the possible work order anomaly with 60240 and 60260. The specialties explained that there is not a rank order anomaly between 60240 and 60260. The pre/intra/post service times are relatively the same, but the post-operative visits are quite different. CPT code 60260 requires post-operative hospital visits, whereas CPT 60240 does not, which is primary reason for the difference in work RVU. The post-operative hospital visits in CPT code 60260 (1-99231 and 1-99232) are necessary to monitor the patient's calcium levels every few hours. Patient's who have had a previous operation on the neck must be monitored to ensure that the parathyroid glands were not disrupted, in turn disrupting the patient's regulation of calcium levels. Therefore, the patient must stay in the hospital longer to ensure they are stable. The Workgroup agreed with the specialty societies that there is not a rank order anomaly between 60240 and 60260 and will notify the CPT Editorial Panel/CPT Assistant Board and agreed that this issue be referred to CPT Assistant to develop an article that revises the 2010 CPTA Q&A guidance and includes numerous clinical examples to support education about correct coding for thyroidectomy procedures.

		1	2	3	4	5**	6
	Total Pre-Service Time	**20**	**25**	**51**	**63**	**8**	**23**
	CATEGORY SUBTOTALS						
A	Pre-Service Evaluation (IWPUT =0.0224)	13	18	33	40	7	17
B	Pre-Service Positioning (IWPUT = 0.0224)	1	1	3	3	0	1
C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	6	15	20	1	5
	DETAILS						
A	History and Exam (Performance and review of appropriate Pre-Tests)	5	10	10	15	4	9
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	2	4	1	1
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	3	5	5	2	3
A	Communicate with other professionals	0	0	5	5	0	2
A	Check/set-up room, supplies and equipment	1	1	5	5	0	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	1	5	5	0	1
A	Prepare/ review/ confirm procedure	1	1	1	1	0	0
B	Perform/ supervise patient positioning	1	1	3	3	0	1
C	Administer local/topical anesthesia	1	1	0	0	1	5
C	Observe (wait anesthesia care)	0	0	10	15	0	0
C	Dress and scrub for procedure	5	5	5	5	0	0

**If the procedure does not require local anesthesia, 1 minute should be removed from pre-service time

1 Straightforward Patient/Straightforward Procedure (No anesthesia care)
2 Difficult Patient/Straightforward Procedure (No anesthesia care)
3 Straightforward Patient/Difficult Procedure
4 Difficult Patient/Difficult Procedure
5 Procedure with minimal anesthesia care (If no anesthesia care deduct 1 minute)
6 Procedure with local/topical anesthesia care requiring wait time for anesthesia to take effect

Additional Positioning Times for Spinal Surgical Procedures

SS1	Anterior Neck Surgery (Supine) (eg ACDF)	15 Minutes
SS2	Posterior Neck Surgery (Prone) (eg laminectomy)	25 Minutes
SS3	Posterior Thoracic/Lumbar (Prone) (eg laminectomy)	15 Minutes
SS4	Lateral Thoracic/Lumbar (Lateral) (eg corpectomy)	25 Minutes
SS5	Anterior Lumbar (Supine) (eg ALIF)	15 Minutes

Additional Positioning Times for Spinal Injection Procedures

SI1	Anterior Neck Injection (Supine) (eg discogram)	7 Minutes
SI2	Posterior Neck Injection (Prone) (eg facet)	5 Minutes
SI3	Posterior Thoracic/Lumbar (Prone) (eg epidural)	5 Minutes
SI4	Lateral Thoracic/Lumbar (Lateral) (eg discogram)	7 Minutes

Additional Positioning Times for Urological Procedures

U1	Dorsal Lithotomy	5 Minutes

Notes:

- Roll-over cells for additional detail where available
- Straightforward procedure: Integumentary, Non-incisional endoscopy, natural orifice

Detailed Description of Facility Based Post-Service Time Packages (Minutes)						
	7A Local Anesthesia/ Straightforward Procedure	**7B Local Anesthesia/ Complex Procedure**	**8A IV Sedation/ Straightforward Procedure**	**8B IV Sedation/ Complex Procedure**	**9A General Anesthesia or Complex Regional Block/ Straightforward Procedure**	**9B General Anesthesia or Complex Regional Block/Complex Procedure**
Total Post-Service Time	**18**	**21**	**25**	**28**	**30**	**33**
Details:

33361	Transcatheter aortic valve replacement (tavr/tavi) with prosthetic valve; percutaneous femoral artery approach	Apr 2012	Transcatheter Aortic Valve Replacement	12	CPT 2013	April 2025	Surveyed again in April 2018 and the RUC indicated that CPT codes 33361, 33362, 33363, 33364, 33365 and 33366 will remain on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions. In April 2024, the Workgroup indicated to Review an update from the specialty societies in 1 year (April 2025). The specialty societies indicated a couple changes: 1) The patient population has changed and is/will be performed on not just the sickest patients but will be available to more candidates and these services may be used to treat aortic regurgitation. 2) The services are changing and co-surgery may not necessarily be necessary in the future. The specialties may pursue a request for CMS to removal of the National Coverage Determination (NCD) regarding co-surgeons for these services. 3) Coding changes may be necessary to keep the highest performed	☐

67516	Suprachoroidal space injection of pharmacologic agent (separate procedure)	Jan 2023	Suprachoroidal Injection	10	CPT 2024	April 2028	There is currently only one FDA-approved medication for this procedure, triamcinolone acetonide, and it is approved for only one indication: macular edema associated with uveitis. The relevant HCPCS code is J-3299. Medicare claims volume for this indication is expected to be low. However, if other drugs for more common indications obtain FDA approval, claims volume may grow substantially. Thus, CPT code 6X000 will be placed on the New Technology list and will be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions. The RUC recommended that if there are new drugs that have an associated J-code that these also be considered by the Relativity Assessment Workgroup as part of the New Technology screen.	☐

78071	Parathyroid planar imaging (including subtraction, when performed); with tomographic (spect)	Apr 2012	Parathyroid Imaging	23	CPT 2013	October 2018	In April 2011, CPT Code 78007, Thyroid imaging, with uptake; multiple determinations was identified in the Harvard Valued-Utilization over 30,000 screen. As part of the review of the entire endocrine family, the specialty societies determined that revisions to the parathyroid imaging procedures were necessary to reflect current bundling policies, guideline changes and new technology. AMA Staff reviewed the work neutrality impacts for codes reviewed in the CPT 2013 cycle. It appeared that was only one issue where there was a large growth in utilization in the first year. For CPT 2013 the Parathyroid Imaging codes were not work neutral, and it was initially estimated as a savings overall. It appears that there was 40% increase from what was projected. The specialty societies submitted an action plan indicating that literature supporting parathyroid scintigraphy as an	☑

							effective diagnostic study for parathyroid disease has recently emerged and supports the clinical utility thus increasing utilization. Secondly, the availability of SPECT/CT cameras has increased and is greater than initially predicted, allowing for a higher utilization. The Workgroup agreed and also noted that these services are conducted on patients who are referred to the radiologists or nuclear medicine physicians. The physicians providing these services do not control the number of patients referred to them who receive these services. The Workgroup recommends that the specialty societies develop a CPT Assistant article to address potential current use of 78803 rather than the new codes 78071 and 78072. The Workgroup noted that these services are on the new technology list for review later this year and should be postponed and reviewed in 2 years

99091			Remote Monitoring (RPM)	20	CPT 2026	January 2028	Resurvey in January 2028. In January 2025, the RUC noted that the use of RPM services continue to fluctuate in terms of the specialties who report and the monitoring that occurs. All the codes in this family would be considered new technology. Since CPT has split out the services it is unclear which technologies are used for each code based on the specific durations. It is also unclear who is predominantly providing these services. The RPM family of services will be placed on the New Technology list and resurveyed and reviewed by the RUC at the January 2028 meeting to ensure correct valuation, patient population, and utilization assumptions. Additionally, the RUC flagged the RPM codes as do not use to validate physician work in the RUC database due to the low survey response. These services will be resurveyed for the January 2028 RUC meeting.	☐

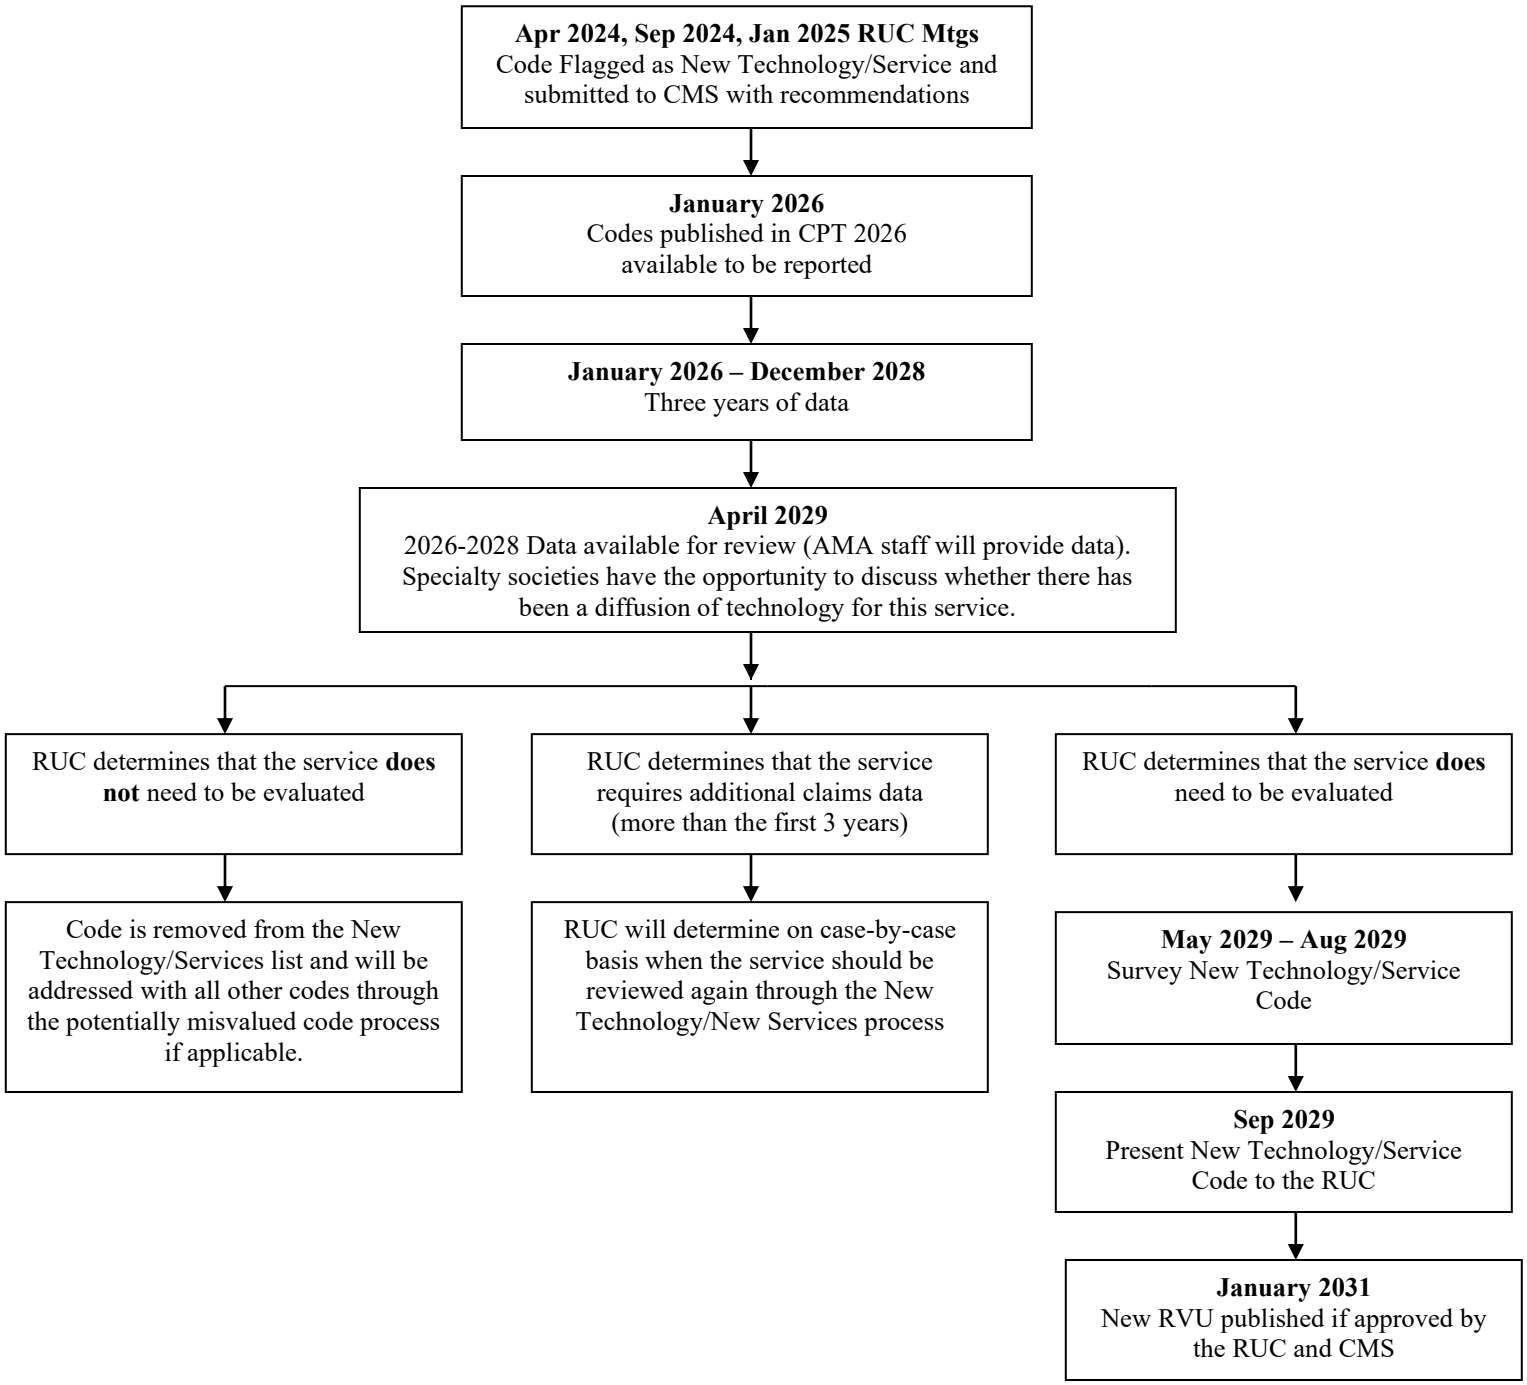
G2066	Interrogation device evaluation(s), (remote) up to 30 days; implantable cardiovascular physiologic monitor system, implantable loop recorder system, or subcutaneous cardiac rhythm monitor system, remote data acquisition(s), receipt of transmissions and technician review, technical support and distribution of results	Jan 2023	Remote Interrogation Device Evaluation - Cardiovascular (PE Only)	20		April 2027	Codes 93297 and 93298 were first flagged at the April 2008 meeting, Tab 23 Cardiac Device Monitoring, for CPT 2009 and reviewed at the RAW in September 2012. An Ad Hoc Workgroup was developed to determine how to address the work neutrality failure and establish guidelines for further RAW review of retrospective work neutralilty. In October 2018, 93297 and 93298 were reviewed and placed on the new technology/new services list for April 2024. CMS did not accept the practice expense for these services and instead created G2066 to report the practice expense associated with these services. In January 2023, the RUC affirmed the work RVUs and recommended direct PE inputs for 93297, 93298 and G2066. These services were placed back on the new technology/new services list to assess the work and PE in 3 years (April 2027).	☐

CPT Code	Long Descriptor	RUC Meeting	Issue	Tab	CPT Year	Date to Re-Review	RUC Rec	Complete

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

Example



Revised January 2024

Specialty Society Acronym List – January 2025

Society	Acronym
Aerospace Medical Association	AsMA
AMDA-The Society for Post-Acute and Long-Term Care Medicine	AMDA
American Academy of Allergy, Asthma & Immunology	AAAAI
American Academy of Child and Adolescent Psychiatry	AACAP
American Academy of Cosmetic Surgery	AACS
American Academy of Dermatology Association	AADA
American Academy of Family Physicians	AAFP
American Academy of Hospice and Palliative Medicine	AAHPM
American Academy of Neurology	AAN
American Academy of Ophthalmology	AAO
American Academy of Orthopaedic Surgeons	AAOS
American Academy of Otolaryngic Allergy	AAOA
American Academy of Otolaryngology - Head and Neck Surgery	AAO-HNS
American Academy of Pain Medicine	AAPM
American Academy of Pediatrics	AAP
American Academy of Physical Medicine and Rehabilitation	AAPMR
American Academy of Sleep Medicine	AASM
American Association for Thoracic Surgery	AATS
American Association of Clinical Endocrinology	AACE
American Association of Clinical Urologist, Inc.	AACU
American Association of Neurological Surgeons	AANS
American Association of Neuromuscular & Electrodiagnostic Medicine	AANEM
American Association of Public Health Physicians	AAPHP
American Burn Association	ABA

Society	Acronym
American Clinical Neurophysiology Society	ACNS
American College of Allergy, Asthma & Immunology	ACAAI
American College of Cardiology	ACC
American College of Chest Physicians	CHEST
American College of Emergency Physicians	ACEP
American College of Gastroenterology	ACG
American College of Medical Genetics	ACMG
American College of Mohs Surgery	ACMS
American College of Nuclear Medicine	ACNM
American College of Obstetricians and Gynecologists	ACOG
American College of Physicians	ACP
American College of Radiation Oncology	ACRO
American College of Radiology	ACR
American College of Rheumatology	ACRh
American College of Surgeons	ACS
American Dental Association	ADA
American Gastroenterological Association	AGA
American Geriatrics Society	AGS
American Medical Group Association	AMGA
American Medical Women's Association	AMWA
American Orthopaedic Foot and Ankle Society	AOFAS
American Osteopathic Association	AOA
American Pediatric Surgical Association	APSA
American Psychiatric Association	APA(psychiatry)
American Rhinologic Society	ARS
American Roentgen Ray Society	ARRS

Society	Acronym
American Society for Clinical Pathology	ASCP
American Society for Dermatologic Surgery	ASDS
American Society for Gastrointestinal Endoscopy	ASGE
American Society for Metabolic and Bariatric Surgery	ASMBS
American Society for Radiation Oncology	ASTRO
American Society for Reproductive Medicine	ASRM
American Society for Surgery of the Hand	ASSH
American Society for Transplantation and Cellular Therapy	ASTCT
American Society of Addiction Medicine	ASAM
American Society of Anesthesiologists	ASA
American Society of Breast Surgeons	ASBS
American Society of Cataract and Refractive Surgery	ASCRS(cat)
American Society of Clinical Oncology	ASCO
American Society of Colon and Rectal Surgeons	ASCRS(col)
American Society of Cytopathology	ASC
American Society of Dermatopathology	ASDP
American Society of Echocardiography	ASE
American Society of General Surgeons	ASGS
American Society of Hematology	ASH
American Society of Interventional Pain Physicians	ASIPP
American Society of Neuroradiology	ASNR
American Society of Nuclear Cardiology	ASNC
American Society of Ophthalmic Plastic and Reconstructive Surgery	ASOPRS
American Society of Plastic Surgeons	ASPS
American Society of Regional Anesthesia and Pain Medicine	ASRA
American Society of Retina Specialists	ASRS

Society	Acronym
American Society of Transplant Surgeons	ASTS
American Thoracic Society	ATS
American Urological Association	AUA
American Venous Forum	AVF
Association of Academic Radiology	AAR
College of American Pathologists	CAP
Congress of Neurological Surgeons	CNS
Endocrine Society	ES
Heart Rhythm Society	HRS
Infectious Diseases Society of America	IDSA
International Pain and Spine Intervention Society	IPSIS
International Society for the Advancement of Spine Surgery	ISASS
National Association of Medical Examiners	NAME
North American Neuromodulation Society	NANS
North American Neuro-Ophthalmology Society	NANOS
North American Spine Society	NASS
Obesity Medicine Association	OMA
Outpatient Endovascular and Interventional Society	OEIS
Radiological Society of North America	RSNA
Renal Physicians Association	RPA
Society for Cardiovascular Magnetic Resonance	SCMR
Society for Investigative Dermatology	SID
Society for Vascular Surgery	SVS
Society of American Gastrointestinal and Endoscopic Surgeons	SAGES
Society of Cardiovascular Computed Tomography	SCCT
Society of Critical Care Medicine	SCCM

Society	Acronym
Society of Hospital Medicine	SHM
Society of Interventional Radiology	SIR
Society of Laparoscopic & Robotic Surgeons	SLS
Society of Nuclear Medicine and Molecular Imaging	SNMMI
Society of Thoracic Surgeons	STS
The Society for Cardiovascular Angiography and Interventions	SCAI
The Society for Pediatric Dermatology	SPD
Underseas and Hyperbaric Medical Society	UHMS

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2025

Hip and Pelvis Arthrodesis Revisions – Tab 4

In May 2022, the CPT Editorial Panel created Category III code 0775T for CPT 2023 to report percutaneous sacroiliac (SI) joint arthrodesis using an intra-articular implant(s), such as bone allograft material or synthetic devices. In September 2022, the Panel replaced Category III code 0775T with a new Category I code 27278 *Arthrodesis, sacroiliac joint, percutaneous, with image guidance, including placement of intra-articular implant(s) (eg, bone allograft[s], synthetic device[s]), without placement of transfixation device*, which was surveyed for and valued at the January 2023 RUC meeting. CPT code 27278 was flagged for new technology and is expected to be re-reviewed by the RUC in 2027.

CPT code 27279 *Arthrodesis, sacroiliac joint, percutaneous or minimally invasive (indirect visualization), with image guidance, includes obtaining bone graft when performed, and placement of transfixation device* was added as a family code to the January 2023 level of interest (LOI) form. However, the specialty societies requested that this code not be re-reviewed with 27278, therefore, the RUC submitted no recommendation for 27279 at the January 2023 RUC meeting.

At the September 2024 CPT Editorial Panel meeting, three separate code change applications (CCAs) were submitted that proposed changes to the guidelines and codes 27278 and 27279. The CPT Editorial Panel combined the CCAs and addressed the matter to further clarify the term "transfixation" through editorial changes to these codes.

In preparation for the January 2025 RUC meeting, the specialty societies delivered two separate letters to the RUC that detail the revisions to each of these codes made by the CPT Editorial Panel and presented a comprehensive timeline outlining the CCAs considered at previous CPT Editorial Panel meetings. In these letters, the specialty societies note that the changes made by CPT to these codes are editorial and request that neither be resurveyed for the January 2025 RUC meeting. The specialty societies requested affirmation by the RUC of the current value for both CPT codes 27278 and 27279, noting that the RUC will have an opportunity to review these codes via the Relativity Assessment Workgroup's new technology screen or as the result of a pending CPT CCA at the February 2025 CPT Editorial Panel meeting which was brought forth independently by the specialty societies. The RUC noted it is well past the time for affirmation of 27279 in terms of when that service was last surveyed in April 2018. The RUC did not vote on affirmation for codes 27278 and 27279 and instead agreed to submit no recommendation.

The RUC submits no recommendation regarding CPT codes 27278 and 27279 as they were not re-reviewed or re-surveyed for the January 2025 RUC meeting.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Musculoskeletal System** **General** **Introduction or Removal**				
20696		*Application of multiplane (pins or wires in more than 1 plane), unilateral, external fixation with stereotactic computer-assisted adjustment (eg, spatial frame), including imaging; initial and subsequent alignment(s), assessment(s), and computation(s) of adjustment schedule(s)*		
20697		*exchange (ie, removal and replacement) of strut, each*		
Manual preparation . . .				
. . .				
Add-on code 20705 (for removal of a manually prepared intra-articular drug delivery device) may be typically used in conjunction with a joint stabilization procedure such as arthrodesis (eg, 22532, 22533, 22534, 22548, 22551, 22552, 22554, 22556, 22558, 22585, 22586, 22590, 22595, 22600, 22610, 22614, 22634, 22800, 22802, 22804, 22808, 22810, 22812, 22830, 22853, 22854, 22899, 24800, 24802, 25800, 25805, 25810, 25825, 25830, 26841, 26842, 26843, 26844, 26850, 26852, 26860, 26861, 26862, 26863, 27279, 27280, 27282, 27284, 27286, 27580, 27870, 27871, 28295, 28296, 28298, 28299, 28705, 28715, 28725, 28730, 28735, 28737, 28740, 28750, 28755, 28760, 29907) and revision joint arthroplasties (eg, 23473, 23474 [shoulder], 24370, 24371 [elbow], 25449 [wrist], 27134 [hip], 27487 [knee], and 27703 [ankle]). In the rare circumstance in which only part of the joint is destroyed by infection, a partial arthroplasty may be reported (eg, 23470, 24360, 24361, 24362, 24365, 24366, 25441, 25442, 25443, 25444, 25445, 27125, 27236, 27438, 27440, 27441, 27442, 27443, and 27446)		
20705		*Removal of drug-delivery device(s), intra-articular (List separately in addition to code for primary procedure)* *(Use 20705 in conjunction with 22864, 22865, 23040, 23044, 23334, 23473, 23474, 24000, 24160, 24370, 24371, 25040, 25250, 25251, 25449, 26070, 26075, 26080, 26990, 27030, 27090, 27132, 27134, 27137, 27138, 27301, 27310, 27487, 27603, 27610, 27703, 28020)* *(Do not report 20705 in conjunction with 11982, 27130, 27447, 27486)* *(For arthrodesis after eradicated infection, see 22532, 22533, 22534, 22548, 22551, 22552, 22554, 22556, 22558, 22585, 22586, 22590, 22595, 22600, 22610, 22614, 22634, 22800, 22802, 22804, 22808, 22810, 22812, 22830, 22853, 22854, 22899, 24800, 24802, 25800, 25805, 25810, 25825, 25830, 26841, 26842, 26843, 26844, 26850, 26852, 26860, 26861, 26862, 26863,*		

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

***27279**, 27280, 27282, 27284, 27286, 27580, 27870, 27871, 28295, 28296, 28298, 28299, 28705, 28715, 28725, 28730, 28735, 28737, 28740, 28750, 28755, 28760, 29907)*

(For implant removal after failed drug delivery device placement, see 22862, 22864, 23334, 23335, 24160, 25250, 25251, 27090, 27091, 27488, 27704)

(For partial replacement after successful eradication of infection with removal of drug delivery implant, see 23470, 24360, 24361, 24362, 24365, 24366, 25441, 25442, 25443, 25444, 25445, 27125, 27236, 27438, 27440, 27441, 27442, 27443, 27446)

Pelvis and Hip Joint
Fracture and/or Dislocation

27216 *Percutaneous skeletal fixation of posterior pelvic bone fracture and/or dislocation, for fracture patterns that disrupt the pelvic ring, unilateral (includes ipsilateral ilium, sacroiliac joint and/or sacrum)*

(To report bilateral procedure, report 27216 with modifier 50)

(For percutaneous/minimally invasive arthrodesis of the sacroiliac joint without fracture and/or dislocation, ~~use~~ see 27278, 27279)

27218 *Open treatment of posterior pelvic bone fracture and/or dislocation, for fracture patterns that disrupt the pelvic ring, unilateral, includes internal fixation, when performed (includes ipsilateral ilium, sacroiliac joint and/ or sacrum)*

(To report bilateral procedure, report 27218 with modifier 50)

(For percutaneous/minimally invasive arthrodesis of the sacroiliac joint without fracture and/or dislocation, ~~use~~ see 27278, 27279)

Arthrodesis

~~Code 27279 describes percutaneous arthrodesis of the sacroiliac joint using a minimally invasive technique to place an internal fixation device(s) that passes through the ilium, across the sacroiliac joint and into the sacrum, thus transfixing the sacroiliac joint. Report 27278 for the percutaneous placement of an intra-articular stabilization device into the sacroiliac joint using a minimally invasive technique that does not transfix the sacroiliac joint.~~

Percutaneous sacroiliac (SI) joint fusion can be achieved utilizing intra-articular or transarticular device(s). Code 27278 describes the placement of intra-articular devices that do not pierce the cortices of the ilium or sacrum. Code 27279 describes the placement of intra-articular and/or transarticular device(s) that pierce the lateral or medial cortices of the ilium and the lateral cortex of the sacrum. Use 27279 to report hybrid SI joint fusion which consists of placement of both intra-articular and transarticular devices, at least one of which pierces the cortices.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

▲27278	N1	Arthrodesis, sacroiliac joint, percutaneous or minimally invasive, with image guidance, ~~including~~ includes obtaining bone graft when performed, unilateral; placement of intra-articular device(s), without cortical piercing ~~implant(s)~~ ~~(eg, bone allograft[s], synthetic device[s]), without placement of transfixation device~~ ~~(For arthrodesis, sacroiliac joint, with placement of a percutaneous transfixation device, use 27279)~~ (For bilateral procedure, report 27278 with modifier 50) (Do not report 27278 in conjunction with 27279, for the same joint)	090	No Recommendation (2025 Work RVU = 7.86)
▲27279	N2	~~Arthrodesis, sacroiliac joint, percutaneous or minimally invasive (indirect visualization), with image guidance, includes obtaining bone graft when performed,~~ placement of transarticular device(s) ~~and placement of *transfixing* transfixation~~ and/or intra-articular device(s) piercing the lateral or medial cortices of the ilium and the lateral cortex of the sacrum ~~(For percutaneous arthrodesis of the sacroiliac joint by intra-articular implant[s], use 27278)~~ (For bilateral procedure, report 27279 with modifier 50) (For hybrid SI joint fusion procedures, use 27279) (Do not report 27279 in conjunction with 27278, for the same joint)	090	No Recommendation (2025 Work RVU = 12.13)
27280	*Arthrodesis, sacroiliac joint, open, includes obtaining bone graft, including instrumentation, when performed* (For percutaneous/minimally invasive arthrodesis of the sacroiliac joint without fracture and/or dislocation, ~~utilizing a transfixation device, use~~ see 27278, 27279) *(To report bilateral procedure, report 27280 with modifier 50)*			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Category III Codes

0773T *Virtual reality (VR) procedural dissociation services provided by a physician or other qualified health care professional other than the physician or other qualified health care professional performing the diagnostic or therapeutic service that the VR procedural dissociation supports; initial 15 minutes of intraservice time, patient age 5 years or older*

0774T *each additional 15 minutes intraservice time (List separately in addition to code for primary service)*

(Use 0774T in conjunction with 0773T)

(0775T has been deleted)

*(For percutaneous arthrodesis of the sacroiliac joint, see **27278, 27279**)*

0807T *Pulmonary tissue ventilation analysis using software-based processing of data from separately captured cinefluorograph images; in combination with previously acquired computed tomography (CT) images, including data preparation and transmission, quantification of pulmonary tissue ventilation, data review, interpretation and report 0808T*

0808T *in combination with computed tomography (CT) images taken for the purpose of pulmonary tissue ventilation analysis, including data preparation and transmission, quantification of pulmonary tissue ventilation, data review, interpretation and report*

(Do not report 0808T in conjunction with 71250, 71260, 71270, 71271, 76000, 78579, 78582, 78598)

(0809T has been deleted)

(For percutaneous arthrodesis of the sacroiliac joint, see 27278, 27279)

Subject: Code 27278 for Hip and Pelvis Arthrodesis Revisions

Dear Dr. Silva:

On behalf of the American College of Radiology (ACR), Society of Interventional Radiology (SIR), American Roentgen Ray Society (ARRS), Radiological Society of North America (RSNA), Association of Academic Radiology (AAR), and Outpatient Endovascular and Interventional Society (OEIS) we are writing in regards to resurveying the revised code for SI joint arthrodesis (27278) approved at the September 2024 CPT Editorial Panel Meeting.

Tabs 25, 34, and 37 were voted on and accepted with modifications (ie, on-site Option E) as a single Panel action. Modifications included:

1. Revision of the Category I/Surgery/Musculoskeletal System/Pelvis and Hip Joint/Fracture and/or Dislocation/Arthrodesis subsection guidelines.
2. Revision of code 27278 by removing language that noted “transfixation.”
3. Revision of code 27278 to reflect a family – parent/child relationship with 27279.
4. Addition of the terms “or minimally invasive”, “unilateral” and “device(s), without cortical piercing” to code 27278 as part of the common language needed for both codes in the family (ie, for 27278 and 27279).
5. Rearrangement of language in code 27278 (ie, “includes obtaining bone graft when performed,”) and deletion of the term “including” to capture additional common language within the “parent” portion of the first code in the family.
6. Deletion of the term “implant(s) (eg, bone allograft[s], synthetic device[s]),” within code 27278.
7. Deletion of a parenthetical note following 27278, regarding reporting for “transfixation” procedures.
8. Deletion of a note following code 27279 that directed the use of 27278 for percutaneous arthrodesis of the SI joint with intra-articular implants.
9. Addition of exclusionary parenthetical notes following codes 27278 and 27279 to restrict reporting 27278 and 27279 together.

We do not believe we need to resurvey 27278 because this was recently surveyed in 2022 for the January 2023 RUC meeting. The changes to this code (ie, for the implant without transfixation) are editorial. Specifically, the changes were made to clarify further transfixation, such as piercing the cortices of the iliac bone and sacrum, which this code/procedure does not do; thus, the changes to this code are purely editorial. Based on this, we are requesting reaffirmation by the RUC of the current values for code 27278 for CY 2026.

For code 27279, the undersigned societies are not the primary providers of this service. We were made aware of the letter written by the surgical societies regarding this code. Should further revisions to 27279 affect the code family, the undersigned societies would prefer to readdress changes at that time. We, therefore, defer discussions of 27279 to its interested societies.

The undersigned specialty society advisors are available to meet with RUC representatives and staff should they need to discuss this further. Please contact staff at amaleki@sirweb.org with additional questions or concerns or to schedule a meeting.

Subject: Tab 4 Codes 27278, 27279 – SI Joint

Dear Dr. Silva:

On behalf of the American Academy of Orthopaedic Surgeons, American Association of Neurological Surgeons, Congress of Neurological Surgeons, International Society for the Advancement of Spine Surgery, and the North American Spine Society, we are writing to a requested survey of revised codes for SI joint arthrodesis (27278 and 27279) approved at the September 2024 CPT Editorial Panel Meeting.

Three separate code change applications (CCAs) were submitted that proposed changes to the guidelines and/or codes 27278 and 27279. **Our societies disagreed with many of the proposed changes.**

One CCA indicated that code 27279 was brought forth to the Editorial Panel resulting in a code that was "directional" piercing both the lateral and medial cortices of the ilium and the lateral cortex of the sacrum. The term transfixation was used to describe this "across both iliac cortices and the SI joint" fixation. This CCA indicated that this term contradicts the FDA definition of transfixation and revisions were necessary. Another CCA also disagreed with the prior change in terminology that defined transfixation and indicated that it caused confusion with providers and coders. The CCA indicated that the definition focused on final anatomical placement and was not consistent with plain English meaning of the term 'fixation' and did not reflect the multiple approaches and device designs to fixate (transfix) the SI joint. A third CCA proposed different nuanced terminology to the guidelines to expand the current code concept of "into the joint" and "across the joint," adding that into the joint plus stabilization (inside-out) should be reported with 27278. This is different from the other two CCAs that proposed that the 'inside-out' stabilization should be reported with 27279. No literature was submitted with any of the CCAs to support a new code. Instead, the literature described various approaches and devices which use three different techniques.

Advisors from the undersigned specialty societies were present at the Panel meeting as well as at a facilitation meeting that was held the night before the CPT Editorial Panel meeting adjourned. Throughout the CPT process and review of the multiple CCAs, we consistently stated that a third code for devices that are placed into the joint that include fixation that pierce the medial iliac and/or the lateral sacrum needed a separate code and this could be supported by the literature associated with the 3 CCAs. However, during the facilitation meeting, we were told by AMA counsel that no CCA was submitted for a third code and that a new third code could not be created. Therefore, the Panel instead bundled what should have been a third code (including "hybrid procedures" – the simultaneous use of two different techniques and implants) into code 27279 – without any CCA or supporting literature. If "hybrid procedures" deserve a

separate code, then we believe that literature was needed, a CCA was needed, and a third code should have been created.

Furthermore, the lateral/posterolateral "across both cortices of the ilium and the SI joint" transfixation procedure (27279) is not typically performed in the office but the code has now been revised to include posterior "into the joint" procedures that are performed in the office.

We would also like to note that societies were told there is a lack of Level 1 evidence for the new procedure that was bundled into revised code 27279, further questioning the bundling of a new distinct procedure into 27279.

We continue to believe there are three broad categories of percutaneous SI joint fusion/stabilization procedures:

1. posterior into the joint (intra-articular) without fixation;
2. posterior/posterolateral into the joint (intra-articular) with **stabilization**; and
3. lateral/posterolateral across both cortices of the ilium and across the SI joint with fixation of the sacrum.

Surveying a revised code that bundled procedure #2 (a new and distinct procedure) above into the current 27279 as described by #3 above would be incorrect. #2 is typically done in the office and #3 is done typically in a facility. These are not the same procedures and should not be a single code. Approach matters – drilling across the ilium and into the sacrum as described in the intra-work description for current code 27279 is not the same work as placing a device into the SI joint and (for example) placing screws inside-out through the device into adjacent bone. A comparison of the intra service description of 27279 to the CPT approved description of procedure for revised code 27279 makes this clear.

