AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Bronchial Thermoplasty

In February 2012, the CPT Panel transitioned CPT Category III codes 0276T and 0277T to CPT Category I codes 31660 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 1 lobe* and 31661 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 2 or more lobes.* The RUC noted that bronchial thermoplasty is used for the treatment of severe asthma that has been unresponsive to standard medication therapy. This procedure is performed with three outpatient visits typically scheduled two weeks apart. Each lower lobe is treated separately in the first two visits and reported using 31660 and the two upper lobes are treated together in the final visit and reported using 31661.

31660
The RUC reviewed the survey results of 45 pulmonologists and thoracic surgeons and determined that a work RVU of 4.50, the survey median is appropriate for 31660. There was consensus among the RUC members that the specialty societies overestimated pre-service evaluation time of 33 minutes. The RUC determined that 19 minutes was more appropriate which corresponds to the survey median. The RUC reviewed CPT Code 31636 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of bronchial stent(s) (includes tracheal/bronchial dilation as required), initial bronchus* (work RVU=4.30, intra-service time= 45 minutes) and determined that 31660 is a more intense procedure, requires 5 more minutes intra-service time and should be valued higher. The RUC also reviewed 31541 *Laryngoscopy, direct, operative, with excision of tumor and/or stripping of vocal cords or epiglottis; with operating microscope or telescope* (work RVU=4.52, intra-service time=60 minutes) and agreed that these services should be valued similarly. **The RUC recommends a work RVU of 4.50 for CPT code 31660.**

31661
The RUC reviewed the survey results of 45 pulmonologists and thoracic surgeons and determined that a work RVU of 5.00, the survey median is appropriate for 31661. The RUC noted that this procedure requires 10 more minutes of intra-service time than the single lobe procedure, CPT code 31660, to treat both upper lobes for a total of 60 minutes. There was consensus among the RUC members that the specialty societies overestimated pre-service evaluation time of 33 minutes. The RUC reviewed 31638 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)* (work RVU=4.88) and agreed that although 31638 requires the same amount of intra-service time, 31661 is a more intense procedure and should be valued higher. The RUC also reviewed 31600 *Tracheostomy, planned (separate procedure)* (work RVU=7.17) and determined that 31600 requires more total time and intensity and should be valued higher. The RUC also agreed that a work RVU of 5.00 would maintain proper rank order within this family of services. **The RUC recommends a work RVU of 5.00 for CPT code 31661.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
⦿●31660	AA1	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 1 lobe	000	4.50
⦿●31661	AA2	with bronchial thermoplasty, 2 or more lobes	000	5.00

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31660 Tracking Number AA1 Original Specialty Recommended RVU: **4.50**
Presented Recommended RVU: **4.50**
Global Period: 000 RUC Recommended RVU: **4.50**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 1 lobe

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old woman presents with a history of poorly controlled severe asthma. Bronchial thermoplasty is performed on either lower lobe.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 78%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Hospital inpatient or ASC admission and preprocedural work-up, review of records, communication with other professionals, patient and family. Obtain informed consent. The physician and staff dress in disposable gown, non-sterile gloves, and protective eyewear before the procedure. Don lead apron for fluoroscopic guidance, if used. Preparing and positioning the patient and equipment. The physician examines the patient to verify that the patient can undergo the procedure. The physician verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulation.

Description of Intra-Service Work: In this procedure, the physician uses the energy created from high-frequency radio waves to reduce airway smooth muscle tissue in the bronchial walls of the lung. The physician skilled in bronchoscopy, working with a skilled bronchoscopic assistant, directs the bronchoscope and operates the catheter. Effective treatment with the radiofrequency catheter requires appropriate patient sedation throughout the procedure.

- A standard patient return electrode is affixed to the patient to provide a complete circuit.
- After the attending physician or anesthesiologist administers appropriate sedation, a standard flexible bronchoscope is inserted through the nose or mouth for access to the lung.
- A detailed inspection of the targeted lobe(s) of the lung is performed to plan the application of bronchial thermoplasty; thereby ensuring that the entire length of each and every accessible bronchial tube in the targeted lobe(s) are treated.
- A small radiofrequency catheter with an expandable electrode array is advanced through the accessory channel of a standard bronchoscope and positioned under direct bronchoscopic visualization into the first treatment area of the targeted lobe(s).
- The electrode array is then expanded and held in contact with the bronchial wall for up to 10 seconds while the radio-frequency controller delivers energy to the location.

- The bronchoscope and catheter are repositioned systematically approximately 55 times such that the electrode array is brought into contact with the entire length of each and every accessible bronchial tube in the targeted lobe(s), thereby providing consistent and thorough thermal treatment throughout the targeted lung region.

Description of Post-Service Work: The physician examines the patient post-bronchoscopy and pre-discharge from the facility to ascertain that no complications, such as bleeding, mucus plugging, acute bronchospasm, or shortness of breath have occurred. The findings from the procedure are explained to the patient and/or family/friend. The physician again reinforces previous instructions about post-procedure complications. The physician generates a detailed report of the procedure. The physician communicates results to the referring physician.

Technical Skill/Physical Effort (Mean)		
Technical skill required	4.53	4.40
Physical effort required	4.00	3.87
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.80	3.80
Outcome depends on the skill and judgment of physician	4.27	4.27
Estimated risk of malpractice suit with poor outcome	3.93	3.64

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.67	3.40
Intra-Service intensity/complexity	4.60	4.40
Post-Service intensity/complexity	3.47	3.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0276T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Sometimes

Specialty Thoracic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Rationale is taken from the CPT proposal where noted 6,000 BT annually, with 4,000 X1 and 2,000 X2.

Specialty Pulmonary Frequency 3600 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 400 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 200
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Expect that severe asthmatics are 5% for Medicare patients

Specialty Pulmonary Frequency 180 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 20 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31636

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31661 Tracking Number AA2 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: 000 RUC Recommended RVU: **5.00**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 2 or more lobes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old woman presents with a history of poorly controlled severe asthma, previously treated with bronchial thermoplasty on the lower lobes. Bronchial thermoplasty will be performed on both upper lobes.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 78%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Hospital inpatient or ASC admission and preprocedural work-up, review of records, communication with other professionals, patient and family. Obtain informed consent. The physician and staff dress in disposable gown, non-sterile gloves, and protective eyewear before the procedure. Don lead apron for fluoroscopic guidance, if used. Preparing and positioning the patient and equipment. The physician examines the patient to verify that the patient can undergo the procedure. The physician verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulation.

Description of Intra-Service Work: The procedure is similar to 31660, but is longer in scope, as it involves navigating the tortuous anatomy of the upper airways and covers more geography than either lower lobe. The bronchoscope and catheter are repositioned systematically approximately 75 times such that the electrode array is brought into contact with the entire length of each and every accessible bronchial tube in the targeted lobe(s), thereby providing consistent and thorough thermal treatment throughout the targeted lung region.

Description of Post-Service Work: The physician examines the patient post-bronchoscopy and pre-discharge from the facility to ascertain that no complications, such as bleeding, mucus plugging, acute bronchospasm, or shortness of breath have occurred. The findings from the procedure are explained to the patient and/or family/friend. The physician again reinforces previous instructions about post-procedure complications. The physician generates a detailed report of the procedure. The physician communicates results to the referring physician.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
31638	000	4.88	**RUC Time**

CPT Descriptor Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31622	000	2.78	**RUC Time**	84,807

CPT Descriptor 1 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31600	000	7.17	**RUC Time**	37,809

CPT Descriptor 2 Tracheostomy, planned (separate procedure);

Other Reference CPT Code	Global	Work RVU	Time Source
31636	000	4.30	**RUC Time**

CPT Descriptor Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of bronchial stent(s) (includes tracheal/bronchial dilation as required), initial bronchus

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 12 **% of respondents:** 26.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 31661**	**Key Reference CPT Code:** 31638	**Source of Time RUC Time**
Median Pre-Service Time	25.00	50.00	
Median Intra-Service Time	60.00	60.00

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.83	4.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	3.92
Urgency of medical decision making	3.42	3.58
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.67	4.67
Physical effort required	4.25	4.17
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.00	4.17
Outcome depends on the skill and judgment of physician	4.67	4.67
Estimated risk of malpractice suit with poor outcome	3.67	3.50

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.25	3.42
Intra-Service intensity/complexity	4.92	4.83
Post-Service intensity/complexity	3.58	3.75

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT Category III code 0277T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Sometimes

Specialty Thoracic Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The CPT application estimated that a total of 6,000 bronchial thermoplasties performed in one year, with 2,000 of those for X2 .

Specialty Pulmonary Frequency 1800 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 200 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated as 5% for these severe asthmatics

Specialty Pulmonary Frequency 90 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 10 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31638

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.

Hide columns and rows that do not contain data.

REF = Key Reference code data

CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.

SVY = Survey data - as it appears on the Summary of Recommendation form.

REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

31660 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 1 lobe
31661 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial thermoplasty, 2 or more lobe

Global Period: **000** Meeting Date: April 26-29, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Chest Physicians (ACCP) and the American Thoracic Society (ATS) met via conference call to review this code, including all the clinical labor, medical supplies and overhead equipment necessary to perform the procedure. The panel was made up of 2 private practice pulmonary/critical care physicians, 2 academic based pulmonary/critical care physicians, 2 practice administrators for private practice pulmonary/critical care physicians, one RN consultant who works specifically on Pulmonary and Critical Care Coding issues and a CPA who is a consultant to some 20 pulmonary and critical care practices. Please note that the consensus data from the panel was modified to the changes in the rules, policies and procedures of the RUC's Practice Expense Subcommittee.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: Three bronchial valve codes were presented to the AMA RUC's Jan 2012 meeting. RUC referred the placement code back to CPT (which met the next week and approved two placement codes to parallel the 2 removal codes – as ACCP and ATS originally proposed) AND RUC approved the two removal codes. The stand alone removal code, initial lobe is an excellent comparison for the pre-service times of clinical staff for the bronchial valve placement codes.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Facility Only

Complete pre-service diagnostic and referral forms

Coordinate pre-surgery services

Schedule space and equipment in the facility

Follow-up phone calls and prescriptions before the procedure

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued-Utilization over 30,000

April 2012

Chest Tube Thoracostomy

In April 2011, CPT code 32551 *Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open (separate procedure)* was identified in the Harvard Valued-Utilization over 30,000 screen. Prior to conducting a survey, the specialty societies noted a recent shift in the primary specialty from general and cardiothoracic surgery and pulmonary medicine to radiology. They attributed possible miscoding to the description which included "thoracostomy;" parenthetical examples for diagnoses (abscess, hemothorax, empyema) that may have been the primary focus for selecting the code, and an incorrect diagram in CPT following the code. In February 2012, the CPT Editorial Panel modified the code descriptor and parenthetical notes and deleted the diagram.

The RUC reviewed and discussed compelling evidence and agreed that the requirement was met to justify consideration of a different work RVU. Specifically, the methodology used to reduce the work RVU of 32551 for CY 2007 was flawed. Harvard time was cited by CMS that included post-service hospital and office visits. However, in 1993, these post service visits were removed, the global period was changed from 010 to 000, and the work RVU was reduced to 4.07. In addition, CPT Code 38300 was cited by CMS as a comparable reference. However, this code is an office/outpatient, non-urgent procedure that has a negative IWPUT (-0.039) and therefore not a valid reference. Lastly, CPT Code 38500 was also cited by CMS as a comparable reference and reverse building block methodology was used to subtract post-operative work from this minor, non-urgent10-day global code to calculate a work RVU for 32551 which has a 000-day global period. The intra-service intensity and complexity of these two services are not comparable.

The RUC reviewed the survey results from 89 general and cardiothoracic surgeons and pulmonologists and determined that a work RVU of 3.50 which corresponds to the survey's 25th percentile is appropriate for CPT code 32551. The RUC compared 32551 to key reference CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU=4.17) and determined that although 32551 required less time, the work intensity and complexity were greater, resulting in only slightly less total work. This was supported by the survey complexity and intensity measures showing 32551 equal to or greater than all measures when compared with 32550. The RUC compared 32551 to MPC CPT code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance* (work RVU=3.69) and determined that with 10 more minutes of intra service time, 19103 should be valued higher. The RUC compared 32551 to CPT code 16035 *Escharotomy; initial incision* (work RVU=3.74) which has the same intra-time and similar urgency of physician work. The RUC also compared 32551 to CPT code 57461 *Colposcopy of the cervix including upper/adjacent vagina; with loop electrode conization of the cervix* (work RVU=3.43) and CPT code 15273 *Application of skin substitute graft to trunk, arms, legs, total wound surface area greater than or equal to 100 sq cm; first 100 sq cm*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

wound surface area, or 1% of body area of infants and children (work RVU=3.50) and agreed that these two services require similar total physician work. **The RUC recommends a work RVU of 3.50 for CPT Code 32551.**

Practice Expense:

The RUC recommends that this is a facility procedure without direct practice expense inputs.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommenda-tion
⊙▲32551	CC1	Tube thoracostomy, includes connection to drainage system (eg, water seal) ~~(eg, for abscess, hemothorax, empyema)~~, when performed, open (separate procedure) ~~*(Do not report 32551 in conjunction with 19260, 19271, 19272, 32503, 32504)*~~ ~~(If imaging guidance is performed, see 75989)~~	000	3.50

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32551 Tracking Number CC1 Original Specialty Recommended RVU: **3.97**
Presented Recommended RVU: **3.50**
Global Period: 000 RUC Recommended RVU: **3.50**

CPT Descriptor: Tube thoracostomy, includes drainage system (eg, water seal), when performed, open

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 24-year-old patient presents to the emergency room after a motor vehicle collision. Breath sounds are diminished and a large right hemothorax is diagnosed. Via a thoracostomy (ie, open cutdown incision), a chest tube is inserted.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 78%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review available labratory and imaging studies. Examine patient to verify that he can undergo the procedure. Explain procedure to patient/family. Review risks and complications. Obtain informed consent for procedure and conscious sedation. Verify that all required instruments and supplies are available. Mark operative site. Assist with appropriate positioning to expose and stabilize operative site. Prep and drape site. Scrub and gown. Perform "time out." Administer local anesthetic at the skin incision site. Administer or supervise administration of moderate sedation.

Description of Intra-Service Work: An incision is made over the rib below the interspace of intended tube placement. Blunt dissection is carried out through all layers from the skin down through the subcutaneous tissues with additional administration of local anesthesia. The chest wall muscles are bluntly dissected including the deep intercostal muscles and pleura. The clinician’s finger is inserted down into the pleural cavity, digitally sweeping the thoracic cavity. Any fluid or blood under pressure is evacuated. A large bore thoracostomy tube is inserted into the pleural cavity, directed superiorly and posteriorly. Layered closure of muscle and skin is performed. A drainage system is attached and the tube is fixed to the skin with tape.

Description of Post-Service Work: An occlusive dressing is placed. Post-insertion chest x-ray is ordered to verify catheter position and to verify lung response to re-expansion. Monitor patient during reversal of moderate sedation. Assist team in moving patient to stretcher. Discuss post-procedure care with staff. Write post-procedure orders for care and medication. Write brief procedure note. Dictate complete procedure note. Write orders for transferring to appropriate inpatient care setting and discuss ongoing care with floor nurses. All appropriate medical records are completed.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
32550	000	4.17	**RUC Time**

CPT Descriptor Insertion of indwelling tunneled pleural catheter with cuff

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
19103	000	3.69	**RUC Time**	108,200

CPT Descriptor 1 Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52276	000	4.99	**RUC Time**	11,473

CPT Descriptor 2 Cystourethroscopy with direct vision internal urethrotomy

Other Reference CPT Code	Global	Work RVU	Time Source
37191	000	4.71	**RUC Time**

CPT Descriptor Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 37 **% of respondents:** 41.5 **%**

TIME ESTIMATES (Median)	**CPT Code: 32551**	**Key Reference CPT Code:** 32550	**Source of Time RUC Time**
Median Pre-Service Time	43.00	40.00	
Median Intra-Service Time	20.00	30.00	
Median Immediate Post-service Time	20.00	20.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**83.00**	**90.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	2.95	2.94
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.84	2.94
Urgency of medical decision making	3.89	2.74
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.11	3.03
Physical effort required	2.89	2.74
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.08	2.77
Outcome depends on the skill and judgment of physician	3.22	3.11
Estimated risk of malpractice suit with poor outcome	2.89	2.68

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.46	3.12
Intra-Service intensity/complexity	3.43	3.12
Post-Service intensity/complexity	2.68	2.68

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Why is this code being reviewed?

Code 32551 was identified as "Harvard-valued with volume greater than 30,000." CMS requested review of this code as potentially misvalued through the "rolling five year review process." When preparing to conduct a RUC survey, it was noted that there has been a recent shift in the specialty reporting of 32551 from general surgery, cardiothoracic surgery, and pulmonology to radiology, as shown in the table below.

32551	1993	1998	2003	2010
FREQ	59,527	53,606	62,787	63,483
General Surgery	34%	34%	28%	18%
Cardiothoracic Surgery	31%	25%	25%	18%
Pulmonology	15%	17%	21%	13%
Radiology	1%	1%	8%	27%

We believe several factors may have resulted in possible miscoding, causing this shift:

1) While the code descriptor includes the word thoracostomy, the descriptor may not clearly indicate 32551 is meant to be an open procedure.
2) The parenthetical examples for diagnoses (abscess, hemothorax, empyema) may have been the primary focus for selecting the code, instead of the procedure's primary term "thoracostomy."
3) The diagram following the code is incorrect. Use of a trocar is considered extremely dangerous.

A CPT coding change proposal for 32551 was submitted and a revised descriptor was approved as follows:

1) Add the word "open" to clearly indicate the approach
2) Indicate water seal as an *example* of a drainage system (not the only system applicable)
3) Remove the parenthetical that refers to diagnoses, as this will not impact the physician work of performing an open tube thoracostomy
4) Delete the parenthetical referencing imaging guidance, as this would rarely be performed
5) Delete the diagram currently shown in CPT 2012 for 32551

Upon approval of the revised descriptor, the ACS, STS, and ACCP/ATS conducted a RUC survey that was sent to a random sample of society members. ACS drew a random sample of general surgeons and trauma surgeons. STS drew a random sample of general thoracic surgeons. ACCP/ATS drew a random sample of pulmonologists. In each of these three groups, some respondents indicated they also specialized in critical care. All respondents had experience in performing the procedure in the past 12 months. Sixty-seven percent of respondents agreed with the typical patient description. Of those who did not agree, most indicated their typical patient would be older or have a spontaneous pneumothorax.

History of the current work RVU

In 1989, the Harvard study surveyed three separate panels to collect information on 32551. Two panels represented thoracic surgeons and one panel represented emergency medicine. General surgery and pulmonology were not included in the Harvard review of this code. All three panels used the vignette "chest tube insertion for spontaneous pneumothorax." All three panels surveyed the code with a 90-global period. The geometric mean intra-time from the three panels was calculated as 24 minutes (range 19-39). Prior to publication of the first fee schedule, CMS reduced the Harvard survey work estimate and changed the global period to 10-days.

In 1992, the published work RVU for 32551 was 4.66 with a global period of 10 days.

In 1993, through refinement, the global period was changed to 000 and the work RVU was further reduced to 4.07.

In 2005, CMS requested review of 32551 as part of the third 5YR. No specialty indicated a level of interest in the code and the RUC did not submit a recommendation for the code.