While we appreciate the Panel's efforts to find a solution that would satisfy all interested stakeholders as an imperative at the meeting, issues remain with the code revisions. The Panel may have agreed that a third code was needed, but because (per legal counsel) there was no CCA submitted to suggest a new code, they instead modified 27279 to include a new code. We do not understand why the Panel could not create a needed third code yet were allowed to merge a distinct third procedure into code 27279.

If the Panel truly believes the work of 27279 has not changed with the revised descriptor because they believe the work for the "posterior into the joint with fixation" procedure is the same as "current across the joint fixation" code 27279, then this is an editorial change and no survey is needed. If the RUC and the Panel believe that work has changed, then current code 27279 should be maintained and a new code for the new procedure should be established before a survey is conducted.

For these reasons, the undersigned societies feel we are not able to survey the revised codes and have submitted a code change application to account for the third code that is not described by either current code (27278 or 27279) but represents different work. We ask that the RUC reaffirm its prior recommendation for these codes and note that the RUC will have the opportunity to review survey data for the family of new and revised codes after CPT considers the CCA at the February 2025 CPT Editorial Panel Meeting.

Specialty society advisors are available to meet with RUC representatives and staff should they feel further discussion is necessary. Please reach out to staff at willer@aaos.org with additional questions or concerns or to schedule meeting.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2025

Thoracic Branch Endograft Services – Tab 5

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore Thoracic Branch Endoprosthesis (TAG) device. This was approximately 5 years after FDA approval of endovascular devices for abdominal aneurysm repair. A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians, including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Payment Schedule (MFS), and the values have not been reviewed since that time. In May 2022, the FDA approved the use of a thoracic branch endoprosthesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR code family.

The CPT Editorial Panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR code family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR.
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR.

The new 6-code family for TEVAR represents a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family more accurately describes the current practice of TEVAR and conforms with current concepts in CPT code creation and valuation. Additionally, the deletion of bypass codes at the time of TEVAR will help simplify coding by reducing the number of codes that describe the same work, which can lead to confusion and improper coding. The specialty societies surveying this code family requested modification to the 090-day survey tool to include language regarding pre-planning time, changes that were similar to those made to the endovascular aneurysm repair (EVAR) survey tool for the January 2017 RUC meeting and the Iliac Branched Endograft survey tool for the January 2019 RUC meeting. With these modifications, the survey tool provides survey respondents with the opportunity to account for this pre-planning time, which is extensive and often occurs more than 24 hours before the procedure due to the surgical complexity. The 2 new codes and 4 revised codes in the TEVAR family were all surveyed for the January 2025 RUC meeting.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33380 ***Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft covering the left subclavian artery and all aortic tube endograft extension(s) proximally in the aortic arch and ascending aorta and distally to the celiac artery, when performed***
The RUC reviewed survey results from 64 vascular surgeons, cardiothoracic surgeons, and interventional radiologists and recommends the 25th percentile work RVU of 30.00, which accounts for the physician work required to perform this service. The RUC recommends 100 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time, 1-99291, 1-99233, 1-99232, 1-99238, 1-99214 and 1-99213 visit, which equals 546 minutes of total time.

The specialty society selected pre-service time package *4-FAC Difficult Patient/Difficult Procedure*. The selected time package was modified to more accurately reflect pre-service planning collected in the modified survey tool to more accurately reflect pre-service time involved with this service. The specialty society requests 100 minutes of pre-service evaluation time which is consistent with the median survey results and 60 minutes above the standard pre-service package time of 40 minutes. The additional pre-service evaluation time includes 40 minutes for pre-service evaluation plus 60 minutes for pre-planning, which should be bundled in the main procedure and cannot be reported separately per CMS policy. For this service, the pre-planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required, including aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally, the surgeon assesses the perceived quality of the aorta, particularly in the seal zones, and the tortuosity of the aorta. During this planning, the surgeon reviews all available endograft sizes from several vendors and develops a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office but more than 24 hours before the procedure, however, is not separately reported. The RUC agreed with the other pre-service time components to complete the necessary positioning and scrub/dress/wait time. Further, the RUC agreed with post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*, hospital visits, and the post-operative visits.

The specialty society requests 15 minutes of pre-service positioning time which is consistent with the median survey results and 12 minutes above the standard pre-service package time of 3 minutes. The additional pre-service position time accounts for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patients during the surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 minutes less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708).

The specialty society selected post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. Regarding post-operative hospital care, the specialty societies provided a detailed rationale to support their recommendation. Among survey respondents, there was a uniform consensus that ICU-level care is provided by the surgeon during the post-operative period. Patients who have undergone thoracic endografting have always been transferred to the ICU immediately post-operatively, but any critical work was generally performed by dedicated critical care personnel. Over time, endovascular repair for thoracic pathology has increased from simple aneurysms to now including dissections,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

penetrating aortic ulcers, and even traumatic ruptures. A wider range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches and longer segments of the aorta are now routinely covered, increasing the risk of spinal cord ischemia. Spinal cord ischemia, though uncommon, is a devastating potential complication for any thoracic aortic work, which has always been and is still best understood and managed by the operating surgeon. Thus, it is typical that prophylactic lumbar drains are still used for elective TEVAR cases, as they were required in the primary trial for the TBE device. Lumbar drains are placed by neurosurgery or anesthesiology before surgery in the operating room, and the ongoing measuring of perfusion to the spinal cord, as well as drain management, is managed by the operating surgeon.

Regarding post-operative office visits, the specialty societies noted that survey respondents indicated that while the number of TEVAR post-operative visits has not changed, the visits are now more complex. The first visit, which typically occurs 1-2 weeks following hospital discharge, is a level 3 post-op office visit (99213), wherein incisions are checked, wound care is provided, and a neurovascular assessment is performed. The second visit, which typically occurs 4-6 weeks following hospital discharge, is a level 4 post-op office visit (99214). Much of this time is spent by the operating surgeon reviewing the postoperative CT scan, which is from the aortic arch to the femoral vessels with fine cuts. Three-dimensional software is utilized to evaluate possible endoleaks or other endograft complications, and clinical decisions are made regarding the need for repeat surgical intervention. This work is independent and distinct from any radiologist's interpretation. Given the increased complexity and treatment length of these visits, more work and time is required for the operating surgeon to review these images and discuss them with the patient compared to 20 years ago when these codes were first valued.

To support the recommended work RVU of 30.00, the RUC compared the surveyed code to top key reference code 34708 *Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; for rupture including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)* (work RVU = 36.50, 120 minutes intra-service time, 677 minutes total time) and second key reference code 34705 *Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 29.58, 150 minutes intra-service time, 512 minutes total time). The RUC recognized that the surveyed code is appropriately compared to the two key reference services in terms of intra-service time and total time, as well as relative intensity and complexity. The top key reference service code 34708 has identical intra-service time compared to the surveyed code, but the surveyed code requires less total time and is a less intense procedure for the physician to perform, thus justifying a lesser work RVU. Notably, the two key reference services chosen by survey respondents bracket the 25th percentile surveyed code work RVU and total time.

For additional support, the RUC referenced MPC codes 33534 *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts* (work RVU = 39.88, 193 minutes intra-service time, 717 minutes total time) and 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time, 404 minutes total time), noting that code

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

I=New code s=Revised code :=Add-on code H=Modifier 51 exempt *=Telemedicine X=Audio-only ~=FDA approval pending #=Resequenced code

35301 has identical intra-service time compared to the surveyed code, but requires 142 less minutes in pre-service time and post-operative visits. Together, both MPC codes require a similar measured intensity and complexity for the physician to perform. **The RUC recommends a work RVU of 30.00 for CPT code 33380.**

33381 ***Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft covering the left subclavian artery and all aortic tube endograft extension(s) proximally in the aortic arch and ascending aorta and distally to the celiac artery, when performed by deployment of an aorto-aortic tube endograft not involving coverage of the left subclavian artery origin and all endograft extension(s) placed from the level of the left subclavian carotid artery to the celiac artery***
The RUC reviewed survey results from 64 vascular surgeons, cardiothoracic surgeons, and interventional radiologists and recommends the 25th percentile work RVU of 26.75, which accounts for the physician work required to perform this service. The RUC recommends 85 minutes pre-service time, 15 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 110 minutes intra-service time, 30 minutes immediate post-service time, 1-99291, 2-99232, 1-99238, 1-99214 and 1-99213 visit, which equals 506 minutes total time.

The specialty society selected pre-service time package *4-FAC Difficult Patient/Difficult Procedure*. The selected time package was modified to more accurately reflect pre-service planning collected in the modified survey tool to more accurately reflect pre-service time involved with this service. The specialty society requests 85 minutes of pre-service evaluation time, 13 minutes less than the median survey results and 45 minutes above the standard pre-service package time of 40 minutes. The additional pre-service evaluation time includes 40 minutes for pre-service evaluation plus 45 minutes for pre-planning, which should be bundled in the main procedure and not reported separately per CMS policy. For this service, the pre-planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required, including aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally, the surgeon assesses the perceived quality of the aorta, particularly in the seal zones, and the tortuosity of the aorta. During this planning, the surgeon reviews all available endograft sizes from several vendors and develops a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office but more than 24 hours before the procedure, however, is not separately reported.

The specialty society requests 15 minutes of pre-service positioning time which is consistent with the median survey results and 12 minutes above the pre-service package time of 3 minutes. The additional pre-service position time accounts for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patients during the surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 minutes less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialty society selected post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. Regarding post-operative hospital care, the specialty societies provided a detailed rationale to support their recommendation. Among survey respondents, there was a uniform consensus that ICU-level care is provided by the surgeon during the postoperative period. Patients who have undergone thoracic endografting have always been transferred to the ICU immediately post-operatively, but any critical work was generally done by dedicated critical care personnel. Over time, endovascular repair for thoracic pathology has increased from simple aneurysms to now including dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches and longer segments of the aorta are now routinely covered, increasing the risk of spinal cord ischemia. Spinal cord ischemia, though uncommon, is a devastating potential complication for any thoracic aortic work, which has always been and is still best understood and managed by the operating surgeon. Thus, it is typical that prophylactic lumbar drains are still used for elective TEVAR cases, as they were required in the primary trial for the TBE device. Lumbar drains are placed by neurosurgery or anesthesiology before surgery in the operating room, and the ongoing measuring of perfusion to the spinal cord, as well as drain management, is managed by the operating surgeon.

Regarding post-operative office visits, the specialty societies noted that survey respondents indicated that while the number of TEVAR post-operative visits has not changed, the visits are now more complex. The first visit, which typically occurs 1-2 weeks following hospital discharge, is a level 3 post-op office visit (99213), wherein incisions are checked, wound care is provided, and a neurovascular assessment is performed. The second visit, which typically occurs 4-6 weeks following hospital discharge, is a level 4 post-op office visit (99214). Much of this time is spent by the operating surgeon reviewing the postoperative CT scan, which is from the aortic arch to the femoral vessels with fine cuts. Three-dimensional software is utilized to evaluate possible endoleaks or other endograft complications, and clinical decisions are made regarding the need for repeat surgical intervention. This work is independent and distinct from any radiologist's interpretation. Given the increased complexity and treatment length of these visits, more work and time is required for the operating surgeon to review these images and discuss them with the patient compared to 20 years ago when these codes were first valued.

To support the recommended work RVU of 26.75, the RUC compared the surveyed code to top key reference code 34701 *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 23.71, 120 minutes intra-service time, 482 minutes total time) and second key reference code 34705 *Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 29.58, 150 minutes intra-service time, 512 minutes total time). The RUC recognized that the two key reference services chosen by survey respondents bracket the 25th percentile work RVU of the surveyed code and total time. Notably, the top key reference service code 34701 requires similar intra-service time and is almost identical in terms of intensity and complexity for the physician to perform.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

I=New code s=Revised code :=Add-on code H=Modifier 51 exempt *=Telemedicine X=Audio-only ~=FDA approval pending #=Resequenced code

For additional support, the RUC referenced MPC code 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time, 404 minutes total time), noting it requires similar intra-service time as the surveyed code but 102 fewer minutes in pre-service time and post-operative visits. **The RUC recommends a work RVU of 26.75 for CPT code 33381.**

33882 ***Endovascular repair of the thoracic aorta by deployment of a branched endograft multipiece system involving an aorto-aortic tube device with a fenestration for the left subclavian artery stentgraft(s) and all aortic tube endograft extension(s) placed from the level of the left common carotid artery to the celiac artery, including pre-procedure sizing and device selection, all target zone angioplasty, all nonselective catheterization(s) and left subclavian artery selective catheterization(s), and all associated radiological supervision and interpretation***
The RUC reviewed survey results from 59 vascular surgeons, cardiothoracic surgeons, and interventional radiologists and recommends the 25th percentile work RVU of 39.00, which accounts for the physician work required to perform this service. The RUC recommends 100 minutes pre-service evaluation time, 20 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 180 minutes intra-service time, 40 minutes immediate post-service time, 1-99291, 1-99233, 1-99232, 1-99238, 1-99214, 1-99213 visit, which equals 621 minutes of total time.

The specialty society selected pre-service time package *4-FAC Difficult Patient/Difficult Procedure*. The selected time package was modified to more accurately reflect pre-service planning collected in the modified survey tool to more accurately reflect pre-service time involved with this service. The specialty society requests 100 minutes of pre-service evaluation time, 20 minutes less than the median survey results and 60 minutes above the standard pre-service package time of 40 minutes. The additional pre-service evaluation time includes 40 minutes for pre-service evaluation plus 60 minutes for pre-planning, which should be bundled in the main procedure and not reported separately per CMS policy. For this service, the pre-planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required, including aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally, the surgeon assesses the perceived quality of the aorta, particularly in the seal zones, and the tortuosity of the aorta. During this planning, the surgeon reviews all available endograft sizes from several vendors and develops a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office but more than 24 hours before the procedure, however, is not separately reported.

The specialty society requests 20 minutes of pre-service positioning time which is consistent with the median survey results and 17 minutes above the pre-service package time of 3 minutes. The additional pre-service position time accounts for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patients during the surgery, appropriately positioning the patient with one arm extended and another tucked or positioned over the head, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is identical to the positioning time included with abdominal aortic aneurysm endovascular repair codes (CPT codes 34701-34708). The specialty society recommended, and the RUC concurred, that 40 minutes of immediate post-service time is typical — it is consistent with the median survey results and 7 minutes above the standard post-service package time of 33 minutes. The additional post-service time accounts for time for the physician to complete the operative note, which includes reviewing all images

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

related to the aortic arch vessels, subclavian, and vertebral arteries, annotating appropriate images, dictating radiologic findings, and documenting radiation exposure and contrast volumes. The RUC agreed these changes to the pre-service and post-service time packages are appropriate.

The specialty society selected post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. Regarding post-operative hospital care, the specialty societies provided a detailed rationale to support their recommendation. Among survey respondents, there was a uniform consensus that ICU-level care is provided by the surgeon during the postoperative period. Patients who have undergone thoracic endografting have always been transferred to the ICU immediately post-operatively, but any critical work was generally done by dedicated critical care personnel. Over time, endovascular repair for thoracic pathology has increased from simple aneurysms to now including dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches and longer segments of the aorta are now routinely covered, increasing the risk of spinal cord ischemia. Spinal cord ischemia, though uncommon, is a devastating potential complication for any thoracic aortic work, which has always been and is still best understood and managed by the operating surgeon. Thus, it is typical that prophylactic lumbar drains are still used for elective TEVAR cases, as they were required in the primary trial for the TBE device. Lumbar drains are placed by neurosurgery or anesthesiology before surgery in the operating room, and the ongoing measuring of perfusion to the spinal cord, as well as drain management, is managed by the operating surgeon.

Regarding post-operative office visits, the specialty societies noted that survey respondents indicated that while the number of TEVAR post-operative visits has not changed, the visits are now more complex. The first visit, which typically occurs 1-2 weeks following hospital discharge, is a level 3 post-op office visit (99213), wherein incisions are checked, wound care is provided, and a neurovascular assessment is performed. The second visit, which typically occurs 4-6 weeks following hospital discharge, is a level 4 post-op office visit (99214). Much of this time is spent by the operating surgeon reviewing the postoperative CT scan, which is from the aortic arch to the femoral vessels with fine cuts. Three-dimensional software is utilized to evaluate possible endoleaks or other endograft complications, and clinical decisions are made regarding the need for repeat surgical intervention. This work is independent and distinct from any radiologist's interpretation. Given the increased complexity and treatment length of these visits, more work and time is required for the operating surgeon to review these images and discuss them with the patient compared to 20 years ago when these codes were first valued.

To support the recommended work RVU of 39.00, the RUC compared the surveyed code to top key reference code 34706 *Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for rupture including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)* (work RVU = 45.00, 178 minutes intra-service time, 735 minutes total time) and second key reference code 34708 *Endovascular repair of iliac artery by deploysument of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; for rupture including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)* (work RVU = 36.50, 120 minutes intra-service time, 677 minutes total time). The RUC recognized that the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

two key reference services chosen by survey respondents bracket the 25th percentile work RVU of the surveyed code. Notably, the top key reference service code 34706 requires nearly identical intra-service time to perform but requires more and a higher level of post-operative hospital visits.

For additional support, the RUC referenced MPC code 33534 *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts* (work RVU = 39.88, 193 minutes intra-service time, 717 minutes total time), noting it has a very similar work RVU as the surveyed code, albeit slightly higher due to more intra-service time and significantly more total time. **The RUC recommends a work RVU of 39.00 for CPT code 33882.**

33883 ***Delayed placement of proximal extension prosthesis(es) not involving coverage of the left subclavian artery origin, after endovascular repair of the thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed***
The RUC reviewed survey results from 61 vascular surgeons, cardiothoracic surgeons, and interventional radiologists and recommends the 25th percentile work RVU of 24.25, which accounts for the physician work required to perform this service. The RUC recommends 85 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 90 minutes intra-service time, 30 minutes immediate post-service time, 1-99291, 2-99232, 1-99238, 1-99214 and 1-99213 visit, which equals 486 minutes of total time.

The specialty society selected pre-service time package *4-FAC Difficult Patient/Difficult Procedure*. The selected time package was modified to more accurately reflect pre-service planning collected in the modified survey tool to more accurately reflect pre-service time involved with this service. The specialty society requests 85 minutes of pre-service evaluation time, 5 minutes less than the median survey results and 45 minutes above the standard pre-service package time of 40 minutes. The additional pre-service evaluation time includes 40 minutes for pre-service evaluation plus 45 minutes for pre-planning, which should be bundled in the main procedure and not reported separately per CMS policy. For this service, the pre-planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required, including aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally, the surgeon assesses the perceived quality of the aorta, particularly in the seal zones, and the tortuosity of the aorta. During this planning, the surgeon reviews all available endograft sizes from several vendors and develops a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office but more than 24 hours before the procedure, however, is not separately reported.

The specialty society requests 15 minutes of pre-service positioning time which is consistent with the median survey results and 12 minutes above the pre-service package time of 3 minutes. The additional pre-service position time accounts for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patients during the surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 minutes less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The specialty society selected post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. Regarding post-operative hospital care, the specialty societies provided a detailed rationale to support their recommendation. Among survey respondents, there was a uniform consensus that ICU-level care is provided by the surgeon during the postoperative period. Patients who have undergone thoracic endografting have always been transferred to the ICU immediately post-operatively, but any critical work was generally done by dedicated critical care personnel. Over time, endovascular repair for thoracic pathology has increased from simple aneurysms to now including dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches and longer segments of the aorta are now routinely covered, increasing the risk of spinal cord ischemia. Spinal cord ischemia, though uncommon, is a devastating potential complication for any thoracic aortic work, which has always been and is still best understood and managed by the operating surgeon. Thus, it is typical that prophylactic lumbar drains are still used for elective TEVAR cases, as they were required in the primary trial for the TBE device. Lumbar drains are placed by neurosurgery or anesthesiology before surgery in the operating room, and the ongoing measuring of perfusion to the spinal cord, as well as drain management, is managed by the operating surgeon.

Regarding post-operative office visits, the specialty societies noted that survey respondents indicated that while the number of TEVAR post-operative visits has not changed, the visits are now more complex. The first visit, which typically occurs 1-2 weeks following hospital discharge, is a level 3 post-op office visit (99213), wherein incisions are checked, wound care is provided, and a neurovascular assessment is performed. The second visit, which typically occurs 4-6 weeks following hospital discharge, is a level 4 post-op office visit (99214). Much of this time is spent by the operating surgeon reviewing the postoperative CT scan, which is from the aortic arch to the femoral vessels with fine cuts. Three-dimensional software is utilized to evaluate possible endoleaks or other endograft complications, and clinical decisions are made regarding the need for repeat surgical intervention. This work is independent and distinct from any radiologist's interpretation. Given the increased complexity and treatment length of these visits, more work and time is required for the operating surgeon to review these images and discuss them with the patient compared to 20 years ago when these codes were first valued.

To support the recommended work RVU of 24.25, the RUC compared the surveyed code to top key reference code 34701 *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 23.71, 120 minutes intra-service time, 482 minutes total time) and second key reference code 34708 *Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; for rupture including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)* (work RVU = 36.50, 120 minutes intra-service time, 677 minutes total time). The RUC recognized that the two key reference services chosen by survey respondents bracket the 25th percentile work RVU of the surveyed code. Notably, the top key reference service code 34701 requires nearly identical total time and intensity to perform as the surveyed code. The second key reference service requires more intra-service time and total time as the surveyed code and is appropriately valued higher.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For additional support, the RUC referenced MPC code 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time, 404 minutes total time), noting it has a similar work RVU as the surveyed code overall. Although it requires more intra-service time, CPT code 35301 has less total time and requires less intensity to perform than the surveyed code. **The RUC recommends a work RVU of 24.25 for CPT code 33883.**

33886 ***Delayed placement of distal extension prosthesis(es) from the level of the left subclavian artery to the celiac artery, after endovascular repair of descending thoracic aorta, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation***

The RUC reviewed survey results from 61 vascular surgeons, cardiothoracic surgeons, and interventional radiologists and recommends the 25th percentile work RVU of 23.50, which accounts for the physician work required to perform this service. The RUC recommends 85 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 90 minutes intra-service time, 30 minutes immediate post-service time, 1-99291, 2-99232, 1-99238, 1-99214 and 1-99213 visit, which equals 486 minutes of total time.

The physician work involved with CPT codes 33886 and 33883 is nearly identical. Notably, CPT code 33886 describes endovascular repair with a distal extension prosthesis, which can be distinguished from CPT code 33883, which describes endovascular repair with a proximal extension prosthesis, the former service being slightly more intense to perform for the surgeon and thus requiring slightly more physician work overall.

The specialty society selected pre-service time package *4-FAC Difficult Patient/Difficult Procedure*. The selected time package was modified to more accurately reflect pre-service planning collected in the modified survey tool to more accurately reflect pre-service time involved with this service. The specialty society requests 85 minutes of pre-service evaluation time, 5 minutes less than the median survey results and 45 minutes above the standard pre-service package time of 40 minutes. The additional pre-service evaluation time includes 40 minutes for pre-service evaluation plus 45 minutes for pre-planning, which should be bundled in the main procedure and not reported separately per CMS policy. For this service, the pre-planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required, including aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally, the surgeon assesses the perceived quality of the aorta, particularly in the seal zones, and the tortuosity of the aorta. During this planning, the surgeon reviews all available endograft sizes from several vendors and develops a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office but more than 24 hours before the procedure, however, is not separately reported.

The specialty society requests 15 minutes of pre-service positioning time which is consistent with the median survey results and 12 minutes above the pre-service package time of 3 minutes. The additional pre-service position time accounts for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patients during the surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

procedure. This extra time is 5 minutes less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708).

The specialty society selected post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. Regarding post-operative hospital care, the specialty societies provided a detailed rationale to support their recommendation. Among survey respondents, there was a uniform consensus that ICU-level care is provided by the surgeon during the postoperative period. Patients who have undergone thoracic endografting have always been transferred to the ICU immediately post-operatively, but any critical work was generally done by dedicated critical care personnel. Over time, endovascular repair for thoracic pathology has increased from simple aneurysms to now including dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches and longer segments of the aorta are now routinely covered, increasing the risk of spinal cord ischemia. Spinal cord ischemia, though uncommon, is a devastating potential complication for any thoracic aortic work, which has always been and is still best understood and managed by the operating surgeon. Thus, it is typical that prophylactic lumbar drains are still used for elective TEVAR cases, as they were required in the primary trial for the TBE device. Lumbar drains are placed by neurosurgery or anesthesiology prior to surgery in the operating room, and the ongoing measuring of perfusion to the spinal cord, as well as drain management, is managed by the operating surgeon.

Regarding post-operative office visits, the specialty societies noted that survey respondents indicated that while the number of TEVAR post-operative visits has not changed, the visits are now more complex. The first visit, which typically occurs 1-2 weeks following hospital discharge, is a level 3 post-op office visit (99213), wherein incisions are checked, wound care is provided, and a neurovascular assessment is performed. The second visit, which typically occurs 4-6 weeks following hospital discharge, is a level 4 post-op office visit (99214). Much of this time is spent by the operating surgeon reviewing the postoperative CT scan, which is from the aortic arch to the femoral vessels with fine cuts. Three-dimensional software is utilized to evaluate possible endoleaks or other endograft complications, and clinical decisions are made regarding the need for repeat surgical intervention. This work is independent and distinct from any radiologist's interpretation. Given the increased complexity and treatment length of these visits, more work and time is required for the operating surgeon to review these images and discuss them with the patient compared to 20 years ago when these codes were first valued.

To support the recommended work RVU of 23.50, the RUC compared the surveyed code to top key reference code 34701 *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 23.71, 120 minutes intra-service time, 482 minutes total time) and second key reference code 34718 *Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral* (work RVU = 24.00, 120 minutes intra-service time, 477 minutes total time). The RUC recognized that the surveyed

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

I=New code s=Revised code :=Add-on code H=Modifier 51 exempt *=Telemedicine X=Audio-only ~=FDA approval pending #=Resequenced code

code is comparable to the two key reference services in terms of total time and overall intensity and complexity. The surveyed code requires less intra-service time than the two key reference services, thus justifying it having a lower work RVU. The top key reference service code 34701 has identical intra-service time compared to the surveyed code, but the surveyed code requires less total time and is a less intense procedure for the physician to perform, thus justifying a lesser work RVU.

For additional support, the RUC referenced MPC code 35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision* (work RVU = 21.16, 120 minutes intra-service time, 404 minutes total time), noting it has a similar work RVU as the surveyed code overall. Although it requires more intra-service time, CPT code 35301 has less total time and requires less intensity to perform than the surveyed code. **The RUC recommends a work RVU of 23.50 for CPT code 33886.**

35602 ***Bypass graft, with other than vein; carotid-contralateral carotid***
The RUC reviewed survey results from 52 vascular surgeons and cardiothoracic surgeons and recommends the 25th percentile work RVU of 27.40, which accounts for the physician work required to perform this service. The RUC recommends 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time, 15 minutes pre-service scrub/dress/wait time, 150 minutes intra-service time, 30 minutes immediate post-service time, 1-99233, 2-99232, 1-99238, 1-99214 and 1-99213 visit, which equals 486 minutes of total time.

Notably, CPT code 35602 has a 090-day global period and replaces existing CPT code 33891, which has a 000-day global period. The specialty society selected pre-service time package *4-FAC Difficult Patient/Difficult Procedure*. The selected time package was modified to more accurately reflect pre-service time involved with this service. Unlike the other codes in the TEVAR family, CPT code 35602 does not include any bundled pre-planning time review. Thus, the specialty society requests 40 minutes of pre-service evaluation time which is consistent with the standard pre-service package time and 43 minutes less than the median survey results.

The specialty society requests 15 minutes of pre-service positioning time, 2 minutes less than the median survey results and 12 minutes above the pre-service package time of 3 minutes. The additional pre-service position time accounts for the time needed for the neck incision. The patient is placed in the "beach chair" position, and a shoulder role is typically placed. The neck is placed in the neutral position but should be free to move from side to side depending on which carotid is being operated on at the specific moment as both carotids will ultimately be dissected. This positioning is done in concert with anesthesia to ensure the endotracheal tube is not dislodged and does not become dislodged during the surgery. The endotracheal tube is secured appropriately under the observation of the surgeon to ensure an appropriate field for skin preparation. The extra positioning time is consistent with other vascular codes involving carotid dissection.

The specialty society selected post-service time package *9B General Anes or Complex Regional Blk/Cmplx Proc*. Regarding post-operative hospital care, the specialty societies provided a detailed rationale to support their recommendation. Among survey respondents, there was a uniform consensus that these patients are typically managed in the ICU following surgery, though, unlike the other codes in this family, the surgeon does not provide any of the critical care time. Typically, an intensivist provides care for blood pressure and other critical care needs, while the surgeon guides the specific parameters to be followed. The first day requires a 99233 visit, and when the patient is transferred out of the ICU,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

all care, including neurologic assessments and blood pressure control, is performed by the surgeon. These additional visits are of moderate complexity.

Regarding post-operative office visits, the specialty societies noted that survey respondents indicated that while the number of TEVAR post-operative visits has not changed, the visits are now more complex. The first visit, which typically occurs 1-2 weeks following hospital discharge, is a level 3 post-op office visit (99213), wherein incisions are checked, wound care is provided, and a neurovascular assessment is performed. The second visit, which typically occurs 4-6 weeks following hospital discharge, is a level 4 post-op office visit (99214). A neurovascular assessment is again performed. Additional time is spent by the operating surgeon reviewing postoperative imaging, either ultrasound, CT, physiologic testing, or some combination of all these. Clinical decisions are made regarding the need for repeat surgical intervention. This work is distinct from any radiologist's interpretation.

To support the recommended work RVU of 27.40, the RUC compared the surveyed code to top key reference code 35601 *Bypass graft, with other than vein; common carotid-ipsilateral internal carotid* (work RVU = 27.09, 180 minutes intra-service time, 484 minutes total time) and second key reference code 35606 *Bypass graft, with other than vein; carotid-subclavian* (work RVU = 22.46, 145 minutes intra-service time, 414 minutes total time). The RUC recognized that the surveyed code is appropriately compared to the two key reference services in terms of intra-service time and total time, as well as relative intensity and complexity. The top key reference service code 35601 requires nearly identical total time compared to the surveyed code, and more intra-service time but is a less intense procedure for the physician to perform. The second key reference service, code 35606, requires nearly identical intra-service time but less total time than the surveyed code and is also less intense to perform than the surveyed code. Notably, the two key reference services chosen by survey respondents bracket the survey 25th percentile of the surveyed code despite lesser intensity. The specialty societies noted that there are many clinical scenarios where this service would be applicable, not just in conjunction with TEVAR, resulting in a range of intensities.

For additional support, the RUC referenced CPT code 34703 *Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-uni-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)* (work RVU = 26.52, 150 minutes intra-service time, 507 minutes total time). The RUC noted that the CPT code 34703 is an appropriate reference service, as it has identical intra-service time, similar total time, and is comparable in terms of the intensity required for the physician to perform. **The RUC recommends a work RVU of 27.40 for CPT code 35602.**

Practice Expense
The Practice Expense (PE) Subcommittee concurred that there is compelling evidence to support an increase over the aggregate current cost for clinical staff time, supplies and equipment. New code 33882 was created to describe a new stent that accommodates the left subclavian artery, thus new technology/technique. And the bypass code 35602 is changing from a 000-day global to a 090-day global. Compelling evidence was accepted based on new technology and change in global period.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The PE Subcommittee reviewed the direct practice expense inputs and made a single modification to the standard 090-day global inputs. Supply item SA053 *pack, post-op incision care (suture & staple)* was changed to SA052 *pack, post-op incision care (staple)* for the code family as the typical incision would be closed with staples. **The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.**

New Technology
CPT code 33882 will be placed on the New Technology list to be reviewed by the RUC in three years.

Work Neutrality
The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Surgery **Cardiovascular System** **Heart and Pericardium** **Endovascular Repair of ~~Descending~~ Thoracic Aorta** ~~Codes 33880-33891 represent a family of procedures to report placement of an endovascular graft for repair of the descending thoracic aorta. These codes include all device introduction, manipulation, positioning, and deployment. All balloon angioplasty and/or stent deployment within the target treatment zone for the endoprosthesis, either before or after endograft deployment, are not separately reportable.~~ ~~Open arterial exposure and associated closure of the arteriotomy sites (eg, 34714, 34715, 34716, 34812, 34820, 34833, 34834), introduction of guidewires and catheters (eg, 36140, 36200-36218), and extensive repair or replacement of an artery (eg, 35226, 35286) may be additionally reported. Transposition of subclavian artery to carotid, and carotid-carotid bypass performed in conjunction with endovascular repair of the descending thoracic aorta (eg, 33889, 33891) may be separately reported. The primary codes, 33880 and 33881, include placement of all distal extensions, if required, in the distal thoracic aorta, while proximal extensions, if needed, may be reported separately.~~ ~~For fluoroscopic guidance in conjunction with endovascular repair of the thoracic aorta, see codes 75956-75959 as appropriate. Codes 75956 and 75957 include all angiography of the thoracic aorta and its branches for diagnostic imaging prior to deployment of the primary endovascular devices (including all routine components of modular devices), fluoroscopic guidance in the delivery of the endovascular components, and intraprocedural arterial angiography (eg, confirm position, detect endoleak, evaluate runoff). Code 75958 includes the analogous services for placement of each proximal thoracic endovascular extension. Code 75959 includes the analogous services for placement of a distal thoracic endovascular extension(s) placed during a procedure after the primary repair.~~			

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~Other interventional procedures performed at the time of endovascular repair of the descending thoracic aorta should be additionally reported (eg, innominate, carotid, subclavian, visceral, or iliac artery transluminal angioplasty or stenting, arterial embolization, intravascular ultrasound) when performed before or after deployment of the aortic prostheses.~~

Codes 33880, 33881, 33882, 33883, 33886 describe delivery, positioning, and deployment of an endograft for treatment of thoracic aortic pathology (with or without rupture), such as aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma (IMH), or traumatic disruption. The terms, endovascular graft, endoprosthesis, endograft, and stentgraft, refer to a covered stent. The thoracic aorta includes the ascending aorta, the aortic arch which includes the arch or brachiocephalic vessels (eg, innominate artery, left common carotid artery, left subclavian artery) and the descending thoracic aorta to the level of the diaphragm above the origin of the celiac arteries. Reporting endovascular repair of the thoracic aorta is based on anatomy with regard to the left subclavian artery.

Code selection for endovascular repair of the thoracic aorta is based on the most proximal extent of thoracic aortic coverage with an endoprosthesis at the end of the operative session and includes all aortic stentgraft(s) implanted both proximally to the aortic root and distally up to the celiac artery, when performed.

When the endoprosthesis is placed proximal to the left subclavian artery, the innominate, common carotid, and/or subclavian arteries may require revascularization through open surgical or endovascular techniques. Open surgical treatment may be performed as a bypass (eg, debranching) or transposition procedure. Endovascular revascularization may also be accomplished through separate parallel stentgraft(s) extending alongside the aortic tube stentgraft into a brachiocephalic vessel(s). Alternatively, a fenestrated and/or branched endograft multipiece (modular) system may be implanted which involves an aortic tube device that has a fenestration through which additional stentgraft extension(s) are placed into a brachiocephalic vessel as needed. Fenestrations within the fabric allow for selective catheterization of the branch vessels and subsequent placement of an endoprosthesis to maintain flow to the branch artery. Parallel stentgrafts placed alongside the thoracic graft permits branch flow to the brachiocephalic vessels that preserve flow to these critical branches otherwise covered by the thoracic endograft. Anatomic variation in the location and orientation of the brachiocephalic (innominate, left common carotid, left subclavian) artery origins requires use of a patient-specific fenestrated endograft for endovascular repair that preserves flow to essential arteries and that allows proximal seal and fixation to be achieved. These procedures involve selective catheterization.

The thoracic aortic endograft may be configured in three orientations:

1. Aortic tube device not covering the left subclavian artery;
2. Aortic tube device with a separate parallel stentgraft(s) extending alongside the aortic stentgraft into one or more of the brachiocephalic vessel(s); or
3. Fenestrated and/or branched endograft multipiece (modular) system involving an aortic tube device that has a fenestration through which additional stentgraft extension(s) are placed into one or more of the brachiocephalic vessel(s) as needed.

Report 33880, 33881 for deployment of an aorto-aortic tube device. Report 33882 for deployment of a fenestrated and/or branched endograft multipiece or modular system involving an aorto-aortic tube device that has a fenestration through which an additional stentgraft extension(s) is placed into the left subclavian artery.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

For brachiocephalic branch vessel preservation, subclavian to carotid artery transposition is reported with code 35694; carotid artery to subclavian artery bypass with other than vein is reported with 35606; and carotid to contralateral carotid artery bypass with other than vein is reported with 35602.

The treatment zone for endograft procedures is defined by those vessels that contain an endograft(s) (aortic tube device, parallel/fenestration stentgraft[s], and/or proximal and distal extension[s]) deployed during that operative session. Adjunctive procedures outside the treatment zone (eg, angioplasty, endovascular stent placement, embolization) may be separately reported.

Code 33883 is reported for delayed placement of a proximal extension prosthesis(es) for endovascular repair of the thoracic aortic aneurysm, pseudoaneurysm, dissection, endoleak, or endograft migration. Code 33883 includes pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed. Code 33883 may only be reported once for all proximal stentgraft extensions placed up to the left subclavian artery proximally. For delayed placement of a proximal aortic stentgraft extension that covers the left subclavian artery, see 33880, 33882.

Code 33886 is reported for delayed placement of distal extension prosthesis(es) for endovascular repair of the descending thoracic aortic aneurysm, false aneurysm, dissection, endoleak, or endograft migration. Code 33886 includes pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed. Code 33886 may only be reported once for all distal stentgraft extensions placed up to the celiac artery distally.

Nonselective catheterization from iliac (with or without conduit) and femoral (with or without conduit) access is included in 33880, 33881, 33882, 33883, 33886 and is not separately reported. However, selective catheterization of the innominate, left common carotid, subclavian, anomalous brachiocephalic (arch) vessels and/or arterial families outside the treatment zone of the endograft may be separately reported. Selective catheterization of the left subclavian artery from iliac (with or without conduit) and femoral (with or without conduit) access is included in 33882. Intravascular ultrasound (37252, 37253) performed during endovascular aneurysm repair may be separately reported, when performed. Balloon angioplasty and/or stenting within the treatment zone of the endograft, either before or after endograft deployment, is not separately reported.

Fluoroscopic guidance and radiological supervision and interpretation in conjunction with endograft repair is not separately reported. Thoracic endograft services for treatment of thoracic aortic pathology include all intraprocedural imaging (eg, angiography, rotational computed tomography) of the aorta and its branches prior to deployment of the endovascular device, fluoroscopic guidance and roadmapping used in the delivery of the endovascular components, and intraprocedural and completion angiography (eg, confirm position, detect endoleak, evaluate runoff) performed at the time of the endovascular thoracic aorta repair.

Code 34712 describes transcatheter delivery of accessory-enhanced fixation devices to the endograft (eg, anchor, screw, tack), including all associated radiological supervision and interpretation. Code 34712 may only be reported once per operative session for the thoracic aortic repair.

Percutaneous vascular access requiring use of closure devices for large sheaths (ie, 12-French or larger) or access requiring open surgical arterial exposure may be separately reported (eg, 34713, 34714, 34715, 34716, 34812, 34820, 34833, 34834). Code 34713 describes percutaneous access and closure of a femoral arteriotomy for delivery of endovascular prosthesis through a large arterial sheath (ie, 12-French

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

or larger). Ultrasound guidance (ie, 76937), when performed, is included in 34713 and not separately reported for the same access. (Percutaneous access using a sheath smaller than 12-French is included in 33880, 33881, 33883, 33884, 33886 and is not separately reported).

Code 34812 describes open repair and closure of the femoral artery. Extensive repair of an artery (eg, 35226, 35286, 35371) may also be reported separately. Iliac exposure for device delivery through a retroperitoneal incision, open brachial exposure, or axillary or subclavian exposure through an infraclavicular, or supraclavicular or sternotomy incision during endovascular aneurysm repair may be separately reported (eg, 34715, 34812, 34820, 34834). Endovascular device delivery or establishment of cardiopulmonary bypass that requires creation of a prosthetic conduit utilizing a femoral artery, iliac artery with a retroperitoneal incision, or axillary or subclavian artery exposure through an infraclavicular, supraclavicular, or sternotomy incision (34714, 34716, 34833) and oversewing of the conduit at the time of procedure completion may be separately reported during endovascular aneurysm repair or cardiac procedures requiring cardiopulmonary bypass. If a conduit is converted to a bypass, report the bypass (eg, 35665) and not the arterial exposure with conduit (34714, 34716, 34833). Arterial embolization(s) of arteries outside the treatment zone (eg, intercostal) to facilitate complete endovascular aneurysm exclusion may be separately reported (eg, 37242) along with selective and/or nonselective catheterizations of those arteries.

Balloon angioplasty and/or stenting at the sealing zone(s) of an endograft is an integral part of the procedure and is not separately reported. However, balloon angioplasty and/or stent deployment in vessels that do not contain endograft (outside the treatment zone for the endograft), either before or after endograft deployment, may be separately reported. To maintain patency of branch vessels during aortic stentgraft deployment, separate smaller stentgrafts may be inserted alongside the aortic stentgraft and are termed “parallel grafts”, “chimney grafts”, and “snorkel grafts”. Parallel stentgraft(s) that are deployed in the vessels during thoracic aortic endovascular repair are outside the treatment zone and may be reported with the corresponding arterial stent, catheterization, and exposure codes as indicated. For example, percutaneous left axillary artery access with a 6-French sheath, retrograde catheterization of the aorta, and placement of a stentgraft that extends from left subclavian artery into the thoracic aorta may be reported with 36200 and 37236.

Interventional procedures that are performed either before or after endograft deployment during the same operative session for endovascular thoracic aortic aneurysm repair may be separately reported (eg, arterial embolization, intravascular ultrasound, balloon angioplasty or stenting of native artery[ies] outside the endograft treatment zone).

For endovascular stenting or balloon angioplasty of congenital coarctation or postsurgical recoarctation of the ascending, transverse, or descending thoracic or abdominal aorta, see 33894, 33895, 33897.

Direct Repair of Aneurysm or Excision (Partial or Total) and Graft Insertion for Aneurysm, Pseudoaneurysm, Ruptured Aneurysm, and Associated Occlusive Disease

Procedures 35001-35152 include…

(For direct repairs associated with occlusive disease only, see 35201-35286)

(For intracranial aneurysm, see 61700 et seq)

(For endovascular repair of abdominal aortic and/or iliac artery aneurysm, see 34701-34716)

(For thoracic aortic aneurysm, see 33858-33875)

(For endovascular repair of ~~descending~~ thoracic aorta~~, involving coverage of left subclavian artery origin~~ by deployment of an aorto-aortic tube endograft covering the left subclavian artery and all aortic tube endograft extension(s) proximally in the aortic arch and ascending aorta and distally to the celiac artery, when performed, use 33880)

35001 *Direct repair of aneurysm, pseudoaneurysm, or excision (partial or total) and graft insertion, with or without patch graft; for aneurysm and associated occlusive disease, carotid, subclavian artery, by neck incision*

Fenestrated Endovascular Repair of the Visceral and Infrarenal Aorta

Exposure of the access vessels (eg, 34713, 34714, 34715, 34716, 34812, 34820, 34833, 34834) may be reported separately. Extensive repair of an artery (eg, 35226, 35286) may be reported separately. For concomitant endovascular treatment of the ~~descending~~ thoracic aorta, 33880-33886 ~~and 75956-75959~~ may be reported with 34841, 34842, 34843, 34844, 34845, 34846, 34847, 34848. For isolated endovascular infrarenal abdominal aortic aneurysm repair that does not require placement of a fenestrated graft to preserve flow to the visceral branch(es), see 34701, 34702, 34703, 34704, 34705, 34706.

Bypass Graft
Other Than Vein

●35602	O6	Bypass graft, with other than vein; carotid-contralateral carotid	090	27.40

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~(For open transcervical common carotid-common carotid bypass performed in conjunction with endovascular repair of descending thoracic aorta, use 33891)~~

(For open subclavian to carotid artery transposition performed in conjunction with endovascular thoracic aneurysm repair by neck incision, use 3569433889)

Arterial Transposition

35691 *Transposition and/or reimplantation; vertebral to carotid artery*

35693 *vertebral to subclavian artery*

35694 *subclavian to carotid artery*

~~(For open subclavian to carotid artery transposition performed in conjunction with endovascular repair of descending thoracic aorta, use 33889)~~

35695 *carotid to subclavian artery*

Transcatheter Procedures
Other Procedures

37217 *Transcatheter placement of intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation*

(37217 includes open vessel exposure and vascular access closure, all access and selective catheterization of the vessel, traversing the lesion, and any radiological supervision and interpretation directly related to the intervention when performed, standard closure of arteriotomy by suture, and imaging performed to document completion of the intervention in addition to the intervention[s] performed. Carotid artery revascularization services [eg, ~~33891,~~ 35602, 35301, 35509, 35510, 35601, 35606] performed during the same session may be reported separately, when performed)

(Do not report 37217 in conjunction with 35201, 36221- 36227, 37246, 37247 for ipsilateral services)

(For open or percutaneous transcatheter placement of intravascular cervical carotid artery stent[s], see 37215, 37216)

(For open or percutaneous antegrade transcatheter placement of innominate and/or intrathoracic carotid artery stent[s], use 37218)

(For open or percutaneous transcatheter placement of extracranial vertebral artery stent[s], see 0075T, 0076T)

(For transcatheter placement of intracranial stent[s], use 61635)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33880 Tracking Number O1 Original Specialty Recommended RVU: **30.00**
Presented Recommended RVU: **30.00**
Global Period: 090 Current Work RVU: **34.58** RUC Recommended RVU: **30.00**

CPT Descriptor: Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft covering the left subclavian artery and all aortic tube endograft extension(s) proximally in the aortic arch and ascending aorta and distally to the celiac artery, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm diameter descending thoracic aortic aneurysm that begins immediately beyond the origin of left subclavian artery. Endovascular repair of the descending thoracic aortic aneurysm is performed. The proximal extent of the endoprosthesis covers the left subclavian artery origin.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 88%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery. However, it must be completed several days prior to surgery to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is a primary determinant of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used, permitting iterative modeling of a virtual device within the aorta in multiplanar views and centerline of flow analysis. The physician manually adjusts the modeling for altered anatomy, which is tortuous or thrombus laden. Orthogonal centerline imaging is used to determine diameter measurements of the ascending aorta, aortic arch, and thoracic aorta. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence, and stenosis require consideration as they may impact device delivery. Cross section, longitudinal, and centerline of flow measurements, with manual adjustments where needed, are used to map the distances between the left carotid artery, subclavian artery, and the celiac artery. A stretched/straightened view permits manual validation of the computer-generated lengths. Preservice work also includes the procedural workup. Preservice work necessarily includes review of surgical indication, physical exam findings, current medications, and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family, including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the OR after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine, and activated coagulation time testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure

and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for easy viewing during the operative procedure. If deemed necessary by the surgeon, a lumbar drain is placed by an appropriate physician. The surgeon supervises appropriate patient positioning on the OR table and ensures that fluoroscopy is functional and that desired imaging angles are attainable with the available equipment. The surgeon changes into radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile preparation of access site(s) and subsequent draping. The surgeon leads the preprocedural time-out.

Description of Intra-Service Work: Perform road-mapping arteriogram with specific attention to great vessel artery origins, celiac origin; image aortic arch in multiple projections to determine exact orthogonal coordinates to deploy prosthesis. Wait for anesthesia to insert and adjust TEE, if employed. Re-confirm availability of endovascular components for correct models, diameters, lengths, etc. Surgeon directs the patient to be anticoagulated with bolus dose heparin and directs anesthesia to maintain this effect throughout the case. Surgeon then exchanges soft j-wires for superstiff lunderquist wires. The initial component is unpacked and inspected for damage. The device is then prepared for insertion. It is then loaded over the superstiff wire and advanced to the femoral artery. The carrier tip is introduced into the arteriotomy. The proximal vascular clamp is opened and the leading edge of the graft is advanced to the artery. Rubber constrictor loops are utilized to minimize blood loss. Under careful fluoroscopic guidance the surgeon directs the first component and carrier through the external iliac, common iliac, and abdominal aorta. The device is navigated into the thoracic aorta up to the arch, employing extreme care so nose-cone lies in the aortic arch with leading edge of component just beyond left subclavian origin. Angiography is employed to confirm great vessel origins in relation to the leading edge of the device. The surgeon instructs the anesthesiologist to lower blood pressure and waits for desired effect. Deployment of the endograft is begun, making final precise adjustments to align leading edge of component in arch, across left subclavian origin. Contrast injections in multiple planes are performed to ensure final exact positioning. The carrier is advanced to recapture the nosecone. The carrier and nosecone are retracted with care not to distrub the first component. The carrier is withdrawn through the descending thoracic aorta and through iliac arteries with care not to disrupt iliacs. The first component carrier is removed through the femoral artery and the femoral artery is re-clamped. A compliant balloon is introduced under fluoro guidance, advance through iliac, abdominal aorta, thoracic aorta, to arch. Anesthesiology is notified the aortic arch is about to be occluded; reduce BP as needed. The compliant balloon is inflated under constant fluoroscopic observation to expand and seat first component. The balloon is deflated and carefully retracted past the first component and out of the femoral artery. A multi-sideport catheter is advanced into the aortic arch and a contrast injection is performed to image the graft and confirm accurate placement. A second component is prepared and loaded onto the superstuff wire and advanced into the thoracic aorta through the iliac vessels, abdominal aorta. Under fluoroscopic guidance the second component is invaginated into the first, precisely adjusting the overlap. A multi-sideport catheter is introduced and contrast injections are performed to ensure the distal edge has not covered the celiac. Final adjustments are made and the second component is deployed. The carrier is carefully retracted through the endograft and removed from the groin, minimizing blood loss. A multi-sideport catheter is introduced and contrast injections are performed to determine need for additional components. All above steps are repeated in sequence to determine sufficient components to complete a hemostatic distal seal above the celiac artery. A compliant balloon is introduced under fluoro guidance and used for final expansion, seating, and seal of all additional components. The balloon is withdrawn. A multi-sideport catheter is introduced into the aortic arch and a final arteriogram is performed and interpreted to determine appropriate coverage, patency of major arteries, and absence of endoleaks. Completion pressure measures are obtained. All catheters, wires, and sheaths are removed using fluoroscopic guidance.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is assisted with transfer from the operating table to the gurney. The patient is monitored for hemodynamic stability in transit. Assessment of adequate perfusion to and motor function of the lower extremities is ensured. Postoperative orders for medications, imaging, and laboratories are written. The procedure and outcome are discussed with family. A brief operative note is written. Postoperative imaging is reviewed. An operative report is dictated which includes a detailed description of all radiographic images. A copy is sent to the referring physician. The surgeon typically spends 60 minutes or more providing critical care, ensuring hemodynamic and cardiovascular stability. Instructions for neurological monitoring and the management of lumbar drain care are provided to ICU staff along with a detailed postoperative examination. Ongoing neurological monitoring is performed. Cerebral spinal fluid (CSF) drainage amounts are carefully directed by the surgeon, when necessary, to provide adequate spinal perfusion pressure but not result in CSF drainage complications. To maintain an appropriate spinal perfusion pressure, vasoactive agents are titrated and directed by the surgeon in combination with other factors such as laboratory values and oxygen administration for spinal cord perfusion and protection. The surgeon must be present to ensure these orders are performed as spinal cord ischemia can result with only a short window of time for remedy. Additional post-operative care is communicated with the ICU staff. Careful monitoring for any complaints of pain or neurovascular compromise is performed at all postoperative in-hospital visits, particularly in the first 24 hours, but continues for 72 hours postoperatively and spinal cord care is directed by the surgeon. Exam requires close monitoring for

neurological changes, chest or abdominal tenderness, upper extremity motor function, lower extremity motor function, and lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are performed as is neurologic evaluation for any signs of spinal cord ischemia. Upper and lower extremities are assessed for emboli and adequate perfusion is ensured. Hemoglobin and coagulation laboratory results are monitored daily. The need for routine or advanced imaging is assessed daily. Postoperative CT scans are obtained, either during the inpatient stay or early in the post discharge period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily. Discharge day management includes communicating with all support services, such as visiting nurses and referring physicians, reviewing interval chart notes, answering patient and family questions, evaluating all predischarge laboratory results, evaluating and redressing the incisions, assessing pain score, and performing medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, an interval history is solicited for ongoing or new symptoms; the chest is examined for tenderness; arterial access sites and surgical incisions are examined for inflammation, drainage, and wound infection. Upper and lower extremities are examined for adequate perfusion. Lower extremity strength is assessed. Diagnostic blood tests and/or imaging studies are ordered based on findings. Postoperative CT scans from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. Wound care is provided, as needed. Staples and sutures are removed as indicated. Patient and family questions are answered. Prescriptions for medication and therapy are written, as necessary. Progress is discussed with the referring physician (verbal and written). Progress notes are dictated/typed for the medical chart.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	6%	25%	38%	31%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	6%	31%	63%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	6%	50%	44%

Physical effort required	0%	63%	38%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	13%	19%	69%

Survey Code Compared to 2nd Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	25%	63%	13%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	31%	69%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	6%	38%	56%
Physical effort required	0%	63%	38%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	25%	75%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore TAG device. This was approximately 5 years after FDA approval of endovascular devices for

abdominal aneurysm repair (EVAR). A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for the various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Fee Schedule and the values have not been reviewed since that time. In May 2022 the FDA approved the use of a thoracic branch endoprothesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR family.

The CPT panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR

Survey Methodology

A multi-disciplinary workgroup including SVS, SIR, and STS was convened. Approval to modify the survey instrument by adding a question regarding pre-planning time was obtained from the Research Subcommittee.

Pre-Service Time

Evaluation – package has 40 minutes. Survey median was 100. The specialties are recommending 100 minutes (40+60).

Pre Planning Time
CMS requested pre planning work be bundled in the main procedure and not report separately. *FedReg, Vol.79, No.219, p67664.*

For codes 33880 and 33882, survey respondents reported a median pre planning time of 60 minutes.

The pre planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required including: aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally the surgeon assesses perceived quality of the aorta, particularly in the seal zones, and tortuosity of the aorta. During this planning the surgeon reviews all available endograft sizes, from several vendors, and develop a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering in specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office, but more than 24 hours prior to the procedure.

33880 and 33882 involve coverage of and stent grafting into the subclavian artery, respectively. The extra 15 minutes of pre-planning time, in comparison to codes 33881, 33883, and 33886 is necessary for several reasons. For the 33880 code, when coverage of the subclavian is necessary, one must review additional cervical and even intracranial imaging to ensure bilateral vertebral artery patency and basilar artery patency. This is necessary to ensure the left arm does not become ischemic during coverage. Additionally, with coverage of the subclavian, posterior circulation stroke could also happen with abnormal vertebral artery circulation. This must be reviewed. Additionally, the endograft is subsequently encroached on the left carotid artery. Diameter measurements and distances must be exact to ensure adequate and appropriate seal as there are no other options for proximal extension should the first device not be correct. Precision is required.

The specialties are recommending a total of 100 minutes for pre evaluation time - 40 for pre service evaluation and 60 for pre planning.

Positioning - package time is 3 minutes. Survey median is 15 minutes. The specialties are requesting an additional 12 minutes of positioning time to account for positioning the imaging equipment and operating room equipment to

minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 min less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708)

SDW – package is 20 minutes. Survey median time is 15 min. The specialties are recommending deleting 5 min from the survey time to achieve the 15 minutes of SDW package time.

Post-Service Time

Post-service package 9B would apply for these complex procedures.

For CPT Codes 33880, 33881, 33883, 33886 - package time is 33 minutes. Survey median time is 30 minutes. The specialties reduced the recommended time to 30 minutes, the survey median.

Post Operative Hospital Care

While our survey respondents confirmed the number of hospital visits has stayed the same for TEVAR codes, there was uniform consensus among the respondents that ICU level care is provided by the surgeon in the post-operative period. Thoracic endografting has significantly changed since the initial codes were valued in 2005. When thoracic endografts were in their infancy, typically short endografts were placed with specific aneurysmal anatomy. Patients with unfavorable endovascular anatomy were treated open or not treated at all. These patients have always been transferred to the ICU immediately post-operatively, but any critical care work was generally done by dedicated critical care personnel. Spinal cord ischemia is a devastating complication for any thoracic aortic work. Protection for open thoracic and thoraco-abdominal aneurysm repairs was commonplace with lumbar drains and other adjuncts. At this same time, given short endograft coverage, spinal cord ischemia was uncommon and prophylactic lumbar drains were unusual.

Our survey respondents felt 3 inpatient visits were typical, plus a discharge day for all codes. 33880, 33881, 33882, 33883, and 33886 all have 1 ICU visit. The additional complexity for 33880 and 33882 for 1 99233 and 1 99232 visit involve the continued complexity on the second day for monitoring for left upper extremity perfusion and for additional neurological exams necessary to ensure no cerebral infarcts or strokes. The 33881, 33883, and 33886 do not require this additional evaluation and thus require two 99232 visits. All inpatient visits align with our survey and correlate clinically.

Hospital care has since changed for these patients. Endovascular repair for thoracic pathology is now the default treatment paradigm for pathology distal to the left carotid artery. The range of pathologies has increased from simple aneurysms to now include not only aneurysms, but dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider age range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches. Longer segments of aorta are now routinely covered, increasing the risk of spinal cord ischemia. Lumbar drains are now typically used for elective TEVAR cases. These drains were *required* in the primary trial for the TBE device. Spinal cord ischemia is a devastating complication which is best understood and managed by the operating surgeon. Lumbar drains are typically placed by neurosurgery or anesthesiology prior to surgery in the operating room. During the case, lumbar drain management (amount to drain) and blood pressure goals are driven by the operating surgeon. This continues when the patient leaves the OR and is transferred to the ICU. The first 24-48 hours are the critical window where the spinal cord is at greatest risk for malperfusion and subsequent ischemia/paralysis. The surgeon guides and personally performs regular neurologic assessments to ensure adequate neurologic function. Perfusion to the spinal cord is measured as spinal cord perfusion pressure (SCPP). This is mean arterial pressure (MAP) minus intra-spinal pressure (ISP). The two components of this, MAP and ISP, are both managed by the operating surgeon. Specific goal directed blood pressure management with pressors and ionotropes are directed by the surgeon. Fluid resuscitation and how much is directed by the surgeon. Over-reaching with MAP goals can compromise the repair and access sites, so tight MAP goals are paramount. Drain management is also typically the responsibility of the surgeon. To ensure low ISP, Cerebral Spinal Fluid (CSF) is drained at regular intervals and varying amounts to ensure low ISP and thus, high SCPP. The amount to drain is based upon ISP and determined at least hourly. Too much drainage can result in headaches, intraspinal hematomas, and even herniation if not managed correctly. BP and ISP management, in conjunction with regular neurologic assessments, is critical to ensure spinal perfusion and minimize risk of paralysis. Given the tenuous nature of these patients, this care is reserved for the operating surgeon.

Post Operative Office Visits

While the number of TEVAR post-operative visits has not changed, our survey respondents did indicate these are more complex visits. It is the consensus of the expert panel these visits are generally performed 1-2 weeks following hospital discharge and 4-6 weeks following discharge. The first visit is generally a low complexity visit of at least 20 minutes (99213). Incisions are checked and wound care is provided. A neurovascular assessment is performed. On the second visit, this is of moderate complexity and typically lasts 30 minutes or more. Much of this time is spent by the operating surgeon reviewing the postoperative CT scan. This is from the aortic arch to femoral vessels with fine cuts. The CT is uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. This is done separately from any radiologist interpretation. Given the increased complexity and treatment length of these, more work is required to review these images and discuss them with the patient compared to 20 years ago when the codes were first valued.

Comparison with Key Reference Services

There were 5 codes that were chosen most often as key reference services for 33880-33882

- 34701, *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for* ***other than rupture*** *(eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34705*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation;* ***for other than rupture*** *(eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34706*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation;* ***for rupture*** *including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*
- 34708*, Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral;* ***for rupture*** *including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)*
- 34718*, Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed,* ***for other than rupture*** *(eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral*

The following table incorporates our recommended RVW for 33880-33882 and 35602 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office

Recommendation

For CPT Code 33880, the specialty societies recommend the 25th percentile survey value of 30.00 RVW. This represents a ***decrease of 31.3%*** from current value of 44.35 RVWs by current coding convention.

Comparison to existing codes is a difficult process due to bundling of the new codes to include pre-service planning, all radiologic S&I, catheter selection, and all extensions when compared to the existing codes. To calculate the current RVW using current coding convention, one would begin with the existing work of 33880. The work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiply by 0.5 for the multiple procedure reduction. The radiologic supervision and interpretation for TEVAR with subclavian coverage is then added. This total would typically be 44.35. Comparing this computed existing value with

our proposed value for 33880 results in a ***31.3% reduction***. The following table is a graphic explanation of this comparison.

Existing TEVAR with Subclavian Coverage	Work RVU	Adjustment	Adjusted Work RVU
33880 TEVAR with coverage of subclavian	34.58	None	34.58
36200-50 Bilateral catheter in aorta	2.77	Bilaterality & MPPR	2.08
75956 Rad S&I code for TEVAR with subclavian coverage	7.00	None	7.00
Total existing coding sequence			**44.35**
New Code			
33880 New Code	30.00	None	**30.00**
Change Existing to New			**-31.3%**

Summary

The new family of CPT codes for TEVAR represent a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family better describes the current practice of TEVAR and conforms with current concepts in code creation and valuation. Additionally, with deletion of bypass codes at the time of TEVAR, this will help simplify coding by reducing the number of codes which describe the same work, leading to confusion and improper coding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33880

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Sometimes

Specialty Thoracic/Cardiac Surgery How often? Sometimes

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 889
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current RUC database (2023 utilization)

Specialty Vascular Surgery Frequency 519 Percentage 61.70 %

Specialty Thoracic/Cardiac Surgery Frequency 228 Percentage 27.11 %

Specialty Interventional Radiology Frequency 10 Percentage 1.18 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33880

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33881 Tracking Number O2 Original Specialty Recommended RVU: **26.75**
Presented Recommended RVU: **26.75**
Global Period: 090 Current Work RVU: **29.58** RUC Recommended RVU: **26.75**

CPT Descriptor: Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft not involving coverage of the left subclavian artery origin and all endograft extension(s) placed from the level of the left subclavian carotid artery to the celiac artery

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm diameter descending thoracic aortic aneurysm that begins several centimeters beyond the left subclavian artery origin. Endovascular repair of his descending thoracic aortic aneurysm is performed. The proximal portion of the endoprosthesis does not cover the left subclavian artery origin.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 88%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery. However, it must be completed several days prior to surgery to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is a primary determinant of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used, permitting iterative modeling of a virtual device within the aorta in multiplanar views and centerline of flow analysis. The physician manually adjusts the modeling for altered anatomy, which is tortuous or thrombus laden. Orthogonal centerline imaging is used to determine diameter measurements of the ascending aorta, aortic arch, and thoracic aorta. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence, and stenosis require consideration as they may impact device delivery. Cross section, longitudinal, and centerline of flow measurements, with manual adjustments where needed, are used to map the distances between the subclavian artery and the celiac artery. A stretched/straightened view permits manual validation of the computer-generated lengths. Preservice work also includes the procedural workup. Preservice work necessarily includes review of surgical indication, physical exam findings, current medications, and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family, including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the OR after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine, and activated coagulation time testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are

fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for easy viewing during the operative procedure. If deemed necessary by the surgeon, a lumbar drain is placed by an appropriate physician. The surgeon supervises appropriate patient positioning on the OR table and ensures that fluoroscopy is functional and that desired imaging angles are attainable with the available equipment. The surgeon changes into radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile preparation of access site(s) and subsequent draping. The surgeon leads the preprocedural time-out.

Description of Intra-Service Work: Perform road-mapping arteriogram with specific attention to great vessel artery origins, celiac origin; image aortic arch in multiple projections to determine exact orthogonal coordinates to deploy prosthesis. Wait for anesthesia to insert and adjust TEE, if employed. Re-confirm availability of endovascular components for correct models, diameters, lengths, etc. Surgeon directs the patient to be anticoagulated with bolus dose heparin and directs anesthesia to maintain this effect throughout the case. Surgeon then exchanges soft j-wires for superstiff lunderquist wires. The initial component is unpacked and inspected for damage. The device is then prepared for insertion. It is then loaded over the superstiff wire and advanced to the femoral artery. The carrier tip is introduced into the arteriotomy. The proximal vascular clamp is opened and the leading edge of the graft is advanced to the artery. Rubber constrictor loops are utilized to minimize blood loss. Under careful fluoroscopic guidance the surgeon directs the first component and carrier through the external iliac, common iliac, and abdominal aorta. The device is navigated into the thoracic aorta up to the arch, employing extreme care so nose-cone lies in the aortic arch with leading edge of component just to the left subclavian origin. Angiography is employed to confirm great vessel origins in relation to the leading edge of the device. The surgeon instructs the anesthesiologist to lower blood pressure and waits for desired effect. Deployment of the endograft is begun, making final precise adjustments to align leading edge of component in arch, just beyond the left subclavian origin. Contrast injections in multiple planes are performed to ensure final exact positioning. The carrier is advanced to recapture the nosecone. The carrier and nosecone are retracted with care not to disturb the first component. The carrier is withdrawn through the descending thoracic aorta and through iliac arteries with care not to disrupt iliacs. The first component carrier is removed through the femoral artery and the femoral artery is re-clamped. A compliant balloon is introduced under fluoro guidance, advance through iliac, abdominal aorta, thoracic aorta, to arch. Anesthesiology is notified the aortic arch is about to be occluded; reduce BP as needed. The compliant balloon is inflated under constant fluoroscopic observation to expand and seat first component. The balloon is deflated and carefully retracted past the first component and out of the femoral artery. A multi-sideport catheter is advanced into the aortic arch and a contrast injection is performed to image the graft and confirm accurate placement. A second component is prepared and loaded onto the superstuff wire and advanced into the thoracic aorta through the iliac vessels, abdominal aorta. Under fluoroscopic guidance the second component is invaginated into the first, precisely adjusting the overlap. A multi-sideport catheter is introduced and contrast injections are performed to ensure the distal edge has not covered the celiac. Final adjustments are made and the second component is deployed. The carrier is carefully retracted through the endograft and removed from the groin, minimizing blood loss. A multi-sideport catheter is introduced and contrast injections are performed to determine need for additional components. All above steps are repeated in sequence to determine sufficient components to complete a hemostatic distal seal above the celiac artery. A compliant balloon is introduced under fluoro guidance and used for final expansion, seating, and seal of all additional components. The balloon is withdrawn. A multi-sideport catheter is introduced into the aortic arch and a final arteriogram is performed and interpreted to determine appropriate coverage, patency of major arteries, and absence of endoleaks. Completion pressure measures are obtained. All catheters, wires, and sheaths are removed using fluoroscopic guidance.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is assisted with transfer from the operating table to the gurney. The patient is monitored for hemodynamic stability in transit. Assessment of adequate perfusion to and motor function of the lower extremities is ensured. Postoperative orders for medications, imaging, and laboratories are written. The procedure and outcome are discussed with family. A brief operative note is written. Postoperative imaging is reviewed. An operative report is dictated which includes a detailed description of all radiographic images. A copy is sent to the referring physician. The surgeon typically spends 60 minutes or more providing critical care, ensuring hemodynamic and cardiovascular stability. Instructions for neurological monitoring and the management of lumbar drain care are provided to ICU staff along with a detailed postoperative examination. Ongoing neurological monitoring is performed. Cerebral spinal fluid (CSF) drainage amounts are carefully directed by the surgeon, when necessary, to provide adequate spinal perfusion pressure but not result in CSF drainage complications. To maintain an appropriate spinal perfusion pressure, vasoactive agents are titrated and directed by the surgeon in combination with other factors such as laboratory values and oxygen administration for spinal cord perfusion and protection. The surgeon must be present to ensure these orders are performed as spinal cord ischemia can result with only a short window of time for remedy. Additional post-operative care is communicated with the ICU staff. Careful monitoring for any complaints of pain or neurovascular compromise is performed at all postoperative in-hospital visits, particularly in the first 24 hours, but continues for 72 hours postoperatively and spinal cord care is directed by the surgeon. Exam requires close monitoring for

neurological changes, chest or abdominal tenderness, upper extremity motor function, lower extremity motor function, and lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are performed as is neurologic evaluation for any signs of spinal cord ischemia. Upper and lower extremities are assessed for emboli and adequate perfusion is ensured. Hemoglobin and coagulation laboratory results are monitored daily. The need for routine or advanced imaging is assessed daily. Postoperative CT scans are obtained, either during the inpatient stay or early in the post discharge period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily. Discharge day management includes communicating with all support services, such as visiting nurses and referring physicians, reviewing interval chart notes, answering patient and family questions, evaluating all predischarge laboratory results, evaluating and redressing the incisions, assessing pain score, and performing medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, an interval history is solicited for ongoing or new symptoms; the chest is examined for tenderness; arterial access sites and surgical incisions are examined for inflammation, drainage, and wound infection. Upper and lower extremities are examined for adequate perfusion. Lower extremity strength is assessed. Diagnostic blood tests and/or imaging studies are ordered based on findings. Postoperative CT scans from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. Wound care is provided, as needed. Staples and sutures are removed as indicated. Patient and family questions are answered. Prescriptions for medication and therapy are written, as necessary. Progress is discussed with the referring physician (verbal and written). Progress notes are dictated/typed for the medical chart.

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	19%	81%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore TAG device. This was approximately 5 years after FDA approval of endovascular devices for

abdominal aneurysm repair (EVAR). A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for the various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Fee Schedule and the values have not been reviewed since that time. In May 2022 the FDA approved the use of a thoracic branch endoprothesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR family.

The CPT panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR

Survey Methodology

A multi-disciplinary workgroup including SVS, SIR, and STS was convened. Approval to modify the survey instrument by adding a question regarding pre-planning time was obtained from the Research Subcommittee.

Pre-Service Time

Evaluation – package has 40 minutes. Survey median was 98. The specialties are recommending 85 minutes (40+45).

Pre Planning Time
CMS requested pre planning work be bundled in the main procedure and not report separately. *FedReg, Vol.79, No.219, p67664.*

For codes 33881, 33883, and 33886, survey respondents reported a median pre planning time of 45 minutes.

The pre planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required including: aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally the surgeon assesses perceived quality of the aorta, particularly in the seal zones, and tortuosity of the aorta. During this planning the surgeon reviews all available endograft sizes, from several vendors, and develop a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering in specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office, but more than 24 hours prior to the procedure.

The specialties are recommending a total of 85 minutes for pre evaluation time - 40 for pre service evaluation and 45 for pre planning.

Positioning - package time is 3 minutes. Survey median is 15 minutes. The specialties are requesting an additional 12 minutes of positioning time to account for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 min less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708)

SDW – package is 20 minutes. Survey median time is 15 min. The specialties are recommending deleting 5 min from the survey time to achieve the 15 minutes of SDW package time.

Post-Service Time

Post-service package 9B would apply for these complex procedures.

For CPT Codes 33880, 33881, 33883, 33886 - package time is 33 minutes. Survey median time is 30 minutes. The specialties reduced the recommended time to 30 minutes, the survey median.

Post Operative Hospital Care

While our survey respondents confirmed the number of hospital visits has stayed the same for TEVAR codes, there was uniform consensus among the respondents that ICU level care is provided by the surgeon in the post-operative period. Thoracic endografting has significantly changed since the initial codes were valued in 2005. When thoracic endografts were in their infancy, typically short endografts were placed with specific aneurysmal anatomy. Patients with unfavorable endovascular anatomy were treated open or not treated at all. These patients have always been transferred to the ICU immediately post-operatively, but any critical care work was generally done by dedicated critical care personnel. Spinal cord ischemia is a devastating complication for any thoracic aortic work. Protection for open thoracic and thoraco-abdominal aneurysm repairs was commonplace with lumbar drains and other adjuncts. At this same time, given short endograft coverage, spinal cord ischemia was uncommon and prophylactic lumbar drains were unusual.

Hospital care has since changed for these patients. Endovascular repair for thoracic pathology is now the default treatment paradigm for pathology distal to the left carotid artery. The range of pathologies has increased from simple aneurysms to now include not only aneurysms, but dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider age range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches. Longer segments of aorta are now routinely covered, increasing the risk of spinal cord ischemia. Lumbar drains are now typically used for elective TEVAR cases. These drains were *required* in the primary trial for the TBE device. Spinal cord ischemia is a devastating complication which is best understood and managed by the operating surgeon. Lumbar drains are typically placed by neurosurgery or anesthesiology prior to surgery in the operating room. During the case, lumbar drain management (amount to drain) and blood pressure goals are driven by the operating surgeon. This continues when the patient leaves the OR and is transferred to the ICU. The first 24-48 hours are the critical window where the spinal cord is at greatest risk for malperfusion and subsequent ischemia/paralysis. The surgeon guides and personally performs regular neurologic assessments to ensure adequate neurologic function. Perfusion to the spinal cord is measured as spinal cord perfusion pressure (SCPP). This is mean arterial pressure (MAP) minus intra-spinal pressure (ISP). The two components of this, MAP and ISP, are both managed by the operating surgeon. Specific goal directed blood pressure management with pressors and ionotropes are directed by the surgeon. Fluid resuscitation and how much is directed by the surgeon. Over-reaching with MAP goals can compromise the repair and access sites, so tight MAP goals are paramount. Drain management is also typically the responsibility of the surgeon. To ensure low ISP, Cerebral Spinal Fluid (CSF) is drained at regular intervals and varying amounts to ensure low ISP and thus, high SCPP. The amount to drain is based upon ISP and determined at least hourly. Too much drainage can result in headaches, intraspinal hematomas, and even herniation if not managed correctly. BP and ISP management, in conjunction with regular neurologic assessments, is critical to ensure spinal perfusion and minimize risk of paralysis. Given the tenuous nature of these patients, this care is reserved for the operating surgeon.