In the NPRM (June 2006), CMS states:

> For CPT code 32020 (32551), *Tube thoracostomy with or without water seal (eg, for abscess, hemothorax, empyema)(separate procedure)*, although there was no RUC recommendation provided due to the lack of a level interest for surveying this code, we continue to believe that this service is misvalued. This code was presented to the RUC during the two previous 5-Year Reviews. Based on a lack of compelling evidence, the RUC recommended maintaining the work RVUs, and we accepted this recommendation. However, we believe that since valuation of this CPT code continues to be based on Harvard time data, changes in practice and technology have not been incorporated, leading to an overvaluation of this service.
>
> The Harvard time data for this service includes: pre-service time of 46 minutes, intra-service time of 24 minutes, post-service time of 25 minutes, 9 minutes for ICU time, 15 minutes for hospital days, and 2 minutes for office visits for a total time of 121 minutes.
>
> We believe that CPT code 32020 (32551) is comparable to CPT code 38300, *Drainage of lymph node abscess or lymphadenitis; simple*, or CPT code 38500, *Biopsy or excision of lymph node(s); open, superficial*. Both of these CPT codes were reviewed by the RUC during the second 5-Year Review. The RUC times for CPT code 38500 are: pre-service time of 35 minutes, intra-service time of 30 minutes and post-service time of 15 minutes, for a total time of 80 minutes, (plus) one outpatient visit resulting in a work RVU of 3.74. If the value of the outpatient visit is removed from CPT code 38500, this results in an RVU of 3.29. We believe CPT code 32020 (32551) compares favorably to 38500 and propose a work RVU of 3.29 for CPT code 32020 (32551).

Compelling Evidence

1. The Harvard review of code 32551 did not include the three dominant specialties that provide the service; general surgeons and pulmonologists were not included.
2. The rationale provided by CMS to reduce the work RVU of 32551 for CY 2007 was flawed:
   a. CMS cited Harvard time that included post-service hospital and office minutes. However, this time was already stripped from code 32551 when the work RVU was reduced 13% in 1993 and the global period was changed from 010 to 000.
   b. CMS cited code 38300 as a comparable reference. However, code 38300 is an office/outpatient, non-urgent procedure that has a negative IWPUT (-0.039), and therefore is not a valid reference.
   c. CMS cited code 38500 as a comparable reference and used reverse building block to subtract post-op work from this 10-day global code to calculate a work RVU for 32551 which has a 000-global period. CMS incorrectly equated a minor non-urgent procedure (10-day global) with a major urgent 0-day global procedure. The intensity and complexity of these two procedures are not comparable.

Recommendation

Pre-time package 4 is chosen (Difficult Patient/Difficult Procedure) with a reduction in evaluation and scrub, dress, wait times consistent with the urgent nature of the procedure and consistent with the survey median times.

The ACS, STS, and ACCP/ATS recommend a work RVU of 3.97 with the following support:

- This is the work RVU as published in 2006, prior to the CMS reduction that was based on flawed methodology that post-hospital and post-office time were included, even though these minutes and work RVUs were already stripped out by CMS in 1993.
- This work RVU is based on two prior reviews and reductions by CMS (1991 and 1993) that stripped away all hospital visit and office visit time and work.
- This work RVU is supported by the current survey as reviewed by the three dominant specialties.
- This work RVU is also supported by comparison with the key reference code, MPC codes, and several other RUC reviewed 000-global codes requiring similar total physician work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The Medicare 5% file indicates that 32551 is reported alone 22% of the time, however, there is no single code typically reported with 32551. Patients requiring chest tube placement are typically trauma patients who may undergo other procedures or services on the same date, but at a different time than when the chest tube is placed (eg, diagnostic or operative procedures later in the day).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32551

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Commonly

Specialty thoracic surgery How often? Commonly

Specialty pulmonogy How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 53,606 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe that correct reporting for OPEN chest tube placement is less than current reporting. The frequency and percentages shown below correspond to 1998 data - prior to the increased reporting by radiologists. (Please see discussion above under additional rationale.) We believe that education and correct reporting will shift frequency from 32551 to other percutaneous interventions provided by radiologists.

Specialty general surgery Frequency 18227 Percentage 34.00 %

Specialty thoracic surgery Frequency 13405 Percentage 25.00 %

Specialty pulmonology Frequency 9115 Percentage 17.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 19260

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued – Utilization over 30,000

April and October 2012

Chest Tube Interventions

In September 2011, CPT Codes 32420 *Pneumocentesis, puncture of lung for aspiration*, *32421 Thoracentesis, puncture of pleural cavity for aspiration, initial or subsequent* and 32422 *Thoracentesis with insertion of tube, includes water seal (eg, for pneumothorax), when performed (separate procedure)* were identified in the Harvard Valued-Utilization over 30,000 screen. At that time, the specialty societies requested, and the RUC agreed that these services should be referred to the CPT Editorial Panel to correctly describe current practice. In February 2012, the CPT Editorial Panel created 32554 *Thoracocentesis, needle or catheter, aspiration of the pleural space; without imaging guidance*, 32555 *Thoracocentesis, needle or catheter, aspiration of the pleural space; with imaging guidance,* 32556 *Pleural drainage, percutaneous, with insertion of indwelling catheter; without imaging guidance* and 32557 *Pleural drainage, percutaneous, with insertion of indwelling catheter;with imaging guidance* and deleted 32420-32422 to accurately describe these procedures.

The family of codes were initially reviewed by the RUC at the April 2012 meeting. The RUC noted that the specialty societies used a split survey process. Specifically, CPT codes 32554 and 32556 were surveyed primarily by pulmonologists and CPT codes 32555 and 32557 were surveyed by radiologists. The split survey process made it difficult to ascertain the appropriate increment of physician work within this family of services. The RUC recommended that the entire family of codes be resurveyed for the October 2012 RUC meeting. The members recommended that pulmonary medicine resurvey all four codes and radiology resurvey only the imaging codes (32555 & 32557). The RUC recommended interim valuation of for these services based on incorrect utilization assumptions.

Work Neutrality:
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense:
The RUC discussed that the staff type included in practice expense for 32554 and 32556 is more appropriately listed as the RN/LPN/MTA blend rather than RN/RT. A staff type of RT for 32555 and CT Tech for 32557 is appropriate because in past reviews for imaging codes a radiologic or CT technologist has been the accepted clinical staff performing this service. The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32554 Tracking Number DD1 Original Specialty Recommended RVU: **1.83**
Presented Recommended RVU: **1.83**
Global Period: 000 RUC Recommended RVU: **1.54**

CPT Descriptor: Thoracentesis, needle or catheter, aspiration of the pleural space; without imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year-old male patient presents short of breath with a chest x-ray showing a large left pleural effusion. Bedside aspiration is performed for diagnosis.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 10%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: Preprocedural work-up, review of records and communication with patient. Obtain informed consent. The physician and staff dress in disposable gown, sterile gloves, and protective eyewear before the procedure. Prepare and position the patient and equipment. The physician examines the patient to verify that the patient can undergo the procedure. The physician verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulation.

Description of Intra-Service Work:
- Chest prepped and draped in sterile fashion.
- 1% subcutaneous Lidocaine solution instilled as local anesthetic
- Needle aspiration of fluid
- Puncture site sterilely dressed
- Fluid sent for appropriate laboratory analysis

Description of Post-Service Work: The physician examines the patient post-thoracentesis to ascertain that no complications have occured. The findings from the procedure are explained to the patient and/or family/friend. The physician again reinforces previous instructions about post-procedure complications. The physician generates a detailed report of the procedure. The physician communicates results to the referring physician.

Intra-Service intensity/complexity	3.45	3.36
Post-Service intensity/complexity	2.73	2.91

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32421

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Commonly

Specialty Internal Medicine How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 200000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Rationale based on review of Medicare utilization data for 32421, 32422, and estimating that Medicare is 50%.

Specialty Pulmonary Frequency 100000 Percentage %

Specialty Internal Medicine Frequency 50000 Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on review of existing codes 32421, 32422.

Specialty Pulmonary Frequency 50000 Percentage %

Specialty Internal Medicine Frequency 25000 Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 32421

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32555 Tracking Number DD2 Original Specialty Recommended RVU: **2.40**
Presented Recommended RVU: **2.40**
Global Period: 000 RUC Recommended RVU: **2.21**

CPT Descriptor: Thoracentesis, needle or catheter, aspiration of the pleural space; with imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57-year-old male patient presents with pneumonia and persistent fever despite antibiotic therapy. Aspiration of his parapneumonic effusion is performed with real-time ultrasound guidance.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 14%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Description of Pre-Service Work:

- The patient's symptoms, history, and allergies are reviewed.
- Medications are reviewed, specifically potential antiplatelet or anticoagulation agents.
- Lab data is evaluated, particularly coagulation results and platelets.
- Available imaging is reviewed.
- Procedure details are discussed, including pain control and recovery time.
- Alternatives and risks are discussed with the patient and family, and informed consent is reviewed.
- Confirm NPO status.
- Ensure imaging, appropriate specimen containers, and catheter devices are available.
- Ensure all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
- Perform surgical "time out".

Description of Intra-Service Work:

- Preliminary ultrasound is performed of the chest to localize the pleural fluid and target site for drainage. Images are recorded.
- The chest is prepped and draped in the usual sterile fashion.
- The skin and deeper tissues down to the parietal pleura are infiltrated with a local anesthetic under ultrasound guidance, taking care to avoid vessels.
- A thoracentesis catheter is advanced into the pleural effusion under ultrasound guidance and secured in place temporarily.
- Through the catheter a variable amount of fluid is drained.
- The catheter is removed.

- The puncture site is dressed appropriately.
- A sample of fluid is sent to the laboratory for analysis.

Description of Post-Service Work:

- The patient is transferred to the recovery suite and a CXR is obtained (reported separately).
- Post-procedure vital signs are assessed.
- The findings are reviewed with patient and family.
- A report of the procedure is prepared for the medical record.

SURVEY DATA

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background:

CPT codes 32422 (*Thoracentesis with insertion of tube, includes water seal (eg, for pneumothorax), when performed (separate procedure))* and 32551 (*Tube thoracostomy, includes water seal (eg, for abscess, hemothorax, empyema), when performed (separate procedure*)), were identified by the RAW screen for Harvard valued codes with greater than 30,000

utilization. The specialty societies referred these two codes, as well as CPT codes 32420 (*Pneumocentesis, puncture of lung for aspiration*) and 32421 (*Thoracentesis, puncture of pleural cavity for aspiration, initial or subsequent*), to CPT for revision of the family to better describe current practice. As a result, four new codes were created, two for thoracentesis: non-image guided (32554) and image guided (32555,) and two for pleural catheter placement: non-image guided (32556) and image guided (32557).

Recommendation:
The specialty societies performed a random survey of diagnostic radiologists, interventional radiologists, and chest physicians, and convened a panel of experts to review the survey data. We are recommending the median survey RVU of 2.40 RVUs and the median intra-service time and post-service times of 20 and 10 minutes, respectively.

Pre-Service Period:
The specialty societies recommend pre-service package 1a (Straightforward Patient/Straightforward Procedure (No sedation/anesthesia care)) with the following adjustments: (1) increase the pre-service evaluation time by 2 minutes, and (2) increase the positioning time by 2 minutes, both compatible with our survey results. These adjustments account for the additional time prior to skin prep necessary for ultrasound localization of a suitable pocket of fluid. Based on the survey data, it is reasonable to conclude respondents would consider imaging work prior to skin prep to be pre-service work. These modifications to the pre-service times are also compatible with several recently reviewed interventional radiology codes, including paracentesis with imaging guidance (49083).

Key Reference Service:
The most commonly chosen key reference service was 49083 (*Abdominal paracentesis (diagnostic or therapeutic); with imaging guidance*), with 2.00 RVUs and 25 minutes of intra-service time. The second most commonly chosen reference service was 36556 (*Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older*), with 2.50 RVUs and 15 minutes of intra-service time. 32555 compares favorably to both of these codes. The intraservice time for 32555 (20 minutes) is lower than 49083 (25 minutes), but the higher RVU is justified by the greater intensity of removing fluid from the pleural space compared to the peritoneal space; This is also supported by 10 of the 11 complexity measures being higher for 32555 than KRS 49083. 32555 is valued lower than 36556 but it has a higher intra-service time so relativity is maintained here also.

Building block methodology:
It should be noted that this is a new CPT code describing a new service with change in dominant provider and service description, so a direct comparison to previously reported codes 32422 and its typical imaging pair, 76942, is not appropriate. As the DOW for the surveyed code suggests, the imaging guidance prior to catheter placement to avoid injury to the lung and pleura, as well as periodic imaging during drainage to ensure optimal drainage of the pleural effusion is distinctly different than in the past, when the procedure was performed based on anatomic landmarks. Drainage is more complete and, as the vignette suggests, performed in a more difficult patient with infection and pleural effusion.

However, as a point of reference for the Panel we provide the following information:
32422 (2.19) + 76942 (0.67) = 2.86

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32421/32422, 76942

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 224,310 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The estimated frequency for Medicare is 224,310, which is the 2010 Medicare utilization frequency for codes 32421 plus 32422. Based on past frequency data, we estimated the percent performed by Radiology to be about 2.98%.

Specialty Radiology Frequency 6694 Percentage 2.98 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 32422

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32556 Tracking Number DD3 Original Specialty Recommended RVU: **2.50**
Presented Recommended RVU: **2.50**
Global Period: 000 RUC Recommended RVU: **2.19**

CPT Descriptor: Pleural drainage, percutaneous, with insertion of indwelling catheter; without imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male patient presents with acute shortness of breath. Chest x-ray shows a right pneumothorax. Bedside chest tube placement is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 67%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 7%

Description of Pre-Service Work: Preprocedural work-up, review of records, communication with patient. Obtain informed consent. The physician and staff dress in disposable gown, sterile gloves, and protective eyewear before the procedure. Prepare and position the patient and equipment. The physician examines the patient to verify that the patient can undergo the procedure. The physician verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulation.

Description of Intra-Service Work:
- Chest prepped and draped in sterile fashion.
- 1% subcutaneous Lidocaine solution instilled as local anesthetic
- Catheter placed through intercostal space
- Catheter secured in place and connected to suction drainage
- Puncture site sterilely dressed

Description of Post-Service Work: The physician examines the patient post-thoracentesis to ascertain that no complications have occured. The findings from the procedure are explained to the patient and/or family/friend. The physician again reinforces previous instructions about post-procedure complications. The physician generates a detailed report of the procedure. The physician communicates results to the referring physician.

Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**60.00**	**50.00**	

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.56	2.89
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.67	3.33
Urgency of medical decision making	4.22	4.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.22	3.78
Physical effort required	3.89	3.56
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.22	3.67
Outcome depends on the skill and judgment of physician	4.00	3.56
Estimated risk of malpractice suit with poor outcome	3.78	3.89

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.00	3.10
Intra-Service intensity/complexity	3.90	3.70
Post-Service intensity/complexity	3.40	3.30

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32422

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Commonly

Specialty Internal Medicine How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 200000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ACCP/ATS believes that ACR listed as the most frequent provider will migrate to the new codes with imaging.

Specialty Pulmonary Frequency 100000 Percentage 50.00 %

Specialty Internal Medicine Frequency 50000 Percentage 25.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Reviewed RUC Database for 32421, 32422

Specialty Pulmonary Frequency 50000 Percentage 50.00 %

Specialty Internal Medicine Frequency 25000 Percentage 25.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:32557 Tracking Number DD4 Original Specialty Recommended RVU: **3.37**
Presented Recommended RVU: **3.37**
Global Period: 000 RUC Recommended RVU: **3.35**

CPT Descriptor: Pleural drainage, percutaneous, with insertion of indwelling catheter; with imaging guidance

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old male patient presents with fever and shortness of breath. CT scan shows a complex parapneumonic effusion. Concern is for an empyema. Image-guided pleural drainage tube placement is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 78%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 16%

Description of Pre-Service Work:

- The patient's symptoms, history, and allergies are reviewed.
- Medications are reviewed, specifically potential antiplatelet or anticoagulation agents.
- Lab data is evaluated, particularly coagulation results and platelets.
- Available imaging is reviewed.
- Procedure details are discussed, including pain control, and recovery time
- Alternatives and risks are discussed with the patient and family, and informed consent is reviewed.
- Confirm NPO status.
- Ensure imaging, appropriate specimen containers, and catheter devices are available.
- Ensure all technical personnel have been familiarized with the procedure and are fully familiar with all required devices.
- Perform surgical "time out".

Description of Intra-Service Work:

- Moderate sedation is administered.
- Preliminary CT is performed of the chest to confirm the presence of a pleural fluid collection (empyema) and target the site for drainage. Images are recorded.
- The chest is prepped and draped in the usual sterile fashion.
- The skin and deeper tissues down to the parietal pleura are infiltrated with a local anesthetic under CT guidance, taking care to avoid vessels.
- A needle is advanced into the pleural collection under CT guidance and a guide wire is then advanced through the needle.

- Tract to the pleural space dilated using a series of fascial dilators.
- A multiside hole drainage catheter is advanced into the pleural collection under CT guidance and secured in place temporarily.
- The catheter is secured in place and connected to suction drainage.
- Post procedure CT images may be obtained (included in procedure code).
- The puncture site is dressed appropriately.
- A sample of fluid is sent to the laboratory for analysis.

Description of Post-Service Work:

- The patient is transferred to the recovery suite and a CXR is obtained (reported separately).
- Post-procedure vital signs are assessed.
- The findings are reviewed with patient and family.
- A report of the procedure is prepared for the medical record.

Pre-Service intensity/complexity	2.62	2.85
Intra-Service intensity/complexity	3.15	3.26
Post-Service intensity/complexity	2.82	2.65

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background:
CPT codes 32422 (*Thoracentesis with insertion of tube, includes water seal (eg, for pneumothorax), when performed (separate procedure))* and 32551 (*Tube thoracostomy, includes water seal (eg, for abscess, hemothorax, empyema), when performed (separate procedure*)), were identified by the RAW screen for Harvard valued codes with greater than 30,000 utilization. The specialty societies referred these two codes, as well as CPT codes 32420 (*Pneumocentesis, puncture of lung for aspiration*) and 32421 (*Thoracentesis, puncture of pleural cavity for aspiration, initial or subsequent*), to CPT for revision of the family to better describe current practice. As a result, four new codes were created, two for thoracentesis: non-image guided (32554) and image guided (32555), and two for pleural catheter placement: non-image guided (32556) and image guided (32557).

Recommendation:
The specialty societies performed a random survey of diagnostic radiologists, interventional radiologists, and chest physicians, and convened a panel of experts to review the survey data. We are recommending the 25th percentile survey RVU of 3.37 RVUs and the median intra-service time and post-service times of 28 and 15 minutes, respectively.

Pre-Service Period:
The specialty societies recommend pre-service package 1b (Straightforward Patient/Straightforward Procedure (With sedation/anesthesia care)) with the following adjustments: (1) increase the pre-service evaluation time by 2 minutes, and (2) increase the positioning time by 2 minutes, both compatible with our survey results. These adjustments account for the additional time prior to skin prep necessary for ultrasound localization of a suitable pocket of fluid. Based on the survey data, it is reasonable to conclude respondents would consider imaging work prior to skin prep to be pre-service work. These modifications to the pre-service times are also compatible with several recently reviewed interventional radiology codes, including paracentesis with imaging guidance (49083 (*Abdominal paracentesis (diagnostic or therapeutic); with imaging guidance*)).

Key Reference Service:
The most commonly chosen key reference service was 49021 (*Drainage of peritoneal abscess or localized peritonitis, exclusive of appendiceal abscess; percutaneous*), with 3.37 RVUs and 60 minutes of intra-service time. The second most commonly chosen reference service was 49041 (*Drainage of subdiaphragmatic or subphrenic abscess; percutaneous),* with 3.99 RVUs and 60 minutes of intra-service time. The expert panel recognizes that the intraservice time for 32557 (29 minutes) is lower than 49021 (60 minutes) but working in the chest is more intense than the abdomen as supported by the greater urgency of decision making, technical skill, physical effort and risk of malpractice indicated by survey respondents.

Building block methodology:
It should be noted that this is a new CPT code describing a new service with change in dominant provider and service description, so a direct comparison to previously reported codes 32551 and its typical imaging pair, 75989, is not appropriate. As the DOW for the surveyed code suggests, the imaging guidance prior to catheter placement to avoid injury to the lung and pleura, as well as periodic imaging during drainage to ensure optimal drainage of the pleural effusion is distinctly different than in the past, when the procedure was performed based on anatomic landmarks. Drainage is more complete and, as the vignette suggests performed in a more difficult patient with infection and pleural effusion.

However, as a point of reference for the Panel, we provide the following information:
32551(3.29) + 75989 (1.19) = 4.48

Comparison to other abscess catheter codes:

The expert panels recommendation compares favorably to the entire family of abscess drainage catheter codes as demonstrated in the below table. To reduce the RVU of 32557 lower than 3.37 alters rank order within the family, a circumstance which is made more significant considering that imaging is now included in 32557.