Post Operative Office Visits

While the number of TEVAR post-operative visits has not changed, our survey respondents did indicate these are more complex visits. It is the consensus of the expert panel these visits are generally performed 1-2 weeks following hospital discharge and 4-6 weeks following discharge. The first visit is generally a low complexity visit of at least 20 minutes (99213). Incisions are checked and wound care is provided. A neurovascular assessment is performed. On the second visit, this is of moderate complexity and typically lasts 30 minutes or more. Much of this time is spent by the operating surgeon reviewing the postoperative CT scan. This is from the aortic arch to femoral vessels with fine cuts. The CT is uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. This is done separately from any radiologist interpretation. Given the increased complexity and treatment length of these, more work is required to review these images and discuss them with the patient compared to 20 years ago when the codes were first valued.

Comparison with Key Reference Services

There were 5 codes that were chosen most often as key reference services for 33880-33882

- 34701, *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for **other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34705*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34706*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*
- 34708*, Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)*
- 34718*, Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral*

The following table incorporates our recommended RVW for 33880-33882 and 35602 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office

Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. The specialty societies offer the following codes as brackets for the TEVAR recommendations:

- MPC 35301, *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*
- MPC 33534, *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35301 MPC	21.16	0.104	404	40	15	20	120	30	33, 32, 38	13x2
33886	**23.50**	**0.105**	**486**	**85**	**15**	**15**	**90**	**30**	**91, 32x2, 38**	**14, 13**

Recommendation

For CPT Code 33881, the specialty societies recommend the 25th percentile survey value of 26.75 RVW. This represents a ***decrease of 29.0%*** from current value of 37.66 RVWs by current coding convention.

Comparison to existing codes is a difficult process due to bundling of the new codes to include pre-service planning, all radiologic S&I, catheter selection, and all extensions when compared to the existing codes. To calculate the current RVW using current coding convention, one would begin with the existing work of 33881. The work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiply by 0.5 for the multiple procedure reduction. The radiologic supervision and interpretation for TEVAR without subclavian coverage is then added. This total would typically be 37.66. Comparing this computed existing value with our proposed value for 33881 results in a ***29.0% reduction***. The following table is a graphic explanation of this comparison.

Existing TEVAR without Subclavian Coverage	Work RVU	Adjustment	Adjusted Work RVU
33881 TEVAR without coverage of subclavian	29.58	None	29.58
36200-50 Bilateral catheter in aorta	2.77	Bilaterality & MPPR	2.08
75957 Rad S&I code for TEVAR without subclavian coverage	6.00	None	6.00
Total existing coding sequence			**37.66**
New Code			

33881 New Code	26.75	None	**26.75**
Change Existing to New			**-29.0%**

Summary

The new family of CPT codes for TEVAR represent a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family better describes the current practice of TEVAR and conforms with current concepts in code creation and valuation. Additionally, with deletion of bypass codes at the time of TEVAR, this will help simplify coding by reducing the number of codes which describe the same work, leading to confusion and improper coding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33881

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Sometimes

Specialty Thoracic/Cardiac Surgery How often? Sometimes

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,407
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current RUC database (2023 utilization)

Specialty Vascular Surgery Frequency 937 Percentage 66.03 %

Specialty Thoracic/Cardiac Surgery Frequency 298 Percentage 21.00 %

Specialty Interventional Radiology Frequency 17 Percentage 1.19 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33881

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Endovascular repair of the thoracic aorta by deployment of a branched endograft multipiece system involving an aorto-aortic tube device with a fenestration for the left subclavian artery stent graft(s) and all aortic tube endograft extension(s) placed from the level of the left common carotid artery to the celiac artery, including preprocedure sizing and device selection, all target zone angioplasty, all nonselective catheterization(s) and left subclavian artery selective catheterization(s), and all associated radiological supervision and interpretation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm diameter descending thoracic aortic aneurysm that begins at the origin of left subclavian artery. Endovascular repair of the descending thoracic aortic aneurysm with a single branch endoprosthesis to the subclavian artery is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 9% , Overnight stay-more than 24 hours 92%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery. However, it must be completed several days prior to surgery to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is a primary determinant of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used, permitting iterative modeling of a virtual device within the aorta in multiplanar views and centerline of flow analysis. Inner and outer curve measurements are also required to ensure successful endograft seal. The physician manually adjusts the modeling for altered anatomy, which is tortuous or thrombus laden. Orthogonal centerline imaging is used to determine diameter measurements of the ascending aorta, aortic arch, and thoracic aorta. Additionally, centerline measurements are taken of the subclavian artery throughout its course. The distance from the origin of the subclavian to the vertebral artery is measured to ensure the endograft will not cover the vertebral artery. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence, and stenosis require consideration as they may impact device delivery. Cross section, longitudinal, outer-curve, inner-curve, and centerline of flow measurements, with manual adjustments where needed, are used to map the distances between the innominate artery, left carotid artery, left subclavian artery, and the celiac artery. A stretched/straightened view permits manual validation of the computer-generated lengths. Preservice work also includes the procedural workup. Preservice work necessarily includes review of surgical indication, physical exam findings, current medications, and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family, including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access

site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the OR after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine, and activated coagulation time testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for easy viewing during the operative procedure. If deemed necessary by the surgeon, a lumbar drain is placed by an appropriate physician. The surgeon supervises appropriate patient positioning on the OR table and ensures that fluoroscopy is functional and that desired imaging angles are attainable with the available equipment. The surgeon changes into radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile preparation of access site(s) and subsequent draping. The surgeon leads the preprocedural time-out.

Description of Intra-Service Work: Perform road-mapping arteriogram with specific attention to great vessel artery origins, celiac origin; image aortic arch in multiple projections to determine exact orthogonal coordinates to deploy prosthesis. Wait for anesthesia to insert and adjust TEE, if employed. Re-confirm availability of endovascular components for correct models, diameters, lengths, etc. Surgeon directs the patient to be anticoagulated with bolus dose heparin and directs anesthesia to maintain this effect throughout the case. Surgeon then exchanges soft j-wires for superstiff lunderquist wires. A wire is placed from left brachial access to across the left subclavian vessel into the thoracic aorta. This wire is snared from the femoral access and brought out the femoral access. The initial component is unpacked and inspected for damage. The device is then prepared for insertion. It is then loaded over the superstiff wire and with the second through (subclavian) wire and advanced to the femoral artery. The carrier tip is introduced into the arteriotomy. The proximal vascular clamp is opened and the leading edge of the graft is advanced to the artery. Rubber constrictor loops are utilized to minimize blood loss. Under careful fluoroscopic guidance the surgeon directs the thoracic component and carrier through the external iliac, common iliac, and abdominal aorta. The device is navigated into the thoracic aorta up to the arch, employing extreme care so nose-cone lies in the aortic arch with leading edge of component across left subclavian origin. The fenestration is oriented toward the left subclavian artery. Angiography is employed to confirm great vessel origins in relation to the leading edge of the device. The surgeon instructs the anesthesiologist to lower blood pressure and waits for desired effect. Deployment of the endograft is begun, making final precise adjustments to align leading edge of component in arch, across left subclavian origin. Contrast injections in multiple planes are performed to ensure final exact positioning. The carrier is advanced to recapture the nosecone. The carrier and nosecone are retracted with care not to disturb the first component. The carrier is withdrawn through the descending thoracic aorta and through iliac arteries with care not to disrupt iliacs. The first component carrier is removed through the femoral artery and the femoral artery is re-clamped. A compliant balloon is introduced under fluoro guidance, advance through iliac, abdominal aorta, thoracic aorta, to arch. Anesthesiology is notified the aortic arch is about to be occluded; reduce BP as needed. The compliant balloon is inflated under constant fluoroscopic observation to expand and seat proximal portion of the first component. The balloon is deflated and carefully retracted past the first component and out of the femoral artery. Contrast injections are performed to ensure imaging of subclavian branches, primarily the vertebral artery. A sheath is advanced from upper extremity access through the graft branch/fenestration into thoracic aorta. The subclavian endoprosthesis advanced from femoral access is mated with the upper extremity sheath. The subclavian endoprosthesis is advanced through the main aortic component and branch/fenestration into the subclavian artery. The surgeon deploys the subclavian endoprosthesis with appropriate vessel overlap, ensuring the vertebral artery is not covered. An appropriate sized balloon is introduced through the femoral access to inflate subclavian endoprosthesis in areas of overlap within main thoracic endograft and distal subclavian artery vessel for seal. A multi-sideport catheter is advanced into the aortic arch and a contrast injection is performed to image the graft and confirm accurate placement. A second component is prepared and loaded onto the superstiff wire and advanced into the thoracic aorta through the iliac vessels, abdominal aorta. Under fluoroscopic guidance the second component is invaginated into the first, precisely adjusting the overlap. A multi-sideport catheter is introduced and contrast injections are performed to ensure the distal edge has not covered the celiac. Final adjustments are made and the second component is deployed. The carrier is carefully retracted through the endograft and removed from the groin, minimizing blood loss. A multi-sideport catheter is introduced and contrast injections are performed to determine need for additional components. All above steps are repeated in sequence to determine sufficient components to complete a hemostatic distal seal above the celiac artery. A compliant balloon is introduced under fluoro guidance and used for final expansion, seating, and seal of all additional components. The balloon is withdrawn. A multi-sideport catheter is introduced into the aortic arch and a final arteriogram is performed and interpreted to determine appropriate coverage, patency of major arteries, and absence of endoleaks. Completion pressure measures are obtained. All catheters, wires, and sheaths are removed using fluoroscopic guidance.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is assisted with transfer from the operating table to the gurney. The patient is monitored for hemodynamic stability in transit. Assessment of adequate perfusion to and motor function of the lower extremities is ensured. Postoperative orders for medications, imaging, and

laboratories are written. The procedure and outcome are discussed with family. A brief operative note is written. Postoperative imaging is reviewed. An operative report is dictated which includes a detailed description of all radiographic images. A copy is sent to the referring physician. The surgeon typically spends 60 minutes or more providing critical care, ensuring hemodynamic and cardiovascular stability. Instructions for neurological monitoring and the management of lumbar drain care are provided to ICU staff along with a detailed postoperative examination. Ongoing neurological monitoring is performed. Cerebral spinal fluid (CSF) drainage amounts are carefully directed by the surgeon, when necessary, to provide adequate spinal perfusion pressure but not result in CSF drainage complications. To maintain an appropriate spinal perfusion pressure, vasoactive agents are titrated and directed by the surgeon in combination with other factors such as laboratory values and oxygen administration for spinal cord perfusion and protection. The surgeon must be present to ensure these orders are performed as spinal cord ischemia can result with only a short window of time for remedy. Additional post-operative care is communicated with the ICU staff. Careful monitoring for any complaints of pain or neurovascular compromise is performed at all postoperative in-hospital visits, particularly in the first 24 hours, but continues for 72 hours postoperatively and spinal cord care is directed by the surgeon. Exam requires close monitoring for neurological changes, chest or abdominal tenderness, upper extremity motor function, lower extremity motor function, and lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are performed as is neurologic evaluation for any signs of spinal cord ischemia. Upper and lower extremities are assessed for emboli and adequate perfusion is ensured. Hemoglobin and coagulation laboratory results are monitored daily. The need for routine or advanced imaging is assessed daily. Postoperative CT scans are obtained, either during the inpatient stay or early in the post discharge period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily. Discharge day management includes communicating with all support services, such as visiting nurses and referring physicians, reviewing interval chart notes, answering patient and family questions, evaluating all predischarge laboratory results, evaluating and redressing the incisions, assessing pain score, and performing medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, an interval history is solicited for ongoing or new symptoms; the chest is examined for tenderness; arterial access sites and surgical incisions are examined for inflammation, drainage, and wound infection. Upper and lower extremities are examined for adequate perfusion. Lower extremity strength is assessed. Diagnostic blood tests and/or imaging studies are ordered based on findings. Postoperative CT scans from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. Wound care is provided, as needed. Staples and sutures are removed as indicated. Patient and family questions are answered. Prescriptions for medication and therapy are written, as necessary. Progress is discussed with the referring physician (verbal and written). Progress notes are dictated/typed for the medical chart.

Technical skill required	0%	79%	21%
Physical effort required	0%	14%	86%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	7%	43%	50%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore TAG device. This was approximately 5 years after FDA approval of endovascular devices for abdominal aneurysm repair (EVAR). A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for the various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Fee Schedule and the values have not been reviewed since that time. In May 2022 the FDA approved the use of a thoracic branch endoprothesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR family.

The CPT panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR

Survey Methodology

A multi-disciplinary workgroup including SVS, SIR, and STS was convened. Approval to modify the survey instrument by adding a question regarding pre-planning time was obtained from the Research Subcommittee.

Pre-Service Time

Evaluation – package has 40 minutes. Survey median was 120. The specialties are recommending 100 minutes (40+60).

Pre Planning Time
CMS requested pre planning work be bundled in the main procedure and not report separately. *FedReg, Vol.79, No.219, p67664.*

For codes 33880 and 33882, survey respondents reported a median pre planning time of 60 minutes.

The pre planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required including: aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally the surgeon assesses perceived quality of the aorta, particularly in the seal zones, and tortuosity of the aorta. During this planning the surgeon reviews all available endograft sizes, from several vendors, and develop a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering in specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office, but more than 24 hours prior to the procedure.

33880 and 33882 involve coverage of and stent grafting into the subclavian artery, respectively. The extra 15 minutes of pre-planning time, in comparison to codes 33881, 33883, and 33886 is necessary for several reasons. For the 33882, additional measurements are required. These include aortic arch inner curve lengths, aortic arch outer curve lengths, diameters at the left carotid and subclavian, diameter of the subclavian origin, and distance to the vertebral artery. These measurements are necessary to ensure the correct device and to ensure a branched device is possible. Not all anatomy is suitable for a branched device. Additionally, since a branch is placed into the subclavian, one must ensure this does not cover the vertebral artery or LIMA in the setting of prior CABG. Both of these scenarios could be devastating. There is no room for manipulation in the OR. These pre-planning times align with our survey and with the clinical demands for these particular codes.

The specialties are recommending a total of 100 minutes for pre evaluation time - 40 for pre service evaluation and 60 for pre planning.

Positioning - package time is 3 minutes. Survey median is 20 minutes. The specialties are requesting an additional 17 minutes of positioning time to account for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with one arm extended and another tucked or positioned over the head, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is identical to the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708)

33882 has 20 minutes of pre-positioning time. This is 5 minutes more than the other 33880, 33881, 33883, and 33886. Since upper-extremity access is required, either with percutaneous or open approaches, the arm needs to be positioned in such a way that it does not interfere with the fluoroscopy equipment and that the image intensifier can move freely with the arm positioned out. Additionally, extra care is required to ensure specific visualization of the vertebral and carotid arteries. Anesthesia lines and monitoring equipment often needs to be adjusted further beyond the other codes. This time aligns with our survey and is clinically appropriate.

SDW – package is 20 minutes. Survey median time is 15 min. The specialties are recommending deleting 5 min from the survey time to achieve the 15 minutes of SDW package time.

Post-Service Time

For CPT Codes 33882 - package time is 33 minutes. Survey median time is 40 minutes. The specialties are recommending an additional 7 minutes to complete the operative note, which includes review of all images and cines in relation to the aortic arch vessels, subclavian, and vertebral arteries, annotate appropriate images, dictate radiologic findings, and document radiation exposure and contrast volumes.

Post Operative Hospital Care

While our survey respondents confirmed the number of hospital visits has stayed the same for TEVAR codes, there was uniform consensus among the respondents that ICU level care is provided by the surgeon in the post-operative period. Thoracic endografting has significantly changed since the initial codes were valued in 2005. When thoracic endografts were in their infancy, typically short endografts were placed with specific aneurysmal anatomy. Patients with unfavorable endovascular anatomy were treated open or not treated at all. These patients have always been transferred to the ICU immediately post-operatively, but any critical care work was generally done by dedicated critical care personnel. Spinal cord ischemia is a devastating complication for any thoracic aortic work. Protection for open thoracic and thoraco-abdominal aneurysm repairs was commonplace with lumbar drains and other adjuncts. At this same time, given short endograft coverage, spinal cord ischemia was uncommon and prophylactic lumbar drains were unusual.

Hospital care has since changed for these patients. Endovascular repair for thoracic pathology is now the default treatment paradigm for pathology distal to the left carotid artery. The range of pathologies has increased from simple aneurysms to now include not only aneurysms, but dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider age range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches. Longer segments of aorta are now routinely covered, increasing the risk of spinal cord ischemia. Lumbar drains are now typically used for elective TEVAR cases. These drains were *required* in the primary trial for the TBE device. Spinal cord ischemia is a devastating complication which is best understood and managed by the operating surgeon. Lumbar drains are typically placed by neurosurgery or anesthesiology prior to surgery in the operating room. During the case, lumbar drain management (amount to drain) and blood pressure goals are driven by the operating surgeon. This continues when the patient leaves the OR and is transferred to the ICU. The first 24-48 hours are the critical window where the spinal cord is at greatest risk for malperfusion and subsequent ischemia/paralysis. The surgeon guides and personally performs regular neurologic assessments to ensure adequate neurologic function. Perfusion to the spinal cord is measured as spinal cord perfusion pressure (SCPP). This is mean arterial pressure (MAP) minus intra-spinal pressure (ISP). The two components of this, MAP and ISP, are both managed by the operating surgeon. Specific goal directed blood pressure management with pressors and ionotropes are directed by the surgeon. Fluid resuscitation and how much is directed by the surgeon. Over-reaching with MAP goals can compromise the repair and access sites, so tight MAP goals are paramount. Drain management is also typically the responsibility of the surgeon. To ensure low ISP, Cerebral Spinal Fluid (CSF) is drained at regular intervals and varying amounts to ensure low ISP and thus, high SCPP. The amount to drain is based upon ISP and determined at least hourly. Too much drainage can result in headaches, intraspinal hematomas, and even herniation if not managed correctly. BP and ISP

management, in conjunction with regular neurologic assessments, is critical to ensure spinal perfusion and minimize risk of paralysis. Given the tenuous nature of these patients, this care is reserved for the operating surgeon.

Our survey respondents felt 3 inpatient visits were typical, plus a discharge day for all codes. 33880, 33881, 33882, 33883, and 33886 all have 1 ICU visit. The additional complexity for 33880 and 33882 for 1 99233 and 1 99232 visit involve the continued complexity on the second day for monitoring for left upper extremity perfusion and for additional neurological exams necessary to ensure no cerebral infarcts or strokes. The 33881, 33883, and 33886 do not require this additional evaluation and thus require two 99232 visits. All inpatient visits align with our survey and correlate clinically.

Post Operative Office Visits

While the number of TEVAR post-operative visits has not changed, our survey respondents did indicate these are more complex visits. It is the consensus of the expert panel these visits are generally performed 1-2 weeks following hospital discharge and 4-6 weeks following discharge. The first visit is generally a low complexity visit of at least 20 minutes (99213). Incisions are checked and wound care is provided. A neurovascular assessment is performed. On the second visit, this is of moderate complexity and typically lasts 30 minutes or more. Much of this time is spent by the operating surgeon reviewing the postoperative CT scan. This is from the aortic arch to femoral vessels with fine cuts. The CT is uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. This is done separately from any radiologist interpretation. Given the increased complexity and treatment length of these, more work is required to review these images and discuss them with the patient compared to 20 years ago when the codes were first valued.

Comparison with Key Reference Services

There were 5 codes that were chosen most often as key reference services for 33880-33882

- 34701, *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for **other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34705*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34706*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*
- 34708*, Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)*
- 34718*, Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral*

The following table incorporates our recommended RVW for 33880-33882 and 35602 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office

Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. The specialty societies offer the following codes as brackets for the TEVAR recommendations:

- MPC 35301, *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*
- MPC 33534, *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35301 MPC	21.16	0.104	404	40	15	20	120	30	33, 32, 38	13x2
33886	**23.50**	**0.105**	**486**	**85**	**15**	**15**	**90**	**30**	**91, 32x2, 38**	**14, 13**

Recommendation

33882 (TBE) is the only code in this family that represents true new technology. Survey respondents were clear this was the procedure in this set with the most complexity and longest time. This procedure is several procedures in one. Like the other codes in this set, this includes all pre-service planning, catheter placement and radiographic S&I. The extra

time and intensity, compared to the other TEVAR codes, is justified clinically. An additional left upper extremity access site is required with TBE. A wire and catheter are placed past the vertebral, LIMA, and subclavian arteries into the descending aorta. This wire is then snared/captured from the bottom and pulled through the femoral access. This typically takes 5-10 minutes. The TBE graft is advanced over 2 wires, with care to ensure the wires are not twisted or wrapped. Doing so could result in significant difficulties and complication during deployment. The graft is advanced to the origin of the left common carotid artery. Multiple fluoroscopic and digital subtraction angiograms are performed to confirm the origin of the left carotid as coverage could result in profound cerebral ischemia and stroke. The graft is positioned confirming the portal of the graft is properly oriented in relation to the left subclavian artery. Misalignment would render the graft un-usable.

Finally, the subclavian graft is advanced through the portal into the left subclavian artery, ensuring the vertebral and LIMA (if applicable) are not covered. Additional angiography confirms this. The two components are ballooned and the remaining TEVAR portion of the case commences. This extra time is intense and takes at least 60 additional minutes above a standard TEVAR.

We recommend the 25th percentile survey value of 39.00 RVW. This procedure is currently reported with the unlisted vascular code 37799 making comparison impossible.

Summary

The new family of CPT codes for TEVAR represent a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family better describes the current practice of TEVAR and conforms with current concepts in code creation and valuation. Additionally, with deletion of bypass codes at the time of TEVAR, this will help simplify coding by reducing the number of codes which describe the same work, leading to confusion and improper coding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Sometimes

Specialty Thoracic/Cardiac Surgery How often? Sometimes

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33881

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33883 Tracking Number O4 Original Specialty Recommended RVU: **24.25**
Presented Recommended RVU: **24.25**
Global Period: 090 Current Work RVU: **21.09** RUC Recommended RVU: **24.25**

CPT Descriptor: Delayed placement of proximal extension prosthesis(es) not involving coverage of the left subclavian artery origin, after endovascular repair of the thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction underwent endovascular repair of descending thoracic aortic aneurysm one year ago. On follow-up CT scan he is found to have a proximal endoleak. Endovascular repair with a proximal extension prosthesis is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 5% , Overnight stay-less than 24 hours 18% , Overnight stay-more than 24 hours 77%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery. However, it must be completed several days prior to surgery to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is a primary determinant of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used, permitting iterative modeling of a virtual device within the aorta in multiplanar views and centerline of flow analysis. The physician manually adjusts the modeling for altered anatomy, which is tortuous or thrombus laden. Orthogonal centerline imaging is used to determine diameter measurements of the ascending aorta, aortic arch, thoracic aorta, and previously placed endograft. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence, and stenosis require consideration as they may impact device delivery. Cross section, longitudinal, and centerline of flow measurements, with manual adjustments where needed, are used to map the distances between the subclavian artery and the prior graft. A stretched/straightened view permits manual validation of the computer-generated lengths. Review of operative records ensures correct diameter of the prior endograft. Preservice work also includes the procedural workup. Preservice work necessarily includes review of surgical indication, physical exam findings, current medications, and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family, including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the OR after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine, and activated coagulation time testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required

devices. Imaging studies are uploaded on the OR computers and placed on monitors for easy viewing during the operative procedure. If deemed necessary by the surgeon, a lumbar drain is placed by an appropriate physician. The surgeon supervises appropriate patient positioning on the OR table and ensures that fluoroscopy is functional and that desired imaging angles are attainable with the available equipment. The surgeon changes into radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile preparation of access site(s) and subsequent draping. The surgeon leads the preprocedural time-out.

Description of Intra-Service Work: Perform road-mapping arteriogram with specific attention to great vessel artery origins, celiac origin; image aortic arch in multiple projections to determine exact orthogonal coordinates to deploy prosthesis. Wait for anesthesia to insert and adjust TEE, if employed. Re-confirm availability of endovascular components for correct models, diameters, lengths, etc. Surgeon directs the patient to be anticoagulated with bolus dose heparin and directs anesthesia to maintain this effect throughout the case. Surgeon then exchanges soft j-wires for superstiff lunderquist wires. The component is unpacked and inspected for damage. The device is then prepared for insertion. It is then loaded over the superstiff wire and advanced to the femoral artery. The carrier tip is introduced into the arteriotomy. The proximal vascular clamp is opened and the leading edge of the graft is advanced to the artery. Rubber constrictor loops are utilized to minimize blood loss. Under careful fluoroscopic guidance the surgeon directs the first component and carrier through the external iliac, common iliac, and abdominal aorta. The device is navigated into the thoracic aorta through the previously placed components up to the arch, employing extreme care so nose-cone lies in the aortic arch with leading edge of component just to the left subclavian origin. Fluoroscopy is used in multiple projections to assure the trailing edge of the endograft overlaps the previous component adequately. Angiography is employed to confirm great vessel origins in relation to the leading edge of the device. The surgeon asks anesthesiology to check position with TEE (if used). The surgeon instructs the anesthesiologist to lower blood pressure and waits for desired effect. Deployment of the endograft is begun, making final precise adjustments to align leading edge of component in arch, just beyond the left subclavian origin. Contrast injections in multiple planes are performed to ensure final exact positioning prior to complete deployment. Endograft deployment is completed. The carrier is advanced to recapture the nosecone. The carrier and nosecone are retracted with care not to disturb the component or prior components. The carrier is withdrawn through the descending thoracic aorta and through iliac arteries with care not to disrupt iliacs. The component carrier is removed through the femoral artery and the femoral artery is re-clamped. A compliant balloon is introduced under fluoro guidance, advance through iliac, abdominal aorta, thoracic aorta, to arch. Anesthesiology is notified the aortic arch is about to be occluded; reduce BP as needed. The compliant balloon is inflated under constant fluoroscopic observation to expand and seat the component with prior components and to the aortic wall. The balloon is deflated and carefully retracted past the first component and out of the femoral artery. A multi-sideport catheter is advanced into the aortic arch and a contrast injection is performed to image the graft and confirm accurate placement. Additional ballooning or other maneuvers are performed, as required, to treat leaks. A multi-sideport catheter is introduced into the aortic arch and a final arteriogram is performed and interpreted to determine appropriate coverage, patency of major arteries, and absence of endoleaks. Completion pressure measures are obtained. All catheters, wires, and sheaths are removed using fluoroscopic guidance.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is assisted with transfer from the operating table to the gurney. The patient is monitored for hemodynamic stability in transit. Assessment of adequate perfusion to and motor function of the lower extremities is ensured. Postoperative orders for medications, imaging, and laboratories are written. The procedure and outcome are discussed with family. A brief operative note is written. Postoperative imaging is reviewed. An operative report is dictated which includes a detailed description of all radiographic images. A copy is sent to the referring physician. The surgeon typically spends 60 minutes or more providing critical care, ensuring hemodynamic and cardiovascular stability. Instructions for neurological monitoring and the management of lumbar drain care are provided to ICU staff along with a detailed postoperative examination. Ongoing neurological monitoring is performed. Cerebral spinal fluid (CSF) drainage amounts are carefully directed by the surgeon, when necessary, to provide adequate spinal perfusion pressure but not result in CSF drainage complications. To maintain an appropriate spinal perfusion pressure, vasoactive agents are titrated and directed by the surgeon in combination with other factors such as laboratory values and oxygen administration for spinal cord perfusion and protection. The surgeon must be present to ensure these orders are performed as spinal cord ischemia can result with only a short window of time for remedy. Additional post-operative care is communicated with the ICU staff. Careful monitoring for any complaints of pain or neurovascular compromise is performed at all postoperative in-hospital visits, particularly in the first 24 hours, but continues for 72 hours postoperatively and spinal cord care is directed by the surgeon. Exam requires close monitoring for neurological changes, chest or abdominal tenderness, upper extremity motor function, lower extremity motor function, and lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are performed as is neurologic evaluation for any signs of spinal cord ischemia. Upper and lower extremities are assessed for emboli and adequate perfusion is ensured. Hemoglobin and coagulation laboratory results are monitored daily. The

need for routine or advanced imaging is assessed daily. Postoperative CT scans are obtained, either during the inpatient stay or early in the post discharge period. Progress notes are recorded daily. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily. Discharge day management includes communicating with all support services, such as visiting nurses and referring physicians, reviewing interval chart notes, answering patient and family questions, evaluating all predischarge laboratory results, evaluating and redressing the incisions, assessing pain score, and performing medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, an interval history is solicited for ongoing or new symptoms; the chest is examined for tenderness; arterial access sites and surgical incisions are examined for inflammation, drainage, and wound infection. Upper and lower extremities are examined for adequate perfusion. Lower extremity strength is assessed. Diagnostic blood tests and/or imaging studies are ordered based on findings. Postoperative CT scans from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. Wound care is provided, as needed. Staples and sutures are removed as indicated. Patient and family questions are answered. Prescriptions for medication and therapy are written, as necessary. Progress is discussed with the referring physician (verbal and written). Progress notes are dictated/typed for the medical chart.

Technical skill required	10%	60%	30%
Physical effort required	0%	80%	20%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	30%	70%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore TAG device. This was approximately 5 years after FDA approval of endovascular devices for

abdominal aneurysm repair (EVAR). A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for the various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Fee Schedule and the values have not been reviewed since that time. In May 2022 the FDA approved the use of a thoracic branch endoprothesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR family.

The CPT panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR

Survey Methodology

A multi-disciplinary workgroup including SVS, SIR, and STS was convened. Approval to modify the survey instrument by adding a question regarding pre-planning time was obtained from the Research Subcommittee.

Pre-Service Time

Evaluation – package has 40 minutes. Survey median was 90. The specialties are recommending 85 minutes (40+45).

Pre Planning Time
CMS requested pre planning work be bundled in the main procedure and not report separately. *FedReg, Vol.79, No.219, p67664.*

For codes 33881, 33883, and 33886, survey respondents reported a median pre planning time of 45 minutes.

The pre planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required including: aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally the surgeon assesses perceived quality of the aorta, particularly in the seal zones, and tortuosity of the aorta. During this planning the surgeon reviews all available endograft sizes, from several vendors, and develop a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering in specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office, but more than 24 hours prior to the procedure.

The specialties are recommending a total of 85 minutes for pre evaluation time - 40 for pre service evaluation and 45 for pre planning.

Positioning - package time is 3 minutes. Survey median is 15 minutes. The specialties are requesting an additional 12 minutes of positioning time to account for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 min less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708)

SDW – package is 20 minutes. Survey median time is 15 min. The specialties are recommending deleting 5 min from the survey time to achieve the 15 minutes of SDW package time.

Post-Service Time

Post-service package 9B would apply for these complex procedures.

For CPT Codes 33880, 33881, 33883, 33886 - package time is 33 minutes. Survey median time is 30 minutes. The specialties reduced the recommended time to 30 minutes, the survey median.

Post Operative Hospital Care

While our survey respondents confirmed the number of hospital visits has stayed the same for TEVAR codes, there was uniform consensus among the respondents that ICU level care is provided by the surgeon in the post-operative period. Thoracic endografting has significantly changed since the initial codes were valued in 2005. When thoracic endografts were in their infancy, typically short endografts were placed with specific aneurysmal anatomy. Patients with unfavorable endovascular anatomy were treated open or not treated at all. These patients have always been transferred to the ICU immediately post-operatively, but any critical care work was generally done by dedicated critical care personnel. Spinal cord ischemia is a devastating complication for any thoracic aortic work. Protection for open thoracic and thoraco-abdominal aneurysm repairs was commonplace with lumbar drains and other adjuncts. At this same time, given short endograft coverage, spinal cord ischemia was uncommon and prophylactic lumbar drains were unusual.

Hospital care has since changed for these patients. Endovascular repair for thoracic pathology is now the default treatment paradigm for pathology distal to the left carotid artery. The range of pathologies has increased from simple aneurysms to now include not only aneurysms, but dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider age range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches. Longer segments of aorta are now routinely covered, increasing the risk of spinal cord ischemia. Lumbar drains are now typically used for elective TEVAR cases. These drains were *required* in the primary trial for the TBE device. Spinal cord ischemia is a devastating complication which is best understood and managed by the operating surgeon. Lumbar drains are typically placed by neurosurgery or anesthesiology prior to surgery in the operating room. During the case, lumbar drain management (amount to drain) and blood pressure goals are driven by the operating surgeon. This continues when the patient leaves the OR and is transferred to the ICU. The first 24-48 hours are the critical window where the spinal cord is at greatest risk for malperfusion and subsequent ischemia/paralysis. The surgeon guides and personally performs regular neurologic assessments to ensure adequate neurologic function. Perfusion to the spinal cord is measured as spinal cord perfusion pressure (SCPP). This is mean arterial pressure (MAP) minus intra-spinal pressure (ISP). The two components of this, MAP and ISP, are both managed by the operating surgeon. Specific goal directed blood pressure management with pressors and ionotropes are directed by the surgeon. Fluid resuscitation and how much is directed by the surgeon. Over-reaching with MAP goals can compromise the repair and access sites, so tight MAP goals are paramount. Drain management is also typically the responsibility of the surgeon. To ensure low ISP, Cerebral Spinal Fluid (CSF) is drained at regular intervals and varying amounts to ensure low ISP and thus, high SCPP. The amount to drain is based upon ISP and determined at least hourly. Too much drainage can result in headaches, intraspinal hematomas, and even herniation if not managed correctly. BP and ISP management, in conjunction with regular neurologic assessments, is critical to ensure spinal perfusion and minimize risk of paralysis. Given the tenuous nature of these patients, this care is reserved for the operating surgeon.

Post Operative Office Visits

While the number of TEVAR post-operative visits has not changed, our survey respondents did indicate these are more complex visits. It is the consensus of the expert panel these visits are generally performed 1-2 weeks following hospital discharge and 4-6 weeks following discharge. The first visit is generally a low complexity visit of at least 20 minutes (99213). Incisions are checked and wound care is provided. A neurovascular assessment is performed. On the second visit, this is of moderate complexity and typically lasts 30 minutes or more. Much of this time is spent by the operating surgeon reviewing the postoperative CT scan. This is from the aortic arch to femoral vessels with fine cuts. The CT is uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. This is done separately from any radiologist interpretation. Given the increased complexity and treatment length of these, more work is required to review these images and discuss them with the patient compared to 20 years ago when the codes were first valued.

Comparison with Key Reference Services

There were 5 codes that were chosen most often as key reference services for 33880-33882

- 34701, *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for **other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34705*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34706*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*
- 34708*, Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)*
- 34718*, Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral*

The following table incorporates our recommended RVW for 33880-33882 and 35602 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office

Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. The specialty societies offer the following codes as brackets for the TEVAR recommendations:

- MPC 35301, *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*
- MPC 33534, *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35301 MPC	21.16	0.104	404	40	15	20	120	30	33, 32, 38	13x2
33886	**23.50**	**0.105**	**486**	**85**	**15**	**15**	**90**	**30**	**91, 32x2, 38**	**14, 13**

33534 MPC	39.88	0.110	717	60	15	20	193	40	91, 33x3, 32, 31, 38	14, 12

Recommendation

For CPT Code 33883, the specialty societies recommend the 25th percentile survey value of 24.25 RVW. This represents a ***decrease of 10.7%*** from current value of 27.17 RVWs by current coding convention.

Comparison to existing codes is a difficult process due to bundling of the new codes to include pre-service planning, all radiologic S&I, catheter selection, and all extensions when compared to the existing codes. To calculate the current RVW using current coding convention, one would begin with the existing work of 33883. The work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiply by 0.5 for the multiple procedure reduction. The radiologic supervision and interpretation for TEVAR extension without subclavian coverage is then added. This total would typically be 27.17. Comparing this computed existing value with our proposed value for 33883 results in a ***10.7% reduction***. The following table is a graphic explanation of this comparison.

Existing Delayed TEVAR Proximal Extension without Subclavian Coverage	Work RVU	Adjustment	Adjusted Work RVU
33883 Delayed TEVAR proximal extension without coverage of subclavian	21.09	None	21.09
36200-50 Bilateral catheter in aorta	2.77	Bilaterality & MPPR	2.08
75958 Rad S&I code for delayed TEVAR extension without subclavian coverage	4.00	None	4.00
Total existing coding sequence			**27.17**
New Code			

33883 New Code	24.25	None	**24.25**
Change Existing to New			**-10.7%**

Summary

The new family of CPT codes for TEVAR represent a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family better describes the current practice of TEVAR and conforms with current concepts in code creation and valuation. Additionally, with deletion of bypass codes at the time of TEVAR, this will help simplify coding by reducing the number of codes which describe the same work, leading to confusion and improper coding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33883

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Sometimes

Specialty Thoracic/Cardiac Surgery How often? Sometimes

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 286
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current RUC database (2023 utilization)

Specialty Vascular Surgery Frequency 169 Percentage 71.30 %

Specialty Thoracic/Cardiac Surgery Frequency 38 Percentage 16.03 %

Specialty Interventional Radiology Frequency 6 Percentage 2.53 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33883

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33886 Tracking Number O5 Original Specialty Recommended RVU: **23.50**

CPT Descriptor: Delayed placement of distal extension prosthesis(es) from the level of the left subclavian artery to the celiac artery, after endovascular repair of descending thoracic aorta, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction underwent endovascular repair of descending thoracic aortic aneurysm one year ago. On follow-up CT scan he is found to have a distal endoleak. Endovascular repair with a distal extension prosthesis is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 5% , Overnight stay-less than 24 hours 20% , Overnight stay-more than 24 hours 75%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preservice endograft planning: Extensive and detailed review of the preoperative imaging studies is required to determine the exact measurements of the aneurysm and to select the precise, correct endograft. This work is unique in that it would not be performed until after the decision for surgery. However, it must be completed several days prior to surgery to ensure that all required implants are ordered and have arrived on site before surgery begins. An accurate preoperative choice of component diameters and lengths is a primary determinant of whether the endovascular procedure will be successful, so this work must be done carefully. Cross-sectional imaging from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used, permitting iterative modeling of a virtual device within the aorta in multiplanar views and centerline of flow analysis. The physician manually adjusts the modeling for altered anatomy, which is tortuous or thrombus laden. Orthogonal centerline imaging is used to determine diameter measurements of the thoracic aorta, previously placed endograft, and the paravisceral aorta. The iliac and femoral diameters also determine the success of the device delivery and any potential adjunctive maneuvers that may be required to facilitate delivery. Tortuosity, calcification, thrombus presence, and stenosis require consideration as they may impact device delivery. Cross section, longitudinal, and centerline of flow measurements, with manual adjustments where needed, are used to map the distances between the prior graft and the celiac artery. A stretched/straightened view permits manual validation of the computer-generated lengths. Review of operative records ensures correct diameter of the prior endograft. Preservice work also includes the procedural workup. Preservice work necessarily includes review of surgical indication, physical exam findings, current medications, and all laboratory test results. Careful final review of imaging is performed. The proposed procedure is discussed with the patient and family, including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The endograft, catheters, and introducer sheaths are brought into the OR after verification of appropriate diameters and lengths. Assessment is made for the need for stand-by devices (eg, balloons) that might be needed emergently. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine, and activated coagulation time testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with all required devices. Imaging studies are uploaded on the OR computers and placed on monitors for easy viewing during the operative

procedure. If deemed necessary by the surgeon, a lumbar drain is placed by an appropriate physician. The surgeon supervises appropriate patient positioning on the OR table and ensures that fluoroscopy is functional and that desired imaging angles are attainable with the available equipment. The surgeon changes into radiation protection gear, ensures that all who will be in the suite do likewise, and supervises sterile preparation of access site(s) and subsequent draping. The surgeon leads the preprocedural time-out.

Description of Intra-Service Work: Perform road-mapping arteriogram with specific attention to great vessel artery origins, celiac origin; image aortic arch in multiple projections to determine exact orthogonal coordinates to deploy prosthesis. Wait for anesthesia to insert and adjust TEE, if employed. Re-confirm availability of endovascular components for correct models, diameters, lengths, etc. Surgeon directs the patient to be anticoagulated with bolus dose heparin and directs anesthesia to maintain this effect throughout the case. Surgeon then exchanges soft j-wires for superstiff lunderquist wires. The component is unpacked and inspected for damage. The device is then prepared for insertion. It is then loaded over the superstiff wire and advanced to the femoral artery. The carrier tip is introduced into the arteriotomy. The proximal vascular clamp is opened and the leading edge of the graft is advanced to the artery. Rubber constrictor loops are utilized to minimize blood loss. Under careful fluoroscopic guidance the surgeon directs the first component and carrier through the external iliac, common iliac, and abdominal aorta. The device is navigated into the descending thoracic aorta through the previously placed components. Fluoroscopy is used in multiple projections to assure the leading edge of the endograft overlaps the previous component adequately. Angiography is employed to confirm celiac origin in relation to the trailing edge of the device. The surgeon ensures the endograft will not cover the celiac artery origin. The surgeon asks anesthesiology to check position with TEE (if used). The surgeon instructs the anesthesiologist to lower blood pressure and waits for desired effect. Deployment of the endograft is begun, making final precise adjustments to align trailing edge of the component with the celiac origin. Contrast injections in multiple planes are performed to ensure final exact positioning prior to complete deployment. Endograft deployment is completed. The carrier is advanced to recapture the nosecone. The carrier and nosecone are retracted with care not to disturb the component or prior components. The carrier is withdrawn through the descending thoracic aorta and through iliac arteries with care not to disrupt iliacs. The component carrier is removed through the femoral artery and the femoral artery is re-clamped. A compliant balloon is introduced under fluoro guidance, advance through iliac, abdominal aorta, thoracic aorta. Anesthesiology is notified the thoracic aorta is about to be occluded; reduce BP as needed. The compliant balloon is inflated under constant fluoroscopic observation to expand and seat the component with prior components and to the aortic wall. The balloon is deflated and carefully retracted past the first component and out of the femoral artery. A multi-sideport catheter is advanced into the aortic arch and a contrast injection is performed to image the graft and confirm accurate placement. Additional ballooning or other maneuvers are performed, as required, to treat leaks. A multi-sideport catheter is introduced into the aortic arch and a final arteriogram is performed and interpreted to determine appropriate coverage, patency of major arteries, and absence of endoleaks. Completion pressure measures are obtained. All catheters, wires, and sheaths are removed using fluoroscopic guidance.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is assisted with transfer from the operating table to the gurney. The patient is monitored for hemodynamic stability in transit. Assessment of adequate perfusion to and motor function of the lower extremities is ensured. Postoperative orders for medications, imaging, and laboratories are written. The procedure and outcome are discussed with family. A brief operative note is written. Postoperative imaging is reviewed. An operative report is dictated which includes a detailed description of all radiographic images. A copy is sent to the referring physician. The surgeon typically spends 60 minutes or more providing critical care, ensuring hemodynamic and cardiovascular stability. Instructions for neurological monitoring and the management of lumbar drain care are provided to ICU staff along with a detailed postoperative examination. Ongoing neurological monitoring is performed. Cerebral spinal fluid (CSF) drainage amounts are carefully directed by the surgeon, when necessary, to provide adequate spinal perfusion pressure but not result in CSF drainage complications. To maintain an appropriate spinal perfusion pressure, vasoactive agents are titrated and directed by the surgeon in combination with other factors such as laboratory values and oxygen administration for spinal cord perfusion and protection. The surgeon must be present to ensure these orders are performed as spinal cord ischemia can result with only a short window of time for remedy. Additional post-operative care is communicated with the ICU staff. Careful monitoring for any complaints of pain or neurovascular compromise is performed at all postoperative in-hospital visits, particularly in the first 24 hours, but continues for 72 hours postoperatively and spinal cord care is directed by the surgeon. Exam requires close monitoring for neurological changes, chest or abdominal tenderness, upper extremity motor function, lower extremity motor function, and lower extremity tenderness. All arterial access sites are monitored for bleeding or hematoma formation. Tight control of blood pressure is critical. Urinary output is followed closely for signs of hypovolemia. Frequent pulse and perfusion checks are performed as is neurologic evaluation for any signs of spinal cord ischemia. Upper and lower extremities are assessed for emboli and adequate perfusion is ensured. Hemoglobin and coagulation laboratory results are monitored daily. The need for routine or advanced imaging is assessed daily. Postoperative CT scans are obtained, either during the inpatient stay or early in the post discharge period. Progress notes are recorded daily. Patient and family questions are answered.

Orders are updated daily. Rounds with nursing staff and other consultants are performed daily. Discharge day management includes communicating with all support services, such as visiting nurses and referring physicians, reviewing interval chart notes, answering patient and family questions, evaluating all predischarge laboratory results, evaluating and redressing the incisions, assessing pain score, and performing medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, an interval history is solicited for ongoing or new symptoms; the chest is examined for tenderness; arterial access sites and surgical incisions are examined for inflammation, drainage, and wound infection. Upper and lower extremities are examined for adequate perfusion. Lower extremity strength is assessed. Diagnostic blood tests and/or imaging studies are ordered based on findings. Postoperative CT scans from the aortic arch to femoral vessels with fine cuts are reviewed and uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. Wound care is provided, as needed. Staples and sutures are removed as indicated. Patient and family questions are answered. Prescriptions for medication and therapy are written, as necessary. Progress is discussed with the referring physician (verbal and written). Progress notes are dictated/typed for the medical chart.

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	3%	30%	50%	17%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	13%	30%	57%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	13%	30%	57%
Physical effort required	3%	57%	40%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	27%	73%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	50%	50%	0%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	17%	33%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	17%	33%	50%
Physical effort required	17%	33%	50%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	33%	67%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore TAG device. This was approximately 5 years after FDA approval of endovascular devices for abdominal aneurysm repair (EVAR). A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for the various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Fee Schedule and the values have not been reviewed since that time. In May 2022 the FDA approved the use of a thoracic branch endoprothesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR family.

The CPT panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR

Survey Methodology

A multi-disciplinary workgroup including SVS, SIR, and STS was convened. Approval to modify the survey instrument by adding a question regarding pre-planning time was obtained from the Research Subcommittee.

Pre-Service Time

Evaluation – package has 40 minutes. Survey median was 90. The specialties are recommending 85 minutes (40+45).

Pre Planning Time
CMS requested pre planning work be bundled in the main procedure and not report separately. *FedReg, Vol.79, No.219, p67664.*

For codes 33881, 33883, and 33886, survey respondents reported a median pre planning time of 45 minutes.

The pre planning time review includes confirming the suitability of the anatomy for TEVAR. To do this, a large number of measurements are required including: aortic diameters throughout the aorta, outer and inner curve lengths, center-line lengths from arch vessels to the celiac, subclavian diameters, distance from the left subclavian to the vertebral artery, and diameters of the access vessels (common femoral, external iliac, and common iliac arteries). Additionally the surgeon assesses perceived quality of the aorta, particularly in the seal zones, and tortuosity of the aorta. During this planning the surgeon reviews all available endograft sizes, from several vendors, and develop a specific operative plan and device selection that will successfully treat the pathology at hand. This may require ordering in specific devices and components which are not readily available at the surgeon's institution. This service is provided after evaluation in the office, but more than 24 hours prior to the procedure.

The specialties are recommending a total of 85 minutes for pre evaluation time - 40 for pre service evaluation and 45 for pre planning.

Positioning - package time is 3 minutes. Survey median is 15 minutes. The specialties are requesting an additional 12 minutes of positioning time given to account for positioning the imaging equipment and operating room equipment to minimize conflicts between equipment and patient during surgery, appropriately positioning the patient with arms tucked as indicated, and confirming that all EKG leads and IV, Foley and arterial catheter lines are clear from the areas to be imaged during the procedure. This extra time is 5 min less than the positioning time included with abdominal aortic aneurysm endovascular repair codes (34701-34708)

SDW – package is 20 minutes. Survey median time is 15 min. The specialties are recommending deleting 5 min from the survey time to achieve the 15 minutes of SDW package time.

Post-Service Time

Post-service package 9B would apply for these complex procedures.

For CPT Codes 33880, 33881, 33883, 33886 - package time is 33 minutes. Survey median time is 30 minutes. The specialties reduced the recommended time to 30 minutes, the survey median.

Post Operative Hospital Care

While our survey respondents confirmed the number of hospital visits has stayed the same for TEVAR codes, there was uniform consensus among the respondents that ICU level care is provided by the surgeon in the post-operative period. Thoracic endografting has significantly changed since the initial codes were valued in 2005. When thoracic endografts were in their infancy, typically short endografts were placed with specific aneurysmal anatomy. Patients with unfavorable endovascular anatomy were treated open or not treated at all. These patients have always been transferred to the ICU immediately post-operatively, but any critical care work was generally done by dedicated critical care personnel. Spinal cord ischemia is a devastating complication for any thoracic aortic work. Protection for open thoracic and thoraco-abdominal aneurysm repairs was commonplace with lumbar drains and other adjuncts. At this same time, given short endograft coverage, spinal cord ischemia was uncommon and prophylactic lumbar drains were unusual.

Hospital care has since changed for these patients. Endovascular repair for thoracic pathology is now the default treatment paradigm for pathology distal to the left carotid artery. The range of pathologies has increased from simple aneurysms to now include not only aneurysms, but dissections, penetrating aortic ulcers, and even traumatic ruptures. A wider age range of patients with a wider complexity of overall health are being treated with these minimally invasive approaches. Longer segments of aorta are now routinely covered, increasing the risk of spinal cord ischemia. Lumbar drains are now typically used for elective TEVAR cases. These drains were *required* in the primary trial for the TBE device. Spinal cord ischemia is a devastating complication which is best understood and managed by the operating surgeon. Lumbar drains are typically placed by neurosurgery or anesthesiology prior to surgery in the operating room. During the case, lumbar drain management (amount to drain) and blood pressure goals are driven by the operating surgeon. This continues when the patient leaves the OR and is transferred to the ICU. The first 24-48 hours are the critical window where the spinal cord is at greatest risk for malperfusion and subsequent ischemia/paralysis. The surgeon guides and personally performs regular neurologic assessments to ensure adequate neurologic function. Perfusion to the spinal cord is measured as spinal cord perfusion pressure (SCPP). This is mean arterial pressure (MAP) minus intra-spinal pressure (ISP). The two components of this, MAP and ISP, are both managed by the operating surgeon. Specific goal directed blood pressure management with pressors and ionotropes are directed by the surgeon. Fluid resuscitation and how much is directed by the surgeon. Over-reaching with MAP goals can compromise the repair and access sites, so tight MAP goals are paramount. Drain management is also typically the responsibility of the surgeon. To ensure low ISP, Cerebral Spinal Fluid (CSF) is drained at regular intervals and varying amounts to ensure low ISP and thus, high SCPP. The amount to drain is based upon ISP and determined at least hourly. Too much drainage can result in headaches, intraspinal hematomas, and even herniation if not managed correctly. BP and ISP management, in conjunction with regular neurologic assessments, is critical to ensure spinal perfusion and minimize risk of paralysis. Given the tenuous nature of these patients, this care is reserved for the operating surgeon.

Post Operative Office Visits

While the number of TEVAR post-operative visits has not changed, our survey respondents did indicate these are more complex visits. It is the consensus of the expert panel these visits are generally performed 1-2 weeks following hospital discharge and 4-6 weeks following discharge. The first visit is generally a low complexity visit of at least 20 minutes (99213). Incisions are checked and wound care is provided. A neurovascular assessment is performed. On the second visit, this is of moderate complexity and typically lasts 30 minutes or more. Much of this time is spent by the operating surgeon reviewing the postoperative CT scan. This is from the aortic arch to femoral vessels with fine cuts. The CT is uploaded to a workstation, where three-dimensional (3D) software is used to evaluate for possible endoleaks or other endograft complications. Clinical decisions are made regarding the need for repeat surgical intervention. This is done separately from any radiologist interpretation. Given the increased complexity and treatment length of these, more work is required to review these images and discuss them with the patient compared to 20 years ago when the codes were first valued.

Comparison with Key Reference Services

There were 5 codes that were chosen most often as key reference services for 33880-33882

- 34701, *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for* ***other than rupture*** *(eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34705*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation;* ***for other than rupture*** *(eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34706*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation;* ***for rupture*** *including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*
- 34708*, Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral;* ***for rupture*** *including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)*
- 34718*, Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed,* ***for other than rupture*** *(eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral*

The following table incorporates our recommended RVW for 33880-33882 and 35602 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office

Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. The specialty societies offer the following codes as brackets for the TEVAR recommendations:

- MPC 35301, *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*
- MPC 33534, *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35301 MPC	21.16	0.104	404	40	15	20	120	30	33, 32, 38	13x2
33886	**23.50**	**0.105**	**486**	**85**	**15**	**15**	**90**	**30**	**91, 32x2, 38**	**14, 13**

33534 MPC	39.88	0.110	717	60	15	20	193	40	91, 33x3, 32, 31, 38	14, 12

Recommendation

For CPT Code 33886, the specialty societies recommend the 25th percentile survey value of 23.50 RVW. This represents a ***decrease of 0.7%*** from current value of 23.67 RVWs by current coding convention.

Comparison to existing codes is a difficult process due to bundling of the new codes to include pre-service planning, all radiologic S&I, catheter selection, and all extensions when compared to the existing codes. To calculate the current RVW using current coding convention, one would begin with the existing work of 33886. The work of bilateral non-selective catheterization is added by multiplying the RVW for 36200 by 1.5 to account for the bilaterality and then multiply by 0.5 for the multiple procedure reduction. The radiologic supervision and interpretation for TEVAR extension without subclavian coverage is then added. This total would typically be 23.67. Comparing this computed existing value with our proposed value for 33886 results in a ***0.7% reduction***. The following table is a graphic explanation of this comparison.

Existing Delayed TEVAR Distal Extension	Work RVU	Adjustment	Adjusted Work RVU
33886 Delayed TEVAR distal extension	18.09	None	18.09
36200-50 Bilateral catheter in aorta	2.77	Bilaterality & MPPR	2.08
75959 Rad S&I code for delayed TEVAR extension without subclavian coverage	3.50	None	3.50
Total existing coding sequence			**23.67**

New Code			
33886 New Code	24.25	None	**23.50**
Change Existing to New			**-0.7%**

Summary

The new family of CPT codes for TEVAR represent a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family better describes the current practice of TEVAR and conforms with current concepts in code creation and valuation. Additionally, with deletion of bypass codes at the time of TEVAR, this will help simplify coding by reducing the number of codes which describe the same work, leading to confusion and improper coding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33886

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Sometimes

Specialty Thoracic/Cardiac Surgery How often? Sometimes

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 165
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current RUC database (2023 utilization)

Specialty Vascular Surgery Frequency 138 Percentage 71.13 %

Specialty Thoracic/Cardiac Surgery Frequency 35 Percentage 18.04 %

Specialty Interventional Radiology Frequency 4 Percentage 2.06 %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

CPT Descriptor: Bypass graft, with other than vein; carotid-contralateral carotid

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm descending thoracic aortic aneurysm. The aneurysm originates immediately beyond her left common carotid artery origin. To achieve a hemostatic proximal seal zone, an endoprosthesis will need to be deployed across (and therefore occlude) the origin of this vessel. To maintain blood flow to her brain, a cross-neck carotid-carotid bypass is performed using a synthetic conduit.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 100% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 21% , Overnight stay-more than 24 hours 79%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Preservice work includes review of surgical indication, physical exam findings, current medications, and all laboratory test results. Any adjunct imaging, including non-invasive vascular studies, CTA, MRA, cerebral angiogram, cardiac stress testing or other imaging, is carefully reviewed. The proposed procedure is discussed with the patient and family, including risks and expected recovery. Final informed consent is obtained. The physical exam, procedural plan, and consent are documented in the medical record. The access site(s) is marked. The surgeon ensures availability of pharmacologic and laboratory agents such as heparin, protamine, and activated coagulation time testing. In addition, the surgeon ensures all technical personnel have been familiarized with the upcoming procedure and that they are fully familiar with the procedure. The surgeon ensures all monitoring systems, including EEG/SSEP neuro-monitoring, are functioning. Imaging studies are uploaded on the OR computers and placed on monitors for easy viewing during the operative procedure. Correct graft conduit is selected and verified. The surgeon supervises appropriate patient positioning on the OR table. The surgeon supervises sterile preparation of incision sites and subsequent draping. The surgeon leads the preprocedural time-out.

Description of Intra-Service Work: 8cm bilateral neck incisions are made along the anterior borders of the sternocleidomastoid muscles. The platysma are divided and dissection continues through the soft tissues, mobilizing adjacent venous and nervous structures. Care is taken to avoid injuring these structures. The vagus nerve is particularly identified on each side. The facial vein is divided if necessary. The common carotid artery is cleared along its length for 5-6 cm, avoiding strong manipulation of the carotid artery which could disrupt plaque. Soft rubber loops are passed proximally and distally around both arteries. Very careful dissection is performed to create a soft tissue tunnel from one side of the neck to the other behind the pharynx. An appropriately sized synthetic conduit is passed through the tunnel. Once adequate exposure is achieved, intravenous heparin anticoagulation is administered. Proximal and distal vascular clamps are applied to the right common carotid artery. The artery is opened longitudinally and the first anastomosis of the bypass, between the conduit and the common carotid artery, is sewn with fine polypropylene sutures. The anastomosis is flushed to remove debris prior to completion of the suture line. Extreme care is taken to avoid air or other embolus from traveling up the carotid artery. The suture line is completed. A vascular clamp is applied to the graft, and clamps are then

removed from the carotid. Anastomotic leaks are sealed with additional sutures. The left common carotid artery is then clamped. An arteriotomy is created and the graft is trimmed to length. The second anastomosis is sewn with the end of the bypass conduit to the side of the carotid artery using fine polypropylene sutures. The anastomosis is flushed to remove debris to prevent cerebral embolization and the suture line is completed. Clamps are removed and leaks are sealed with additional sutures. All pulses are checked and flow is confirmed with a Doppler or ultrasound. The left common carotid artery just proximal to the anastomosis may be suture ligated at this point to help maintain patency of the carotid-carotid bypass graft. The wounds are irrigated copiously. Protamine is administered to reverse the effects of heparin. The surgeon waits for its affect and ensures hemostasis is sufficient. Tissue layers are closed sequentially with absorbable braded sutures. Skin is closed with suture or staples.

Description of Post-Service Work: Hospital: Sterile dressings are applied. The patient is assisted with transfer from the operating table to the gurney. A neurological exam is performed before the leaving the operating room. The patient is monitored for hemodynamic stability in transit to the intensive care unit. Postoperative orders for medications, imaging, and laboratories are written. The procedure and outcome are discussed with family. A brief operative note is written. An operative report is dictated, and a copy is sent to the referring physician. A discussion takes place with the family regarding the surgery. Postoperative imaging is reviewed. The plan of care is communicated with the ICU provider. These patients are typically co-managed with an intensivist. Extensive dissection of bilateral carotid arteries and the associated carotid body baroreceptors can result in significant instability. This instability typically requires application of and minute-to-minute adjustment of vasopressors such as norepinephrine or epinephrine. Some of these patients have paradoxical severe hypertension that requires nitroglycerin or nicardipine infusions to prevent reperfusion hyperemia and post-operative seizures. These decisions are made in partnership with the intensivist. Hemoglobin and coagulation laboratory results are monitored daily. The need for routine or advanced imaging is assessed daily. The patient is generally transferred out of the ICU after 24-48 hours under the care of the surgeon. Daily visits which include obtaining a relevant history, performing a physical exam including a detailed neurological examination and assessment of speech and swallow, are performed. Daily progress notes are recorded. Patient and family questions are answered. Orders are updated daily. Rounds with nursing staff and other consultants are performed daily. Discharge day management includes communicating with all support services, such as visiting nurses and referring physicians, reviewing interval chart notes, answering patient and family questions, evaluating all predischarge laboratory results, evaluating and redressing the incisions, assessing pain score, and performing medication reconciliation. Surgeon discusses home restrictions (ie, diet, activity, bathing) with patient and family members; writes orders for home care, discharge medications and supplies; and completes all appropriate medical records, including day of discharge progress notes and final discharge instructions.

Office: At each office visit, an interval history is solicited for ongoing or new symptoms; the neck is examined for tenderness; surgical incisions are examined for inflammation, drainage, and wound infection. A thorough neurological exam is performed. Upper extremities are examined for adequate perfusion. Diagnostic blood tests and/or imaging studies are ordered based on findings. Postoperative CT scans or noninvasive vascular labs are reviewed for complications. Clinical decisions are made regarding the need for repeat surgical intervention. Wound care is provided, as needed. Staples and sutures are removed as indicated. Patient and family questions are answered. Prescriptions for medication and therapy are written, as necessary. Progress is discussed with the referring physician (verbal and written). Progress notes are dictated/typed for the medical chart

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	0%	37%	43%	20%

Mental Effort and Judgment	**Less**	**Identical**	**More**
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	10%	37%	53%

Technical Skill/Physical Effort	**Less**	**Identical**	**More**
Technical skill required	0%	40%	60%
Physical effort required	3%	47%	50%

Psychological Stress	**Less**	**Identical**	**More**
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	27%	73%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	10%	0%	60%	30%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	10%	90%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	0%	90%
Physical effort required	10%	0%	90%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	10%	0%	90%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Endovascular repair of thoracic aortic aneurysms (TEVAR) received FDA approval in March 2005 following the pivotal trial utilizing the Gore TAG device. This was approximately 5 years after FDA approval of endovascular devices for abdominal aneurysm repair (EVAR). A family of TEVAR codes was presented to the RUC in April 2005. At that time, TEVAR was typically performed by a team of physicians including vascular surgeons, cardiothoracic surgeons, and interventional radiologists. These codes utilized component coding to account for the various providers and portions of the procedure performed. The TEVAR family of codes appeared in the 2006 Medicare Physician Fee Schedule and the values have not been reviewed since that time. In May 2022 the FDA approved the use of a thoracic branch endoprothesis (TBE) during TEVAR procedures. This was the first new type of device to gain FDA approval within the TEVAR family.

The CPT panel approved TEVAR coding changes at the September 2024 CPT meeting. This recommendation includes 2 new codes, 4 revised codes, and 3 code deletions. The new family of codes updates the TEVAR family to current coding standards as outlined below:

1. Catheter placement is now bundled into the main procedure.
2. Radiologic supervision & interpretation is now bundled into the main procedure.
3. All proximal extensions performed at the time of TEVAR are now bundled into the main procedure.
4. A new code has been created for the distinct work required for a TBE, which includes all the work of a TEVAR
5. There will no longer be separate codes for extra-anatomic bypass surgery performed in conjunction with TEVAR

Survey Methodology

A multi-disciplinary workgroup including SVS, SIR, and STS was convened. The SVS and STS surveyed this particular code which is an open procedure.

Pre Planning Time

35602 does not have any pre-planning time since this is an open bypass code. This is not an endovascular/endograft code. The specialty socities used the standard package times to align with our survey, adjusting accordingly. Similar codes do not have pre-planning time and the expert panel did not feel this time was necessary for this code.

Pre-Service Time

Evaluation – package has 40 minutes. Survey median was 83 minutes. The specialties are recommending the package time of 40 minutes.

Positioning - package time is 3 minutes. Survey median is 17 minutes. The specialties are requesting an additional 12 minutes of positioning time,15 minutes total, given the positioning related to the neck incision. The patient is placed in the "beach chair" position. A shoulder role is typically placed. The neck is placed in the neutral position but should be free to move from side to side depending on which carotid is being operated on at the specific moment as both carotids will ultimately be dissected. This positioning is done in concert with anesthesia to ensure the endotracheal tube is not dislodged and does not become dislodged during the surgery. The endotracheal tube is secured appropriately under the observation of the surgeon to ensure an appropriate field for skin preparation. The common carotid arteries and the carotid bifurcations are marked. The two planned incisions are then subsequently marked. This extra positioning time is consistent with other vascular codes involving carotid dissection: carotid endarterectomy (35301), carotid-carotid bypass with vein (35501), Retrograde carotid stent (37217). Extra positioning time is externally similar to other procedures in the neck region: total thyroidectomy (60240) and excision of carotid body tumor (60605)

SDW – package is 20 minutes. Survey median time is 15 min. The specialties are recommending deleting 5 min from the survey time to achieve the 15 minutes of SDW package time.

Post-Service Time

For CPT Codes 35602 - package time is 33 minutes. Survey median time is 30 minutes. The specialties reduced the recommended time to 30 minutes, the survey median.

Post Operative Hospital Care

Our expert panel believes these patients are typically managed initially in the ICU following surgery and our survey respondents did not believe the surgeon was providing any of the critical care time. The expert panel agrees with this. An intensivist is typically providing care for blood pressure and other critical care needs, while the surgeon guides the specific parameters to be followed. This first day requires at least 50 minutes of time (99233). When the patient is transferred out of the ICU, all care, including neurologic assessments and blood pressure control, is performed by the surgeon. These 2 additional visits are of moderate complexity. On the day of discharge, greater than 30 minutes is spent to coordinate these activities which is consistent with our survey.

Our survey respondents felt 3 inpatient visits were typical, plus a discharge day for all codes. For code 35602, one 99233 visit is needed the first day, the complexity is due to blood pressure control requirements and a neurological assessment given clamping of the bilateral carotid arteries. The additional 2 inpatient visits are 99232 to reflect the less complexity and risk of stroke following the first 24 hours of surgery. All inpatient visits align with our survey and correlate clinically.

Post Operative Office Visits

It is the consensus of the expert panel 2 post-op visits are generally performed; 1-2 weeks following hospital discharge and 4-6 weeks following discharge. The first visit is generally a low complexity visit of at least 20 minutes (99213). Incisions are checked and wound care is provided. A neurovascular assessment is performed. On the second visit, this is of moderate complexity and typically lasts 30 minutes or more. A neurovascular assessment is again performed. Additional time is spent by the operating surgeon reviewing the postoperative imaging, either ultrasound, CT, physiologic testing, or some combination of all these. Clinical decisions are made regarding the need for repeat surgical intervention. This is done separately from any radiologist interpretation.

Comparison with Key Reference Services

There were 5 codes that were chosen most often as key reference services for 33880-33882

- 34701, *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for **other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34705*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*
- 34706*, Endovascular repair of infrarenal aorta and/or iliac artery(ies) by deployment of an aorto-bi-iliac endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the iliac bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the iliac bifurcation; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, traumatic disruption)*
- 34708*, Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; **for rupture** including temporary aortic and/or iliac balloon occlusion, when performed (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, traumatic disruption)*
- 34718*, Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, **for other than rupture** (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral*

The following table incorporates our recommended RVW for 33880-33882 and 35602 along with the key reference services identified for these codes arranged in ascending order of values.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office

Comparison to MPC codes

There are limited MPC codes in the RVW range of these complex procedures. The specialty societies offer the following codes as brackets for the TEVAR recommendations:

- MPC 35301, *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*
- MPC 33534, *Coronary artery bypass, using arterial graft(s); 2 coronary arterial grafts*

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	Office
35301 MPC	21.16	0.104	404	40	15	20	120	30	33, 32, 38	13x2

33534 MPC	39.88	0.110	717	60	15	20	193	40	91, 33x3, 32, 31, 38	14, 12

Recommendation

New CPT Code 35602 replaces existing code 33891. Existing CPT Code 33891 has a 000 day global period. New CPT Code 35602 is a 90 day global service making a direct comparison difficult. The existing value for CPT Code 33891 is 20.00 RVW. The specialty societies are recommending the 25th percentile survey value of 27.40 RVW for new CPT Code 35602. A more direct comparison can be estimated by using the RUC's IWPUT calculator to sum, the pre, intra and immediate post RVWs. This methodology would equal 18.86 RVW (1.35+16.84+0.67), lower than the current value of 20.00 RVW for existing CPT code 33891.

There are many clinical scenarios where this service would be applicable, not just in conjunction with TEVAR, resulting in a range of intensities. For example, when this is performed for atherosclerotic occlusive disease, clamping the carotid arteries in patients with already compromised cerebral flow is stressful. Risk of stroke, both ischemic and embolic, is a

real risk. The IWPUT of 0.112 is similar to other carotid surgeries, including carotid endarterectomy. Carotid endarterectomy, CPT Code 35301, is on our MPC list above with an IWPUT of 0.104.

The expert panel agrees with 2 post-operative visits. Based on the survey results data, both visits would reach the complexity of a 99214. However, the specialty societies are recommending one 99213 and one 99214, which they believe would be more in line with clinical practice.

Summary

The new family of CPT codes for TEVAR represent a complex set of operations that now include pre-planning, all radiologic supervision and interpretation, all routine catheterization, and all currently placed extensions at the initial time of TEVAR. This updated code family better describes the current practice of TEVAR and conforms with current concepts in code creation and valuation. Additionally, with deletion of bypass codes at the time of TEVAR, this will help simplify coding by reducing the number of codes which describe the same work, leading to confusion and improper coding.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 33891

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Sometimes

Specialty Thoracic/Cardiac Surgery How often? Sometimes

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 25 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Current RUC database (2022 utilization)

Specialty Vascular Surgery Frequency 19 Percentage 76.00 %

Specialty Cardiac/Thoracic Surgery Frequency 5 Percentage 20.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:
Major procedure

BETOS Sub-classification Level II:
Other

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 33886

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

Meeting Date: 01/2025

CPT Code	Long Descriptor	Global Period
33880	Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft covering the left subclavian artery and all aortic tube endograft extension(s) proximally in the aortic arch and ascending aorta and distally to the celiac artery, when performed	090
33881	Endovascular repair of thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation; by deployment of an aorto-aortic tube endograft not involving coverage of the left subclavian artery origin and all endograft extension(s) placed from the level of the left subclavian carotid artery to the celiac artery	090
33882	Endovascular repair of the thoracic aorta by deployment of a branched endograft multipiece system involving an aorto-aortic tube device with a fenestration for the left subclavian artery stent graft(s) and all aortic tube endograft extension(s) placed from the level of the left common carotid artery to the celiac artery, including preprocedure sizing and device selection, all target zone angioplasty, all nonselective catheterization(s) and left subclavian artery selective catheterization(s), and all associated radiological supervision and interpretation	090
33883	Delayed placement of proximal extension prosthesis(es) not involving coverage of the left subclavian artery origin, after endovascular repair of the thoracic aorta, including pre-procedure sizing and device selection, nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed	090
33886	Delayed placement of distal extension prosthesis(es) from the level of the left subclavian artery to the celiac artery, after endovascular repair of descending thoracic aorta, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation	090
35602	Bypass graft, with other than vein; carotid-contralateral carotid	090

Vignette(s) (*vignette required even if PE only code(s)***):**

CPT Code	Vignette
33880	A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm diameter descending thoracic aortic aneurysm that begins immediately beyond the origin of left subclavian artery. Endovascular repair of the descending thoracic aortic aneurysm is performed. The proximal extent of the endoprosthesis covers the left subclavian artery origin.

PRESENTER(S): Vigneshwar Kasirajan, MD (STS), Robert Kennedy, MD (SIR), Minhaj Khaja, MD (SIR), James Levett, MD (STS), Matthew Sideman, MD (SVS), Jonathan Thompson, MD (SVS) and Joseph Turek, MD (STS)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

33881	A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm diameter descending thoracic aortic aneurysm that begins several centimeters beyond the left subclavian artery origin. Endovascular repair of his descending thoracic aortic aneurysm is performed. The proximal portion of the endoprosthesis does not cover the left subclavian artery origin.
33882	A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm diameter descending thoracic aortic aneurysm that begins at the origin of left subclavian artery. Endovascular repair of the descending thoracic aortic aneurysm with a single branch endoprosthesis to the subclavian artery is performed.
33883	A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction underwent endovascular repair of descending thoracic aortic aneurysm one year ago. On follow-up CT scan he is found to have a proximal endoleak. Endovascular repair with a proximal extension prosthesis is performed.
33886	A 68-year-old male with hypertension, 50 pack-years smoking, and previous myocardial infarction underwent endovascular repair of descending thoracic aortic aneurysm one year ago. On follow-up CT scan he is found to have a distal endoleak. Endovascular repair with a distal extension prosthesis is performed.
35602	A 65-year-old female with hypertension, 50 pack-years smoking, and previous myocardial infarction is found to have a 7-cm descending thoracic aortic aneurysm. The aneurysm originates immediately beyond her left common carotid artery origin. To achieve a hemostatic proximal seal zone, an endoprosthesis will need to be deployed across (and therefore occlude) the origin of this vessel. To maintain blood flow to her brain, a cross-neck carotid-carotid bypass is performed using a synthetic conduit.

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society RVS Committee Expert Panel:

The specialty societies convened a consensus panel consisting of practicing physicians who perform the procedures. The consensus panel developed the PE recommendations based on best practices and RUC guidelines.

FACILITY DIRECT PE INPUTS

PRESENTER(S): Vigneshwar Kasirajan, MD (STS), Robert Kennedy, MD (SIR), Minhaj Khaja, MD (SIR), James Levett, MD (STS), Matthew Sideman, MD (SVS), Jonathan Thompson, MD (SVS) and Joseph Turek, MD (STS)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

2. Please provide reference code(s) for comparison on your spreadsheet. If you are making recommendations on an existing code, you are required to use the current direct PE inputs as your reference code but may provide an additional reference code for support. Provide an explanation for the selection of reference code(s) here:

The specialty societies included the current PE inputs for all the existing codes in this family. The specialty societies also included CPT Code 34701 as a reference code for new code 33882. CPT Code 34701 is a recently reviewed, facility only service, 90 day global period performed by the specialties making the recommendations for Tab 5.

NOTE: For services reviewed prior to the implementation of clinical activity codes in 2016-17, detail is not provided in the RUC database, please contact *Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org* for PE spreadsheets for your older reference codes.

3. Is this code(s) typically reported with an E/M service?

No

See the *Billed Together* tab in the RUC Database.

4. If you are requesting an increase over the aggregate current cost for clinical activities, supplies and equipment, please provide compelling evidence:

The specialty societies are recommending the standard 90 day package. The recommendations (eg, clinical labor, supplies, time on equipment) are directly related to the recommended office visits. Any increase over the aggregate current practice expense cost relates to CMS pricing. **Compelling evidence was accepted based on new technology and change in global period:** New code 33882 was created to describe a new stent that accommodates the left subclavian artery, thus new technology, and the bypass code 35602 is changing from a 000-day global to a 090-day global.