Code	Descriptor	Work RVW	Pre	Intra	Post	Total time	IWPUT
49021	Drainage of peritoneal abscess or localized peritonitis, exclusive of appendiceal abscess; percutaneous	3.37	38	60	26	124	0.0323

44901	Incision and drainage of appendiceal abscess; percutaneous	3.37	38	60	20	118	0.0345
50021	Drainage of perirenal or renal abscess; percutaneous	3.37	38	68	25	131	0.0288
32557	Pleural drainage, percutaneous, with insertion of indwelling catheter; with imaging guidance	3.35	29	28	15	72	0.0877
47011	Hepatotomy; for percutaneous drainage of abscess or cyst, 1 or 2 stages	3.69	38	60	25	123	0.0380
49061	Drainage of retroperitoneal abscess; percutaneous	3.69	38	60	28	126	0.0369
32201	Pneumonostomy; with percutaneous drainage of abscess or cyst	3.99	38	60	24	122	0.0434
49041	Drainage of subdiaphragmatic or subphrenic abscess; percutaneous	3.99	38	60	30	128	0.0411
48511	External drainage, pseudocyst of pancreas; percutaneous	3.99	40	62	25	127	0.0409

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32551, 75989

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 63,483 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The estimated frequency for Medicare is 63,483, which is the 2010 Medicare utilization frequency for code 32251. Based on past frequency data, we estimated the percent performed by Radiology to be about 1.55%.

Specialty Radiology Frequency 986 Percentage 1.55 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 32551

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.

Hide columns and rows that do not contain data.

REF = Key Reference code data

CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.

SVY = Survey data - as it appears on the Summary of Recommendation form.

REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
32554 Thoracentesis, needle or catheter, aspiration of the pleural space, without imaging guidance
32556 Pleural drainage, percutaneous, with insertion of indwelling catheter, without imaging guidance

Global Period: 000 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: **These two codes are revised codes 32421, 32422. Code 32421 does not have individual data for pre-service, intra-service and post-service so 32422 was used as the comparison code.** 32421 showed clinical staff as an RN. 32422 showed clinical staff as an RT. Currently, we indicate **RN/RT as clinical staff.**

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- **Complete pre-service diagnostic and referral forms**
- **Coordinate pre-surgery services**
- **Provide pre-service education/obtain consent**
- Follow-up phone calls and prescriptions

Service Clinical Labor Activities:

- **Greet patient, provide gowning, ensure appropriate medical records are available**
- **Obtain vital signs**
- **Prepare room, equipment and supplies**
- **Prepare and position patient, monitor patient, set up IV**
- **Assist physician in performing the procedure**
- **Monitor patient following service, check tubes, monitors, drains**
- **Clean room and equipment**
- **Complete diagnostic forms, lab and x-ray requisitions**
- **Check dressings and wound, home care instructions provided, coordinate office visits and prescriptions**

Post-Service Clinical Labor Activities:

- **Conduct phone calls and call-in prescriptions**

CPT Code: 32555 and 32557
Specialty Society('s) ACR and SIR

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
32555 - Thoracentesis, needle or catheter, aspiration of the pleural space; with imaging guidance
32557 - Pleural drainage, percutaneous, with insertion of indwelling catheter; with imaging guidance

Global Period: 000 Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACR and SIR convened a consensus panel to review and finalize the practice expense data for codes 32555 and 32557.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The existing codes, 32421, 32422, and 32551, are being replaced by the new chest tube placement codes, 32555 and 32557, and the practice expense inputs for these codes are similar to the practice expense inputs for the new codes.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
- Complete pre-service diagnostic & referral forms
- Coordinate pre-surgery services
- Provide pre-service education/obtain consent
- Follow-up phone calls & prescriptions
- Retrieve prior images for comparison

Service Clinical Labor Activities:
- Review charts
- Greet patient and provide gowning
- Obtain vital signs
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Acquire Image
- Assist physician in performing procedure
- Monitor pt. following service/check tubes, monitors, drains
- Clean room/equipment by physician staff
- Complete diagnostic forms, lab & X-ray requisitions
- Check dressings & wound/ home care instructions /coordinate office visits /prescriptions
- Process images, complete data sheet, present images and data to the interpreting physician

Post-Service Clinical Labor Activities:
- Conduct phone calls/call in prescriptions

CPT Code: 32555 and 32557
Specialty Society('s) ACR and SIR

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Transcatheter Aortic Valve Replacement

In February 2012, the CPT Editorial Panel deleted four Category III code (0256T-0259T) and approved nine codes to report transcatheter aortic valve replacement procedures.

The RUC thoroughly discussed the unique nature of these services to understand and assign the appropriate valuation for these services. First, the members noted these services require two physicians, an interventional cardiologist and a cardiothoracic surgeon, be actively working on the patient during these procedures. Each operator has distinctly required work, which are specific to the operator's skill set, and are not duplicative between the two. For these reasons, the CMS National Coverage Determination (NCD) mandates that two physicians be present for this procedure to be completed. Second, the RUC recognized the intense nature of these procedures. Patients eligible for these procedures have previously been turned down for aortic valve replacement surgery and are receiving these procedures as a last resort. The NCD further mandates this patient population and there are currently no indications that these procedure will be approved for otherwise operable patients in the future. Finally, the RUC noted that the recommendations made by the Committee will value the total work of the service. Physician time includes the clock time of the procedure and does not constitute the addition of each physician's time. Payment policy issues, related to the co-surgery modifier and resulting payment modifications, were not determined, as it is outside the purview of the RUC. The RUC understands that CMS will consider these issues.

Prior to surveying, the specialty societies obtained approval from the Research Subcommittee to conduct an alternative methodology for surveying these services. To ensure the complete work of both physicians was captured, each survey was conducted concurrently by a thoracic surgeon and an interventional cardiologist.

33361 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach***
The RUC reviewed the survey data from 33 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 135 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. The RUC agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 29.50, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33361 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33361, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. Finally, the RUC conducted the following methodology to ensure the recommended work value is relative to similar services. The Committee took CPT code 92986 *Percutaneous balloon valvuloplasty; aortic valve* (work RVU= 22.85, intra-service time= 113 minutes) and backed out the post-operative visits (remaining work RVU= 17.90) to ensure the comparison is based on a 000 day global equivalent. The difference between the two intra-service times (22 minutes) was multiplied by the IWPUT (0.16) and came to a value of 3.52. The value of 3.52 and 4.50 (the work RVU of 99291) were added to the base 17.90 work RVU of the balloon valvuloplasty code to arrive at a value of 25.92. The committee recognized that the surveyed code 33361 is a much more intense and complicated procedure compared to the balloon valvuloplasty service. **The RUC recommends a work RVU of 29.50 for CPT code 33361.**

33362 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach***
The RUC reviewed the survey data from 38 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 150 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 32.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33362 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33362, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. Finally, the RUC reviewed 33362 in comparison to 33361 and agreed that the increase complexity due to the open approach was accurately reflected with the increase work RVU of 2.50 and increased time of 15 minutes. **The RUC recommends a work RVU of 32.00 for CPT code 33362.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33363 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach***
The RUC reviewed the survey data from 33 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 180 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 33.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33363 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33363, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. Finally, the RUC reviewed 33363 in comparison to 33361 and agreed that the increase complexity due to the open approach was accurately reflected with the increase work RVU of 3.50 and increased time of 45 minutes. **The RUC recommends a work RVU of 33.00 for CPT code 33363.**

33364 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach***
The RUC reviewed the survey data from 31 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 180 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 34.87, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33364 is a much more intense procedure, as indicated by the survey's intensity/complexity measures. In addition, 33364, as described above, is a unique

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 33364 in comparison to 33361 and agreed that the increase complexity due to the open approach was accurately reflected with the increase work RVU of 5.37 and increased time of 45 minutes. The RUC noted that while 33364 and 33363 have the same intra-service times, 33364 is a more intense procedure due to the transplant incision and longer closure times. **The RUC recommends a work RVU of 34.87 for CPT code 33364.**

33365 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)***
The RUC reviewed the survey data from 30 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 180 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 37.50, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33979 *Insertion of ventricular assist device, implantable intracorporeal, single ventricle* (work RVU= 37.50) and agreed that while 33979 has more intra-service time compared to the surveyed code, both services should be valued similarly given that 33365 is a more intense procedure, as seen in the intensity complexity measures. The RUC also reviewed CPT code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 33365 is a much more intense procedure. In addition, 33365, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 33365 in comparison to 33361 and agreed that the increase complexity was accurately reflected with the increase work RVU of 8.00 and increased time of 45 minutes. The RUC noted that while 33365 and 33364 have the same intra-service times, 33364 is a more intense procedure due to complexities opening the chest via median sternotomy. **The RUC recommends a work RVU of 37.50 for CPT code 33365.**

0318T ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)***
The RUC reviewed the survey data from 31 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time= 85 minutes, intra-service time= 195 minutes and post-service time= 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 40.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33979 *Insertion of ventricular assist device, implantable intracorporeal, single ventricle* (work RVU= 37.50) and agreed that while 33979 has more intra-service time compared to the surveyed code, 0318T should be valued slightly higher due to greater intensity, as seen in the intensity complexity measures. The RUC also reviewed CPT code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 0318T is a much more intense procedure. In addition, 0318T, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 0318T in comparison to 33361 and agreed that the increase complexity was accurately reflected with the increase work RVU of 10.50 and increased time of 60 minutes. **The RUC recommends a work RVU of 40.00 for CPT code 0318T.**

Add-On Services
The RUC noted that the three add-on cardiopulmonary bypass support services (33367-X9) are only reported by the thoracic surgeon and not performed by two physicians. These procedures are performed during standard transcatheter aortic valve replacement services upon the patient becoming hemodynamically unstable and cannot be stabilized by any standard medical means.

33367 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with percutaneous peripheral arterial and venous cannulation (eg, femoral vessels)***
The RUC reviewed the survey results from 35 cardiothoracic surgeons and agreed with the specialties that the appropriate intra-service time for this ZZZ global service is 90 minutes. The RUC reviewed the survey respondents' estimated physician work value and agreed with the specialties that a work RVU of 11.88 (the survey's 25th percentile) accurately reflects the physician work involved in this procedure. To justify this value, the RUC reviewed the key reference code 37223 *Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 4.25) and agreed that the surveyed code has double the intra-service time and is a more intense procedure. Given this, 33367 should be valued much higher. In addition, CPT code 22845 *Anterior instrumentation; 2 to 3 vertebral segments* (work RVU= 11.94) was compared to 33367 and the RUC noted that the two services have identical intra-service time, 90 minutes, with comparable physician work, and should be valued similarly. **The RUC recommends a work RVU of 11.88 for CPT code 33367.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33368 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with open peripheral arterial and venous cannulation (eg, femoral, iliac, axillary vessels)***
The RUC reviewed the survey results from 34 cardiothoracic surgeons and agreed with the specialties that the appropriate intra-service time for this ZZZ global service is 120 minutes. The RUC reviewed the survey respondents' estimated physician work value and agreed with the specialties that a work RVU of 14.39 (the survey's 25th percentile) accurately reflects the physician work involved in this procedure. To justify this value, the RUC reviewed the key reference code 33960 *Prolonged extracorporeal circulation for cardiopulmonary insufficiency; initial day* (work RVU= 10.59, valued as a ZZZ global service) and agreed that while the reference code has slightly greater intra-service time, 13 minutes, compared to 33368, the surveyed code is a more intense procedure and should be valued higher. In addition, the RUC reviewed CPT code 22843 *Posterior segmental instrumentation (eg, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 7 to 12 vertebral segments* (work RVU= 13.44, intra-time= 120 minutes) and agreed that with identical intra-service time the surveyed code should be valued slightly higher due to greater intensity. **The RUC recommends a work RVU of 14.39 for CPT code 33368.**

33369 ***Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with central arterial and venous cannulation (eg, aorta, right atrium, pulmonary artery)***
The RUC reviewed the survey results from 35 cardiothoracic surgeons and agreed with the specialties that the appropriate intra-service time for this ZZZ global service is 160 minutes. The RUC reviewed the survey respondents' estimated physician work value and agreed with the specialties that a work RVU of 19.00 (the survey's 25th percentile) accurately reflects the physician work involved in this procedure. To justify this value, the RUC reviewed the key reference code 33305 Repair of cardiac wound; with cardiopulmonary bypass (work RVU= 29.60, valued as a ZZZ global period) and agreed that while the surveyed code is a more intense procedure, the reference code should be valued higher due to greater intra-service time, 296 minutes compared to 160 minutes. In addition, the RUC reviewed CPT code 22844 *Posterior segmental instrumentation (eg, pedicle fixation, dual rods with multiple hooks and sublaminar wires); 13 or more vertebral segments* (work RVU= 16.42, intra-service time= 150 minutes) and agreed that since the surveyed code has greater intra-service time and a higher intensity the value should be higher for 33369. **The RUC recommends a work RVU of 19.00 for CPT code 33369.**

Practice Expense: The TAVR codes represent procedures that will be performed in the facility 100% of the time and will require office staff time that would be typical for a 90-day global procedure performed in the facility setting. The TAVR codes will be done jointly with the cardiologist and cardiovascular surgeon and requires additional scheduling and coordination of services because the cardiology office and the cardiovascular surgery office must both coordinate with the other specialists involved in the procedure which at a minimum include radiology, perfusionist and a specialized anesthesiologist. In addition the procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment. Since the codes were jointly surveyed involving cardiology and cardiac surgeons, the specialty societies are recommending CMS Code L037D with a blended staff type of RN/ LP/ MTA rather then the RN staff type typical to the cardiothoracic surgery codes. The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

New Technology: These services will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

RUC Database: These services will be flagged in the RUC database so they are not used to validate the physician work of other services in the RBRVS.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Codes 33361-33365, 0318T are used to report transcatheter aortic valve replacement (TAVR)/transcatheter aortic valve implantation (TAVI). TAVR/TAVI requires two physician operators and all components of the procedure are coded using modifier 62.

Codes 33361–33365, 0318T include the work, when performed, of percutaneous access, placing the access sheath, balloon aortic valvuloplasty, advancing the valve delivery system into position, repositioning the valve as needed, deploying the valve, temporary pacemaker insertion for rapid pacing (33210), and closure of the arteriotomy when performed. Codes 33362–33365, 0318T also include open arterial or cardiac approach.

Angiography, radiological supervision, and interpretation performed to guide TAVR/TAVI (eg, guiding valve placement, documenting completion of the intervention, assessing the vascular access site for closure) are included in these codes.

Diagnostic left heart catheterization codes (93452, 93453, 93458-93461) and the supravalvular aortography code (93567) should ~~NOT~~ **not** be used with TAVR/TAVI services (33361-33365, 0318T) to report:

1. Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the TAVR/TAVI,
2. Aorta/left ventricular outflow tract measurement for the TAVR/TAVI, or
3. Post-TAVR/TAVI aortic or left ventricular angiography, as this work is captured in the TAVR/TAVI services codes (33361-33365, 0318T).

Diagnostic coronary angiography performed at the time of TAVR/TAVI may be separately reportable if:

1. No prior catheter-based coronary angiography study is available and a full diagnostic study is performed, OR
2. A prior study is available, but as documented in the medical record:
    a. The patient's condition with respect to the clinical indication has changed since the prior study, OR
    b. There is inadequate visualization of the anatomy and/or pathology, OR
    c. There is a clinical change during the procedure that requires new evaluation.
    d. For same session/same day diagnostic coronary angiography services, report the appropriate diagnostic cardiac catheterization code(s) appended with modifier 59 indicating separate and distinct procedural service from TAVR/TAVI

Other cardiac catheterization services are reported separately when performed for diagnostic purposes not intrinsic to TAVR/TAVI.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Percutaneous coronary interventional procedures are reported separately, when performed.

When transcatheter ventricular support is required in conjunction with TAVR/TAVI, the appropriate code should be reported with the appropriate ventricular assist device (VAD) procedure code (33990-33993, 33975, 33976, 33999) or balloon pump insertion code (33967, 33970, 33973)

The TAVR/TAVI cardiovascular access and delivery procedures are reported with 33361-33365, 0318T. When cardiopulmonary bypass is performed in conjunction with TAVR/TAVI, codes 33361-33365, 0318T should be reported with the appropriate add-on code for percutaneous peripheral bypass (33367), open peripheral bypass (33368), or central bypass (33369)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33361 Tracking Number GG1 Original Specialty Recommended RVU: **29.50**
Presented Recommended RVU: **29.50**
Global Period: 000 RUC Recommended RVU: **29.50**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. Invasive monitoring with a radial arterial and pulmonary arterial catheter is established . External defibrillator pads are placed on the anterior and posterior chest. A transesophageal echo probe is inserted for intraoperative monitoring. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on the operative field. Critical personnel, including surgeons, interventional

cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

Description of Intra-Service Work: A temporary transvenous pacemaker electrode is advanced into the apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

Femoral arterial access is obtained (Seldinger technique) for the valve delivery system. Angiography of the access vessel is performed to confirm anatomical suitability of the vessel for passage of the delivery catheter. Using fluoroscopic guidance, a standard guidewire is advanced to the descending aorta and exchanged for a stiff guidewire with an angiographic catheter. Over the stiff guidewire, the arteriotomy is progressively enlarged with dilators, and a large-bore vessel introducer sheath is inserted and advanced to a level that is inferior to the renal arteries. The guidewire is removed and antithrombotic therapy is administered to achieve therapeutic anticoagulation levels.

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle and the wire is exchanged for a stiff guide wire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained, requiring repositioning. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guidewire, and sheath are removed from the patient. The opening of the access artery is closed, typically via direct suture or with percutaneous suture. Percutaneous closure requires at least two separate suture delivery catheters due to the large size of the arteriotomy. The access site is monitored for adequate hemostasis. If heparin was administered, it may be reversed using protamine. A sterile dressing is applied to the entry site

Description of Post-Service Work: The physicians confirm the patient hemodynamic status,including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed

assessing for adequate limb perfusion. Post operative orders are written. A detailed “hand-off” process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient’s fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post-operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD		
Specialty(s):	STS, ACC, SCAI		
CPT Code:	33361		
Sample Size:	70	**Resp N:** 33	**Response:** 47.1 %
Description of Sample:	Targeted. As approved by the Research Subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites and 180 physicians. The survey was sent to the cardiologist and cardiothoracic surgeon at each instution and asked to complete the survey jointly.

Intra-Service intensity/complexity	4.93	3.50
Post-Service intensity/complexity	4.57	2.79

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:
    a. Surgeon requirements:
        i. Board Certified/Eligible in Cardiovascular Surgery;
        ii. Professional experience with:
            1. ≥ 100 AVR/career including 10 high risk patients; OR
            2. ≥ 25 AVR/year or 50 AVR in 2 years; AND
            3. ≥ 20 in the last year prior to TAVR.
    b. Interventionalist requirements:
        i. Operators must be Board Certified/Eligible in Interventional Cardiology
        ii. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

CPT Code: 33361

	Time		**IWPUT**	
Intra-service	135		**0.1036**	**13.98375**

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the MPC list.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency of the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery. The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0256T Implantation of catheter-delivered prosthetic aortic heart valve; endovascular approach

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 990
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovasular approaches (3300) 33361 ercutaneous 30%, 33362 femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery Frequency 990 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 940
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery Frequency 940 Percentage 100.00 %

Specialty Frequency Percentage %

Presented Recommended RVU: **32.00**
Global Period: 000 RUC Recommended RVU: **32.00**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open femoral artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. The femoral vessels are found to be unsuitable for percutaneous cannulation, and an open femoral approach is utilized.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on the operative field. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and

perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

Description of Intra-Service Work: A temporary transvenous pacemaker electrode is advanced into apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

A skin incision is made in the inguinal region. The subcutaneous tissue is dissected until the common femoral artery is isolated. Care is taken to avoid injury to the femoral nerve and vein that lie in close proximity. The common, superficial, and deep femoral arteries are dissected and captured in vessel loops. The distal external iliac artery is typically included in the dissection. This approach facilitates introduction of the very large diameter sheath required for delivery of the transcatheter aortic valve. It also serves to apply countertraction and temporarily reduce tortuosity of the iliac arteries as the sheath is advanced. Intravenous anti-thrombotic therapy is begun. Angiography of the access vessel is performed to confirm anatomical suitability of the vessel for passage of the delivery catheter. A transverse arteriotomy is made in the anterior surface of the common femoral or distal-most external iliac artery. If necessary an end-side prosthetic graft is sewn in place to facilitate catheter delivery and/or preserve distal leg perfusion.