See the *PE compelling evidence guidelines* on the RUC Collaboration website. Be sure to explain if the increase can be entirely accounted for because of an increase in physician time.

CLINICAL STAFF ACTIVITIES

The RUC has agreed that there is a presumption of zero pre-service clinical staff time unless the specialty can provide evidence to the PE Subcommittee that any pre-service time is appropriate. The RUC agreed that with evidence some subset of codes may require either minimal or extensive use of clinical staff and has allocated time when appropriate (for example when a service describes a major surgical procedure). If the package times are not applicable, alternate times may be presented and should be justified for consideration by the Subcommittee.

5. Are the global periods of the codes transitioning? Information about the amount of pre-service clinical staff time and a rationale for the change from a 090-day global to a 000 or 010 day global should be described below.

CPT Code 35602 represents a current code (33891) transitioning from a 000 day service to a 90 day service.

FACILITY DIRECT PE INPUTS

CPT CODE(S):33880, 33881, 33882, 33883, 33886, 35602
SPECIALTY SOCIETY(IES): SIR, STS, SVS
PRESENTER(S): Vigneshwar Kasirajan, MD (STS), Robert Kennedy, MD (SIR), Minhaj Khaja, MD (SIR), James Levett, MD (STS), Matthew Sideman, MD (SVS), Jonathan Thompson, MD (SVS) and Joseph Turek, MD (STS)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

6. If you are recommending more minutes than the PE Subcommittee standards for clinical activities, you must provide rationale to justify the time:

N/A

7. If a clinical activity in your reference code(s) is being rolled into a similar clinical activity approved by the PE Subcommittee and assigned a clinical activity code (*please see 2nd worksheet tab in PE spreadsheet*), please explain the difference here:

N/A

8. Please provide a brief description of the clinical staff work for the following:
   a. Pre-Service period:

Clinical staff reviews all forms with patient and family to ensure all relevant history and diagnostic information is included. Staff coordinates collection and documentation of imaging/lab results, patient specific information and other relevant patient information for a surgical procedure. Clinical staff coordinates schedules. Clinical staff enters and records all clinical updates in EHR. Clinical staff interacts with facility to schedule space, supplies, equipment, and review checklists. Clinical staff reviews procedure, complication risk, process of recovery, and answers patient/family questions. Clinical staff reviews preoperative medication changes, preop diet restrictions, reviews patient medical status and answers final pre-admission questions.

   b. Service period (includes pre, intra and post):

Prior to discharge, office clinical staff will assist with necessary post-discharge care coordination. Coordination with other physicians and QHPs involved in the care of the patient for transfer of records. Transitioning discharge information to the surgeon office medical record, including medication list, correspondence and imaging or lab results pending at discharge.

   c. Post-service period:

The clinical staff work includes the standard activities involved in the E/M visit including ensuring the appropriate supplies are available in the room, ensuring imaging and lab reports are available, rooming and gowning the patient, reviewing current medications/allergies in EHR, obtaining vital signs, assisting with positioning, wound care, coordination of care, and cleaning of the room.

9. If you are recommending a new clinical activity, please provide a detailed explanation of why the new clinical activity is needed and cannot conform to any of the existing clinical activities (*please see 2nd worksheet tab in PE spreadsheet*):

N/A

10. If you wish to identify a new staff type, please include a very specific staff description, salary estimate and its source. Staff types or an identified and appropriate proxy must be listed by the Bureau of Labor Statistics (BLS). You can find the BLS database at http://www.bls.gov.

MEDICAL SUPPLIES & EQUIPMENT/INVOICES

11. ☐ Please check the box to confirm that you have provided invoices for all new supplies and/or equipment?

12. ☐ Please check the box to confirm that you have provided an estimate price on the PE spreadsheet for all new supplies and/or equipment?

13. If you wish to include a supply that is not on the Direct PE Inputs Medical Supplies Listing (*please see 4th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the supply input and invoice here:

N/A

14. Are you recommending a PE supply pack for this recommendation? Yes or No.
If Yes, please indicate if the pack is an established package of supplies as defined by CMS (eg, SA047 *pack, E/M visit*) or a pack that is commercially available?

SA048 pack, minimum multi-specialty visit SA053 pack, post-op incision care (suture & staple)

AMA/SPECIALTY SOCIETY RELATIVE VALUE UPDATE COMMITTEE (RUC)
PRACTICE EXPENSE SUMMARY OF RECOMMENDATION (SOR)

15. Please provide an itemized list of the contents for all supply kits, packs and trays included in your recommendation (*please see 8-10th worksheet tabs in PE spreadsheet*). Please include the description, CMS supply code, unit, item quantity and unit price (if available).

DESCRIPTION	Code	Unit	Item Qty
pack, minimum multi-specialty visit	**SA048**	**pack**	
paper, exam table		foot	7
gloves, non-sterile		pair	2
gown, patient		item	1
pillow case		item	1
cover, thermometer probe		item	1

DESCRIPTION	Code	Unit	Item Qty
pack, post-op incision care (suture & staple)	**SA053**	**pack**	
kit, staple removal		kit	1
kit, suture removal		kit	1
povidone soln (Betadine)		ml	10
gauze, sterile 4in x 4in		item	2
gloves, sterile		pair	1
steri-strip (6 strip uou)		item	2
swab-pad, alcohol		item	2
tape, surgical paper 1in (Micropore)		inch	12
tincture of benzoin, swab		item	1

16. If you wish to include an equipment item that is not on the Direct PE Inputs Equipment Listing (*please see 5th worksheet tab in PE spreadsheet*), a paid invoice is required. Identify and explain the equipment input and invoice here:

N/A

17. Please provide an estimate of the useful life of the new equipment item as required to calculate the equipment cost per minute:

N/A

18. Have you recommended equipment minutes for a computer or equivalent laptop/integrated computer, equipment item computer, desktop, w-monitor, ED021 or notebook (Dell Latitute D600), ED038?
    a. If yes, please explain how the computer is used for this service(s).

b. Is the computer used exclusively as an integral component of the service or is it also used for other purposes not specific to the code?
c. Does the computer include code specific software that is typically used to provide the service(s)?

N/A

19. List all the equipment included in your recommendation and the equipment formula chosen *(please see 7th worksheet tab in PE spreadsheet: Equipment minute formulas).* If you have selected "other formula" for any of the equipment please explain here:

The specialty societies are recommending the office visit formula for the following equipment items: EQ168 light, exam EF031 table, power

PE-ONLY CODES ADDITIONAL INFORMATION

20. (a) Estimate the number of times this service might be provided nationally in a one-year period?
(b) Estimate the number of times this service might be provided to Medicare patients nationally in a one-year period?

N/A

21. Please select a Professional Liability Insurance (PLI) crosswalk based on a similar specialty mix:

N/A

ADDITIONAL INFORMATION

22. If there is any other item(s) on your spreadsheet not covered in the categories above that requires greater detail/explanation, please include here:

ITEMIZED LIST OF CHANGES (FOLLOWING THE PE SUBCOMMITTEE MEETING)

NOTE: The PE spreadsheets will be updated and finalized in real-time at the meeting. PE SORs must be updated based on modifications made during the meeting and resubmitted asap. The PE SOR should match the updated PE spreadsheet. Please provide a list of the modifications made to the PE spreadsheet during the PE Subcommittee meeting in the space below with brief justification for the modification (e.g. Equipment item EF023 *table, exam* was changed to EF031 *table, power* as the power table is typical in the surgeon's office).

The PE SOR serves as key support for the spreadsheet and should include any important details/explanation for the inputs as these cannot be elaborated upon in the excel document itself.

Bilateral femoral access is required for TEVAR, with an associated skin incision. How this incision is closed is at the discretion of the surgeon, with either sutures or staples. At the Practice Expense Subcommittee, it was discussed the typical incision would be closed with staples. The specialties changed the suture and staple removal kit (SA053) to a staple removal kit (SA052).

Please submit the revised form electronically to Rebecca Gierhahn at rebecca.gierhahn@ama-assn.org.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Screen: PE High-Cost Supplies and High-Volume Growth (37220-37235)*

January 2025

Lower Extremity Revascularization – Tab 06

In October 2018, CPT codes 37225, 37227 and 37229 were identified by the Relativity Assessment Workgroup's (RAW's) PE High-Cost Supplies screen for services with non-facility Medicare utilization over 10,000, which were not reviewed in the last five years and include a supply item greater than $500. The RUC requested an action plan for the January 2019 RUC meeting proposing how to address these flagged services. The RAW reviewed the action plan for these services and noted that CMS repriced these supply items for 2019. The specialty societies indicated that they agreed these supply items were essential to perform CPT codes 37225, 37227 and 37229 and that the current repricing activity was appropriate. The RAW noted that CPT code 37229 was also identified on the High-Volume Growth screen at that meeting and the Workgroup agreed with the specialty societies to refer this entire family of services to CPT for revision to accommodate new technologies. The specialty societies worked with the CPT Editorial Panel and submitted multiple code change applications (CCAs). In September 2021, the CPT Editorial Panel did not approve of the proposed coding changes which suggested unbundling previous bundling efforts.

Since this issue was not addressed via the CPT process in September 2021, it was placed back on the RAW agenda for review. In April 2022, the RAW discussed the complexity of this issue and determined that coding clarification was still necessary. The RAW recommended that a joint CPT/RUC Workgroup be created to develop coding solutions for the endovascular revascularization (37220-37235) code family. In September 2022, CPT indicated the specialty societies should develop a CCA by the May 2024 CPT meeting. The specialties successfully submitted a CCA for the September 2024 CPT Editorial Panel meeting. The CPT Editorial Panel created four new subsections and 46 new codes to report lower extremity revascularization (LER) services. The 16 existing codes (37220-37235) to report these services were deleted.

The CPT Editorial Panel updated the code set to include more granularity to better reflect the large changes in technology and standards of practice since the code family was last updated 13 years ago, including the migration of many of these services to the outpatient and non-facility settings. The code set was updated to more appropriately recognize the variation in physician work and practice expense when LER services are performed for a stenosis (ie a straightforward lesion) versus an occlusion (ie a complex lesion), when these procedures are performed in multiple vessels in the same territory, and to recognize that certain services require specific balloons, stents, catheters and/or atherectomy devices depending on what vessel is typically being treated.

The specialties noted and the RUC concurred that the consequences of a complication with distal embolization or rupture of the vessel, which are risks for LER procedures, can lead to worsening circulation in the patient and can lead to amputation. It can create a patient that has a chronic ischemia or turn the patient into an acute ischemia, where the patient would need to go directly from the lab to an operating room to try to bypass or reestablish blood flow. The risks of complications are present with all lower extremity revascularizations, though they are higher with complex lesions, increasing the intensity of physician work for these services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Coding Structure
This code family includes 22 new 000-day global codes which are now differentiated between straightforward or complex lesions and cover 4 different vascular territories. The new code structure maintains a unilateral coding structure, where add-on codes would only reported if there is a second or subsequent vessel treated in the same territory and the same leg. A straightforward lesion is defined as a stenosis and a complex lesion is defined as an occlusion. When a procedure involves lesions in more than one vascular territory, then these services are subject to CMS' multiple procedure payment reduction policy. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not previously include add-on codes under the legacy coding structure – instead, that territory previously included only base codes that were for one or more vessels in that territory. The code family now includes 22 new add-on codes that describe performing these services on additional vessels and 2 add-on codes for reporting intravascular lithotripsy(ies). There are codes specific to balloon transluminal angioplasty (TA), stent with TA, atherectomy with TA, stent and atherectomy with TA and lithotripsy of calcified vessels. Codes 37254-37299 include:

1. All maneuvers necessary for
    a. accessing and selectively catheterizing the artery,
    b. crossing the lesion, and
    c. performing the endovascular intervention
2. All imaging
    a. for intraprocedural guidance including radiological supervision and interpretation directly related to the intervention performed,
    b. to document completion of the intervention, and
    c. to document completion of the procedure
3. Embolic protection if used; and
4. Closure of the arteriotomy by pressure and application of an arterial closure device or standard closure of the puncture by suture.

Research-Approved Custom Survey Methodology
In September 2024, the Research Subcommittee approved a custom survey methodology which included conducting a standard RUC survey of 11 anchor codes for the family and then conducting an abbreviated survey for the other 35 codes. The 11 anchor codes represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. The 35 abbreviated survey codes were split into two groups and survey respondents only received one of those two groups along with the 11 core codes. There were two notable changes made to the abbreviated survey. First, survey respondents were provided with one of the anchor codes as a comparator instead of using a reference service list; second, survey respondents were only asked one question per abbreviated code in the intensity/complexity section.

Compelling Evidence
The RUC reviewed compelling evidence based on a change in technology, change in patient population and change in site of service. The specialties noted that there have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug-eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions. They also noted that this evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced diseases and more complex patients. Therefore, the complexity and pathology of the typical patient is significantly different today. As both techniques and technology

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

have developed over the years, the shift of procedures from open surgical bypass to endovascular has continued. In addition, patients who were previously thought to be poor candidates for revascularization (either through surgical or endovascular methods) are now being routinely treated with documented safety. Advanced age, extensive arterial occlusive disease and advanced limb ischemia are no longer exclusion criteria for endovascular revascularization and for that reason, the patient population has significantly changed.

Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. At that time, the non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation. **The RUC accepted compelling evidence based on changes in technology, patient population, and site of service.**

General Relativity within the Lower Extremity Revascularization Code Family
The RUC reviewed intra-family relativity across three main dimensions: straightforward to complex, proximal to distal territories, and increasing complexity of interventions. The RUC concurred with the specialties that the hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. It was also agreed upon that interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < inframalleolar.

As part of their deliberations, the RUC noted that in general the survey data was robust. However, in order to ensure proper relativity within a 46 code family, it would sometimes be appropriate to use direct work RVU crosswalks. The RUC noted that the second page of the summary spreadsheet, titled "Delta," provides additional context on the relativity within the code family.

Pre-service and Post-service Time
The RUC adjusted the times to be consistent with the survey pre-service time for each 000-day global code to reflect the time typically required to perform the pre-service evaluation and other work to prepare for the procedure. The evaluation time beyond the standard package time includes time for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff. The positioning time beyond the standard package time includes positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required to be able to obtain all necessary views to treat the lesion. The immediate post-service time beyond the standard package time includes time to document the additional radiologic supervision and interpretation portion of the procedure in the operative note.

Iliac Vascular Territory (37254-37262)

37254 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel***

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 7.30 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, 30 minutes immediate post-service time. This would be reported for an initial vessel with stenosis in the iliac vascular territory.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 36905 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty* (work RVU= 9.00, intra-service time= 75, total time= 126) and noted that the surveyed code typically involves 15 minutes less intra-service time and is a somewhat less intense service to perform. The RUC also compared the survey code to second key reference code 36253 *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU= 7.30, intra-service time= 60, total time= 121) and determined that both services typically involve the same amount of intra-service time, similar total time and the same overall amount of physician work. **The RUC recommends a work RVU of 7.30 for CPT code 37254.**

+37255 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 3.00 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes intra-service and total time. This would be reported for a stenosis after treating an initial iliac vessel on the ipsilateral side.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 3.50, intra-service time and total time= 30) and noted that both services typically involve the same amount of time, though the reference code is somewhat more intense to perform. The RUC also compared the surveyed code to CPT code 36908 *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service time and total time= 40) and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

noted that the surveyed code typically involves 10 fewer minutes and would have appropriate relativity to this reference code. **The RUC recommends a work RVU of 3.00 for CPT code 37255.**

37256 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 10.75 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 80 minutes intra-service time, 30 minutes immediate post-service time. This procedure would typically be in the common iliac artery. This procedure describes an angioplasty for an occlusion where it requires the additional work of crossing the occluded vessel and reentering the true lumen beyond the occlusion, which greatly increases the intensity and risk of complications for this procedure.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and determined that although the surveyed code involves less intra-service time, it involves more total time and is slightly more intense to perform. **The RUC recommends a work RVU of 10.75 for CPT code 37256.**

+37257 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 3.89 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 36 minutes intra-service and total time. This add-on code describes an angioplasty for an occlusion which requires the additional work of crossing the occluded vessel and reentering the true lumen beyond the occlusion, which greatly increases the intensity and risk of complications for this procedure.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37255 (recommended work RVU= 3.00, intra-service and total time= 30) to ensure appropriate relativity within the family and noted that both services typically involve the same amount of time, though 37257 is more intense as it is for a complex lesion. For further support, the RUC also referenced CPT Code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery;*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

each additional artery (List separately in addition to code for primary procedure) (work RVU= 3.50, intra-service time and total time= 30) and noted that both services are valued similarly and have similar times. **The RUC recommends a work RVU of 3.89 for CPT code 37257.**

37258 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 8.75 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 75 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37254 (recommended work RVU= 7.30, intra-service time= 60, total time= 128) to ensure appropriate relativity within the family and determined that 37258 code typically involves 15 more minutes of time and a more complex treatment modality. For further support, the RUC also referenced CPT code 36905 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty* (work RVU= 9.00, intra-service time= 75, total time= 126) and noted that both services typically involve the same intra-service time. **The RUC recommends a work RVU of 8.75 for CPT code 37258.**

+37259 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 4.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 40 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37255 (recommended work RVU= 3.00, intra-service and total time= 30) to ensure appropriate relativity within the family and determined that 37259 typically involves 10 more minutes of time and includes a more intensive treatment modality. For further support, the RUC also referenced CPT Code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 3.50, intra-service and total time= 30) and noted that the surveyed code typically involves 10 more minutes of time. **The RUC recommends a work RVU of 4.00 for CPT code 37259.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

37260 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 12.69 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 117 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37256 (recommended work RVU= 10.75, intra-service time= 80, total time= 148) to ensure appropriate relativity within the family and determined that 37256 typically involves 37 more minutes and a more intensive treatment modality. For further support, the RUC also referenced CPT code 49594 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including implantation of mesh or other prosthesis when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated* (work RVU= 13.46, intra-service time= 120, total time= 225) and noted that the reference code involves similar intra-service time and somewhat more total time. **The RUC recommends a work RVU of 12.69 for CPT code 37260.**

+37261 ***Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the survey 25th percentile work RVU of 4.25 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 44 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37255 (recommended work RVU= 3.00, intra-service time= 30, total time= 30) to ensure appropriate relativity within the family and determined that 37261 involves 14 more minutes of time and describes a complex lesion. For further support, the RUC also referenced CPT code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated* (List separately in addition to code for primary procedure) (work RVU= 6.50, intra-service and total time= 60) and noted that the reference code involves 16 more minutes of time and has appropriate relativity to the surveyed code. **The RUC recommends a work RVU of 4.25 for CPT code 37261.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

+37262 ***Intravascular lithotripsy(ies), iliac vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 3.00 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes intra-service and total time.

Intravascular lithotripsy is a new technology combining angioplasty with lithotripsy specifically for lesions that are heavily calcified. The balloon is inserted over a wire and inflated to where contact is made with the balloon in the vessel wall. The catheter is then connected to a generator, and pulses of ultrasonic energy are emitted from multiple transducers within the balloon itself, and transmitted through the fluid in the balloon into the wall of the vessel with the idea of causing microfractures within the calcium of the wall, so that the vessel can respond better to a standard angioplasty and/or a stent.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 36908 *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service and total time= 40) and determined that the key reference code typically involves 10 more minutes and both codes would have appropriate relativity. The RUC also compared the survey code to second key reference code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 3.50, intra-service and total time= 30) and noted that the surveyed code is somewhat less intense to perform. **The RUC recommends a work RVU of 3.00 for CPT code 37262.**

Femoral and Popliteal Vascular Territory (37263-37279)

37263 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 48 surgeons and determined a direct work RVU crosswalk to CPT code 37211 *Transcatheter therapy, arterial infusion for thrombolysis other than coronary or intracranial, any method, including radiological supervision and interpretation, initial treatment day* (work RVU= 7.75, intra-service time= 60, total time= 128) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of intra-service time and total time, as well as the same overall amount of physician work. The surveyed code is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

in the femoral and popliteal territory are typically of greater length, require more time to perform and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37267 (recommended work RVU= 8.75, intra-service time= 75, total time= 143) and determined that both codes maintain the appropriate relativity in this family of services. This reference code typically requires more time and involves a treatment modality that is also somewhat more intense (stent placement with angioplasty, when performed versus angioplasty alone). For further support, the RUC also referenced CPT code 36905 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty* (work RVU= 9.00, intra-service time= 75, total time= 126) and noted that the surveyed code typically involves 15 minutes less of intra-service time, and would have appropriate relativity with this reference code. **The RUC recommends a work RVU of 7.75 for CPT code 37263.**

+37264 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 3.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service time= 35, total time= 35) to ensure appropriate relativity within the family and determined that 37264 typically involves 5 less minutes and a less complex treatment modality (angioplasty alone versus stent placement with angioplasty, when performed). The RUC also referenced CPT code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 3.50, intra-service time= 30, total time= 30), which involves the same amount of time, though is somewhat more intense to perform. **The RUC recommends a work RVU of 3.00 for CPT code 37264.**

37265 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 10.50 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 90 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform, and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37269 (recommended work RVU= 14.75, intra-service time= 110, total time= 178) to ensure appropriate relativity within the family and determined that 37265 typically involves 20 minutes less intra-service and total time and a less complex treatment modality (angioplasty alone versus stent placement with angioplasty, when performed). The RUC also compared the survey code to CPT code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that both codes typically involve an identical amount of intra-service time and a similar amount of total time. **The RUC recommends a work RVU of 10.50 for CPT code 37265.**

37266 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 4.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 40 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service time= 35, total time= 35) to ensure appropriate relativity within the family and determined that 37266 typically involves 5 more minutes and a complex lesion. The RUC also referenced CPT code 44128 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; each additional resection and anastomosis (List separately in addition to code for primary procedure)* (work RVU= 4.44, intra-service and total time= 40) and noted that both services typically involve the same amount of time, though the reference code is somewhat more intense to perform typically. **The RUC recommends a work RVU of 4.00 for CPT code 37266.**

37267 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 8.75 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 75 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. This is typically performed in the vessel in the whole family is the longest vessel treated, the superficial femoral popliteal vessel, which will average somewhere around 40 cm, depending on the height of the patient. The specialty societies noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and determined that the surveyed code typically involves 15 minutes less intra-service time. The RUC also compared the survey code to second key reference code 36905 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty* (work RVU= 9.00, intra-service time= 75, total time= 126) and noted that both services involve the same amount of intra-service time and a similar amount of physician work. **The RUC recommends a work RVU of 8.75 for CPT code 37267.**

37268 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 3.73 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 35 minutes of intra-service and total time. Add-on codes did not exist in the previous code structure for this vascular territory.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 36908 *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service and total time= 40) and noted that the surveyed code typically involves 5 minutes less of intra-service

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

and total time. The RUC also compared the survey code to the second key reference code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)* (work RVU= 6.50, intra-service time= 60, total time= 60) and noted that the reference code typically involves 25 minutes more of intra-service and total time. **The RUC recommends a work RVU of 3.73 for CPT code 37268.**

37269 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 14.75 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 110 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. This is typically performed in the vessel in the whole family is the longest vessel treated, the superficial femoral popliteal vessel, which will average somewhere around 40 cm, depending on the height of the patient The specialty societies noted that this is the service with the highest physician work intensity in the code family. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform, and are more intense than a comparative iliac lesion.

The presenters noted that these complex chronic total occlusions of the superficial femoral popliteal artery can have very long occlusions. They often require advanced techniques to cross the lesion. Often, the surgeons use advanced reentry catheters as part of this procedure.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU= 15.00, intra-service time= 100, total time= 241) and noted that, although the surveyed code involves 10 more minutes of intra-service time, the reference code involves more total time. The RUC also compared the survey code to the second key reference code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that the surveyed code typically involves much more time and work to perform. **The RUC recommends a work RVU of 14.75 for CPT code 37269.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

37270 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 5.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 52 minutes intra-service time and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service and total time= 35) to ensure appropriate relativity within the family and determined that 37270 typically involves 17 more minutes and describes a complex lesion. The RUC also referenced CPT code 34715 *Open axillary/subclavian artery exposure for delivery of endovascular prosthesis by infraclavicular or supraclavicular incision, unilateral* (work RVU= 6.00, intra-service and total time= 60) and noted that the surveyed code typically involves 8 minutes less of intra-service and total time, as well as somewhat less physician work. **The RUC recommends a work RVU of 5.00 for CPT code 37270.**

37271 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 9.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 90 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37267 (recommended work RVU= 8.75, intra-service time= 75, total time= 143) to ensure appropriate relativity within the family and determined that 37271 typically involves 15 more minutes of time and a more complex treatment modality (atherectomy with angioplasty, when performed versus stent placement with angioplasty, when performed). The RUC also compared the survey code to CPT code 36905 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

angioplasty (work RVU= 9.00, intra-service time= 75, total time= 126) and noted that although the surveyed code involves more time, it is a somewhat less intense service to perform. **The RUC recommends a work RVU of 9.00 for CPT code 37271.**

37272 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 4.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 43 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service time= 35, total time= 35) to ensure appropriate relativity within the family and determined that the 37272 typically involves 8 more minutes of time and a more complex treatment modality (atherectomy with angioplasty, when performed versus stent placement with angioplasty, when performed). The RUC also compared the survey code to CPT code 37237 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery* (work RVU= 4.25, intra-service time= 45, total time= 47) and noted that the reference code involves slightly more intra-service and total time. **The RUC recommends a work RVU of 4.00 for CPT code 37272.**

37273 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 12.63 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 118 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other 3 vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 49594 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including implantation of mesh or other prosthesis when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated* (work RVU= 13.46, intra-service time= 120, total time= 225) and noted that both codes involve a similar amount of intra-service time, the reference code involves more total time and the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

surveyed code has higher level of physician work intensity. The RUC also compared the survey code to CPT code 49621 *Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including implantation of mesh or other prosthesis, when performed; reducible* (work RVU= 13.70, intra-service= 120 minutes, total time= 220 minutes) and noted that both services also involve a similar amount of intra-service time, though the reference code involves more total time. **The RUC recommends a work RVU of 12.63 for CPT code 37273.**

37274 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 5.50 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 60 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service and total time= 35) to ensure appropriate relativity within the family and noted that 37274 typically 25 more minutes of time as it involves a complex patient and a more intensive treatment modality (atherectomy with angioplasty, when performed versus stent placement with angioplasty, when performed). For further support, the RUC also referenced CPT code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated* (List separately in addition to code for primary procedure) (work RVU= 6.50, intra-service and total time= 60). **The RUC recommends a work RVU of 5.50 for CPT code 37274.**

37275 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***

The RUC reviewed the survey results from 48 surgeons and determined that the 25th percentile work RVU of 11.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 115 minutes intra-service time, 30 minutes immediate post-service time. Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37267 (recommended work RVU= 8.75, intra-service time= 75, total time= 143) and noted that 37275 typically involves 40 more minutes of intra-service and total time, as although both services involve the placement of a stent, 37275 also involves an atherectomy. The RUC also compared the survey code to CPT code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that the surveyed code involves 15 more minutes of intra-service time and 42 more minutes of total time. **The RUC recommends a work RVU of 11.00 for CPT code 37275.**

37276 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 48 surgeons and determined a direct work RVU crosswalk to CPT code 37237 *Transcatheter placement of an intravascular stent(s) (except lower extremity artery(s) for occlusive disease, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery* (work RVU= 4.25, intra-service time= 45, total time= 47) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of time and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 45 minutes intra-service time and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service time= 35, total time= 35) to ensure appropriate relativity within the family and noted that 37276 includes 10 more minutes of time and involves a more intense treatment modality (stent placement with atherectomy and angioplasty, when performed versus stent placement with angioplasty, when performed). The RUC also referenced CPT code 36908 *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service time= 40, total time= 40). **The RUC recommends a work RVU of 4.25 for CPT code 37276.**

37277 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation***

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium…* (work RVU= 15.00, intra-service time of 120 minutes, total time of 199 minutes) and noted that both services typically involve a similar amount of time and the same overall amount of physician work. CPT code 37277 is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 123 minutes intra-service time, 30 minutes immediate post-service time.

Unlike the other three vascular territories, the femoral and popliteal vascular territory did not have any add-on codes under the legacy coding structure. The presenters noted that the femoral and popliteal vascular territory is deeper and generally more complex than the iliac vascular territory. The specialty societies noted that the lesions in the femoral and popliteal territory are typically of greater length, require more time to perform and are more intense than a comparative iliac lesion.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37269 (recommended work RVU= 14.75, intra-service time= 110, total time= 178) to ensure appropriate relativity within the family and determined that both services have appropriate relativity to one another. The RUC also referenced 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU= 15.00, intra-service time= 100, total time= 241). **The RUC recommends a work RVU of 15.00 for CPT code 37277.**

37278 ***Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 6.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends minutes pre-service evaluation time, minutes pre-service positioning time, minutes pre-service scrub/dress/wait time, 60 minutes intra-service time, minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37268 (recommended work RVU= 3.73, intra-service time= 35, total time= 35) to ensure appropriate relativity within the family and determined that code 37278 typically involves 25 more minutes of time. The RUC also compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral* (work RVU= 7.00, intra-service

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

time= 60, total time= 60) and noted that although both services typically involve the same amount of time, the surveyed code is a somewhat less intensive service to perform. **The RUC recommends a work RVU of 6.00 for CPT code 37278.**

37279 ***Intravascular lithotripsy(ies), femoral and popliteal vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intravascular lithotripsy(ies) within the same artery (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined that the median work RVU of 4.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 40 minutes intra-service and total time.

Intravascular lithotripsy is a new technology combining angioplasty with lithotripsy specifically for lesions that are heavily calcified. The balloon is inserted over a wire and inflated to where contact is made with the balloon in the vessel wall. The catheter is then connected to a generator, and pulses of ultrasonic energy are emitted from multiple transducers within the balloon itself, and transmitted through the fluid in the balloon into the wall of the vessel with the idea of causing microfractures within the calcium of the wall, so that the vessel can respond better to a standard angioplasty and/or a stent.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37262 (recommended work RVU= 3.00, intra-service time= 30, total time= 30) to ensure appropriate relativity within the family and noted that 37279 typically involves 10 more minutes of time and is performed in a territory that has smaller vessels. The RUC also referenced CPT code 36908 *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)* (work RVU= 4.25, intra-service time= 40, total time= 40). **The RUC recommends a work RVU of 4.00 for CPT code 37279.**

Tibial and Peroneal Vascular Territory (37280-37295)

37280 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 9.80 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 90 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37288 (recommended work RVU= 13.50, intra-service time= 120, total time= 188) to ensure appropriate relativity within the family and noted that 37280 typically takes 30 minutes less time and, unlike 37288, does not include the work of an atherectomy. The RUC also referenced CPT code 36906 *Percutaneous transluminal*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that although both services typically involve the same intra-service time, the reference code describes a slightly more intense service to perform. **The RUC recommends a work RVU of 9.80 for CPT code 37280.**

37281 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 47543 *Endoluminal biopsy(ies) of biliary tree, percutaneous, any method(s) (eg, brush, forceps, and/or needle), including imaging guidance (eg, fluoroscopy), and all associated radiological supervision and interpretation, single or multiple* (work RVU= 3.00, intra-service and total time= 30) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of time and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (recommended work RVU= 4.75, intra-service time= 45, total time= 45) to ensure appropriate relativity within the family and noted that 37281 typically takes 15 minutes less time and, unlike 37289, does not include the work of an atherectomy. The RUC also referenced CPT code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 3.50, intra-service and total time= 30)**. The RUC recommends a work RVU of 3.00 for CPT code 37281.**

37282 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 92943 *Percutaneous transluminal revascularization of chronic total occlusion, coronary artery, coronary artery branch, or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty; single vessel* (work RVU= 12.31, intra-service time= 92 minutes, total time= 151 minutes) appropriately accounts for the work required to perform this service. Both services typically involve a similar amount of intra-service time and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 100 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37290 (recommended work RVU= 17.00, intra-service time= 150, total time= 218) to ensure appropriate relativity within the family and determined that the 37282 involves munch less time, and unlike 37290, does not also include an atherectomy. The RUC also compared the survey code to CPT code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that the surveyed code involves 10 more minutes of intra-service time, 27 more minutes of total time and a higher level of physician work intensity. **The RUC recommends a work RVU of 12.31 for CPT code 37282.**

37283 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 4.26 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 45 minutes of intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (recommended work RVU= 4.75, intra-service time= 45, total time= 45) to ensure appropriate relativity within the family and determined that, unlike 37289, 37283 does not include the work of performing an atherectomy. The RUC also compared the survey code to CPT code 67340 *Strabismus surgery involving exploration and/or repair of detached extraocular muscle(s)* (work RVU= 5.00, intra-service and total time= 45) and noted that both services typically involve the same amount of time, though the reference code is somewhat more intense to perform. **The RUC recommends a work RVU of 4.26 for CPT code 37283.**

37284 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 10.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 100 minutes intra-service time, 30 minutes immediate post-service time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37288 (recommended work RVU= 13.50, intra-service time= 120, total time= 188) to ensure appropriate relativity within the family and determined that 37284 typically involves 20 minutes less time and involves a less intense treatment modality (stent placement with angioplasty, when performed versus atherectomy with angioplasty, when performed). The RUC also compared the survey code to CPT code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that although the surveyed code involves somewhat more time, it is a somewhat less intense service to perform. **The RUC recommends a work RVU of 10.00 for CPT code 37284.**

37285 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 35686 *Creation of distal arteriovenous fistula during lower extremity bypass surgery (non-hemodialysis)* (work RVU= 3.34, intra-service and total time= 35) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of time and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 35 minutes of intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (work RVU= 4.75, intra-service time= 45, total time= 45) to ensure appropriate relativity within the family and determined that 37285 involves 10 minutes less time and a less intense treatment modality. The RUC also referenced CPT code 37247 *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)* (work RVU= 3.50, 30 minutes intra-service and total time) and determined that both codes have similar work RVU's and times supporting the relativity of the recommendation. **The RUC recommends a work RVU of 3.34 for CPT code 37285.**

37286 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 49594 *Repair of anterior abdominal hernia(s) (ie, epigastric, incisional, ventral, umbilical, spigelian), any approach (ie, open, laparoscopic, robotic), initial, including implantation of mesh or other prosthesis when performed, total length of defect(s); 3 cm to 10 cm, incarcerated or strangulated* (work RVU=

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

13.46, intra-service time= 120, total time= 225) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of intra-service time and the same overall amount of physician work. The surveyed code is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37290 (recommended work RVU= 17.00, intra-service time= 150, total time= 218) to ensure appropriate relativity within the family and noted that the 37286 typically involves 30 minutes less time and a less intense treatment modality (stent placement with angioplasty, when performed versus atherectomy with angioplasty, when performed). **The RUC recommends a work RVU of 13.46 for CPT code 37286.**

37287 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 5.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 50 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (recommended work RVU= 4.75, intra-service time= 45, total time= 45) to ensure appropriate relativity within the family and determined that both services have appropriate relativity as 37287 typically involves 5 more minutes of intra-service and total time. The RUC also referenced CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral* (work RVU= 7.00, intra-service and total time= 60), which involves 10 more minutes of time than the surveyed code. **The RUC recommends a work RVU of 5.00 for CPT code 37287.**

37288 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 13.50 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU= 15.00, intra-service time= 100, total time= 241) and determined that although the surveyed code typically involves 20 more minutes of intra-service time, the reference code involves more total time. The RUC also compared the survey code to second key reference code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit* (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that the surveyed code involves much more intra-service and total time and has appropriate relativity with this reference code. **The RUC recommends a work RVU of 13.50 for CPT code 37288.**

37289 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 4.75 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 45 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)* (work RVU= 6.50, intra-service and total time= 60) and noted that the reference code involves 15 more minutes of time. The RUC also compared the survey code to second key reference code 37186 *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)* (work RVU= 4.92, intra-service and total time= 60) and noted that this reference code also involves 15 more minutes of time, though is a less intense service to perform than the surveyed code. **The RUC recommends a work RVU of 4.75 for CPT code 37289.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

I=New code s=Revised code :=Add-on code H=Modifier 51 exempt *=Telemedicine X=Audio-only ~=FDA approval pending #=Resequenced code **f**=Family Code **e**=Editorial **D**=Deleted

37290 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 17.00 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 150 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU= 15.00, intra-service time= 100, total time= 241) and noted that the surveyed code involves 50 more minutes of intra-service time, less total time, and is more intense to perform. The RUC also referenced CPT code 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium…* (work RVU= 15.00, intra-service time of 120 minutes, total time of 199 minutes) and noted that the surveyed code involves 30 more minutes of intra-service time and 19 more minutes of total time. **The RUC recommends a work RVU of 17.00 for CPT code 37290.**

37291 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 34709 *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)* (work RVU= 6.50, intra-service and total time of 60 minutes) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of intra-service and total time and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 60 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (recommended work RVU= 4.75,

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intra-service time= 45, total time= 45) to ensure appropriate relativity within the family and determined that 37291 typically involves 15 more minutes of time and involves a complex lesion (instead of a straightforward lesion) for the same treatment modality. The RUC also compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral* (work RVU= 7.00, intra-service and total time= 60) and noted that both services involve the same amount of time, though the reference code is somewhat more intense. The RUC also referenced CPT code 96547 *Intraoperative hyperthermic intraperitoneal chemotherapy (HIPEC) procedure, including separate incision(s) and closure, when performed; first 60 minutes (List separately in addition to code for primary procedure)* (work RVU=6.53, intra-service and total time of 60 minutes). **The RUC recommends a work RVU of 6.50 for CPT code 37291.**

37292 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel***

The RUC reviewed the survey results from 46 surgeons and determined that the median work RVU of 15.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC noted that using the median survey value is warranted for this code as it includes the work of stent placement and atherectomy and an angioplasty, when performed. A lower value would create a rank order anomaly with other services in the code family given the treatment modalities and the vascular territory.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 142 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37288 (recommended work RVU= 13.50, intra-service time= 120, total time= 188) to ensure appropriate relativity within the family and noted that 37292 typically involves 22 more minutes of time and a more intense treatment modality (stent placement with atherectomy and angioplasty, when performed versus atherectomy and angioplasty, when performed). The RUC also referenced CPT code 93653 *Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium…* (work RVU= 15.00, intra-service time of 120 minutes, total time of 199 minutes). **The RUC recommends a work RVU of 15.00 for CPT code 37292.**

37293 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 6.50 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 60 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (recommended work RVU= 4.75, intra-service and total time= 45) to ensure appropriate relativity within the family and noted that 37293 includes all of the work of 37289 and then also the placement of a stent. The RUC also referenced CPT code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral* (work RVU= 7.00, intra-service and total time= 60) and CPT code 96547 *Intraoperative hyperthermic intraperitoneal chemotherapy (HIPEC) procedure, including separate incision(s) and closure, when performed; first 60 minutes (List separately in addition to code for primary procedure)* (work RVU=6.53, intra-service and total time of 60 minutes). **The RUC recommends a work RVU of 6.50 for CPT code 37293.**

37294 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, initial vessel***

The RUC reviewed the survey results from 46 surgeons and determined that the median work RVU of 18.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC noted that using the median survey value is warranted for this code as it involves a complex lesion and includes the work of stent placement and atherectomy and an angioplasty, when performed. A lower value would create a rank order anomaly with other services in the code family given the treatment modalities and the vascular territory.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 170 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37290 (recommended work RVU= 17.00, intra-service time= 150, total time= 218) to ensure appropriate relativity within the family and noted that 37294 includes all of the work of 37290 and then also the placement of a stent. The RUC also referenced CPT code 49622 *Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including implantation of mesh or other prosthesis, when performed; incarcerated or strangulated* (work RVU= 17.06, intra-service time= 150 minutes, total time= 255 minutes) and noted that the surveyed code typically involves 20 more minutes of intra-service time. **The RUC recommends a work RVU of 18.00 for CPT code 37294.**

37295 ***Revascularization, endovascular, open or percutaneous, tibial and peroneal vascular territory, with transluminal stent placement, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation***

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

necessary to perform the stent placement, atherectomy, and angioplasty when performed, within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 34833 *Open iliac artery exposure with creation of conduit for delivery of endovascular prosthesis or for establishment of cardiopulmonary bypass, by abdominal or retroperitoneal incision, unilateral (List separately in addition to code for primary procedure)* (work RVU= 8.16, intra-service and total time of 72 minutes) appropriately accounts for the work required to perform this service. Both services typically involve similar intra-service and total times and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 75 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37289 (recommended work RVU= 4.75, intra-service and total time= 45) to ensure appropriate relativity within the family and determined that 37295 is appropriately valued higher as it typically involves 30 more minutes of intra-service and total time, requires a more intensive treatment modality (stent placement with atherectomy and angioplasty, when performed versus atherectomy with angioplasty, when performed) and describes a complex lesion. The RUC also compared the survey code to CPT code 34820 *Open iliac artery exposure for delivery of endovascular prosthesis or iliac occlusion during endovascular therapy, by abdominal or retroperitoneal incision, unilateral* (work RVU= 7.00, intra-service time= 60, total time= 60) and noted that the surveyed code typically involves 15 more minutes of time. **The RUC recommends a work RVU of 8.16 for CPT code 37295.**

Inframalleolar Vascular Territory (37296-37299)

37296 ***Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel***
The RUC reviewed the survey results from 113 surgeons and determined that the 25th percentile work RVU of 11.00 appropriately accounts for the physician work required to perform this service. This is one of the eleven survey codes that underwent a full standard RUC survey based on the custom survey methodology approved by the Research Subcommittee.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 100 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to top key reference code 61645 *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)* (work RVU= 15.00, intra-service time= 100, total time= 241) and noted that, although both services typically involve the same amount of intra-service time, the reference code involves more total time. The RUC also compared the survey code to second key reference code 36906 *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit (work RVU= 10.42, intra-service time= 90, total time= 141) and noted that the surveyed code involves 10 more minutes of intra-service time and 27 more minutes of total time. The RUC agreed that their recommended value would have appropriate relativity with these two reference codes. **The RUC recommends a work RVU of 11.00 for CPT code 37296.**

37297 ***Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined that the 25th percentile work RVU of 4.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 40 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 44128 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; each additional resection and anastomosis (List separately in addition to code for primary procedure)* (work RVU= 4.44, intra-service and total time= 40) and noted that both services typically involve the same amount of time, though the reference code is somewhat more intense to perform typically. The RUC also referenced CPT code 67340 *Strabismus surgery involving exploration and/or repair of detached extraocular muscle(s)* (work RVU= 5.00, intra-service time= 45, total time= 45) and noted that the surveyed code typically involves 5 minutes less time. **The RUC recommends a work RVU of 4.00 for CPT code 37297.**

37298 ***Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, initial vessel***
The RUC reviewed the survey results from 46 surgeons and determined a direct work RVU crosswalk to CPT code 49621 *Repair of parastomal hernia, any approach (ie, open, laparoscopic, robotic), initial or recurrent, including implantation of mesh or other prosthesis, when performed; reducible* (work RVU= 13.70, intra-service= 120 minutes, total time= 220 minutes) appropriately accounts for the work required to perform this service. Both services typically involve the same amount of intra-service time and the same overall amount of physician work. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee.

The RUC recommends 30 minutes pre-service evaluation time, 3 minutes pre-service positioning time, 5 minutes pre-service scrub/dress/wait time, 120 minutes intra-service time, 30 minutes immediate post-service time.

To support the recommended work RVU, the RUC compared the surveyed code to core family code 37296 (recommended work RVU= 11.00, intra-service time= 100, total time= 168) to ensure appropriate relativity within the family and determined that 37298 typically involves 20 more minutes of intra-service time and total time, as well as a complex lesion. The RUC also compared the survey code to CPT code 93653

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Comprehensive electrophysiologic evaluation with insertion and repositioning of multiple electrode catheters, induction or attempted induction of an arrhythmia with right atrial pacing and recording and catheter ablation of arrhythmogenic focus, including intracardiac electrophysiologic 3-dimensional mapping, right ventricular pacing and recording, left atrial pacing and recording from coronary sinus or left atrium… (work RVU= 15.00, intra-service time of 120 minutes, total time of 199 minutes) and noted that both services typically involve the same amount of intra-service time, though the reference code typically involves 11 more minutes of total time. **The RUC recommends a work RVU of 13.70 for CPT code 37298.**

37299 ***Revascularization, endovascular, open or percutaneous, inframalleolar vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; complex lesion, each additional vessel (List separately in addition to code for primary procedure)***
The RUC reviewed the survey results from 46 surgeons and determined that the median work RVU of 5.00 appropriately accounts for the physician work required to perform this service. This is one of the 35 survey codes that underwent an abbreviated RUC survey based on the custom survey methodology approved by the Research Subcommittee. The RUC recommends 45 minutes intra-service and total time.

To support the recommended work RVU, the RUC compared the surveyed code to CPT code 44128 *Enterectomy, resection of small intestine for congenital atresia, single resection and anastomosis of proximal segment of intestine; each additional resection and anastomosis (List separately in addition to code for primary procedure)* (work RVU= 4.44, intra-service and total time= 40) and noted that the surveyed code typically involves 5 more minutes of time and is somewhat more intense to perform. The RUC also referenced CPT code 67340 *Strabismus surgery involving exploration and/or repair of detached extraocular muscle(s)* (work RVU= 5.00, intra-service and total time= 45) and noted that the surveyed code typically involves the same amount of time and the same level of physician work intensity. **The RUC recommends a work RVU of 5.00 for CPT code 37299.**

Practice Expense
The Practice Expense (PE) Subcommittee considered and approved compelling evidence based on changes in technique, changes in technology, significant shifts in site of service for the performance of these procedures and a change in population.

The PE Subcommittee reviewed the direct practice expense inputs and made a modification to remove 4 supply inputs to avoid overlapping with moderate sedation services that are separately reportable (and in SA044 *pack, moderate sedation*). The supplies removed were SC001 *angiocatheter 14g-24g*, SG037 *dressing, 4in x 4.75in (Tegaderm)*, SC018 *iv infusion set* and SA019 *kit, iv starter*. . The specialties noted that in general most lower extremity revascularization services are performed with moderate sedation a little more than half the time. The specialties also noted that all arterial access procedures have a minimum four hours post procedure recovery time as per standard national protocol. The first hour of post-procedure recovery/monitoring is now typically reported with separate moderate sedation codes and therefore did not include overlapping time for clinical labor or in their equipment minute recommendations. The specialties recommended and the PE Subcommittee concurred that 45 minutes of RN time should be allocated to CA022 *Monitor patient following procedure/service, multitasking 1:4* for the 2nd through 4th hour of recovery, and this time is not duplicative with the separately reported moderate sedation services codes. The Subcommittee confirmed that there is no overlap between the separately reported moderate sedation codes and the equipment minute recommendations.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The PE Subcommittee acknowledged the four existing and six new high-cost supply inputs as recommended by the specialty societies. The RUC continues to call on CMS to separately identify and pay for high-cost disposable supplies using appropriate HCPCS codes.

High-Cost Supplies:
SD253 Atherectomy Device
SD254 covered stent (VIABAHN, Gore)
SD255 Reentry device (Frontier, Outback, Pioneer)
SD256 Embolic Protection Device Spider FX (EV3, documentation available)
NEW drug eluting stent, tibial
NEW Iliac IVL Catheter
NEW FemPop IVL Catheter
NEW Drug coated balloon
NEW Drug eluting stent
NEW Embolic protection for atherectomy

The high-cost supplies were discussed in detail. The presenters noted the difference between the existing embolic protection device (SD256) and the newly recommended "Ebolic protection for atherectomy" device. When performing atherectomy, proprietary wires are typically used which can accommodate rapid rotations of the devices. In most cases, the support wire represents a proprietary wire that is associated with each product but is best represented by SD173. In those cases, the Spider FX Embolic Protection device (SD256) cannot be used because it would otherwise shatter and fragment the wire. For this reason, a new product that can be used with the proprietary wires for various atherectomy devices is more appropriate (see Embolic protection device for atherectomy).

The presenters noted that base CPT codes 37263, 37265, 37271 and 37273 would typically require two drug-coated balloons, whereas their corresponding add-on codes (37264, 37266, 37272 and 37274) would typically only require one drug-coated balloon for each additional vessel. For the base codes, the surgeon is typically treating the superficial femoral artery and popliteal artery, which is considered one segment, and that segment is much longer than the common femoral artery or the profunda femoris. It is typical to have multifocal or long-segment disease in the superficial femoral artery and popliteal artery segment to where one drug-coated balloon, which can only be used once, will not be adequate to treat the whole area. It would be most common to report the add-on codes for the common femoral artery or the profunda femoral artery segment, which are short enough that the surgeon can treat them with one drug-coated balloon. If the surgeon is only performing a procedure on one vessel in this territory, it would typically be the longer superficial femoral artery and popliteal artery segment. The length of superficial femoral artery disease almost always extends from the origin of the superficial femoral artery down to the end of the superficial femoral artery, which is the adductor canal just above the knee. The presenters noted that in this vessel, it is most typical to have long-segment disease.

The presenters noted that tibial segment complex codes 37286 and 37287 typically require two drug-eluding stents each, whereas tibial segment straightforward codes 37284 and 37285 only require one drug-eluding stent each. The length of the vessel is the same between a straightforward and a complex lesion for 37284-37287. The difference is that in tibial interventions the surgeons are typically working with stents that are as long as 38mm, which is still relatively short. In general, the surgeon would only use stents in areas where they feel they have to maintain the patency of

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

the vessel. For a straightforward lesion, it is usually only needed in one location. Whereas for complex lesions (which are defined as occlusive disease), the occlusive disease is typically quite long. It is most typical to use 2 stents in the tibial segment for complex lesions and there are even edge cases where the surgeon could use 4 or 5 stents in the tibial segment. The longest stents are around 38mm whereas the tibial segment averages around 300mm.

Finally, the PE Subcommittee considered the request from the specialties to create a new supply pack for angiography services and agreed that an angio pack would facilitate the PE process and ensure consistency within the vascular/interventional procedures. The RUC recommends the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Creation of New Angio Supply Pack

The PE Subcommittee considered the request from the specialties to create a new pack for angiography services. As described in the PE SOR, the specialty societies are recommending the PE Subcommittee consider creating an angio pack with the following components:

Angio Pack Contents	Supply Code	Corresponding Supply list components	Unit	Price	Quantity	Total: $ 68.26
10 cc syringe	SC051	syringe 10-12ml	item	0.21	4	$ 0.84
Bowl, sterile	SJ079	basin, sterile 500cc	item	3.51	2	$ 7.02
gauze	SG055	gauze, sterile 4in x 4in	item	0.19	20	$ 3.80
marker, regular tip	SK075	skin marking pen, sterile (Skin Skribe)	item	1.62	1	$ 1.62
dome cover	SB008	drape, sterile, c-arm, fluoro	item	5.38	1	$ 5.38
blue towels	SB019	drape-towel, sterile 18in x 26in	item	0.47	4	$ 1.88
scalpel	SF007	blade, surgical (Bard-Parker)	item	0.68	1	$ 0.68
back table cover	SB014	drape, sterile, three-quarter sheet	item	3.46	1	$ 3.46

The PE Subcommittee agrees that an angio pack would facilitate the PE process and ensure consistency within the vascular/interventional procedures. The RUC recommends the angio supply pack as proposed by the Practice Expense Subcommittee.

New Technology/New Services

The two intravascular lithotripsy (IVL) CPT codes 37262 and 37279 will be placed on the New Technology list to be reviewed by the RUC in three years to ensure correct valuation, patient population, and utilization assumptions. CPT 37262 and 37279 describe a new treatment modality which was not previously captured in the existing code set. All other services in this code family were described by the legacy code set and are not considered new technology. It was noted that utilization assumptions will automatically be reviewed for all codes in the family once one year of claims data are available.

Endovascular Repair of Abdominal Aorta and/or Iliac Arteries

Codes 34701, 34702, 34703, 34704, 34705, 34706 describe introduction, positioning, and deployment of an endograft for treatment of abdominal aortic pathology (with or without rupture), such as aneurysm, pseudoaneurysm, dissection, penetrating ulcer, or traumatic disruption in the infrarenal abdominal aorta with or without extension into the iliac artery(ies). The terms, endovascular graft, endoprosthesis, endograft, and stentgraft, refer to a covered stent. The infrarenal aortic endograft may be an aortic tube device, a bifurcated unibody device, a modular bifurcated docking system with docking limb(s), or an aorto-uni-iliac device. Codes 34707 and 34708 describe introduction, positioning, and deployment of an ilio-iliac endograft for treatment of isolated arterial pathology (with or without rupture), such as aneurysm, pseudoaneurysm, arteriovenous malformation, or trauma involving the iliac artery. For treatment of atherosclerotic occlusive disease in the iliac artery(ies) with a covered stent(s), see 37258, 37259, 37260, 37261~~37221, 37223~~. For covered stent placement for atherosclerotic occlusive disease in the aorta, see 37236, 37237.

Balloon angioplasty and/or stenting at the sealing zone(s) of an endograft is an integral part of the procedure and is not separately reported. However, balloon angioplasty and/or stent deployment in vessels that do not contain endograft (outside the treatment zone for the endograft),

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

either before or after endograft deployment, may be separately reported (eg, 37254, 37255, 37256, 37257, 37258, 37259, 37260, 37261~~37220, 37221, 37222, 37223~~).

Other interventional ...

(For fenestrated endovascular repair of the visceral aorta, see 34841-34844. For fenestrated endovascular repair of the visceral aorta and concomitant infrarenal abdominal aorta, see 34845-34848)

34701 *Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*

(For covered stent placement[s] for atherosclerotic occlusive disease isolated to the aorta, see 37236, 37237)

...

34707 *Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; for other than rupture (eg, for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation)*

~~(For covered stent placement[s] for atherosclerotic occlusive disease of the abdominal aorta, see 37236, 37237)~~

(For covered stent placement[s] for atherosclerotic occlusive disease of the iliac artery, see 37258, 37259, 37260, 37261~~37221, 37223~~)

✚*34713* *Percutaneous access and closure of femoral artery for delivery of endograft through a large sheath (12 French or larger), including ultrasound guidance, when performed, unilateral (List separately in addition to code for primary procedure)*

(Use 34713 in conjunction with 33880, 33881, 33882, 33883, ~~33884,~~ 33886, 34701, 34702, 34703, 34704, 34705, 34706, 34707, 34708, 34710, 34712, 34718, 34841, 34842, 34843, 34844, 34845, 34846, 34847, 34848, as appropriate. Do not report 34713 in conjunction with 33880, 33881, 33882, 33883, ~~33884,~~ 33886, 34701, 34702, 34703, 34704, 34705, 34706, 34707, 34708, 34710, 34712, 34718, 34841, 34842, 34843, 34844, 34845, 34846, 34847, 34848, for percutaneous closure of femoral artery after delivery of endovascular prosthesis if a sheath smaller than 12 French was used)

(34713 may only be reported once per side. For bilateral procedure, report 34713 twice. Do not report modifier 50 in conjunction with 34713)

(Do not report ultrasound guidance [ie, 76937] for percutaneous vascular access in conjunction with 34713 for the same access)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(Do not report 34713 for percutaneous access and closure of the femoral artery in conjunction with 37258, 37259, 37260, 37261~~37221, 37223~~, 37236, 37237)

(Do not report 34713 in conjunction with 37258, 37259, 37260, 37261~~37221, 37223~~ for covered stent placement[s] for atherosclerotic occlusive disease of the iliac artery[ies])

Fenestrated Endovascular Repair of the Visceral and Infrarenal Aorta

34845 *Endovascular repair of visceral aorta and infrarenal abdominal aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption) with a fenestrated visceral aortic endograft and concomitant unibody or modular infrarenal aortic endograft and all associated radiological supervision and interpretation, including target zone angioplasty, when performed; including one visceral artery endoprosthesis (superior mesenteric, celiac or renal artery)*

34846 *including two visceral artery endoprostheses (superior mesenteric, celiac and/or renal artery[s])*

34847 *including three visceral artery endoprostheses (superior mesenteric, celiac and/or renal artery[s])*

34848 *including four or more visceral artery endoprostheses (superior mesenteric, celiac and/or renal artery[s])*

(Use 34845, 34846, 34847, 34848 in conjunction with 37254, 37255, 37256, 37257, 37258, 37259, 37260, 37261~~37220, 37221, 37222, 37223~~, only when 37254, 37255, 37256, 37257, 37258, 37259, 37260, 37261~~37220, 37221, 37222, 37223~~ are performed outside the target treatment zone of the endoprosthesis)

(Do not report 34845, 34846, 34847, 34848 in conjunction with 34701, 34702, 34703, 34704, 34705, 34706, 34841, 34842, 34843, 34844, 35081, 35102)

(Do not report 34845, 34846, 34847, 34848 in conjunction with 34839, when planning services are performed on the day before or the day of the fenestrated endovascular repair procedure)

(Do not report 34841-34848 in conjunction with 37236, 37237 for bare metal or covered stents placed into the visceral branches within the endoprosthesis target zone)

(For placement of distal extension prosthesis[es] terminating in the internal iliac, external iliac, or common femoral artery[ies], see 34709, 34710, 34711, 34718)

Thromboendarterectomy

35301 *Thromboendarterectomy, including patch graft, if performed; carotid, vertebral, subclavian, by neck incision*

35302 *superficial femoral artery*

35303 *popliteal artery*

(Do not report 35302, 35303 in conjunction with ~~37225, 37227~~ 37271, 37272, 37273, 37274, 37275, 37276, 37277, 37278, when performed in the same vessel)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

35304	*tibioperoneal trunk artery*
35305	*tibial or peroneal artery, initial vessel*
+35306	*each additional tibial or peroneal artery (List separately in addition to code for primary procedure)*

(Use 35306 in conjunction with 35305)

(Do not report 35304, 35305, 35306 in conjunction with ~~37229, 37231, 37233, 37235~~ 37288, 37289, 37290, 37291, 37292, 37293, 37294, 37295, when performed in the same vessel)

Endovascular Revascularization Lower Extremities for Arterial Occlusive Disease

~~Codes 37220-37235 are to be used to describe lower extremity endovascular revascularization services performed for occlusive disease. These lower extremity codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. The code inclusive of all of the services provided for that vessel should be reported (ie, use the code inclusive of the most intensive services provided). Only one code from this family (37220-37235) should be reported for each lower extremity vessel treated.~~

~~These lower extremity endovascular revascularization codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, embolic protection if used, closure of the arteriotomy by pressure and application of an arterial closure device or standard closure of the puncture by suture, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. Extensive repair or replacement of an artery may be additionally reported (eg, 35226 or 35286). These codes describe endovascular procedures performed percutaneously and/or through an open surgical exposure. These codes include balloon angioplasty (eg, low-profile, cutting balloon, cryoplasty), atherectomy (eg, directional, rotational, laser), and stenting (eg, balloon-expandable, self-expanding, bare metal, covered, drug-eluting). Each code in this family (37220-37235) includes balloon angioplasty, when performed.~~

~~These codes describe revascularization therapies (ie, transluminal angioplasty, atherectomy, and stent placement) provided in three arterial vascular territories: iliac, femoral/popliteal, and tibial/peroneal.~~

~~When treating multiple vessels within a territory, report each additional vessel using an add-on code, as applicable. Select the base code that represents the most complex service using the following hierarchy of complexity (in descending order of complexity): atherectomy and stent>atherectomy>stent>angioplasty. When treating multiple lesions within the same vessel, report one service that reflects the combined procedures, whether done on one lesion or different lesions, using the same hierarchy.~~

1. ~~***Iliac Vascular Territory*** - The iliac territory is divided into 3 vessels: common iliac, internal iliac, and external iliac.~~
2. ~~***Femoral/Popliteal Vascular Territory*** - The entire femoral/popliteal territory in 1 lower extremity is considered a single vessel for CPT reporting specifically for the endovascular lower extremity revascularization codes 37224-37227.~~
3. ~~***Tibial/Peroneal Territory*** - The tibial/peroneal territory is divided into 3 vessels: anterior tibial, posterior tibial, and peroneal arteries.~~

~~There are specific coding guidelines for each of the 3 vascular territories.~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

1. ~~***Iliac Vascular Territory***~~ ~~– A single primary code is used for the initial iliac artery treated in each leg (37220 or 37221). If other iliac vessels are also treated in that leg, these interventions are reported with the appropriate add-on code(s) (37222, 37223). Up to 2 add-on codes can be used in a unilateral iliac vascular territory since there are 3 vessels which could be treated. Add-on codes are used for different vessels, not distinct lesions within the same vessel.~~

2. ~~***Femoral/Popliteal Territory***~~ ~~– A single interventional code is used no matter what combination of angioplasty/stent/atherectomy is applied to all segments, including the common, deep and superficial femoral arteries as well as the popliteal artery (37224, 37225, 37226, or 37227). There are no add-on codes for additional vessels treated within the femoral/popliteal territory. Because only 1 service is reported when 2 lesions are treated in this territory, report the most complex service (eg, use 37227 if a stent is placed for 1 lesion and an atherectomy is performed on a second lesion).~~

3. ~~***Tibial/Peroneal Territory***~~ ~~– A single primary code is used for the initial tibial/peroneal artery treated in each leg (37228, 37229, 37230, or 37231). If other tibial/peroneal vessels are also treated in the same leg, these interventions are reported with the appropriate add-on code(s) (37232-37235). Up to 2 add-on codes could be used to describe services provided in a single leg since there are 3 tibial/peroneal vessels which could be treated. Add-on codes are used for different vessels, not distinct lesions within the same vessel. The common tibio-peroneal trunk is considered part of the tibial/peroneal territory, but is not considered a separate, fourth segment of vessel in the tibio-peroneal family for CPT reporting of endovascular lower extremity interventions. For instance, if lesions in the common tibio-peroneal trunk are treated in conjunction with lesions in the posterior tibial artery, a single code would be reported for treatment of this segment.~~

~~When treating multiple territories in the same leg, one primary lower extremity revascularization code is used for each territory treated. When second or third vessel(s) are treated in the iliac and/or tibial/peroneal territories, add-on code(s) are used to report the additional service(s). When more than one stent is placed in the same vessel, the code should be reported only once.~~

~~When multiple vessels in multiple territories in a single leg are treated at the same setting, the primary code for the treatment in the initial vessel in each vascular territory is reported. Add-on code(s) are reported when second and third iliac or tibial/peroneal arteries are treated in addition to the initial vessel in that vascular territory.~~

~~If a lesion extends across the margins of one vessel vascular territory into another, but can be opened with a single therapy, this intervention should be reported with a single code despite treating more than one vessel and/or vascular territory. For instance, if a stenosis extends from the common iliac artery into the proximal external iliac artery, and a single stent is placed to open the entire lesion, this therapy should be coded as a single stent placement in the iliac artery (37221). In this example, a code for an additional vessel treatment would not be used (do not report both 37221 and 37223).~~

~~For bifurcation lesions distal to the common iliac origins which require therapy of 2 distinct branches of the iliac or tibial/peroneal vascular territories, a primary code and an add-on code would be used to describe the intervention. In the femoral/popliteal territory, all branches are included in the primary code, so treatment of a bifurcation lesion would be reported as a single code.~~

~~When the same territory(ies) of both legs are treated in the same session, modifiers may be required to describe the interventions. Use modifier 59 to denote that different legs are being treated, even if the mode of therapy is different.~~

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes 37254-37299 describe lower extremity endovascular revascularization services performed percutaneously and/or through an open surgical exposure for occlusive disease, including:

1. All maneuvers necessary for
    a. accessing and selectively catheterizing the artery,
    b. crossing the lesion, and
    c. performing the endovascular intervention;
2. All imaging
    a. for intraprocedural guidance including radiological supervision and interpretation directly related to the intervention performed,
    b. to document completion of the intervention, and
    c. to document completion of the procedure;
3. Embolic protection if used; and
4. Closure of the arteriotomy by pressure and application of an arterial closure device or standard closure of the puncture by suture.

Extensive repair or replacement of an artery may be additionally reported (eg, 35226, 35286).

For lower extremity endovascular revascularization treatment, a straightforward lesion is a stenosis and a complex lesion is an occlusion.

A vascular territory is a collection of anatomically related arteries considered together for coding purposes. Codes 37254-37299 are divided into four vascular territories: iliac, femoral and popliteal, tibial and peroneal, and inframalleolar. Territories are further divided into vessels (ie, one or more arteries) for which a primary intervention code may only be reported once. The four territories each have specific guidelines:

1. ***Iliac Vascular Territory (37254, 37255, 37256, 37257, 37258, 37259, 37260, 37261, 37262)*** includes the common iliac, internal iliac, and external iliac arteries.
    - The initial vessel in the iliac vascular territory treated with angioplasty alone is reported with 37254 (straightforward lesion) or 37256 (complex lesion). The initial vessel in the iliac vascular territory treated with stent placement and angioplasty when performed is reported with 37258 (straightforward lesion) or 37260 (complex lesion).
    - Additional vessels in the iliac vascular territory treated with angioplasty or angioplasty/stent in the same leg may be reported with the appropriate add-on code(s) (37255, 37257, 37259, 37261). Add-on codes may only be reported for distinct lesions in different vessels, not distinct lesions within the same vessel. If a lesion crosses from one vessel to another vessel, report only a single treatment code. A maximum of two angioplasty and/or stent add-on codes may be reported in a unilateral iliac vascular territory since there are three vessels (common iliac artery, internal iliac artery, external iliac artery) which could be treated.
    - Add-on code 37262 may be reported for intravascular lithotripsy(ies) in the iliac vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intervention. A maximum of three intravascular lithotripsy add-on

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

codes may be reported in a unilateral iliac vascular territory since there are three vessels (common iliac artery, internal iliac artery, external iliac artery) which could be treated.

- For atherectomy in the iliac vascular territory, use 0238T.

2. ***Femoral and Popliteal Vascular Territory (37263-37279)*** includes the common femoral, profunda femoris, superficial femoral, and popliteal arteries. For coding purposes, the common femoral and profunda femoris arteries are considered a single vessel, and the superficial femoral and popliteal arteries are considered a single vessel.

   - The initial vessel in the femoral and popliteal vascular territory treated with angioplasty alone is reported with 37263 (straightforward lesion) or 37265 (complex lesion). The initial vessel in the femoral and popliteal vascular territory treated with angioplasty and stent placement is reported with 37267 (straightforward lesion) or 37269 (complex lesion). The initial vessel in the femoral and popliteal vascular territory treated with angioplasty and atherectomy is reported with 37271 (straightforward lesion) or 37273 (complex lesion). The initial vessel in the femoral and popliteal vascular territory treated with angioplasty, stent, and atherectomy is reported with 37275 (straightforward lesion) or 37277 (complex lesion).

   - Additional vessels in the femoral and popliteal vascular territory treated with angioplasty, angioplasty/stent, or angioplasty/stent/atherectomy in the same leg may be reported with the appropriate add-on code (37264, 37266, 37268, 37270, 37272, 37274, 37276, 37278). An add-on code may only be reported for a distinct lesion in a different vessel, not a distinct lesion within the same vessel. If a lesion crosses from one vessel to another vessel, report only a single treatment code. A maximum of one angioplasty, stent, atherectomy, or stent/atherectomy add-on code may be reported in a unilateral femoral and popliteal vascular territory since there are only two vessels for coding purposes (the common femoral/profunda femoris and the superficial femoral/popliteal) which could be treated.

   - Add-on code 37279 may be reported for intravascular lithotripsy(ies) in the femoral and popliteal vascular territory, including all imaging guidance and radiological supervision and interpretation necessary to perform the intervention. A maximum of two intravascular lithotripsy add-on codes may be reported in a unilateral femoral and popliteal vascular territory since there are only two vessels for coding purposes (the common femoral/profunda femoris and the superficial femoral/popliteal) which could be treated.

3. ***Tibial and Peroneal Vascular Territory (37280-37295)*** includes the anterior tibial, posterior tibial, and peroneal arteries. For coding purposes, the tibioperoneal trunk is considered part of the posterior tibial or peroneal artery and not a separate vessel unless it is the only vessel treated.

   - The initial vessel in the tibial and peroneal vascular territory treated with angioplasty alone is reported with 37280 (straightforward lesion) or 37282 (complex lesion). The initial vessel in the tibial and peroneal vascular territory treated with angioplasty and stent placement is reported with 37284 (straightforward lesion) or 37286 (complex lesion). The initial vessel in the tibial and peroneal vascular territory treated with angioplasty and atherectomy is reported with 37288 (straightforward lesion) or 37290 (complex lesion). The initial vessel in the tibial and peroneal vascular territory treated with angioplasty, stent placement, and atherectomy is reported with 37292 (straightforward lesion) or 37294 (complex lesion).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

- Additional vessels in the tibial and peroneal vascular territory treated with angioplasty, angioplasty/stent, or angioplasty/stent/atherectomy in the same leg may be reported with the appropriate add-on code(s) (37281, 37283, 37285, 37287, 37289, 37291, 37293, 37295). An add-on code may only be reported for a distinct lesion in a different vessel, not a distinct lesion within the same vessel. If a lesion crosses from one vessel to another vessel, report only a single treatment code. A maximum of two angioplasty, stent, atherectomy, and/or stent/atherectomy add-on codes may be reported in a unilateral tibial and peroneal vascular territory since there are only three vessels for coding purposes (the anterior tibial artery, posterior tibial artery, and peroneal artery) which could be treated.

4. ***Inframalleolar Vascular Territory (37296, 37297, 37298, 37299)*** includes the dorsalis pedis and the plantar arteries. For coding purposes, the pedal arch is considered part of the dorsalis pedis or plantar arteries and not a separate vessel unless it is the only vessel treated.

    - The initial vessel in the inframalleolar vascular territory treated with angioplasty alone is reported with 37296 (straightforward lesion) or 37298 (complex lesion).

    - Additional vessels in the inframalleolar vascular territory treated with angioplasty in the same leg may be reported with the appropriate add-on code (37297, 37299). An add-on code may only be reported for a distinct lesion in a different vessel, not a distinct lesion within the same vessel. If a lesion crosses from one vessel to another vessel, report only a single treatment code. A maximum of one angioplasty add-on code may be reported in a unilateral inframalleolar vascular territory since there are only two vessels for coding purposes (the dorsalis pedis artery and plantar artery) which could be treated.

When treating multiple vessels in the same territory, one primary lower extremity revascularization code (37254, 37256, 37258, 37260, 37263, 37265, 37267, 37269, 37271, 37273, 37275, 37277, 37280, 37282, 37284, 37286, 37288, 37290, 37292, 37294, 37296, 37298) is reported. Treatment of additional vessels within a vascular territory may be reported with add-on codes (37255, 37257, 37259, 37261, 37262, 37264, 37266, 37268, 37270, 37272, 37274, 37276, 37278, 37279, 37281, 37283, 37285, 37287, 37289, 37291, 37293, 37295, 37297, 37299), as appropriate. However, if a lesion extends across the margins of one vessel into another vessel in the same or adjacent territory, but can be treated with a single therapy, the intervention should be reported with a single primary code for the more distal of the adjacent vessels. For example, if a unilateral lesion extends from the common iliac vessel to the external iliac vessel and a single angioplasty with stent placement is performed to open the entire lesion, report 37258, 37260, as appropriate (ie, do not report revascularization of both the common iliac and external iliac vessels). If discrete lesions (ie, not contiguous) are treated with a single therapy, the intervention should be reported with a single primary code. However, if discrete lesions (ie, not contiguous) in two territories are treated with two separate therapeutic maneuvers, both primary codes may be reported. For example, if a lesion is found in the common iliac vessel and a separate lesion is found in the midportion of the superficial femoral vessel and both lesions are treated with separate balloons, 37254 and 37263 may be reported.

When the same treatment in an initial vessel is performed in the same territory of both legs in the same session, append modifier 50 to the initial vessel procedure code to denote a bilateral procedure. When the same treatment in an additional vessel is performed in the same territory of both legs in the same session, report the add-on code for the same treatment additional vessel twice with modifier 59 appended to denote different legs are being treated. When different treatments in either the same or different vascular territory(ies) are performed in the same leg or each leg, append modifier 59 to denote distinct procedures.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Traversing a lower extremity occlusive lesion may include the use of multiple techniques or devices designed to cross arterial occlusions (eg, crossing catheters, re-entry devices, specialty wires). A procedure that does not result in successful crossing of a lesion and successful endovascular intervention is considered a diagnostic procedure and is reported using the appropriate catheterization and diagnostic angiography code(s). For example, an unsuccessful attempted crossing of an occluded 16-cm superficial femoral artery lesion from contralateral access would be reported as a diagnostic arteriogram (eg, 36247, 75710).

Intravascular ultrasound (eg, 37252, 37253) used during lower extremity arterial revascularization may be separately reported when performed. Catheterization codes (36140, 36200, 36245, 36246, 36247, 36248) may not be additionally reported for diagnostic lower extremity angiography, when performed through the same access site, when therapy codes (37254-37299) are reported for the same session. However, catheterization for the diagnostic lower extremity angiogram may be reported separately if a different arterial puncture site is necessary. Diagnostic lower extremity arteriography performed at the time of an interventional procedure is separately reportable, only if:

1. No prior catheter-based angiographic study is available, and a full diagnostic study is performed, and the decision to intervene is based on the diagnostic study, OR
2. A prior study is available, but as documented in the medical record:
   a. The patient's condition with respect to the clinical indication has changed since the prior study, OR
   b. There is inadequate visualization of the anatomy and/or pathology, OR
   c. There is a clinical change during the procedure that requires new evaluation outside the target area of intervention.

Mechanical thrombectomy and/or thrombolysis in the lower extremity vessels are sometimes necessary to aid in restoring flow to areas of occlusive disease, and are reported separately.