Using fluoroscopic guidance, a standard guidewire is advanced to the descending aorta and exchanged for a stiff guidewire with an angiographic catheter. Over the stiff guidewire a large-bore vessel introducer sheath is inserted and advanced to a level that is inferior to the renal arteries.

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle and the wire is exchanged for a stiff guide wire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained, requiring repositioning. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guide wire, and sheath are removed from the patient.

The femoral arteriotomy is repaired with very fine (e.g. 6-0 polypropylene) sutures. Hemostasis is achieved, the wound irrigation, and the soft tissue is re-approximated in several layers. Skin closure is performed with staples or sutures.

Description of Post-Service Work: The physicians confirm the patient hemodynamic status,including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed assessing for adequate limb perfusion. Post operative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD		
Specialty(s):	STS, ACC, SCAI		
CPT Code:	33362		
Sample Size:	70	**Resp N:** 38	**Response:** 54.2 %
Description of Sample:	Targeted. As approved by the Research Subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites and 180 physicians. The survey was sent to the cardiologist and cardiothoracic surgeon at each instution and asked to complete the survey jointly.

Post-Service intensity/complexity	4.53	4.26

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:
    a. Surgeon requirements:
        i. Board Certified/Eligible in Cardiovascular Surgery;
        ii. Professional experience with:
            1. ≥ 100 AVR/career including 10 high risk patients; OR
            2. ≥ 25 AVR/year or 50 AVR in 2 years; AND
            3. ≥ 20 in the last year prior to TAVR.
    b. Interventionalist requirements:
        . Operators must be Board Certified/Eligible in Interventional Cardiology
        i. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

Intra-service	150		**0.1036**	**15.54625**

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the current MPC list.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency on the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery. The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0256T Implantation of catheter-delivered prosthetic aortic heart valve; endovascular approach

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1716
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovasular approaches (3300) 33361 ercutaneous 30%, 33362 femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery Frequency 1716 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,630
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery Frequency 1630 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Global Period: 000 RUC Recommended RVU: **33.00**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open axillary artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. The patient has severe aortoiliac occlusive disease that precludes the femoral or iliac arterial approach for prosthesis delivery.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on the operative field. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and

perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure..

Description of Intra-Service Work: A temporary transvenous pacemaker electrode is advanced into apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

A subclavicular incision is made, and the subcutaneous tissue is dissected until the axillary artery is located. Care is taken to avoid injury to the axillary nerve and vein that lie in close proximity. Once adequate approach is achieved and intravenous antithrombotic therapy begun, proximal and distal vascular clamps are applied. A longitudinal arteriotomy is made. The conduit (a large diameter tubular segment of synthetic bypass graft) is brought onto the field, tailored to appropriate size, and an anastomosis of conduit to axillary artery is sutured with fine polypropylene. The conduit is clamped and vascular clamps are removed from the axillary artery. The suture line is checked for hemostasis and additional sutures are applied as required. A sheath is passed over a guidewire through the graft and a pigtail angiographic catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. Typically, several aortograms in different angles are required.

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle and the wire is exchanged for a stiff guide wire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained, requiring repositioning. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guide wire, and sheath are removed from the patient.

The axillary artery is then clamped with a partial occlusion clamp to isolate the graft, which is excised leaving a 5-6 mm cuff. This is oversewn in two layers with polypropylene suture, deaired, and the clamp removed. Hemostasis is achieved. The wound is irrigated and closed in layers.

Description of Post-Service Work: The physicians confirm the patient hemodynamic status,including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed assessing for adequate limb perfusion. Post operative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012				
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD				
Specialty(s):	STS, ACC, SCAI				
CPT Code:	33363				
Sample Size:	70	**Resp N:**	33	**Response:** 47.1 %	
Description of Sample:	Targeted. As approved by the Research Subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites and 180 physicians. The survey was sent to the cardiologist and cardiothoracic surgeon at each instution and asked to complete the survey jointly.

Post-Service intensity/complexity	4.50	3.64

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:
    a. Surgeon requirements:
        i. Board Certified/Eligible in Cardiovascular Surgery;
        ii. Professional experience with:
            1. ≥ 100 AVR/career including 10 high risk patients; OR
            2. ≥ 25 AVR/year or 50 AVR in 2 years; AND
            3. ≥ 20 in the last year prior to TAVR.
    b. Interventionalist requirements:
        . Operators must be Board Certified/Eligible in Interventional Cardiology
        i. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the current MPC list.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency on the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery.
The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0256T Implantation of catheter-delivered prosthetic aortic heart valve; endovascular approach

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 330
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovasular approaches (3300) 33361 ercutaneous 30%, 33362 femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery Frequency 330 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 313
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery Frequency 313 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33880

Global Period: 000 RUC Recommended RVU: **34.87**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; open iliac artery approach

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. Preoperative studies indicate that the femoral vessels are too small and diseased to permit either the percutaneous or open femoral arterial approach for prosthesis delivery and therefore an open iliac approach is selected.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on the operative field. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and

perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

Description of Intra-Service Work: A temporary transvenous pacemaker electrode is advanced into apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

A transverse suprainguinal skin incision is made and a retroperitoneal dissection plane is developed. The dissection is continued deep into the pelvis until the iliac artery is located. Care is taken to avoid injury to the nerves, veins, and ureter that lie in close proximity. The common, internal, and external iliac arteries are dissected and isolated with vessel loops. Intravenous antithrombotic therapy is administered. A longitudinal arteriotomy is made. A graft conduit (a large diameter tubular segment of synthetic bypass graft) is brought onto the field, tailored to appropriate size, and an end-to-side anastomosis of conduit to common iliac artery is sutured with fine polypropylene. The conduit is clamped and vascular clamps are removed. The suture line is checked for hemostasis and additional sutures are applied as required. A sheath is passed over a guidewire through the graft and a pigtail angiographic catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. Typically, several aortograms in different angles are required.

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle and the wire is exchanged for a stiff guide wire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained, requiring repositioning. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter, guide wire, and sheath are removed from the patient.

The iliac arterial graft site is then clamped with a partial occlusion clamp to isolate the graft, which is excised leaving a 5-6 mm cuff. This is oversewn in two layers with polypropylene suture, deaired, and the clamp removed. Hemostasis is achieved. The wound is irrigated and closed in layers.

Description of Post-Service Work: The physicians confirm the patient hemodynamic status,including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed assessing for adequate limb perfusion. Post operative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into theSmandatory TAVR registry by the two procedural physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012				
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD				
Specialty(s):	STS, ACC, SCAI				
CPT Code:	33364				
Sample Size:	70	**Resp N:**	31	**Response:** 44.2 %	
Description of Sample:	Targeted. As approved by the Research Subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites and 180 physicians. The survey was sent to the cardiologist and cardiothoracic surgeon at each instution and asked to complete the survey jointly.

Post-Service intensity/complexity	4.07	3.60

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:
    a. Surgeon requirements:
        i. Board Certified/Eligible in Cardiovascular Surgery;
        ii. Professional experience with:
            1. ≥ 100 AVR/career including 10 high risk patients; OR
            2. ≥ 25 AVR/year or 50 AVR in 2 years; AND
            3. ≥ 20 in the last year prior to TAVR.
    b. Interventionalist requirements:
        . Operators must be Board Certified/Eligible in Interventional Cardiology
        i. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the current MPC list.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency on the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery.
The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0256T Implantation of catheter-delivered prosthetic aortic heart valve; endovascular approach

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 264
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovasular approaches (3300) 33361 ercutaneous 30%, 33362 femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery Frequency 264 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 250
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery Frequency 250 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33880

SUMMARY OF RECOMMENDATION

CPT Code:33365 Tracking Number GG5 Original Specialty Recommended RVU: **37.50**
Presented Recommended RVU: **37.50**
Global Period: 000 RUC Recommended RVU: **37.50**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transaortic approach (eg, median sternotomy, mediastinotomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. Because of severe peripheral vascular disease, including severe aortoiliac, femoral and axillary artery disease, along with severe pulmonary disease that precludes a transapical approach, a direct aortic approach is recommended via either median sternotomy or mediastinotomy.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 600%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on

the operative field. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

Description of Intra-Service Work: A temporary transvenous pacemaker electrode is advanced into apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. .

A full or partial median sternotomy incision is performed.. Dissection of the thymic fat pad reveals the pericardium, which is opened vertically and sutures used to retract and expose the ascending aorta. Alternatively an anterior mediastinotomy is performed providing access to the ascending aorta. Antithromotic therapy is begun. Epiaortic ultrasonic scanning is performed to identify a disease free site for sheath delivery. A pledgeted double pursestring suture is placed in the mid ascending aorta and the adventia locally dissected within the pursestring. The aorta is opened with a knife, the vascular sheath introduced, and the pursestring tightened to achieve hemostasis. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. Typically, several aortograms in different angles are required??

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the left ventricle, a small catheter is advanced over the wire into the left ventricle and the wire is exchanged for a stiff guide wire. Ventricular ectopy induced by the catheter/wire is frequent and may be sustained, requiring repositioning. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced to the aortic root and positioned across the native aortic valve annulus under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter and guide wire are removed from the patient.

The sheath is removed from the ascending aorta and the aortic double pursestring suture tied. Additional sutures may be required for hemostasis. The pericardium is closed over a single drain. Anticoagulation is reversed. After achieving

satisfactory hemostasis, the sternum is reapproximated with stainless steel wires. The wound is irrigated and closed in layers.

Description of Post-Service Work: The physicians confirm the patient hemodynamic status,including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed assessing for adequate limb perfusion. Post operative orders are written. A detailed "hand-off" process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient's fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012				
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD				
Specialty(s):	STS, ACC, SCAI				
CPT Code:	33365				
Sample Size:	70	**Resp N:**	30	**Response:** 42.8 %	
Description of Sample:	Targeted. As approved by the Research Subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites and 180 physicians. The survey was sent to the cardiologist and cardiothoracic surgeon at each instution and asked to complete the survey jointly.

Post-Service intensity/complexity	4.44	3.88

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:
    a. Surgeon requirements:
        i. Board Certified/Eligible in Cardiovascular Surgery;
        ii. Professional experience with:
            1. ≥ 100 AVR/career including 10 high risk patients; OR
            2. ≥ 25 AVR/year or 50 AVR in 2 years; AND
            3. ≥ 20 in the last year prior to TAVR.
    b. Interventionalist requirements:
        . Operators must be Board Certified/Eligible in Interventional Cardiology
        i. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

Intra-service	180		**0.1055**	**18.98375**

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the current MPC list.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency on the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery.
The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0257T Implantation of catheter-delivered prosthetic aortic heart valve; open thoracic approach (eg, transapical, transventricular) and 0258T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; without cardiopulmonary bypass

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 510
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovasular approaches (3300) 33361 ercutaneous 30%, 33362 femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery Frequency 510 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 484
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery Frequency 484 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33979

Global Period: 000 RUC Recommended RVU: **40.00**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. Because of severe peripheral vascular disease, including severe aortoiliac, femoral axillary artery disease, and the presence of a porcelain aorta, a transapical approach is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on

the operative field. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

Description of Intra-Service Work: A temporary transvenous pacemaker electrode is advanced into apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

The heart is exposed through a left anterior thoracotomy in the fifth or sixth intercostal space. Single lung ventilation is initiated and the left lung is collapsed. A pericardiotomy is performed, and pacing wires are affixed to the ventricular muscle. Two circumferential pledgeted pursestring sutures are placed in the apex of the left ventricle. Anticoagulant therapy is administered to achieve therapeutic anticoagulation levels. A sheath is introduced into the left ventricle, and a pigtail catheter advanced over a guidewire into the ascending aorta using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. Typically, several aortograms in different angles are required

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the aorta, a small catheter is advanced over the wire and the wire is exchanged for a stiff guide wire. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced across the native aortic valve annulus to the aortic root and positioned under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter and guide wire are removed from the patient.

The LV apical sheath is removed and the pursestring sutures are tied. Hemostasis is assured. Protamine is given to reverse the heparin. Chest tube(s) are placed. Double lung ventilation is resumed. The incision is closed in layers and dressings are placed.

Description of Post-Service Work: The physicians confirm the patient hemodynamic status,including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed

assessing for adequate limb perfusion. Post operative orders are written. A detailed “hand-off” process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient’s fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD		
Specialty(s):	STS, ACC		
CPT Code:	0318T		
Sample Size:	70	**Resp N:** 31	**Response:** 44.2 %
Description of Sample:	Targeted. As approved by the Research subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites and 180 physicians. The survey was sent to the cardiologist and cardiothoracic surgeon at each instution and asked to complete the survey jointly.

Time Segments (Mean)		
Pre-Service intensity/complexity	4.35	3.88
Intra-Service intensity/complexity	4.41	4.12
Post-Service intensity/complexity	3.88	4.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:
    a. Surgeon requirements:
        i. Board Certified/Eligible in Cardiovascular Surgery;
        ii. Professional experience with:
            1. ≥ 100 AVR/career including 10 high risk patients; OR
            2. ≥ 25 AVR/year or 50 AVR in 2 years; AND
            3. ≥ 20 in the last year prior to TAVR.
    b. Interventionalist requirements:
        . Operators must be Board Certified/Eligible in Interventional Cardiology
        i. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

IWPUT Calculator				

33366	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)

Post-service total				**3.44**
	Time		**IWPUT**	
Intra-service	195		**0.1054**	**20.54625**

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the current MPC list.

PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency on the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

SAME DAY POST PROCEDURE VISIT

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery.
The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0257 T Implantation of catheter-delivered prosthetic aortic heart valve; open thoracic approach (eg, transapical, transventricular) and 0258T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; without cardiopulmonary bypass

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1190
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovasular approaches (3300) 33361 ercutaneous 30%, 33362 femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery Frequency 1190 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,130
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery Frequency 1130 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33979

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33367 Tracking Number GG7 Original Specialty Recommended RVU: **11.88**
Presented Recommended RVU: **11.88**
Global Period: ZZZ RUC Recommended RVU: **11.88**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with percutaneous peripheral arterial and venous cannulation (eg, femoral vessels)
(Use 33367 in conjunction with 33361-33366)
(Do not report 33367 in conjunction with 33368 or 33369)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. Note: This is an add-on service to the TAVR/TAVI which is reported separately.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A patient undergoing TAVR becomes hemodynamically unstable, and cannot be stabilized with inotropic support or any standard medical means. The patient is anticoagulated. The artery and vein are cannulated with sheaths using direct percutaneous access. Guidewires are advanced into the distal abdominal aorta and into the superior vena cava. Dilators are employed to ultimately place a sufficient sized arterial cannula and a multiply ported venous drainage cannula across the right atrium into the superior vena cava. The cannulas are de-aired and connected to a cardiopulmonary bypass circuit. Cardiopulmonary bypass is initiated. Cardiopulmonary bypass with its attendant volume shifts and the activation of the inflammatory system is managed with volume replacement and alpha effector agents. Anticoagulation is maintained. Management continues while the TAVR procedure is completed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are normalized and the patient is weaned from cardiopulmonary bypass. Anticoagulation is reversed. The cannulas are removed percutaneously. Hemostasis is achieved through percutaneous closure devices or, if necessary, open vascular repair (reported separately).

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
37223	ZZZ	4.25	**RUC Time**

CPT Descriptor Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 1 see separate MPC table for TAVR codes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
33960	ZZZ	10.59	**RUC Time**

CPT Descriptor Prolonged extracorporeal circulation for cardiopulmonary insufficiency; initial 24 hours
*CPT code is a 000 day global that was adjusted in work and time to represent a ZZZ global per approval from the research subcommittee and the adjusted time data was used on the RSL.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 7 **% of respondents:** 20.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 33367**	**Key Reference CPT Code:** 37223	**Source of Time RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	90.00	45.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	

Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**90.00**	**45.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.29	3.29
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.86	3.71
Urgency of medical decision making	4.57	3.29
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.29	4.00
Physical effort required	3.43	3.43
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.57	3.43
Outcome depends on the skill and judgment of physician	4.71	3.43
Estimated risk of malpractice suit with poor outcome	4.29	3.43

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.29	3.14
Intra-Service intensity/complexity	3.71	3.57
Post-Service intensity/complexity	4.00	3.14

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were the cardiac surgeon members of teams of co-operators who participated in clinical trials of these new devices.

They evaluated the three add-on, ZZZ codes to report when cardiopulmonary bypass is necessary for the procedure (**33367**, **33368**, **33369**).

The three bypass codes represent different approaches for accomplishing bypass if it becomes necessary during the procedure. The majority of TAVR cases that require bypass will involve an emergent situation that occurs during the procedure due to aortic insufficiency or the patient's inability to withstand rapid pacing or balloon valvuloplasty. There will be a small percentage of cases where bypass is planned as part of the procedure and it will only be applicable to a specific patient population and will not be typical.

The three cardiopulmonary bypass codes were surveyed specifically as they relate to the TAVR procedures. Bypass related to TAVR is not equivalent to any of the existing "with or without" bypass procedure. In addition, the typical TAVR patient is 83 years old with multiple comorbidities, adding to the complexity of the procedure.

The Expert Panel reviewed the survey results and recommends that the 25th percentile RVWs for these codes accurately represents the work involved and results in an appropriate IWPUT (0.132) for this service. This intensity is well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including several codes from the current MPC list. This intensity is frequently observed in add-on codes, and accurately reflects the significant urgent decision making which must be made to select appropriate vascular access sites and accomplish the technical aspects of the procedure in patients with significant diffuse vascular disease. Management of cardiopulmonary bypass and the inherent bleeding risk and inflammatory while continuing the valve replacement procedure adds significant work to the base procedure.

In the context of the entire presentation of **33361**-**33369**, it is important to note that the -62 modifier would not be appended to the codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your

scenario. Code 33367 will be reported in conjunction with one of the new codes 33361- 33366 when applicable.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0259T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; with cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 75
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, of that number it is estimated that approximately 5% will require emergent cardiopulmonary bypas support. There are three bypass codes and it is estimated that the 33367 percutaneouls peripheraial approach will be utilized 30% of the time, that 33368 open peripherial approach will be utilized 30% of the time and that 33369 central access will be used 40% of the time.

Specialty Cardiovascular Surgery Frequency 75 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 71 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiovascular Surgery Frequency 71 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33979

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33368 Tracking Number GG8 Original Specialty Recommended RVU: **14.39**
Presented Recommended RVU: **14.39**
Global Period: ZZZ RUC Recommended RVU: **14.39**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; cardiopulmonary bypass support with open peripheral arterial and venous cannulation (eg, femoral, iliac, axillary vessels)
(Use 33368 in conjunction with 33361-33366)
(Do not report 33368 in conjunction with 33367 or 33369)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm2. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. However, the femoral vessels are not suitable for percutaneous cannulation, therefore an open approach is utilized. In the course of the procedure, the patient becomes unstable and full extracorporeal cardiopulmonary support is required. Note: This is an add-on service to the TAVR/TAVI which is reported separately.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A patient undergoing TAVR becomes hemodynamically unstable, and cannot be stabilized with inotropic support or any standard medical means. The patient is anticoagulated. A new incision is made and the artery and vein are exposed and controlled with vessel loops. The artery is clamped and a transverse arteriotomy performed. A suitably sized arterial cannula is advanced over a guidewire. A pursestring polypropylene suture is place in the vein, and a guidewire inserted through a needle placed within it and advanced into the vena cava under fluoroscopic guidance. A multiply ported venous drainage cannula is passed over the guidewire, across the right atrium and into the vena cava. The cannulas are de-aired and connected to a cardiopulmonary bypass circuit. Cardiopulmonary bypass is initiated. Cardiopulmonary bypass with its attendant volume shifts and the activation of the inflammatory system is managed with volume replacement and alpha effector agents. Anticoagulation is maintained. Management continues while the TAVR procedure is completed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are

normalized and the patient is weaned from cardiopulmonary bypass. The venous cannula is removed and bleeding controlled by tying the previously placed pursestring. The arterial cannula is removed and the arteriotomy is repaired with 6-0 polypropylene sutures. Anticoagulation is reversed, and after assuring hemostasis the wound is closed in layers.