Iliac Vascular Territory (Bold Black Header)

●37254	P1	Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel (For bilateral procedure, report 37254 with modifier 50)	000	7.30
●+37255	P2	straightforward lesion, each additional vessel (List separately in addition to code for primary procedure) (Use 37255 in conjunction with 37254, 37256, 37258, 37260)	ZZZ	3.00

Codes 37246, 37247, 37248, 37249 describe open or percutaneous transluminal balloon angioplasty (eg, conventional, low profile, cutting, drug-coated balloon). Codes 37246, 37247 describe transluminal balloon angioplasty in an artery excluding the central nervous system (61630, 61635), coronary (92920-~~92944~~, 92945, 0913T), pulmonary (92997, 92998), and lower extremities for occlusive disease (37254-37299 ~~37220-37235~~). Codes 37248 and 37249 describe transluminal balloon angioplasty in a vein excluding the dialysis circuit (36902, 36905, 36907) when				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

approached through the ipsilateral dialysis access. Transluminal balloon angioplasty is inherent to stenting in the extracranial carotid and innominate arteries (37215, 37216, 37217, 37218), peripheral arteries (37254-37299 ~~37220-37237~~), and in peripheral veins (37238, 37239) and, therefore, is not separately reportable. Multiple angioplasties performed in a single vessel, including treatment of separate and distinct lesions within a single vessel, are reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, separate and distinct ipsilateral or contralateral vessels are treated in the same session, 37247 and/or 37249 may be reported as appropriate.

Radiology
Diagnostic Radiology (Diagnostic Imaging)
Vascular Procedures
Aorta and Arteries

The lower extremity endovascular revascularization codes describing services performed for occlusive disease (37254-37299 ~~37220-37235~~) include catheterization (36200, 36140, 36245-36248) in the work described by the codes. Catheterization codes are not additionally reported for diagnostic lower extremity angiography when performed through the same access site as the therapy (37254-37299 ~~37220-37235~~) performed in the same session. However, catheterization for the diagnostic lower extremity angiogram may be reported separately if a different arterial puncture site is necessary.

Other Procedures

76000 *Fluoroscopy (separate procedure), up to 1 hour physician or other qualified health care professional time*

(Do not report 76000 in conjunction with 33274, 33275, 33957, 33958, 33959, 33962, 33963, 33964, 37254-37299, 0515T, 0516T, 0517T, 0518T, 0519T, 0520T, 0795T, 0796T, 0797T, 0798T, 0799T, 0800T, 0801T, 0802T, 0803T, 0823T, 0824T, 0825T, 0861T, 0862T, 0863T)

Category III Codes
Atherectomy (Open or Percutaneous) for Supra-Inguinal Arteries

Codes 0234T-0238T describe atherectomy performed by any method (eg, directional, rotational, laser) in arteries above the inguinal ligaments. These codes are structured differently than the codes describing atherectomy performed below the inguinal ligaments (~~37225, 37227, 37229, 37231, 37233, 37235~~ 37271, 37272, 37273, 37274, 37275, 37276, 37277, 37278, 37288, 37289, 37290, 37291, 37292, 37293, 37294, 37295).

These supra-inguinal ….

0234T *Transluminal peripheral atherectomy, open or percutaneous, including radiological supervision and interpretation; renal artery*

….

0505T *Endovenous femoral-popliteal arterial revascularization, with transcatheter placement of intravascular stent graft(s) and closure by any method, including percutaneous or open vascular access, ultrasound guidance for vascular access when performed, all catheterization(s) and intraprocedural roadmapping and imaging guidance necessary to complete the intervention, all associated radiological supervision and interpretation, when performed, with crossing of the occlusive lesion in an extraluminal fashion*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

	(0505T includes all ipsilateral selective arterial and venous catheterization, all diagnostic imaging for ipsilateral, lower extremity arteriography, and all related radiological supervision and interpretation) (Do not report 0505T in conjunction with 37267, 37268, 37269, 37270 ~~37224, 37225, 37226, 37227~~, 37238, 37239, 37248, 37249, within the femoral-popliteal segment)
#0620T	*Endovascular venous arterialization, tibial or peroneal vein, with transcatheter placement of intravascular stent graft(s) and closure by any method, including percutaneous or open vascular access, ultrasound guidance for vascular access when performed, all catheterization(s) and intraprocedural roadmapping and imaging guidance necessary to complete the intervention, all associated radiological supervision and interpretation, when performed* *(0620T includes all ipsilateral selective arterial and venous catheterization, all diagnostic imaging for ipsilateral, lower extremity arteriography, and all related radiological supervision and interpretation)* (Do not report 0620T in conjunction with ~~37228, 37229, 37230, 37231,~~ 37280, 37281, 37282, 37283, 37284, 37285, 37286, 37277, 37288, 37289, 37290, 37291, 37292, 37293, 37294, 37295, 37238, 37239, 37248, 37249, within the tibial-peroneal segment)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37254 Tracking Number P1 Original Specialty Recommended RVU: **7.30**
Presented Recommended RVU: **7.30**
Global Period: 000 Current Work RVU: **n/a** RUC Recommended RVU: **7.30**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, initial vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57-year-old male who smokes presents for right buttock and calf claudication. Diagnostic studies show a focal concentric stenosis of the right common iliac artery which is treated with balloon angioplasty.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 60% , In the ASC 4%, In the office 35%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 75% , Overnight stay-less than 24 hours 20% , Overnight stay-more than 24 hours 6%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 100%

Description of Pre-Service Work: Review patient history, records, laboratory, diagnostic tests, and the planned procedure. Give special attention to status of anticoagulant and antiplatelet therapy in addition to potential contrast allergy and renal function. Conduct physical examination to ensure no changes have occurred since the prior visit. Conmmunicate with patient and family including review of risks, benefits and alternatives of the recommended procedure. Obtain informed consent. Mark access sites. Communicate with other medical professionals, as needed. Confirm presence of guiding and selective catheters, sheaths, guidewires, balloons, stents, and all additional required devices. Confirm availability of rescue devices. Ensure all technical personnel are aware of the upcoming procedure and competent is use of required devices. Following transport to the procedure suite, ensure patient is properly positioned on the table, adequate IV access has been obtained, and all required monitors appropriately attached. Supervise sterile preparation of skin access sites, placement of sterile drapes, and administration of pre-procedure antibiotics as indicated. Don radiation protection gear and ensure team members do likewise. Perform pre-procedure time out.

Description of Intra-Service Work: Cannulate a suitable access vessel either percutaneously or with open exposure of the vessel and manipulate a catheter and guidewire into the diseased common iliac artery using fluoroscopic guidance. Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Cross the area of stenosis with a guidewire and advance a sheath to or through the stenosis. Exchange wires and catheters to create a stable staging platform suitable for performing the intervention. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the stenosis has been adequately treated. Repeat balloon inflations as required, or potentially use additional balloons with larger or smaller diameters as indicated by anatomic review of the images obtained. All segments of disease within the same common iliac artery segment are treated with appropriate- sized balloon(s). Once a satisfactory result has been shown with the absence of extravasation and flow-limiting dissection, confirm patency of the vessel, and remove the wire and sheath. Obtain hemostasis and closure of the arteriotomy by manual pressure, application of an arterial closure device, or standard surgical closure of the puncture by suture.

Description of Post-Service Work: Apply sterile dressings. Conduct debriefing. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Perform patient examination including assessment of vital signs and perfusion of treated limb. Repeat this exam as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with patient and family when patient has emerged from sedation. Complete all appropriate medical records with copy sent to referring physician. Transfer the patient to the appropriate care setting, or arrange for discharge, when recovery area discharge criteria have been met, writing appropriate orders for follow-up laboratory tests, X rays, and patient care.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

TOP KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
36905	000	9.00	**RUC Time**

CPT Descriptor Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty

SECOND HIGHEST KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
36253	000	7.30	**RUC Time**

CPT Descriptor Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
37212	000	6.81	**RUC Time**	1,269

CPT Descriptor 1 Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52356	000	0.00	**RUC Time**	82,797

CPT Descriptor 2 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00

• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	23%	23%	54%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high-cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high-cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.

April 2022: The RAW reviewed an action plan that was required because of a misunderstanding that the CPT Panel rejected the proposed coding changes, however, the Panel actually postponed until time uncertain. The RAW discussed the complexity of this issue - including the importance of correct coding to account for varied and significant practice expense related to these codes - and recommended that a joint CPT/RUC Workgroup be created to develop coding solutions that would address this issue.

May 2022: The CPT Panel Executive Committee voted to refer this issue to the CPT Editorial Panel with a recommendation for creation of a CPT-convened workgroup to address this code family with appropriate RUC expertise on the Workgroup.

August 2022: The CPT Panel sent an email that indicated concerns with the creation of a traditional Workgroup: "… a workgroup should result in a CCA from the workgroup (ie, not the applicants) and that the Panel lacks the clinical expertise to be "responsible" for the creation of a new CCA. However, in this scenario, the Panel reviewers can offer guidance and direction but cannot adequately craft the proposal themselves." The proposed solution was to convene an open "discussion forum" that included the Panel Chair and the Panel Reviewers for an open dialogue to address issues and work towards a compromise.

September 2022: An open in-person / virtual Discussion Forum was convened during the CPT Panel meeting to discuss society and Panel concerns and questions to be able to develop a new coding option.

February 2023: After meeting at CPT meetings and via conference calls, the societies contacted CPT staff to set up a call with the Panel reviewers to present a coding option and provide a verbal rationale for the option as written information never conveys the complete picture.

April 2023: The Panel reviewers held a conference call to allow the advisors from the societies to present the revised coding structure that bundles interventions as directed by the Panel. The call ended with a consensus of a conceptual code structure that included some additional bundling and a method to reduce society and Panel burden regarding literature requirements.

May 2023: The societies finalized the coding structure at an in-person meeting during the Panel meeting and a CCA began development for deletion of the current codes and development of 46 new codes.

March 2024: The societies developed and reviewed the guidelines, 46 new bundled codes, vignettes and DOWs for all 46 codes, revisions to all sections of CPT affected by the proposed coding changes, and collection of necessary literature for "new" codes.

June 2024: The societies submitted the new code change application.

September 2024: The CPT Panel reviewed and passed the LER CCA. The CCA created a new subsection titled, "Iliac Vascular Territory" accompanied by nine new codes; added a new subsection titled, "Femoral and Popliteal Vascular Territory" accompanied by 17 new codes; added a new subsection titled, "Tibial and Peroneal Vascular Territory" accompanied by 16 new codes; and added a new subsection titled, "Inframalleolar Vascular Territory" accompanied by four new codes. The CCA also deleted the existing 16 lower extremity revascularization codes and one Category III code. Finally, the CCA also revised the "Endovascular Revascularization (Open, Percutaneous, Transcatheter) guidelines and parenthetical revisions throughout the code set.

The new family of codes is significantly different than the initial CCA but represents the best compromise between the CPT panel and the specialty society coalition of SVS, ACS, SIR, ACR, SCAI, ACC, and OEIS. They address many of the concerns described above and are outlined as follow:

1. Recognition of differing complexity of interventions by separating straightforward and complex interventions.
2. Complex interventions require more time, intensity, and supplies to complete.
3. New codes for intravascular lithotripsy of the iliac and femoral-popliteal territories.
4. New codes for additional interventions within the femoral-popliteal territory of either the common femoral or profunda femoral artery.
5. New territory capturing the work of intervention of the inframalleolar arteries.

Survey Methodology

At the September 2024 CPT Editorial Panel meeting, the Panel created 46 new CPT code to describe Lower Extremity Revascularization (LER) services and deleted the 16 existing lower extremity revascularization codes. The surveying societies submitted a proposal for surveying these codes for the January 2025 meeting using a custom survey instrument.

Prior to the meeting, the surveying specialty societies submitted a proposal to conduct a standard RUC survey of 10 anchor codes for the family and then conduct an abbreviated survey for the other 36 codes in the same template, with the abbreviated-surveys split into three separate groupings: (1) Tibial – Peroneal, (2) Femoral – Popliteal and (3) Iliac + Inframalleolar. Each physician in the sample would receive a standard RUC survey for the 10 anchor codes and one abbreviated survey. The specialty societies will break up their samples to evenly distribute the abbreviated surveys. The presenters noted that the intent of their proposal is to avoid survey fatigue and to maximize the number of survey responses for each code.

The presenters noted the abbreviated portion of the survey for the remainder of the codes would present the CPT code, CPT descriptor, and Vignette. The respondent would be asked to affirm the vignette, provide Intra Time, Overall Complexity, Estimated Work RVU, and 12 Month Experience without selecting a reference service code. The abbreviated portion of the surveys would also include the survey

respondent's answers from the anchor codes populated into the abbreviated survey table to allow comparison. All 000 pre/post time cells in the abbreviated portion of the survey would be pre-populated (editable) based on pre- and post-packages selected for the anchoring codes. For the single intensity/complexity question in the abbreviated portion of the survey, an anchor survey code from the same territory would be provided for comparison/reference.

Subcommittee members overall were supportive of the request for a combined full and abbreviated survey. Several Subcommittee members expressed concern with the initial proposal to divide respondents into three groupings with a preference for two groupings, and also expressed concerns with the group of anchor survey codes not having an angioplasty only service. Subcommittee members requested for the societies to consider switching the abbreviated survey groupings to two groups instead of three. Also, the Subcommittee requested for the societies to reconsider the representation of anchor codes that would receive a full RUC survey. The Chair suggested the societies consider adding a question on the survey to assess the typical number of blockages/stenoses typical for the femoral/ popliteal stent and/or atherectomy/stent codes.

In order to provide additional time to the surveying societies, the Research Subcommittee reconvened the next morning. The societies provided an updated proposal with 11 anchor survey codes which represented every territory in the family, straightforward procedures, complex procedures, angioplasty only procedures, stent placement procedures, atherectomy procedures and add-on procedures. Also, the societies provided two groupings of abbreviated survey codes instead of three. Finally, the societies provided a list of which comparator codes would be used for the intensity/complexity question for each abbreviated survey code (included in the September 2024 handouts at the meeting folder). **The Research Subcommittee approved the custom survey instrument and methodology as follows:**

Research-Approved Core Survey Codes (Standard RUC Survey):

37254	Iliac, angioplasty, init, SF
37255	+ Iliac, angioplasty, addl, SF
37256	Iliac, angioplasty, init, CX
37262	+ Iliac IVL

Research-Approved Questions for Abbreviated Portio of the Survey

New Codes	**CPT Codes** **CPT Descriptor**	
Typical Patients	**Is your typical patient for this procedure similar to the typical patient described?**	Yes or No
	If no, please describe your typical patient	
Physician Time	**How much of your own time is required per patient treated for each of the following steps in patient care related to this procedure? [Pre and Post times piped from package times]**	Pre Eval
		Pre Pos
		Pre SDW
		INTRA
		Imm Pos
		Total Time
Intensity/Complexity	**Compare OVERALL intensity/complexity of all physician work you perform for the new codes relative to [Piped Comparator Code]**	

Physician Work RVUs	**Based on your review of all previous questions, please provide your estimated work RVU (to the 2nd decimal place) for the new codes.**
Experience	**How many times have you personally performed these procedures in the past 12 months?**

General Relatively Principles for the Family

The survey data was analyzed for relativity in three dimensions; straight forward to complex, proximal to distal territories, and increasing complexity of interventions. The survey respondents confirmed the bimodal work of intervention based on time and recommended values that was maintained through the family, although to a lesser extend for additional interventions. The expert panel recommendations include 25th percentile, median values, existing values, and crosswalks with the goal of maintaining the relativity between complexity, territory and interventions. This relativity is detailed in the attached table and summarized below.

1. The straightforward procedures are less intense than the complex procedures. This is reflected in time and RVW resulting and differential IWPUT. In general, the straightforward procedures cluster around an IWPUT of 0.100 while the complex procedures cluster around an IWPUT of 0.120.
2. The hierarchy of treatment modalities from simple to difficult is angioplasty < stent < atherectomy. This is reflected in the recommended RVW; however, the magnitude of difference varies based on territory, complexity, and initial or additional vessel treated. There is ***not*** a standard RVW increment applicable per treatment modality that functions like a building block to arrive at an RVW recommendation.
3. Interventions increase in time and difficulty with progression from larger vessels to smaller vessels, i.e., iliac < femoral/popliteal < tibial < Inframalleolar. This is mostly consistent with the survey data, although it is less apparent with the additional vessels treated.

Budget Neutrality

Creation of the new family of codes for lower extremity revascularization necessitated projections to redistribute existing utilization across the new codes. The multispecialty expert panel deliberated this question extensively and made an educated forecast of what the utilization distribution will be for the new family. This is detailed in the attached spreadsheet but is summarized below:

1. The straightforward to complex split for the iliac territory is 85% to 15%.
2. Iliac intravascular lithotripsy is a new service. Utilization was estimated from vendor sales data.
3. The straightforward to complex split for the femoral/popliteal territory is 70% to 30% for the initial vessel, all modalities.
4. Additional vessels in the femoral/popliteal territory represent new services that were not previous reportable. Utilization for these new services was estimated from the corresponding tibial additional vessels frequency as a proxy.
5. The straightforward to complex split for the femoral/popliteal territory, additional vessels, is
    - 85% to 15% for angioplasty
    - 50% to 50% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
6. The straightforward to complex split for the tibial territory is 50% to 50% for the initial vessel, all modalities.
7. The straightforward to complex split for the tibial territory, additional vessels, is
    - 50% to 50% for angioplasty
    - 30% to 70% for stent
    - 50% to 50% for atherectomy
    - 30% to 70% for angioplasty, stent, atherectomy
8. The inframalleolar angioplasty codes represent new services that were previous reported as tibial interventions. Utilization for these new services was estimated as 10% of the analogous tibial angioplasties (initial and additional).

9. The straightforward to complex split for the inframalleolar territory is 90% to 10%.

Budget neutrality calculations based on these utilization estimates results in a family that is an increase of 8.7% over the existing code family. However, when the RVWs for the new services (iliac intravascular lithotripsy, femoral/popliteal intravascular lithotripsy, and femoral/popliteal additional vessel interventions) are removed, the result is a net increase of 2.3%. A budget neutrality calculation has been included with the submission as well as a worksheet in the RUC Summary Excel file.

Compelling Evidence

The submitted proposal represents an 8.7% increase in total RVWs for this family of codes over the existing codes. The specialty societies believe compelling evidence to consider these changes has been met based on the following criteria:

1. Change in technology. The additional codes 37262 and 37279 represent intravascular lithotripsy of the iliac and femoral/popliteal territories, respectively. This a new treatment modality not previously captured in the existing code set. There have also been significant changes to existing technology over the past 15 years including drug coated balloons, drug eluting stents, newer atherectomy devices, and advanced wires/catheters to treat more complex lesions.
2. Change in patient population. The complexity of patients and pathology treated today is significantly different from when the codes were previously valued in 2010. Patients treated at that time had simpler lesions and less symptomatic disease. More advanced disease was treated with surgical bypass surgery. The evolution of technology and techniques has allowed the expansion of endovascular revascularization to patients with more advanced disease and to more complex patients leading to an increased utilization of these minimally invasive techniques and a corresponding drop in utilization of surgical bypass. The net effect is a change in the patient population and compelling evidence for change in valuation.
3. Change in venue. Prior to 2010, the vast majority of lower extremity revascularization was performed in the hospital setting. Non-facility inputs created in 2010 allowed the migration of patient care out of the facility and into the non-facility setting as it became apparent that these procedures were able to be performed safely and more efficiently. The shift in site of service also results in compelling evidence for valuation.

Pre-Service Time

Pre Time Package 2 is appropriate for LER procedures with adjustment to the times.

Evaluation – package is 18 minutes. Survey medians ranged from 45-50 minutes. The specialty societies recommend a total of 30 minutes for evaluation time. The additional 12 minutes of evaluation time is to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging equipment, and the coordination of all technical staff.

Positioning – package is 1 minute. Survey medians ranged from 10-12 minutes. The specialty societies recommend a total of 3 minutes for positioning time. The additional 2 minutes of positioning time is for appropriately positioning and securing the patient on the angiographic table including the placement of bolsters to protect the arms and placement of rulers underneath the patient to make sure that there is a reference for the physician during the deployment of the devices as well as other activities which are required in order to be able to obtain all necessary views to treat the lesion.

SDW – package is 6 minutes. Survey medians ranged from 12-15 minutes. The specialties are recommending a total of 5 minutes for SDW time (the SDW time assigned to the current LER codes).

Post-Service Time

Post service package 8a is appropriate for LER procedures with adjustment to times.

Package has 25 minutes. Survey median 30 minutes. The specialty societies recommend a total of 30 minutes for post-service time. The additional 5 minutes of post service time is to document the additional radiologic S&I portion of the procedure in the operative note.

Core Survey Overview of Recommended Values

The 11 codes in the Core Survey completed by all survey respondents were carefully chosen to be anchors across the family with codes in each complexity, territory, and treatment modality. Anchor codes were also chosen for initial and additional vessels. The goal was to firmly establish relativity.

Comparison with Key Reference Services

There were four codes that were chosen most often as key reference services for the 000-day global core survey codes. They are as follows:

- 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral*
- 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- 61645, *Percutaneous arterial transluminal mechanical thrombectomy and/or infusion for thrombolysis, intracranial, any method, including diagnostic angiography, fluoroscopic guidance, catheter placement, and intraprocedural pharmacological thrombolytic injection(s)*

The following table incorporates the recommended RVW for the core survey codes along with the key reference services identified for these codes arranged in ascending order of values.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

There were also four codes that were chosen most often as key reference services for the ZZZ core survey codes. They are as follows:

- 36908, *Transcatheter placement of intravascular stent(s), central dialysis segment, performed through dialysis circuit, including all imaging and radiological supervision and interpretation required to perform the stenting, and all angioplasty in the central dialysis segment (List separately in addition to code for primary procedure)*
- 34709, *Placement of extension prosthesis(es) distal to the common iliac artery(ies) or proximal to the renal artery(ies) for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, dissection, penetrating ulcer, including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and treatment zone angioplasty/stenting, when performed, per vessel treated (List separately in addition to code for primary procedure)*
- 37186, *Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, non-intracranial, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*
- 37247, *Transluminal balloon angioplasty (except lower extremity artery(ies) for occlusive disease, intracranial, coronary, pulmonary, or dialysis circuit), open or percutaneous, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty within the same artery; each additional artery (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey addon codes along with the key reference services identified for these codes arranged in ascending order of values.

Comparison to MPC codes

The following seven MPC codes were chosen as brackets for the core survey 000-day global recommendations:

- MPC 36253, *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological*

supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral

- MPC 36905, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transluminal balloon angioplasty, peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the angioplasty*
- MPC 36906, *Percutaneous transluminal mechanical thrombectomy and/or infusion for thrombolysis, dialysis circuit, any method, including all imaging and radiological supervision and interpretation, diagnostic angiography, fluoroscopic guidance, catheter placement(s), and intraprocedural pharmacological thrombolytic injection(s); with transcatheter placement of intravascular stent(s), peripheral dialysis segment, including all imaging and radiological supervision and interpretation necessary to perform the stenting, and all angioplasty within the peripheral dialysis circuit*
- MPC 37212, *Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day*
- MPC 37244, *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation*
- MPC 52353, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)*
- MPC 52356, *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37212 MPC	6.81	0.089	128	30	3	5	60	30
37254	**7.30**	**0.097**	**128**	**30**	**3**	**5**	**60**	**30**

52356 MPC	8.00	0.110	133	33	5	15	60	20
37267	**8.75**	**0.097**	**143**	**30**	**3**	**5**	**75**	**30**
36905 MPC	9.00	0.106	126	22	4	5	75	20
36906 MPC	10.42	0.104	141	22	4	5	90	20
37256	**10.75**	**0.116**	**148**	**30**	**3**	**5**	**80**	**30**
37296	**11.00**	**0.095**	**168**	**30**	**3**	**5**	**100**	**30**
37288	**13.50**	**0.100**	**188**	**30**	**3**	**5**	**120**	**30**
37244 MPC	13.75	0.135	166	23	3	5	90	45
37269	**14.75**	**0.121**	**178**	**30**	**3**	**5**	**110**	**30**
37290	**17.00**	**0.104**	**218**	**30**	**3**	**5**	**150**	**30**

The following four MPC codes bracket the core survey ZZZ addon code recommendations:

- MPC 22632, *Arthrodesis, posterior interbody technique, including laminectomy and/or discectomy to prepare interspace (other than for decompression), single interspace, lumbar; each additional interspace (List separately in addition to code for primary procedure)*
- MPC 34812, *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral (List separately in addition to code for primary procedure)*
- MPC 36476, *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*
- MPC 63048, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*

The following table incorporates the recommended RVW for the core survey codes along with the bracketing MPC codes arranged in ascending order of values.

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
36476 MPC	2.65	0.088	30				30

22632 MPC	5.22	0.087	60				60	

Core Survey Additional Rationale for Specific Codes:

37254 Iliac angioplasty, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 7.30 RVW. This represents a ***decrease of 7.6%*** from current value of 7.90 RVWs for existing CPT code 37220.

37256 Iliac angioplasty, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 10.75 RVW. This represents an ***increase of 36.1%*** from current value of 7.90 RVWs for existing CPT code 37220.

The existing CPT code 37220, *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty*, will be replaced by 37254 and 37256 splitting it into straightforward and complex interventions. The most selected key reference services for 37254 were
KRS 36253 and KRS 36905 while the most selected key reference services for 37256 were KRS 36906 and KRS 61645. MPC codes 37212 and 52356 bracket 37254 and MPC codes 36906 and 37244 bracket 37256 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37254 and 37256.

When looking at the RVWs for 37254 and 37256 combined, the overall budget neutrality for existing CPT code 37220 is a ***decrease of 1.0%***

				-1.0%

+37255 Iliac angioplasty, addition vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW. This represents a ***decrease of 19.6%*** from current value of 3.73 RVWs for existing CPT code 37222.

The existing CPT code 37222, *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal angioplasty (List separately in addition to code for primary procedure)*, will be replaced by +37255 and +37257 splitting it into straightforward and complex interventions. The most selected key reference services for +37255 were KRS 37247 and KRS 34709. MPC codes 36476 and 63048 bracket +37255 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37255.

When looking at the RVWs for +37255 and +37257 combined, the overall budget neutrality for existing CPT code 37222 is a ***decrease of 16.0%***

				9329
				-16.0%

+37262 Iliac, intravascular lithotripsy:

The specialty societies recommend the 25th percentile survey value of 3.00 RVW for this new service.

Intravascular lithotripsy is a new treatment modality that can be used in addition to angioplasty and/or stenting in the iliac territory. +37262 is a ZZZ addon code created to capture the additional work of performing iliac IVL. The most selected key reference services for +37262 were KRS 36908 and KRS 37247. MPC codes 36476 and 63048 bracket +37262 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37262.

MPC								

37267 Femoral/popliteal angioplasty, stent, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW. This represents a ***decrease of 14.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

37269 Femoral/popliteal angioplasty, stent, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 14.75 RVW. This represents an ***increase of 30.6%*** from current value of 10.24 RVWs for existing CPT code 37226.

The existing CPT code 37226, *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed*, will be replaced by 37267 and 37269 splitting it into straightforward and complex interventions. The most selected key reference services for 37267 were KRS 36906 and 36905 while the most selected key reference services for 37269 were KRS 61645 and 36906. MPC codes 52353 and 36905 bracket 37267 and MPC codes 52356 and 36905 bracket 37269 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37267 and 37269.

When looking at the RVWs for 37267 and 37269 combined, the overall budget neutrality for existing CPT code 37226 is an ***increase of 3.0%***

				186,314
				3.0%

+37268 Femoral/popliteal angioplasty, stent, additional vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 8.75 RVW for this new service.

The existing CPT codes do not allow for reporting of more than one intervention in the femoral/popliteal territory. The societies did not feel that this represents current practice as it is now common to treat the common femoral artery and/or the profunda femoral artery in the appropriately selected patients. The societies advocated for the creation of codes to capture the work of addition interventions in the femoral/popliteal territory at CPT. The Panel agreed that additional procedures may be reported with the coding guidance that the superficial femoral and popliteal arteries constitute one segment and that it is only appropriate to report one additional vessel per session. CPT code +37268 captures the work of angioplasty and stenting of an additional fem/pop vessel that is straightforward. The most selected key reference services for +37268 were KRS 36908 and 34709. MPC codes 63048 and 34812 bracket +37268 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37268.

+37268 represents new work, therefore budget neutrality does not apply.

KRS	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post
37268	**3.73**	**0.107**	**35**				**35**	
36908 KRS	4.25	0.106	40				40	
34709 KRS	6.50	0.108	60				60	

MPC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post

37268	**3.73**	**0.107**	**35**				**35**	
34812 MPC	4.13	0.103	40				40	

37288 Tibial/peroneal angioplasty, atherectomy, initial vessel, straightforward:
The specialty societies recommend the 25th percentile survey value of 13.50 RVW. This represents a ***decrease of 2.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

37290 Tibial/peroneal angioplasty, atherectomy, initial vessel, complex:
The specialty societies recommend the 25th percentile survey value of 17.00 RVW. This represents an ***increase of 23.2%*** from current value of 13.80 RVWs for existing CPT code 37229.

The existing CPT code 37229, *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed*, will be replaced by 37288 and 37290 splitting it into straightforward and complex interventions. The most selected key reference services for 37288 were KRS 61645 and 36906 while the most selected key reference services for 37290 were KRS 61645 and 36906. MPC codes 36906 and 37244 bracket 37288 and MPC code 37244 brackets 37290 on the lower side providing relativity across the database. These key reference services and MPCs compare favorably with the recommendations for the 25th percentile survey values for 37288 and 37290.

When looking at the RVWs for 37288 and 37290 combined, the overall budget neutrality for existing CPT code 37229 is an ***increase of 9.5%***

				578,250
				9.5%

+37289 Tibial/peroneal angioplasty, atherectomy, additional vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 4.75 RVW. This represents a ***decrease of 26.9%*** from current value of 6.50 RVWs for existing CPT code 37233.

The existing CPT code 37233, *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with atherectomy, includes angioplasty within the same vessel, when performed (List*

separately in addition to code for primary procedure), will be replaced by +37289 and +37291 splitting it into straightforward and complex interventions. The most selected key reference services for +37289 were KRS 34709 and 37186. MPC codes 34812 and 22632 bracket +37289 providing relativity across the database. These key reference services and MPCs compare favorably with and support the recommendation for the 25th percentile survey value for +37289.

When looking at the RVWs for +37289 and +37291 combined, the overall budget neutrality for existing CPT code 37233 is a ***decrease of 13.5%***

37296 Inframalleolar angioplasty, initial vessel, straightforward:

The specialty societies recommend the 25th percentile survey value of 11.00 RVW for this new service.

The most selected key reference services for 37296 were KRS 36906 and 61645. MPC codes 36906 and 37244 bracket 37296 providing relativity across the database. These key reference services and MPCs compare favorably with the recommendation of the 25th percentile survey value for 37296.

Core Survey Summary

The newly rewritten family of CPT codes for lower extremity revascularization adds new codes for procedures not performed in 2010. These include a new territory to capture work done on arteries in the foot, new codes for additional femoral/popliteal territory interventions, and new add-on codes for the new treatment modality of intravascular lithotripsy. In addition, the legacy codes have been divided into straightforward and complex procedures. Obtaining valid survey data and creating recommendations for appropriate relative value units has been a daunting task. Modification of the survey instrument as described above allowed for adequate numbers of surveys to be received for all codes.

The survey data was reviewed by the multispecialty workgroup and validated. Detailed analysis of the survey results by expert panel, comparison to key reference services, MPC codes, and to the other codes have resulted in the above detailed recommendations of RVW for the Core Survey codes. A combination of 25th percentile, median, existing values, and crosswalks were used to maintain relativity from straightforward to complex, initial to addition vessels, proximal to distal territories, and across escalating treatment modalities.

The 11 core codes surveyed by all survey respondents were carefully chosen and vetted to provide representative anchor codes within each territory, each treatment modality, straightforward and complex interventions, and initial and additional vessels. Recommendations for all core codes are supported by key reference services and MPC codes to provide internal relativity as well as relativity across the database. The specialty societies believe these recommendations are appropriate and well supported with this additional rationale.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37220

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Surgery How often? Commonly

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? n/a
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National utilization is not available.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated Medicare utilization is provided in a separate spreadsheet.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Berenson-Eggers Type of Service (BETOS) Assignment

Please pick the appropriate BETOS classification that best corresponds to the clinical nature of this CPT code. Please select the main BETOS classification and sub-classification to the greatest level of specificity possible.

Main BETOS Classification:
Procedures

BETOS Sub-classification:

SUMMARY OF RECOMMENDATION

CPT Code:37255 Tracking Number P2 Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: ZZZ Current Work RVU: **n/a** RUC Recommended RVU: **3.00**

CPT Descriptor: Revascularization, endovascular, open or percutaneous, iliac vascular territory, with transluminal angioplasty, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the angioplasty within the same artery, unilateral; straightforward lesion, each additional vessel (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During endovascular treatment for right buttock and calf claudication in a 77-year-old male who smokes, after a separately reported balloon angioplasty of a stenosis of the right common iliac artery, an additional 75% stenosis of the left external iliac artery is treated with balloon angioplasty. [Note: This is an add-on service. Only consider the additional work related to the balloon angioplasty of the additional stenosis of the left external iliac artery.]

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 000, 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure for the typical patient; In the hospital 0% , In the ASC 0%, In the office 0%

Of those survey respondents that stated they perform this procedure for the typical patient in the hospital, the percent of respondents who stated the patient is discharged: Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Of those survey respondents that keep the typical patient overnight, the percent who stated they perform an E&M service later on the same day 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The lesion in the external iliac artery has previously been crossed for treatment of the more proximal common iliac stenosis (reported separately). Perform angiography and obtain road-mapping images for vessel sizing and to confirm anatomy. Advance and position an appropriately sized angioplasty balloon catheter to the area of stenosis using fluoroscopic guidance, and then inflate it to the appropriate pressure and time for treating of the lesion. Remove or pull back the balloon over the wire and obtain follow-up images with contrast injection to determine if the stenosis has been adequately treated. Repeat balloon inflations as required, or potentially use additional balloons with larger or smaller diameters as indicated by anatomic review of the images obtained. All segments of disease within the same external iliac artery segment are treated with appropriate-sized balloon(s). Completion angiography is performed to confirm vessel patency, a satisfactory treatment result, and absence of extravasation, embolization, or flow-limiting dissection.

Description of Post-Service Work: N/A

INTENSITY/COMPLEXITY MEASURES
(of those that selected Key Reference codes)

Survey respondents are rating the survey code relative to the key reference code.

Survey Code Compared to Top Key Reference Code	**Much Less**	**Somewhat Less**	**Identical**	**Somewhat More**	**Much More**
Overall intensity/complexity	0%	5%	48%	43%	5%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	14%	52%	33%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	10%	48%	43%
Physical effort required	5%	62%	33%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	0%	43%	57%

Survey Code Compared to 2nd Key Reference Code	Much Less	Somewhat Less	Identical	Somewhat More	Much More
Overall intensity/complexity	0%	0%	64%	14%	21%

Mental Effort and Judgment	Less	Identical	More
• The number of possible diagnosis and/or the number of management options that must be considered • The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed • Urgency of medical decision making	0%	50%	50%

Technical Skill/Physical Effort	Less	Identical	More
Technical skill required	0%	69%	31%
Physical effort required	0%	69%	31%

Psychological Stress	Less	Identical	More
• The risk of significant complications, morbidity and/or mortality • Outcome depends on the skill and judgment of physician • Estimated risk of malpractice suit with poor outcome	14%	57%	29%

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The additional rationale below is the original rationale submitted by the specialty society(ies) prior to the RUC meeting and does not necessarily represent the rationale for the RUC recommendation. To view the RUC's rationale, please review the separate RUC recommendation document.

Background

Revascularization of the lower extremities includes angioplasty, atherectomy, and/or stent placement in the iliac, femoral/popliteal, and tibial arteries. These lower extremity revascularization (LER) procedures had been reported with component coding prior to the creation of a new family of CPT codes bundling the access, catheterization, intervention, and radiologic supervision & interpretation in January 2010. CPT codes 37220-37235 were valued at the April 2010 RUC Meeting. Non-facility inputs were also established at the April 2010 RUC meeting for CPT Code 37220-37225.

October 2018: RAW identifies 37229 through high growth screen with criteria: over 10,000 claims and increased over 100% from 2012-2017. Code 37229 was new for 2011 and the societies responded that the growth was appropriate and in line with best practices for limb sparing. However, the specialties noted changes in technology since 2011 and suggested referral to CPT to update the code descriptors and to accommodate new technologies.

January 2019: RAW identified CPT Codes 37225, 37227 and 37229 through a high-priced supplies screen. At the same time, CMS contracted with StrategyGen to conduct an independent evaluation of all Medicare direct supplies and equipment items. At the RAW, the specialty societies argued that the RUC did not need an independent screen for high-cost supplies because CMS was addressing the necessity to routinely review pricing information. The RAW had no further action for CPT Codes 37225, 37227 and 37228 related to high-cost supplies.

October 2020: A code change application (CCA) was submitted to delete lower extremity endovascular revascularization codes 37220-37235, establish 32 new codes, and rewrite the guidelines to reflect current practice in performing these procedures. There were a few Panel questions asked just prior to the meeting that were responded to. However, prior to the meeting, the application was withdrawn based on an email from Panel staff that stated the literature was not sufficient for some of the codes and the utilization was not sufficient for some of the codes and the structure and content of the proposal did not meet general criteria for CPT because the structure unbundled services. Therefore, the Panel would not support the proposal.

June 2021: A revised CCA was submitted that deleted or excluded codes with insufficient literature or utilization and included 83 articles to address the feedback from the Panel reviewers in the previous application from October 2020. The Panel postponed the issue until time uncertain and provided 12 instructions to be addressed in a revision.