Description of Post-Service Work: N/A

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally

consistent. All survey respondents were the cardiac surgeon members of teams of co-operators who participated in clinical trials of these new devices.

They evaluated the three add-on, ZZZ codes to report when cardiopulmonary bypass is necessary for the procedure (33367, 33368, 33369).

The three bypass codes represent different approaches for accomplishing bypass if it becomes necessary during the procedure. The majority of TAVR cases that require bypass will involve an emergent situation that occurs during the procedure due to aortic insufficiency or the patient's inability to withstand rapid pacing or balloon valvuloplasty. There will be a small percentage of cases where bypass is planned as part of the procedure and it will only be applicable to a specific patient population and will not be typical.

The three cardiopulmonary bypass codes were surveyed specifically as they relate to the TAVR procedures. Bypass related to TAVR is not equivalent to any of the existing "with or without" bypass procedure. In addition, the typical TAVR patient is 83 years old with multiple comorbidities, adding to the complexity of the procedure.

The Expert Panel reviewed the survey results and recommends that the 25th percentile RVWs for these codes accurately represents the work involved and results in an appropriate IWPUT (0.120) for this service. This intensity is well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including several codes from the current MPC list. This intensity is frequently observed in add-on codes, and accurately reflects the significant urgent decision making which must be made to select appropriate vascular access sites and accomplish the technical aspects of the procedure in patients with significant diffuse vascular disease. Management of cardiopulmonary bypass and the inherent increased bleeding and inflammatory response as well as operative repair of the cannulation sites (not billed separately) adds significant work to the base procedure.

In the context of the entire presentation of 33361-33369, it is important to note that the -62 modifier would not be appended to the codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Code 33368 will be reported in conjunction with one of the new codes 33361-33367 when applicable

---

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0259T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; with cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 75
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, of that number it is estimated that approximately 5% will require emergent cardiopulmonary bypas support. There are three bypass codes and it is estimated that the 33367 percutaneouls peripheraial approach will be utilized 30% of the time, that 33368 open peripherial approach will be utilized 30% of the time and that 33369 central access will be used 40% of the time.

Specialty Cardiovascular Surgery Frequency 75 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 71 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiovascular Surgery Frequency 71 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: A patient undergoing TAVR becomes hemodynamically unstable, and cannot be stabilized with inotropic support or any standard medical means. The patient is anticoagulated. If not already achieved by the TAVR approach, exposure of the great vessels is obtained by rapid median sternotomy and the creation of a pericardial well. The aorta is directly cannulated for arterial inflow and a dual stage venous return cannula is placed through a right atrial incision. Cardiopulmonary bypass is initiated. Pursestrings are then placed about both cannulae and they are secured. Cardiopulmonary bypass with its attendant volume shifts and the activation of the inflammatory system is managed with volume replacement and alpha effector agents. Anticoagulation is maintained. Management continues while the TAVR procedure is completed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are normalized and the patient is weaned from cardiopulmonary bypass. Anticoagulation is reversed, the cannulae removed and hemostasis is achieved by tying the previously placed pursestring sutures. Additional sutures may be required. After assuring

hemostasis, the sternum is reapproximated with stainless steel wires over mediastinal drains. The wound is then irrigated and closed in layers.

Description of Post-Service Work: N/A

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Jim Levett, MD; Stephen Lahey, MD; Jeff Jacobs, MD; Richard Wright, MD; Clifford Kavinsky, MD		
Specialty(s):	STS, ACC		
CPT Code:	33369		
Sample Size:	70	**Resp N:** 35	**Response:** 50.0 %
Description of Sample:	Targeted. As approved by the Research subcommittee, the STS and ACC sent the survey to physicians who participated in a TAVR trial. This sample represented 70 sites.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status?

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service?

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
33305	ZZZ	29.60	**RUC Time**

CPT Descriptor Repair of cardiac wound; with cardiopulmonary bypass
*code value was adjusted to ZZZ global from 0900 day global for RSL which was approved by the Research Subcommittee

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 1 see separate MPC table for TAVR codes

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
33530	ZZZ	8.08	**RUC Time**

CPT Descriptor Reoperation, coronary artery bypass procedure or valve procedure, more than 1 month after original operation (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 15 **% of respondents:** 42.8 **%**

TIME ESTIMATES (Median)	**CPT Code: 33369**	**Key Reference CPT Code:** 33305	**Source of Time RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	160.00	296.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**160.00**	**296.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.87	4.47
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.87	4.27
Urgency of medical decision making	4.73	4.33
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.87	4.80
Physical effort required	4.47	4.40
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.87	4.33
Outcome depends on the skill and judgment of physician	4.73	4.33
Estimated risk of malpractice suit with poor outcome	4.20	3.87

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.80	4.40
Intra-Service intensity/complexity	4.87	4.33
Post-Service intensity/complexity	4.80	4.20

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and

finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were the cardiac surgeon members of teams of co-operators who participated in clinical trials of these new devices.

They evaluated the three add-on, ZZZ codes to report when cardiopulmonary bypass is necessary for the procedure (33367, 33368, 33369).

The three bypass codes represent different approaches for accomplishing bypass if it becomes necessary during the procedure. The majority of TAVR cases that require bypass will involve an emergent situation that occurs during the procedure due to aortic insufficiency or the patient's inability to withstand rapid pacing or balloon valvuloplasty. There will be a small percentage of cases where bypass is planned as part of the procedure and it will only be applicable to a specific patient population and will not be typical.

The three cardiopulmonary bypass codes were surveyed specifically as they relate to the TAVR procedures. Bypass related to TAVR is not equivalent to any of the existing "with or without" bypass procedure. In addition, the typical TAVR patient is 83 years old with multiple comorbidities, adding to the complexity of the procedure.

The Expert Panel reviewed the survey results and recommends that the 25th percentile RVWs for these codes accurately represents the work involved and results in an appropriate IWPUT (0.119) for this service. This intensity is well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including several codes from the current MPC list. This intensity is frequently observed in add-on codes, and accurately reflects the significant urgent decision making which must be made to select appropriate vascular access sites and accomplish the technical aspects of the procedure in patients with significant diffuse vascular disease. Management of cardiopulmonary bypass and the inherent increased bleeding and inflammatory response as well as operative repair of the cannulation sites (not billed separately) adds significant work to the base procedure.

In the context of the entire presentation of 33361-33369, it is important to note that the -62 modifier would not be appended to the codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Code 33369 will be reported in conjunction with one of the new codes 33361-33366 when applicable

---

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0259T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; with cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiovascular Surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, of that number it is estimated that approximately 5% will require emergent cardiopulmonary bypas support. There are three bypass codes and it is estimated that the 33367 percutaneouls peripheraial approach will be utilized 30% of the time, that 33368 open peripherial approach will be utilized 30% of the time and that 33369 central access will be used 40% of the time.

Specialty Cardiovascular Surgery Frequency 100 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 95 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiovascular Surgery Frequency 95 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33305

Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

33361 - Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach
33362 - open femoral artery approach
33363 - open axillary artery approach
33364 - open iliac artery approach
33365 - transaortic approach (eg, median sternotomy, mediastinotomy)
33366 - transapical approach (eg, left thoracotomy)

Global Period: 000 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Codes 33980 - Removal of ventricular assist device, implantable intracorporeal, single ventricle
This code represents an XXX global procedure that was reviewed by the RUC and the Practice Expense Subcommittee at the February of 2011 RUC meeting. 33980 is a procedure that is performed in the facility setting 100% of the time and requires office staff time that would be typical of a 90-day global procedure performed in the facility setting. This code has an approved pre-facility clinical staff time of 60 minutes. Since cardiothoracic offices typically employ PAs, the cardiothoracic codes are typically assigned CMS code L051A and staff type RN.

The TAVR codes also represent procedures that will be performed in the facility 100% of the time and will require office staff time that would be typical for a 90-day global procedure performed in the facility setting. The main difference between the TAVR codes and the reference code is that the TAVR codes will be done jointly with the cardiologist and cardiovascular surgeon and requires additional scheduling and coordination of services because the cardiology office and the cardiovascular surgery office must both coordinate with the other specialists involved in the procedure which at a minimum include radiology, perfusionist and a specialized anesthesiologist. In addition the procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment. Since the codes were jointly surveyed involving cardiology and cardiac surgeons, the specialty societies are recommending CMS Code L037D with a blended staff type of RN/ LP/ MTA rather then the RN staff type typical to the cardiothoracic surgery codes.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff from both offices fill out the pre-service diagnostic and referral forms. They call the hospital

to schedule space and equipment needed in the facility. They will also coordinate with specialized anesthesiologist, the perfusionist, radiology and any other physician offices to set up the case. The clinical staff will also coordinate with the hospital to schedule the OR and the specialized equipment for the procedure. The operating room coordinating requires ensuring the needed hybrid equipment including the catheter-based equipment for the valve deployment, any instrumentation needed for an open approach or conversion to an open approach and cardiopulmonary bypass equipment as well as supporting imaging equipment for the procedure. The clinical staff will educate the patient on what they need to do to prepare for surgery. The staff ensures the patient and family fully understands the procedure and the recovery afterwards and obtains the operative consent. They make follow-up phone calls to the patient and the office of referring physicians and call in needed prescriptions.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2012

Stereotactic Body Radiation

In October 2011, the CPT Editorial Panel created 32701 *Thoracic target(s) delineation for stereotactic body radiation therapy (SRS/SBRT), (photon or particle beam), entire course of treatment* to describe the work provided by the surgeon when they are involved in the planning of thoracic stereotactic radiosurgery (SRS) or stereotactic body radiation therapy (SRS/SBRT) for the treatment of lung lesions. Since 2010, the non-specific CPT code 32999 *Unlisted procedure, lungs and pleura* was used to report this service and the Panel agreed that a more specific code was necessary.

The RUC discussed the survey results from 36 thoracic surgeons and recommend the following physician time components: 25 minutes pre-service time, 60 minutes intra-service time and 15 minutes post-service time. The RUC then reviewed the survey respondents' estimated work RVUs and determined that the values were overestimated at the 25th percentile, 5.83 work RVUs. To determine an appropriate work value for this service, the RUC discussed the physician work involved in this service. The surgeons' work for this service is primarily performed in the initial planning phase for the patient's radiation treatment, which is only performed one time per treatment cycle. Once the CT simulations are obtained, the physician works collaboratively with the radiation oncologist to determine the appropriate plan, including contours, dose and fractionation. The overlap of physician work with the radiation oncologist is minimal because this service is set up so that the two physicians work interchangeably throughout the planning stage in order for the treatment to be effectively administered. In addition to this work, the surgeon is also present on the first day of delivery to ensure the patient is comfortable and able to receive the treatment.

With this understanding of the physician work, the RUC compared the surveyed code 99291 *Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes* (work RVU= 4.50) and determined that a critical care procedure at 71 minutes, has more intensive, patient-focused physician work than 32701 (60 minutes intra-service) and should be valued slightly higher than the surveyed code. Additionally, the Committee reviewed CPT code 61781 *Stereotactic computer-assisted (navigational) procedure; cranial, intradural* (work RVU= 3.75) and agreed that while the physician work is more intense for 61781, 32701 has double the intra-service time, 60 minutes compared to 30 minutes, and should valued higher. Given these work value ranges, the RUC, using magnitude estimation, determined that a work RVU of 4.18 appropriately aligns 32701, relative to other services. To validate this work value across the RBRVS, the RUC compared the surveyed code to CPT code 43232 *Esophagoscopy, rigid or flexible; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)* (work RVU= 4.47) and determined that while the two services have identical intra-service time, 60 minutes, 43232 is a slightly more intense service than 32701 and should be valued higher. Finally, the RUC agreed that the work of the thoracic surgeon in this code should be compared to similar physician work performed by a radiation oncologist. Therefore, CPT code 77301 *Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications* (work RVU= 7.99) was reviewed. The

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RUC noted that while the reference codes has more intra-service time than the surveyed code, 131 minutes compared to 60 minutes, the recommended value of 4.18 accurately accounts for the difference in time and relative value of the physician work performed in these two procedures. **The RUC recommends a work RVU of 4.18 for CPT code 32701.**

New Technology:
The specialty society requests and the RUC agrees that these three codes should be added to the new technology list.

Practice Expense:
This service is primarily performed in the facility setting and no direct practice inputs are recommended.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
● 32701	H1	Thoracic target(s) delineation for stereotactic body radiation therapy (SRS/SBRT), (photon or particle beam), entire course of treatment (Do not report 32701 in conjunction with 77261-77799) (For placement of fiducial markers, see 31626, 32553)	000	4.18
77435		Stereotactic body radiation therapy, treatment management, per treatment course, to 1 or more lesions, including image guidance, entire course not to exceed 5 fractions (Do not report 77435 in conjunction with 77427-77432) (The same physician should not report both stereotactic radiosurgery services [32701, 63620, 63621] and radiation treatment management [77435] ~~for extracranial lesions~~)	XXX	11.87 (No Change)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old female with a biopsy proven 2.5 cm stage 1A non-small cell lung cancer (T1N0M0) located in the periphery of the right lower lobe is felt to be a poor surgical candidate because of advanced chronic obstructive pulmonary disease and is scheduled for stereotactic body radiotherapy (SRS/SBRT).

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 17%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 44%

Description of Pre-Service Work: Review previous medical records, evaluation of the imaging studies, appropriate lab and screening studies and obtain informed consent from the patient and family.

Description of Intra-Service Work: Stereotactic computerized imaging studies (CT, MRI, and/or PET; radiology reported separately) are obtained. A CT simulation +/- respiratory gating is performed separately in radiation oncology. The physician works with the radiation oncologist to verify that the target is optimally imaged. The treatment planning computer is utilized to process all of the stereotactic and simulation images in a planning program with image fusion. The physician collaborates with the radiation oncologist to outlin the target volume throughout the fused data sets and/or Maximum Intensity Projection data set. This process includes the integration of all imaging and functional tests previously acquired and analyzed by the physician. The physician jointly prepares the dosimetry plan with the radiation oncologist and the radiation physicist. Multiple dosimetry plans may be necessary to achieve optimal dose coverage of the target lesion while minimizing the dose to the surrounding normal structures. The plan that achieves the greatest radiation dose to the target with the least radiation risk to critical surrounding tissues is ultimately selected. The patient is then brought to the linear accelerator and positioned on the treatment table. The physician is available to make changes in the treatment plan if optimal positioning cannot be achieved. Correct positioning of the patient is radiographically verified and treatment is then delivered.

Description of Post-Service Work: The patient is stabilized and monitored. The operative note is dictated and the physician communicates with the family, nurses, and referring physician (including written and telephone reports and orders). Discharge records are prepared, medications ordered, and questions from the family and other providers are answered.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2012				
Presenter(s):	Keith Naunheim, MD; James Levett, MD				
Specialty(s):	The Society of Thoracic Surgeons				
CPT Code:	32701				
Sample Size:	250	**Resp N:**	36	**Response:** 14.4 %	
Sample Type:	Random	**Additional Sample Information:**

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
11005	000	14.24	**RUC Time**

CPT Descriptor Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52342	000	5.85	**RUC Time**	291

CPT Descriptor 1 Cystourethroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
19298	000	6.00	**RUC Time**	154

CPT Descriptor 2 Placement of radiotherapy afterloading brachytherapy catheters (multiple tube and button type) into the breast for interstitial radioelement application following (at the time of or subsequent to) partial mastectomy, includes imaging guidance

Other Reference CPT Code	Global	Work RVU	Time Source
31600	000	7.17	**RUC Time**

CPT Descriptor Tracheostomy, planned (separate procedure);

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 25.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 32701**	**Key Reference CPT Code:** 11005	**Source of Time** **RUC Time**
Median Pre-Service Time	25.00	60.00	
Median Intra-Service Time	60.00	120.00	
Median Immediate Post-service Time	15.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	55.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**100.00**	**265.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	5.00	3.36
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.73	3.45
Urgency of medical decision making	3.09	4.27
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.09	3.82
Physical effort required	3.55	3.45
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.91	3.36
Outcome depends on the skill and judgment of physician	4.18	3.64
Estimated risk of malpractice suit with poor outcome	3.64	3.36

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.45	3.09
Intra-Service intensity/complexity	4.00	3.55
Post-Service intensity/complexity	3.09	2.91

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 32999 or not reported

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiothoracic surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Approximately 2500 SRS procedures were performed on thoracic tumors in CY 2007. It is estimated that 80-90% were performed on Medicare patients.
There are currently over 60 thoracic surgeons performing SRS/SBRT services in centers across the United States.

Specialty cardiothoracic surgery Frequency 500 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 37 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate of services reported under 32999 for this service.

Specialty cardiothoracic surgery Frequency 37 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33468

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

Thoracic target(s) delineation for stereotactic body radiation therapy (SRS/SBRT), (photon or particle beam), entire course of treatment

Global Period: 000 Meeting Date: January, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

There are no direct practice expenses associated with this procedure.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

NA
Intra-Service Clinical Labor Activities:

NA

Post-Service Clinical Labor Activities:

NA

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Insertion of Percutaneous Ventricular Assist Device

In February 2012, the CPT Editorial Panel deleted two Category III codes (0048T and 0050T) and created four Category I codes to describe the insertion of a percutaneous ventricular assist device.

33990 ***Insertion of ventricular assist device, percutaneous including radiological supervision and interpretation; arterial access only***
The RUC reviewed the survey results from 33 cardiologists and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time= 45 minutes, intra-service time= 60 minutes and post-service time= 40 minutes. The RUC agreed that pre-service time is equivalent to a pre-service package 2B (difficult patient, straightforward procedure), with additional time for evaluation of the patient, was appropriate for this service because while an Evaluation and Management service is typically reported on the same day, the visit is typically performed by another physician at a separate encounter. The recommended pre and post times do not overlap with Evaluation and Management services.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overestimated the physician work involved. In addition, the RUC could not find suitable reference codes to support values at the 25th percentile (work RVU= 12.00). The RUC reviewed comparator codes with analogous time and intensity and noted that CPT code 37220 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU= 8.15) has identical intra-service time, 60 minutes, compared to 33990 and similar physician work. Therefore, a direct crosswalk to CPT code 37220 is justified. Finally, the RUC discussed the high intensity of this service. Candidates for this procedure are urgent, high risk patients that are not eligible for surgery. These assist devices are placed to maintain the patient until an angioplasty can be performed. Therefore, the Committee concurred that this service is appropriately valued and is an intense procedure. **The RUC recommends a work RVU of 8.15 for CPT code 33990, a direct crosswalk to CPT code 37220.**

33991 ***Insertion of ventricular assist device, percutaneous including radiological supervision and interpretation; both arterial and venous access, with transseptal puncture***
The RUC reviewed the survey results and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time= 60 minutes, intra-service time= 90 minutes and post-service time= 45 minutes. The RUC agreed that pre-service time is equivalent to a pre-service package 2B (difficult patient, straightforward procedure), with additional time for evaluation of the patient, was appropriate for this service because while an Evaluation and Management service is typically reported on the same day, the visit is typically performed by another physicians at a separate encounter. The recommended pre and post times do not overlap with Evaluation and Management services.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overestimated the physician work involved. In addition, the RUC could not find suitable reference codes to support values at the 25th percentile (work RVU= 16.63). The RUC reviewed comparator codes with analogous time and intensity and noted that CPT codes 37220 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU= 8.15) and CPT code 93462 *Left heart catheterization by transseptal puncture through intact septum or by transapical puncture* (work RVU= 3.73) combined have similar intra-service time, 100 minutes compared to 90, and comparable physician work to 33991. To ensure the resulting work RVU of 11.88 is relative to similar services in the RBRVS, the committee reviewed CPT code 37228 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU= 11.00, intra-service time 90 minutes) and agreed that these two services have analogous physician work and should be valued similarly. Finally, the RUC discussed the high intensity of this service. Candidates for this procedure are urgent, high risk patients that are not eligible for surgery. These assist devices are placed to tide the patient over so an angioplasty can be performed. Therefore, the Committee concurred that this service is appropriately valued and is relative to 33990, with similar intensity. **The RUC recommends a work RVU of 11.88 for CPT code 33991.**

33992 ***Removal of percutaneous ventricular assist device at separate and distinct session from insertion***

The RUC reviewed the survey results and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time= 30 minutes, intra-service time= 45 minutes and post-service time= 30 minutes. The RUC agreed that pre-service time is equivalent to a pre-service package 2B (difficult patient, straightforward procedure) was appropriate to evaluate and wean the patient from the assist device. The RUC also discussed the appropriate billing for this code. The typical patient, roughly 85%, receiving a percutaneous ventricular assist device will have the device removed in the catheterization laboratory during the same session as insertion. The physician work of removal in that scenario is included in the insertion codes. However, a minority of patients will require that the device be removed in the intensive care unit where 33992 would be appropriately reportable with a 59 modifier, per CPT instructions.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overestimated the physician work involved. In addition, the RUC could not find suitable reference codes to support values at the 25th percentile (work RVU= 6.44). The RUC reviewed comparator codes with analogous time and intensity and noted that CPT code 31634 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with balloon occlusion, with assessment of air leak, with administration of occlusive substance (eg, fibrin glue), if performed* (work RVU= 4.00) has identical intra-service time, 45 minutes, and should have the same value as the surveyed code. **The RUC recommends a work RVU of 4.00 for CPT code 33992, a direct crosswalk to CPT code 31634.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

33993 ***Repositioning of percutaneous ventricular assist device with imaging guidance at separate and distinct session from insertion***
The RUC reviewed the survey results and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time= 30 minutes, intra-service time= 30 minutes and post-service time= 30 minutes. The RUC agreed that pre-service time is equivalent to a pre-service package 2B (difficult patient, straightforward procedure) was appropriate to evaluate a patient with a device that has position malfunction. As is the case with the removal code, 33992, 33993 can only be reported when repositioning of a device is performed during a separate encounter, which is not typical. Repositioning during insertion is not separately reportable.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the respondents overestimated the physician work involved. In addition, the RUC could not find suitable reference codes to support values at the 25th percentile (work RVU= 6.00). The RUC reviewed comparator codes with analogous time and intensity and noted that CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) has identical intra-service time as 33993, 30 minutes, and analogous physician work. Therefore, the Committee agreed that the two services should be valued the same. Finally, the RUC noted that 33993 is appropriately valued compared to 33992 because although repositioning takes less time compared to the removal code, 33993 is much more intense, as shown in the intensity/complexity measures, and should be valued slightly higher. **The RUC recommends a work RVU of 4.17 for CPT code 33993, a direct crosswalk to CPT code 32550.**

Practice Expense: There are no direct practice expense inputs for these services as they are only done in the Facility setting.

New Technology: These services will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
The insertion of a ventricular assist device (VAD) can be performed via percutaneous (~~0048T~~, 33990, 33991) or transthoracic (33975, 33976, 33979) approach. The location of the ventricular assist device may be intracoporeal or extracorporeal. For surgical insertion of cannula(s) for prolonged extracorporeal circulation for cardiopulmonary insufficiency (ECMO), see 36822). Open arterial exposure when necessary to facilitate percutaneous ventricular assist device insertion (33990, 33991), ~~is~~ may be reported separately (34812). Extensive repair or replacement of an artery may be additionally reported [eg, 35226 or 35286]) Removal of a ventricular assist device (33977, 33978, 33980, ~~0050T~~, 33992) includes removal of the entire device, including the cannulas. Removal of a percutaneous ventricular assist device at the same session as insertion is not separately reportable. For removal of a percutaneous ventricular assist device at a separate and distinct session, but on the same day as insertion, report 33992 appended with modifier 59 indicating a distinct procedural service.				
Repositioning of a percutaneous ventricular assist device at the same session as insertion is not separately reportable. Repositioning of percutaneous ventricular assist device not necessitating imaging guidance is not a reportable service. For repositioning of a percutaneous ventricular assist device necessitating imaging guidance at a separate and distinct session, but on the same day as insertion, report 33993 with modifier 59 indicating a distinct procedural service. Replacement of the entire implantable ventricular assist device system, ie, pump(s) and cannulas, is reported using the insertion codes (ie, 33975, 33976, 33979). Removal (ie, 33977, 33978, 33980) of the ventricular assist device system being replaced is not separately reported. Replacement of a percutaneous ventricular assist device is reported using implantation codes (ie, 33990, 33991). Removal (ie 33992) is not reported separately. ~~(For implantation or removal of ventricular assist device, extracorporeal, percutaneous transseptal access, see 0048T, 0050T. For replacement of a ventricular assist device, extracorporeal, percutaneous transseptal access, use 33999)~~				
Transthoracic Cardiac Assist **Percutaneous Ventricular Assist**

Surgery **Cardiovascular** **Heart and Pericardium** **~~Wounds of the~~ Heart (Including Valves) and Great Vessels**				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Cardiopulmonary bypass may be required for patients receiving major cardiac procedures requiring insertion of cannulae into the venous and arterial circulation with placement on a cardiopulmonary bypass (ie, heart-lung) machine. Many codes are dyads so as to report procedures with cardiopulmonary bypass as contrasted to without cardiopulmonary bypass. Cardiopulmonary bypass is distinct from support of cardiac output using devices (eg, ventricular assist or intra-aortic balloon). For cardiac assist services see 33960-33983 33990-33993.

Venous Grafting Only for Coronary Artery Bypass

The following codes…

Procurement of the saphenous vein graft is included in the description of the work for 33510-33516 and should not be reported as a separate service or co-surgery. To report harvesting of an upper extremity vein, use 35500 in addition to the bypass procedure. To report harvesting of a femoropopliteal vein segment, report 35572 in addition to the bypass procedure. When surgical assistant performs graft procurement, add modifier 80 to 33510-33516. For percutaneous ventricular assist device insertion, removal, repositioning, see 33990-33993.

Combined Arterial-Venous Grafting for Coronary Bypass

The following codes…

To report combined…

Procurement of the saphenous vein graft is included in the description of the work for 33517-33523 and should not be reported as a separate service or co-surgery. Procurement of the artery for grafting is included in the description of the work for 33533-33536 and should not be reported as a separate service or co-surgery, except when an upper extremity artery (eg, radial artery) is procured. To report harvesting of an upper extremity artery, use 35600 in addition to the bypass procedure. To report harvesting of an upper extremity vein, use 35500 in addition to the bypass procedure. To report harvesting of a femoropopliteal vein segment, report 35572 in addition to the bypass procedure. When surgical assistant performs arterial and/or venous graft procurement, add modifier 80 to 35517-33523, 33533-33536, as appropriate. For percutaneous ventricular assist device insertion, removal, repositioning, see 33990-33993.

Arterial Grafting for Coronary Artery Bypass

The following code…

To report combined…

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Procurement of the saphenous vein graft is included in the description of the work for 33517-33523 and should not be reported as a separate service or co-surgery. Procurement of the artery for grafting is included in the description of the work for 33533-33536 and should not be reported as a separate service or co-surgery, except when an upper extremity artery (eg, radial artery) is procured. To report harvesting of an upper extremity artery, use 35600 in addition to the bypass procedure. To report harvesting of an upper extremity vein, use 35500 in addition to the bypass procedure. To report harvesting of a femoropopliteal vein segment, report 35572 in addition to the bypass procedure. When surgical assistant performs arterial and/or venous graft procurement, add modifier 80 to 33517-33523, 33533-33536, as appropriate. For percutaneous ventricular assist device insertion, removal, repositioning, see 33990-33993.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33990 Tracking Number HH1 Original Specialty Recommended RVU: **12.00**
Presented Recommended RVU: **12.00**
Global Period: XXX RUC Recommended RVU: **8.15**

CPT Descriptor: Insertion of ventricular assist device, percutaneous including radiological supervision and interpretation; arterial access only

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68 year-old obese male with oxygen dependent obstructive pulmonary disease, diabetes mellitus, hypertension, and dyslipidemia presents with signs of acute systolic heart failure and unstable angina. Cardiac catheterization demonstrates a left ventricular ejection fraction of 25%, down from 60% one year ago. Coronary angiography shows a 30 mm long, heavily calcified 90% stenosis in the left anterior descending artery (LAD), a 30 mm long, heavily calcified 80% stenosis in the left circumflex artery (LCX), and a 50% focal right coronary stenosis. Cardiac surgery consult deems him too high risk for surgical revascularization due to severe pulmonary disease and comorbidities. Rotational atherectomy of the calcified LAD and LCX lesions is planned with placement of arterial pVAD due to the severely impaired left ventricular function and large myocardial territories at risk.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 94%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, ECG, echocardiogram, laboratory and diagnostic tests are reviewed, including relevant coronary angiograms, CT angiograms, and ilio-femoral contrast angiograms. This includes review of the CT and/or angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. The potential access sites are prepped. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is

loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

A peripheral IV access site is obtained. If general anesthesia is induced, the patient is intubated and connected to a mechanical ventilator. If conscious sedation is used, oxygen saturation monitoring is secured. A radial artery catheter may be inserted for hemodynamic monitoring. The heart rate and rhythm are monitored throughout the procedure. Transesophageal echocardiography (TEE) or transthoracic echocardiography (TTE) may be used by an echocardiographer to confirm ejection fraction and to rule out ventricular thrombus. (If performed, TTE/TEE is separately reported). The patient is prepped and draped.

Femoral arterial access for the reference pigtail catheter is obtained by needle puncture (modified Seldinger technique). After arterial access is obtained, serial dilation of the femoral artery is performed up to 11Fr. A 13 French peel-away sheath or a 14 F indwelling sheath is then positioned in the femoral artery over a standard guide wire. (Note: the device is available in both 13F and 21F versions). A catheter is then advanced over a wire from the femoral artery up to the ascending aorta and then used to cross the aortic valve into the left ventricle. The standard guide wire is exchanged out through the catheter for the transcatheter pVAD guidewire, which is then positioned in the ventricle toward the apex. The catheter is then withdrawn over the wire leaving the wire alone in the ventricle. This typically generates significant ventricular ectopy and repositioning of the wire. Using fluoroscopic guidance, the pVAD device is backloaded on to the guidewire and then advanced over the wire, into the aortoiliac system, around the aortic arch, through the aortic valve and into the ventricle. The wire is removed. Under fluoroscopic guidance the pVAD catheter is positioned so that the inflow of the cannula is properly positioned below the aortic valve. The pVAD transcatheter/transvalvular catheter is then activated to counteract the passive flow through the catheter from the aorta. In this manner, the pump is in a transvalvular position with uptake placed in the ventricle and arterial delivery into the aorta. The other end of the pVAD catheter exits through the arterial access site, and is fixed externally to prevent untoward inward migration (too much catheter inside the heart). The external end of the device is connected to the control console and the pump is adjusted as needed to optimize its output.

During the interventional procedure, the transcatheter/transvalvular assist device is adjusted as necessary to achieve an optimal performance level in order to maintain systolic pressure during long inflations of the coronaries and to provide unloading of the ventricle during the entire procedure.

If device removal is appropriate at conclusion of case, weaning of the pump is gradually performed. The patient's temperature, hematocrit, level of oxygenation and electrolytes are normalized as necessary. Once the transcatheter device is set at a low, or a neutral setting (no forward flow), the pump is withdrawn to the iliac artery and turned off. Once the ACT is reduced to <150 seconds, the pump is withdrawn through the sheath and removed. Arterial hemostasis is achieved with prolonged manual pressure or via an arterial closure system. The patient has vital signs recorded every hour until release to the step down unit with checks of the groin by nursing every hour for the next four hours then every two hours as directed.

Description of Post-Service Work: The physician confirms the hemodynamics upon arrival to the recovery area. Post-op orders are written. The family and referring physician are apprised of the procedure outcome. The results of the procedure are reviewed with the patient after sedation wears off. Intra-procedural images are reviewed, interpreted and archived. The patient's fluoroscopic exposure time and contrast administration volume are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary and signed. A formal report is sent to the PCP and referring providers.

Pre-Service intensity/complexity	4.71	4.86
Intra-Service intensity/complexity	4.86	4.86
Post-Service intensity/complexity	4.57	4.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Percutaneous ventricular assist devices (PVADs) are used for certain patients as aides to recovery following percutaneous coronary interventions or in patients with cardiogenic shock as a bridge to other therapies. This technology is distinct from

the more commonly known ventricular assist devices that are implanted by surgeons. Devices are placed and removed during a single hospital stay.

This service has developed in recent years and was granted Category III codes in 2006. At the February meeting of the CPT Editorial Panel, four new Category I codes were created – 33990 and 33991 describe implantation of the device, 33992 describes the removal of the device if not placed at the same time, and 33993 covers a repositioning of the device under fluoroscopy.

The ACC and SCAI completed a survey of the PVAD codes. Because of the relatively low utilization of the services, surveyees were drawn from a list of centers that had been identifying as providing the service buttressed by a random sample of interventional cardiologists from the ACC member database. Research Subcommittee approved this request.

An expert panel of ACC and SCAI physicians reviewed the data from the survey. Although the response rate was relatively low, the panel believed the survey was valid. The survey median RVU was 15 – while the expert panel agreed that the service was intense, they did not believe that it justified 15 RVUs. They believed that the 25th percentile RVU of 12 RVUs was more appropriate. The key reference service of 93580 has a much higher of RVU of 17.97 but a much longer total time – 210 total minutes in comparison to 145 minutes of total time for the surveyed code. The comparison of intensity and complexity showed that survey respondees considered both services to be very complex but the urgency of medical decision making to be quite a bit higher for the surveyed 33990 code.

The panel also reviewed the times reported by the surveyees and thought they represented the time required to complete the service. Since the service is an XXX code, there is no pre-service package associated with the service. The panel used the times associated with pre-service package 2B (difficult patient, straightforward procedure) to determine the appropriate level of time to associate with positioning and scrub, dress, and wait. The remainder of the pre-service time from the survey was assigned to the evaluation time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Percutaneous ventricular assist devices may be used in conjunction with percutaneous coronary interventions including atheretomy and stent but also may be used alone. In cases in which the PCI and the PVAD are used together, the less valuable procedure would be reduced by 50% in accordance with the multiple procedure edits. It is only used in a small minority of PCI cases.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0048T

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 73%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, ECG, echocardiogram, laboratory and diagnostic tests are reviewed, including relevant coronary angiograms, CT angiograms, and ilio-femoral contrast angiograms. This includes review of the CT and/or angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. The potential venous and arterial access sites are prepped. Instruments and supplies for the procedure are pulled, including trans-septal puncture needle and equipment if necessary. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The injection manifold and

hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

Description of Intra-Service Work: A peripheral IV access site is obtained. If general anesthesia is induced, the patient is intubated and connected to a mechanical ventilator. If conscious sedation is used, oxygen saturation monitoring is secured. Pulmonary and radial artery catheters may be inserted for hemodynamic monitoring. The heart rate and rhythm are monitored throughout the procedure. Transesophageal echocardiography (TEE) or transthoracic echocardiography (TTE) may be used by an echocardiographer to confirm ejection fraction and to rule out left atrial thrombus (if performed, TEE is separately reported). The patient is prepped and draped.

The femoral artery and femoral vein are accessed percutaneously or by cutdown. An appropriate catheter is inserted over a wire through the venous sheath into the venous system under fluoroscopic guidance up to the superior vena cava. The wire is removed. A rigid transeptal puncture needle is carefully advanced through the catheter stopping just short of the end of the catheter. The needle-catheter unit is flushed and attached to a second pressure manifold and then withdrawn to the level of the fossa ovalis in the interatrial septum under fluoroscopic guidance. The imaging system is rotated in both the anterior and lateral positions to confirm proper positioning with respect to the arterial catheter positioned just above the aortic valve. The needle-catheter unit is then advanced several millimeters while observing the pressure waveform. The transeptal puncture is achieved. Left atrial position is confirmed by pressure waveform analysis, oxygen saturation measurement, and contrast injection through the system. If the needle-catheter unit has not traversed the septum properly, complications are first excluded and then the device is repositioned and repeat attempt is performed until successful. The transseptal procedure typically requires more than one attempt to achieve success. The transseptal needle is removed, the catheter flushed, and a wire advanced through the catheter into the left atrium. The catheter is removed and an dilating catheter is advanced over the wire across the interatrial septum into the left atrium in order to dilate the septum. The venous access site is progressively dilated over a wire to allow placement of a large bore cannula. The large bore 21F venous pVAD cannula is flushed and then advanced over the wire into the left atrium under fluoroscopic guidance. The femoral artery is progressively dilated over the previously placed wire to allow placement of a large bore 16F pVAD arterial return catheter, which is advanced over the wire into the proximal iliac artery or distal aorta for arterial return. The pVAD cannulas are deaired and connected to the external pump. The pump is activated and proper flows are ensured. If flows are inadequate, suggesting malpositioning of the left atrial cannula, the cannula is repositioned under fluoroscopic guidance. During the interventional procedure, the pump is running at high performance level and thus maintains delivery of oxygenated blood to the body while the heart is compromised and unloads the heart during the entire procedure.

If device removal is appropriate at conclusion of case, weaning of the pump is gradually performed. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are normalized as necessary and the patient is weaned. The heart pump console is turned off. The left atrial catheter is withdrawn from the atrium, into the inferior vena cava, and once the ACT is reduced to <150 seconds the device is ultimately withdrawn from the femoral vein, under direct fluoroscopic or echocardiographic guidance. Prolonged manual compression is applied to the exit site to achieve hemostasis and a deep skin suture may also be applied to the area around the cannulation site to enhance hemostasis. The arterial catheter(s) is/are usually removed and arterial hemostasis is achieved with prolonged manual compression, with an arterial closure system, or by surgical closure. The patient has vital signs recorded every hour until release to the step down unit with checks of the groin by nursing every hour for the next four hours then every two hours as directed.

Description of Post-Service Work: The physician confirms the hemodynamics upon arrival to the recovery area. Post-op orders are written. The family and referring physician are apprised of the procedure outcome. The results of the procedure are reviewed with the patient after sedation wears off. Intra-procedural images are reviewed, interpreted and archived. The patient's fluoroscopic exposure time and contrast administration volume are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary and signed. A formal report is sent to the PCP and referring providers.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Percutaneous ventricular assist devices (PVADs) are used for certain patients as aides to recovery following percutaneous coronary interventions or in patients with cardiogenic shock as a bridge to other therapies. This technology is distinct from

the more commonly known ventricular assist devices that are implanted by surgeons. Devices are placed and removed during a single hospital stay.

This service has developed in recent years and was granted Category III codes in 2006. At the February meeting of the CPT Editorial Panel, four new Category I codes were created – 33990 and 339901 describe implantation of the device, 33992 describes the removal of the device if not placed at the same time, and 33993 covers a repositioning of the device under fluoroscopy.

The ACC and SCAI completed a survey of the PVAD codes. Because of the relatively low utilization of the services, surveyees were drawn from a list of centers that had been identifying as providing the service buttressed by a random sample of interventional cardiologists from the ACC member database. The response rate for this particular survey was lower than the others in the family reflecting the relatively rarity of the procedure. However, the panel thought that the data was valid and decided to proceed with recommendations.

The panel reviewed the 33991 both in comparison to other codes in the cardiovascular family as well as the 33990 code. They believed that the service, while intense, did not justify the median RVU of 18.38. Instead, the panel recommended the 25th percentile RVU of 16.63. This value demonstrates a much longer operating time than the 33990 code but a somewhat lower intensity. The key reference code of 93581 has a much higher work value but also reflects an intraservice time that is twice as long as the surveyed 33991 code. However, the survey respondents considered the surveyed code to be extraordinarily intense, in some cases universally reporting at the highest level of intensity.

The panel also reviewed the times reported by the surveyees and thought they represented the time required to complete the service. Since the service is an XXX code, there is no pre-service package associated with the service. The panel used the times associated with pre-service package 2B (difficult patient, straightforward procedure) to determine the appropriate level of time to associate with positioning and scrub, dress, and wait. The remainder of the pre-service time from the survey was assigned to the evaluation time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Percutaneous ventricular assist devices may be used in conjunction with percutaneous coronary interventions including atheretomy and stent but also may be used alone. In cases in which the PCI and the PVAD are used together, the less valuable procedure would be reduced by 50% in accordance with the multiple procedure edits. It is only used in a small minority of PCI cases.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Code:33992 Tracking Number HH3 Original Specialty Recommended RVU: **6.44**
Presented Recommended RVU: **6.44**
Global Period: XXX RUC Recommended RVU: **4.00**

CPT Descriptor: Removal of percutaneous ventricular assist device at separate and distinct session from insertion

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68 year old man presents with a large anterior STEMI and progresses rapidly to cardiogenic shock. An arterial-venous pVAD is implanted emergently. Despite successful stent placement to the occluded proximal left anterior descending artery, he manifests persistent hypotension, pulmonary edema, and EF 25%. The pVAD is maintained in place for prolonged hemodynamic support post procedure. Two days later, he has clinically improved with ejection fraction up to 35%. He remains stable during weaning of the pVAD and the device is now removed successfully.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 91%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient is weaned from the pVAD as the native heart improves function. In most cases, patients are no longer in the cath lab procedure room but in a critical care setting when this device removal is contemplated. Typically, patients will be brought back to the catheterization laboratory or surgical suite for device removal. The patient's temperature, hematocrit, pH, level of oxygenation and electrolytes are normalized as necessary and the patient is weaned.

Description of Intra-Service Work: For arterial approach only devices, the device flow is reduced to minimal flow (or neutral setting), and withdrawn from the ventricle into the aorta, under fluoroscopic or echocardiographic guidance. Once it approaches the iliac artery it is turned off and with the ACT <150 seconds the device is removed. The arterial catheter(s) is/are removed and arterial hemostasis is achieved with prolonged manual compression, with an arterial closure system, or by surgical closure. The patient has vital signs recorded every hour until release to the step down unit with checks of the groin by nursing every hour for the next four hours then every two hours as directed.

For arterial-venous approach devices, the heart pump console is turned off. The left atrial catheter is withdrawn from the left atrium, across the right atrium, into the inferior vena cava and, once the ACT is reduced to <150 seconds, ultimately withdrawn from the femoral vein under direct fluoroscopic or echocardiographic guidance. Prolonged manual compression is applied to the exit site to achieve hemostasis and a deep skin suture may also be applied to the area around the cannulation site to enhance hemostasis. The arterial catheter(s) is/are removed and manual pressure applied or the artery is closed surgically with prolonged manual compression, with an arterial closure system, or by surgical closure. The

patient has vital signs recorded every hour until release to the step down unit with checks of the groin by nursing every hour for the next four hours then every two hours as directed.

Description of Post-Service Work: During the immediate post-procedure period, the physician evaluates and manages the patient's hemodynamics and bleeding in order to ascertain stability post-device removal, as this period is vital in terms of confirming that removal was clinically appropriate. In addition, failure to achieve adequate hemostasis must be addressed urgently. If there is a clinically apparent decrement in cardiac function, the physician must decide whether replacement of the support device or alternate therapies are necessary, including inotrope/medical therapies as appropriate. Because the typical patient is not stable, multiple adjustments of inotropic/vasoactive agents and volume status are determined minute to minute. In addition, the physician talks to family, nursing and other staff, talks to and coordinates care with other physicians, writes orders, writes a procedure note, and discusses outcome with patient and family during this time.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Percutaneous ventricular assist devices (PVADs) are used for certain patients as aides to recovery following percutaneous coronary interventions or in patients with cardiogenic shock as a bridge to other therapies. This technology is distinct from

the more commonly known ventricular assist devices that are implanted by surgeons. Devices are placed and removed during a single hospital stay.

This service has developed in recent years and was granted Category III codes in 2006. At the February meeting of the CPT Editorial Panel, four new Category I codes were created – 33990 and 33991 describe implantation of the device, 33992 describes the removal of the device if not placed at the same time, and 33993 covers a repositioning of the device under fluoroscopy.

The ACC and SCAI completed a survey of the PVAD codes. Because of the relatively low utilization of the services, surveyees were drawn from a list of centers that had been identifying as providing the service buttressed by a random sample of interventional cardiologists from the ACC member database. An ACC/SCAI expert panel reviewed the survey data and thought the data was a valid starting point for making a recommendation.

The surveyed 33992 code covers the removal of the device at a separate session from the initial placement. In some cases, the device is removed on the same day as the initial implantation – in those cases, this code would not be reported. However, in other cases, the device remains in the patient for more than a single day or recovery. Removal would then be reported using this code.

The work values from the survey were compared to the reference service of 33973 and other services within the family. The surveyees indicated that the service was less intense than either than the initial placement or the repositioning of the device, reflecting less technical skill required and clinical risk to remove the device than to place it properly. The panel did not feel that the median work value of 9.38 was supported but did feel that the 25th percentile work value of 6.44 was appropriate. While the key comparison code has a much longer time, the panel noted that it was value in the early days of the RUC using a different instrument, and times from that era have tended to be longer. The panel also noted that the long total time is more reflective of the lengthy post time associated with the reference code than the differences in the intraservice time in the procedures.

The panel also reviewed the times reported by the surveyees and thought they represented the time required to complete the service. Since the service is an XXX code, there is no pre-service package associated with the service. The panel used the times associated with pre-service package 2B (difficult patient, straightforward procedure) to determine the appropriate level of time to associate with positioning and scrub, dress, and wait. The remainder of the pre-service time from the survey was assigned to the evaluation time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Previously reported with 0050T, which has been deleted as part of this application

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. based on expert opinion

Specialty cardiology Frequency 3000 Percentage 100.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,500
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. based on expert opinion

Specialty cardiology Frequency 1500 Percentage 100.00 %

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33240

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:33993 Tracking Number HH4 Original Specialty Recommended RVU: **6.00**
Presented Recommended RVU: **6.00**
Global Period: XXX RUC Recommended RVU: **4.17**

CPT Descriptor: Repositioning of percutaneous ventricular assist device with imaging guidance at separate and distinct session from insertion

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75 year old man presents with a large anterior STEMI and progresses rapidly to cardiogenic shock. An arterial pVAD is implanted emergently. Despite successful stent placement to the occluded proximal left anterior descending artery, he manifests persistent hypotension, pulmonary edema, and EF 25%. The pVAD is maintained in place for prolonged hemodynamic support post procedure. Upon transfer to the coronary care unit, the patient's oxygen saturation and blood pressure drop, and an alarm sounds on the device console. Vasopressors are started to augment blood pressure. Echocardiogram confirms the pVAD has come back from the desired left ventricular position to a position now completely in the ascending aorta, indicating the need to reposition the device. The patient is brought back to the catheterization laboratory, where the device is repositioned into the left ventricular under fluoroscopic guidance.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 69%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: When device position malfunction occurs, the patient is returned to the catheterization lab or hybrid lab for urgent fluoroscopic and/or echocardiographic visualization. Such patients are typically continuing on support due to ongoing hemodynamic instability so the patient is connected to the physiologic monitoring available there. The access site(s) is/are usually prepared as if for another sterile procedure, and the patient draped. Repositioning is performed under fluoroscopic and/or echocardiographic guidance.

Description of Intra-Service Work: For the venous only approach, the devices are visualized and repositioned as necessary with respect to the right atrium and pulmonary artery as needed. For the arterial approach devices, the pump is visualized and the device is repositioned with respect to the aortic valve as needed. For the combined arterial and venous devices, the venous and arterial cannulas are visualized and repositioned as necessary with respect to the right atrium and aortoiliac system. For the combined arterial and venous devices with transeptal access, the venous and arterial cannulas are visualized and repositioned as necessary with respect to the right and left atria and the aortoiliac system. Once back in position, the pump is restarted to maintain adequate cardiac support.

Description of Post-Service Work: During the immediate post-repositioning period, the physician evaluates and manages the patient's hemodynamics in order to ascertain stability post-device repositioning, as this period is vital in terms of

confirming that repositioning was clinically successful. This may include evaluation of post-procedure echocardiogram performed at the bedside, or analysis of cardiac output or other hemodynamic indices. Because the typical patient is not stable, multiple adjustments of inotropic/vasoactive agents and volume status are determined minute to minute, as well as more minor repositioning of the device. The physician also works with the rest of the team, including other physicians and nurses, in order to increase stability of the device position externally, so that device movement is minimized. In addition, the physician talks to family, nursing and other staff, talks to and coordinates care with other physicians, writes orders, writes a procedure note, and discusses outcome with patient and family during this time.

Post-Service intensity/complexity	3.50	3.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Percutaneous ventricular assist devices (PVADs) are used for certain patients as aides to recovery following percutaneous coronary interventions or in patients with cardiogenic shock as a bridge to other therapies. This technology is distinct from

the more commonly known ventricular assist devices that are implanted by surgeons. Devices are placed and removed during a single hospital stay.

This service has developed in recent years and was granted Category III codes in 2006. At the February meeting of the CPT Editorial Panel, four new Category I codes were created – 33990 and 33991 describe implantation of the device, 33992 describes the removal of the device if not placed at the same time, and 33993 covers a repositioning of the device under fluoroscopy.

The ACC and SCAI completed a survey of the PVAD codes. Because of the relatively low utilization of the services, surveyees were drawn from a list of centers that had been identifying as providing the service buttressed by a random sample of interventional cardiologists from the ACC member database.

An expert panel of ACC and SCAI physicians reviewed the data from the survey. While the service was considered intense, the panel did not believe that the median work value of 8 would allow for an appropriate rank order with other services within the family based on earlier recommendations. The panel and the surveyees seemed to indicate that the intensity for the repositioning of the device was comparable to the initial placement of the device, reflecting the skilled work required to place the device in the correct position within the vessels. As in the 33992 removal code, the key reference service of 33973 included a great deal more time than the surveyed 33993 code. However, the panel again noted that 33973 includes a significant post procedure time and that it was valued in the early days of the RUC using a different instrument that appeared to have resulted in generally longer times. In comparing the service to the intensity of the other codes in the family, the panel thought that the service fit properly within the family.

The panel also reviewed the times reported by the surveyees and thought they represented the time required to complete the service. Since the service is an XXX code, there is no pre-service package associated with the service. The panel used the times associated with pre-service package 2B (difficult patient, straightforward procedure) to determine the appropriate level of time to associate with positioning and scrub, dress, and wait. The remainder of the pre-service time from the survey was assigned to the evaluation time.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More

April 2012

Cervicocerebal Angiography

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup. In January 2012, the RUC requested that new guidelines and 8 codes to bundle selective catheter placement with radiological supervision and interpretation, including angiography, be established. The specialty societies report that non-invasive vascular imaging has replaced diagnostic angiography as a screening test. The use of routine noninvasive vascular imaging for diagnosis means that the smaller patient population undergoing catheter cerebral angiography are inherently a more complex patient population. These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology.

36221 *Non-selective catheter placement, thoracic aorta, with angiography of the extracranial carotid, vertebral, and/or intracranial vessels, unilateral or bilateral, and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=48 minutes, intra-service time=30 minutes and post-service time=40 minutes. The RUC agreed that the pre-service time package 2B(Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)), is appropriate. There is also additional pre-service time that has been established in the renal angiography codes, for positioning the equipment around the patient, as well as additional time in the evaluation unique to these patients, to conduct a neurological evaluation. The same neurological evaluation is included in the post-service period to ensure that there is no change in deficits, because a stroke continues to be a significant risk factor in these procedures. There is also additional time in the post-service period for review and interpretation of the imaging sequences. The RUC compared 36221 to the key reference service 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU=5.35) and determined that the two codes have similar total time at 118 and 116, respectively. 36221 has slightly higher intensity than 36251, however the additional time for 36251 is in the intra-service period at 45 minutes, which accounts for the higher RVU. The RUC agreed with the specialty societies that in order to maintain rank order and magnitude of estimation a direct crosswalk to the two component codes being bundled, CPT codes 36200 *Introduction of catheter, aorta* (work RVU=3.02) and 75650 *Angiography, cervicocerebral, catheter, including vessel origin, radiological supervision and interpretation* (work RVU=1.49), is justified.
The RUC recommends a work RVU of 4.51 for CPT code 36221, a direct crosswalk to CPT codes 36200 and 75650.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

36222 *Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=48 minutes, intra-service time=40 minutes and post-service time=40 minutes. The RUC agreed that the pre-service time package 2B(Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)), is appropriate. There is also additional pre-service time that has been established in the renal angiography codes, for positioning the equipment around the patient, as well as additional time in the evaluation unique to these patients, to conduct a neurological evaluation. The same neurological evaluation is conducted in the post-service period to ensure that there is no change in deficits, because a significant risk factor in these procedures continues to be stroke. There is also additional time in the post-service period for review and interpretation of the imaging sequences. The RUC agreed with the specialties that the median survey RVU of 6.00 is an accurate measure of the physician work involved in this service. The RUC compared 36222 to the key reference service 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU=5.35) and determined that 36222 has more total time at 128 and 116, respectively, and significantly higher level of intensity to perform. These factors account for the higher RVU. **The RUC recommends a work RVU of 6.00 for CPT code 36222.**

36223 *Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=48 minutes, intra-service time=45 minutes and post-service time=40 minutes. The RUC agreed that the pre-service time package 2B(Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)), is appropriate. There is also additional pre-service time that has been established in the renal angiography codes, for positioning the equipment around the patient, as well as additional time in the evaluation unique to these patients, to conduct a neurological evaluation.. The same neurological evaluation is conducted in the post-service period to ensure that there is no change in deficits, because a significant risk factor in these procedures continues to be stroke. There is also additional time in the post-service period for review and interpretation of the imaging sequences. The RUC agreed with the specialties that the physician work of 36223 is analogous to the work of 36225. Both services have identical survey median times and thus should be valued identically. Therefore, the RUC recommends a work RVU of 6.50, the survey median for 36223. The RUC compared 36223 to the key reference service CPT code 36253 *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

including pressure gradient measurements when performed, and flush aortogram when performed; unilateral (work RVU=7.55) and determined that the two codes have similar total time at 133 and 131 and similar levels of intensity to perform. The additional time for 36253 is in the intra-service period at 60 minutes (as compared to 45 minutes for 36223), which accounts for the higher RVU. **The RUC recommends a work RVU of 6.50 for CPT code 36223.**

36224 *Selective catheter placement, internal carotid artery, unilateral, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=48 minutes, intra-service time=50 minutes and post-service time=40 minutes. The RUC agreed that the pre-service time package 2B(Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)), is appropriate. There is also additional pre-service time that has been established in the renal angiography codes, for positioning the equipment around the patient, as well as additional time in the evaluation unique to these patients, to conduct a neurological evaluation. The same neurological evaluation is conducted in the post-service period to ensure that there is no change in deficits, because a significant risk factor in these procedures continues to be stroke. There is also additional time in the post-service period for review and interpretation of the imaging sequences. The RUC agreed with the specialties that the survey median, 8.00 work RVUs, was too high for this procedure. The RUC compared 36224 to the key reference service CPT code 36253 *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU=7.55) and determined that the two codes have similar total time at 138 and 131 and that 36224 requires a slightly higher level of intensity to perform. The RUC agreed that these two services have similar physician work and should be valued identically. **The RUC recommends a work RVU of 7.55, a direct crosswalk to CPT code 36253, for CPT code 36224.**

36225 *Selective catheter placement, subclavian or innominate artery, unilateral, with angiography of the ipsilateral vertebral circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=48 minutes, intra-service time=45 minutes and post-service time=40 minutes. The RUC agreed that the pre-service time package 2B(Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)), is appropriate. There is also additional pre-service time that has been established in the renal angiography codes, for positioning the equipment around the patient, as well as additional time in the evaluation unique to these patients, to conduct a neurological evaluation. The same neurological evaluation is conducted in the post-service period to ensure that there is no change in deficits, because a significant risk factor in these procedures continues to be stroke. There is also additional time in the post-service period for review and interpretation of the imaging sequences. The RUC agreed with the specialties that the physician work of 36225 is analogous to the work of 36223. Both services have identical survey median times and thus should be valued identically. The RUC agreed with the specialties that the median survey RVU of 6.50 is an

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

accurate measure of the physician work involved in this service. The RUC compared 36225 to the key reference service CPT code 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU=5.35) and determined that the codes have identical intra-service times at 45 minutes. 36225 has more total time at 133 and 116, respectively, and a significantly higher level of intensity to perform. These factors account for the higher RVU. **The RUC recommends a work RVU of 6.50 for CPT code 36225.**

36226 *Selective catheter placement, vertebral artery, unilateral, with angiography of the ipsilateral vertebral circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=48 minutes, intra-service time=50 minutes and post-service time=40 minutes. The RUC agreed that the pre-service time package 2B(Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)), is appropriate. There is also additional pre-service time that has been established in the renal angiography codes, for positioning the equipment around the patient, as well as additional time in the evaluation unique to these patients, to conduct a neurological evaluation. The same neurological evaluation is conducted in the post-service period to ensure that there is no change in deficits, because a significant risk factor in these procedures continues to be stroke. There is also additional time in the post-service period for review and interpretation of the imaging sequences. The RUC agreed with the specialties that the survey median, 8.00 work RVUs, was too high for this procedure. The RUC compared 36226 to the key reference service CPT code 36253 *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU=7.55) and determined that the two codes have similar total time at 138 and 131 and a 36226 has a higher level of intensity to perform. The RUC agreed that these two services have similar physician work and should be valued identically. **The RUC recommends a work RVU of 7.55, a direct crosswalk to CPT code 36253, for CPT code 36226.**

36227 *Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)*
The RUC reviewed the survey results from 55 multi-specialty respondents and agreed with the specialty societies that the following physician times accurately reflect the physician work involved in this service: pre-service time=0 minutes, intra-service time=15 minutes and post-service time=0 minutes. The specialty societies recommended 10 minutes of post-service time for review and interpretation of the imaging sequences, however the RUC found that post-service time is not appropriate for ZZZ codes and the additional review and interpretation was accounted for in the base codes, as well as the intra-service time as described. The RUC discussed the estimated survey work values and agreed that the respondents overestimated the physician work involved in the service. The RUC agreed with the specialty societies that in order to maintain rank order and magnitude of estimation a direct crosswalk to the two component codes being bundled CPT codes 36218 *Selective catheter placement,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

arterial system; additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate) (work RVU=1.01) and 75660 *Angiography, external carotid, unilateral, selective, radiological supervision and interpretation* (work RVU=1.31), is justified. **The RUC recommends a work RVU of 2.32 for CPT code 36227, a direct crosswalk to CPT codes 36218 and 75660.**

36228 *Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure)*
The RUC reviewed the survey results from 55 multi-specialty respondents and recommends to a work RVU of 4.25, the survey's 25th percentile. The RUC agreed with the specialty societies that there is 30 minutes intra-service time for this ZZZ global service. The RUC discussed whether or not post-service time was appropriate for this service and agreed that post-service time is not appropriate for ZZZ codes and the additional review and interpretation was accounted for in the base codes, as well as intra-service time as described. The RUC compared 36228 to the key reference service CPT code 61642 *Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)* (work RVU=8.66) and determined that 61642 has significantly more intra-service time at 60 minutes accounting for the higher RVU. The RUC also compared 36228 to CPT code 34826 *Placement of proximal or distal extension prosthesis for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, or dissection; each additional vessel (List separately in addition to code for primary procedure)* (work RVU=4.12) and noted that the codes are both ZZZ global service and have identical intraservice time, 30 minutes. **The RUC recommends a work RVU of 4.25 for CPT code 36228.**

Work Neutrality
The RUC's recommendations for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Diagnostic Studies of Cervicocerebral Arteries. Codes 36221-36228 describe non-selective and selective arterial catheter placement and diagnostic imaging of the aortic arch, carotid, and vertebral arteries. Codes 36221-36226 include the work of accessing the vessel, placement of catheter(s), contrast injection(s), fluoroscopy, radiological supervision and interpretation, and closure of the arteriotomy by pressure, or application of an arterial closure device. Codes 36221-36228 describe arterial contrast injections with arterial, capillary, and venous phase imaging, when performed. Code 36227 is an add-on code to report unilateral selective arterial catheter placement and diagnostic imaging of the ipsilateral external carotid circulation and includes all the work of accessing the additional vessel, placement of catheter(s), contrast injection(s), fluoroscopy, radiological supervision and interpretation. Code 36227 is reported in conjunction with 36222, 36223, or 36224. Code 36228 is an add-on code to report unilateral selective arterial catheter placement and diagnostic imaging of the initial and each additional intracranial branch of the internal carotid or vertebral arteries. Code 36228 is reported in conjunction with 36224 or 36226. This includes any additional second or third order catheter selective placement in the same primary branch of the internal carotid, vertebral, or basilar artery and includes all the work of accessing the additional vessel, placement of catheter(s), contrast injection(s), fluoroscopy, radiological supervision and interpretation. It is not reported more than twice per side regardless of the number of additional branches selectively catheterized. Codes 36221-36226 are built on progressive hierarchies with more intensive services inclusive of less intensive services. The code inclusive of all of the services provided for that vessel should be reported (ie, use the code inclusive of the most intensive services provided). Only one code in the range 36222-36224 may be reported for each ipsilateral carotid territory. Only one code in the range 36225-36226 may be reported for each ipsilateral vertebral territory. Code 36221 is reported for non-selective arterial catheter placement in the thoracic aorta and diagnostic imaging of the aortic arch and great vessel origins. Codes 36222-X8 are reported for unilateral artery catheterization. Do not report code 36221 in conjunction with 36222-36226 as these selective codes include the work of 36221 when performed. Do not report 36222, 36223, or 36224 together for ipsilateral angiography. Instead, select the code that represents the most comprehensive service using the following hierarchy of complexity (listed in descending order of complexity): 36224>36223>36222. Do not report 36225 and 36226 together for ipsilateral angiography. Select the code that represents the more comprehensive service using the following hierarchy of complexity (listed in descending order of complexity): 36226>36225.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

When bilateral carotid and/or vertebral arterial catheterization and imaging is performed, add modifier 50 to codes 36222-36228 if the same procedure is performed on both sides. For example, bilateral extracranial carotid angiography with selective catheterization of each common carotid artery would be reported with code 36222 and modifier 50. However, when different territory(ies) is/are studied in the same session on both sides of the body, modifiers may be required to report the imaging performed. Use modifier 59 to denote that different carotid and/or vertebral arteries are being studied. For example, selective right internal carotid artery catheterization accompanied by right extracranial and intracranial carotid angiography is followed by selective left common carotid artery catheterization with left extracranial carotid angiography, use 36224 to report the right side and 36222-59 to report the left side.

Diagnostic angiography of the cervicocerebral vessels may be followed by an interventional procedure at the same session. Interventional procedures may be separately reportable using standard coding conventions.

Do not report 75774 as part of diagnostic angiography of the extracranial and intracranial cervicocerebral vessels. It may be appropriate to report 75774 for diagnostic angiography of upper extremities and other vascular beds performed in the same session.

Report 76376 or 76377 for 3D rendering when performed in conjunction with 36221-36228.

Report 76937 for ultrasound guidance for vascular access, when performed in conjunction with 36221-36228.

36200 Introduction of catheter, aorta

(For non-selective angiography of the extracranial carotid and/or cerebral vessels and cervicocerebral arch, when performed, see 36221)

36215 Selective catheter placement, arterial system; each first order thoracic or brachiocephalic branch, within a vascular family

(For catheter placement for coronary angiography, see 93454-93461)

36216 *initial second order thoracic or brachiocephalic branch, within a vascular family*

36217 *initial third order or more selective thoracic or brachiocephalic branch, within a vascular family*

36218 *additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate)*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

(Use 36218 in conjunction with 32616 or 36217)

(For angiography, see 36147, 36222-36228, 75600-75774, 75791)

(For angioplasty, see ~~37228-37235,~~ 35471, 35472, 35475)

(For transcatheter therapies, see 37200-37208, 61624, 61626)

(When coronary artery, arterial conduit (eg, internal mammary, inferior epigastric or free radical artery) or venous bypass graft angiography is performed in conjunction with cardiac catheterization, see the appropriate cardiac catheterization, injection procedure, and imaging supervision code(s) (93455, 93457, ~~9345~~93459~~-~~, 93461, ~~93503-9353~~93530-93533, ~~93563-9356~~93564) in the~~-~~ **Medicine** section ~~of the CPT codebook. When coronary artery, arterial coronary conduit or venous bypass graft angiography is performed without concomitant left heart cardiac catheterization, see 93454-93457, 93563, 93564~~. When internal mammary artery angiography only is performed without a concomitant ~~left heart~~ cardiac catheterization, use 36216 or 36217 as appropriate.)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36221 Tracking Number S1 Original Specialty Recommended RVU: **4.51**
Presented Recommended RVU: **4.51**
Global Period: 000 RUC Recommended RVU: **4.51**

CPT Descriptor: Non-selective catheter placement, thoracic aorta, with angiography of the extracranial carotid, vertebral, and/or intracranial vessels, unilateral or bilateral, and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male with extensive smoking history and family history of aortic aneurysmal disease presents with a six-month history of intermittent symptoms of cerebral ischemia. Ultrasound demonstrates bilateral <30% internal carotid artery stenoses, but increased velocity is noted in the left common carotid artery. A diagnostic cervicocerebral arch arteriogram is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 91%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 75%

Description of Pre-Service Work:
* A targeted H&P is performed.
* The planned procedure is discussed with the patient/family and consent is obtained for the procedure and moderate sedation.
* In the procedure room, the patient's identity and the nature of the procedure are confirmed.
* The patient is placed supine on the procedure table, monitoring equipment is attached. The head is secured. Leads and IVs are positioned away from the imaging field and out of the way of the angiographic unit. Trial rotation of the angiographic equipment is performed to ensure adequate imaging and the ability to achieve steep obliquities without patient injury or EKG lead interference. The right groin is prepared and draped in usual sterile fashion.
* Conscious sedation is administered.

Description of Intra-Service Work:
* Right common femoral arterial access is obtained and an arterial sheath placed
* A wire is inserted and a pigtail catheter is advanced over the wire retrograde into the ascending aorta.
* Test injection of contrast is performed. After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the area of interest in multiple projections to evaluate the aortic arch, great vessel origins, and cervical carotid arteries.

* The wire is reinserted and the pigtail catheter is removed
* Contrast material is injected with imaging over the common femoral artery to insure that no vessel injury, dissection, pseudoaneurysm, or significant iatrogenic vasospasm has occurred.
* The sheath is removed.
* Closure of the arteriotomy by application of an arterial closure device.

Description of Post-Service Work:
* All imaging sequences are reviewed frame by frame. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.
* Appropriate care orders are entered in the electronic medical record.
* The procedure is documented in the chart.
* A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
* The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.

Pre-Service intensity/complexity	2.70	2.65
Intra-Service intensity/complexity	2.90	2.75
Post-Service intensity/complexity	2.80	2.70

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Post Time

Carotid and cerebral angiography are performed as a problem solving procedure in patients with complex atherosclerotic carotid and companion cerbrovascular disease, work-up of intra- and extracranial tumors, and vasculopathies. The number or main vessels, multitude of small caliber *named* branch vessels, clinically important potential collateral pathways, and additionally complex venous anatomy translate to a 3-6 fold increase in the the: number of necessary angiographic runs (each with 10-60 frames/second), intensity of cognitive interpretation, and physician effort and time. The multi-disciplinary expert panel realizes this significant effort and that it was not reflected in the responses of our survey respondents. We believe this is due to their lack of understanding of the post-service period as suggested by exactly similar response times for all 8 codes. We believe that 40 minutes of post service time more accurately reflects the additional work involved.

Survey Results

A multi-specialty survey of 55 respondents yielded a median wRVU of 5.00 and median intra-procedural time of 30 minutes. 84% of the survey respondents found the vignette to be typical. Maintenance of the current wRVU 4.51 is recommended for 36221 although the expert panel believes that noninvasive imaging is utilized for straightforward patients and now results in a change of the overall patient population undergoing catheter cerebral angiography who are inherently a more complex patient population.

Pre Time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. 91% of the survey respondents found CS to be typical in the facility setting. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure (including securing the head), and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary AP, oblique and lateral views involved with the complex nature of the intra- and extra- cranial vasculature. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

The key reference service chosen was 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (wRVU 5.35, intra- time of 45, total time 116).

This is similar to 36221 in the sense that they are both diagnostic angiographic procedures. The reference service involves shorter catheters and abdominal imaging in the AP projection as well as a selective first order vessel catheterization thus accounting for the additional 10 minutes in intra- time. 36221 involves longer catheters without additional selectivity, however, does involve a more complex clinical scenario with significant increased patient risk (stroke). Additionally the involved anatomy demonstrates more tortuosity and cardiac motion compared to the referenced code and more (numerical) vessels are evaluated in the surveyed code requiring a greater number of views and interpretive effort.

Given these similarities and differences, the two codes compare favorably and support our recommended wRVU 4.51 (current value). In addition, the recommendation for 36221 lines up nicely with several other codes. See below:

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36221	4.51	0.087	118	40	3	5	30	40
37191	4.71	0.1198	83	30	3	5	30	15
93452	4.75	0.1025	108	40	3	5	30	30
93454	4.79	0.1038	108	40	3	5	30	30
36251	5.35	0.085	116	33	3	5	45	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to attached budget neutrality table for information on previous reporting.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,600
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Plase refer to the attached budget neutrality table for information on previous reporting.

Specialty Vascular Surgery Frequency 1066 Percentage 41.00 %

Specialty Cardiology Frequency 468 Percentage 18.00 %

Specialty Radiology Frequency 442 Percentage 17.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36200

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36222 Tracking Number S2 Original Specialty Recommended RVU: **6.00**
Presented Recommended RVU: **6.00**
Global Period: 000 RUC Recommended RVU: **6.00**

CPT Descriptor: Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old male with a prior right carotid endarterectomy three years ago presents with ultrasound evidence for a >80% asymptomatic internal carotid artery restenosis. A diagnostic carotid arteriogram is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 89%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 82%

Description of Pre-Service Work:
• A targeted H&P is performed.
• The planned procedure is discussed with the patient/family and consent is obtained for the procedure and moderate sedation.
• In the procedure room, the patient's identity and the nature of the procedure are confirmed.
• The patient is placed supine on the procedure table and monitoring equipment is attached. The head is secured. Leads and IVs are positioned away from the field of interest and out of the way of the C-arm. The equipment is tested to assure attainability of desired obliquities. The right groin is prepared and draped in usual sterile fashion.
• Conscious sedation is administered.

Description of Intra-Service Work:

• Right common femoral arterial access is obtained and an arterial sheath placed
• A wire is inserted and a pigtail catheter is advanced over the wire retrograde into the ascending aorta. Test injection of contrast is performed.

• After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the area of interest in multiple projections to evaluate the aortic arch, great vessel origins, and cervical carotid arteries.
• A guidewire is placed into the indwelling diagnostic pigtail catheter. This catheter is removed over a wire.
• The guidewire and catheter combination are advanced selectively under realtime fluoroscopic guidance as well as road map imaging first into the innominate artery followed by the right common carotid artery. The guidewire is removed.
• A test injection of contrast is performed. After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the area of interest in the extracranial carotid territory, using multiple projections.
• The selective catheter is removed
• Contrast material is injected with imaging over the common femoral artery to insure that no vessel injury, dissection, pseudoaneurysm, or significant iatrogenic vasospasm has occurred.
• The sheath is removed.
• Closure of the arteriotomy by pressure or application of an arterial closure device, as appropriate

Description of Post-Service Work:
• All imaging sequences are reviewed frame by frame. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.
• Appropriate care orders are entered in the electronic medical record.
• The procedure is documented in the chart.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.

Pre-Service intensity/complexity	2.89	2.68
Intra-Service intensity/complexity	3.42	3.16
Post-Service intensity/complexity	2.83	2.78

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Post Time

Carotid and cerebral angiography are performed as a problem solving procedure in patients with complex atherosclerotic carotid and companion cerbrovascular disease, work-up of intra- and extracranial tumors, and vasculopathies. The number or main vessels, multitude of small caliber *named* branch vessels, clinically important potential collateral pathways, and additionally complex venous anatomy translate to a 3-6 fold increase in the the: number of necessary angiographic runs (each with 10-60 frames/second), intensity of cognitive interpretation, and physician effort and time. The multi-disciplinary expert panel realizes this significant effort and that it was not reflected in the responses of our survey respondents. We believe this is due to their lack of understanding of the post-service period as suggested by exactly similar response times for all 8 codes. We believe that 40 minutes of post service time more accurately reflects the additional work involved.

Survey Results

A multi-specialty survey of 55 respondents yielded a median wRVU of 6.00 and a median intra-procedural time of 40 minutes. 96% of the survey respondents found the vignette to be typical. The expert panel recommends the median surveyed wRVU of 6.00.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. 89% of the survey respondents found CS to be typical in the facility setting. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure (including securing the head), and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views involved with the complex nature of the intra- and extra- cranial vasculature. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

The key reference service chosen was 36251 Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral (wRVU 5.35, intra- time of 45, total time 116).

This is similar to 36236222 in the sense that they are both diagnostic angiographic procedures. The reference service involves shorter catheters and abdominal imaging as well as a selective first order vessel catheterization. 36236222 involves longer catheters in addition to a second order vessel catheterization. The aortic arch, braciocephalic artery, and common carotid artery are typically more tortuous requiring more work in the opinion of the multidisciplinary expert panel. Additionally there is increased stroke risk. Overall, the expert panel and the surveyed respondents (true?) found 36236222 to be of greater complexity than the key reference code. Therefore it is unclear why the median time value for the surveyed code was 5 minutes less than the key reference.

Despite these similarities and differences, the two codes compare reasonably. Although time comparisons are not exact, the expert panel believes that since 36236222 involves a more selective vessel catheterization and increased risk, the median wRVU 6.00 is supported and maintains rank order with a similar diagnostic angiographic code.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36236222	6.00	0.103	128	40	3	5	40	40
36251	5.35	0.085	116	33	3	5	45	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to attached budget neutrality table for information on previous reporting

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty NeuroSurgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
30,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Please refer to attached budget neutrality table for information on previous reporting

Specialty Radiology	Frequency 9600	Percentage 32.00 %
Specialty Cardiology	Frequency 7500	Percentage 25.00 %
Specialty NeuroSurgery	Frequency 3900	Percentage 13.00 %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36216

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36223 Tracking Number S3 Original Specialty Recommended RVU: **6.50**
Presented Recommended RVU: **6.50**
Global Period: 000 RUC Recommended RVU: **6.50**

CPT Descriptor: Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old female presents with complaints of left upper extremity numbness and weakness, symptoms of right cerebral TIA, and ultrasound documentation of right internal carotid artery 70% stenosis. A diagnostic cerebral arteriogram is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 89%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Description of Pre-Service Work:
• A targeted H&P is performed.
• The planned procedure is discussed with the patient/family and consent is obtained for the procedure and moderate sedation.
• In the procedure room, the patient's identity and the nature of the procedure are confirmed.
• The patient is placed supine on the procedure table and monitoring equipment is attached. The head is secured. Leads and IVs are positioned away from the field of interest and out of the way of the C-arm. The equipment is tested to assure attainability of desired obliquities. The right groin is prepared and draped in usual sterile fashion.
• Conscious sedation is administered

Description of Intra-Service Work:
• Right common femoral arterial access is obtained and an arterial sheath placed
• A wire is inserted and a pigtail catheter is advanced over the wire retrograde into the ascending aorta. Test injection of contrast is performed.
• After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the area of interest in multiple projections to evaluate the aortic arch, great vessel origins, and cervical carotid arteries.
• A guide wire is introduced through the pigtail catheter and the catheter is exchanged for a selective catheter.

• The selective catheter is guided into the right common carotid artery under real time fluoroscopic guidance and/or roadmap imaging guidance using either guide wire technique or contrast puff technique.
• A test injection of contrast is performed. After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the areas of interest. Multiple contrast injections are made and digital subtraction imaging of the cervical and intracranial carotid distributions is acquired in AP, oblique, and lateral projections. If necessary, oblique views are obtained to profile the carotid bifurcation and the intracranial pathology.
• The selective catheter is removed
• Contrast material is injected with imaging over the common femoral artery to insure that no vessel injury, dissection, pseudoaneurysm, or significant iatrogenic vasospasm has occurred.
• The sheath is removed.
• Closure of the arteriotomy by pressure or application of an arterial closure device, as appropriate

Description of Post-Service Work:
•All imaging sequences are reviewed frame by frame. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.
• Appropriate care orders are entered in the electronic medical record.
• The procedure is documented in the chart.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Post Time

Carotid and cerebral angiography are performed as a problem solving procedure in patients with complex atherosclerotic carotid and companion cerbrovascular disease, work-up of intra- and extracranial tumors, and vasculopathies. The number or main vessels, multitude of small caliber *named* branch vessels, clinically important potential collateral pathways, and additionally complex venous anatomy translate to a 3-6 fold increase in the the: number of necessary angiographic runs (each with 10-60 frames/second), intensity of cognitive interpretation, and physician effort and time. The multi-disciplinary expert panel realizes this significant effort and that it was not reflected in the responses of our survey respondents. We believe this is due to their lack of understanding of the post-service period as suggested by exactly similar response times for all 8 codes. We believe that 40 minutes of post service time more accurately reflects the additional work involved.

36223/36225 Preamble

The expert panel believes that there are significant similarities between 36236223 and 36236225; Both diagnostic angiographic codes involve second or third order cervico-cerebral vessel selection. Furthermore both codes involve extensive angiography. Multiple S&I codes are now bundled with the corresponding surgical codes to describe this work. Specifically in addition to arch aortography, this new code now also includes 2 DSA runs of the extra-cranial circulation in addition to 3 DSA runs of intra-cranial circulation. Based on the significant changes compared to current coding convention, survey respondents may not have completely understood the ramifications of code bundling. Survey respondents reported similar median intra-service times of 45 minutes for each code and the expert panel will recommend median value of 36225 (wRVU 6.50) for both codes.

Survey Results

A multi-specialty survey of 55 respondents yielded a median wRVU of 7.00 (25^{th} percentile, wRVU 6.00) and median intra-procedural time of 45 minutes. 95% of the survey respondents found the vignette to be typical. After considerable discussions considering magnitude estimation both within this family and other related families, the expert panel recommends for 36236223 the median surveyed for the similar code within this family 36236225: wRVU of 6.50.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. 89% of the survey respondents found CS to be typical in the facility setting. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure (including securing the head), and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views involved with the

complex nature of the intra- and extra- cranial vasculature. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

The key reference service chosen was 36253 Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral (wRVU 7.55, intra- time 60 minutes, total time 131).

This is similar to 36236223 in the sense that they are both diagnostic angiographic procedures. The reference service involves shorter catheters and abdominal imaging as well as a sub-selective second order (or higher) vessel catheterization. 36236223 involves longer catheters as well as second or third order sub-selective vessel catheterization. The aortic arch, braciocephalic artery, and common carotid artery are typically more tortuous requiring more work in the opinion of the multidisciplinary expert panel. Additionally there is increased stroke risk and significantly more imaging. Overall, the expert panel and the surveyed respondents (true?) found 36236223 to be of greater complexity than the key reference code. Therefore it is unclear why the median time value for the surveyed code was 15 minutes less than the key reference unless the respondents did not understand the full impact of significant code bundling.

Despite these similarities and differences, the two codes compare reasonably. Although time comparisons are not exact, the expert panel believes that since 36236223 involves a similar degree of selective vessel catheterization, increased imaging, and increased risk, the median 36225 wRVU 6.50 is supported and maintains rank order within this code family and similar diagnostic angiographic code families.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36236223	6.50	0.102	133	40	3	5	45	40
36253	7.55	0.101	131	33	3	5	60	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to attached budget neutrality table for information on previous reporting.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty Cardiology How often? Commonly

Specialty NeuroSurgery How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 40,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Please refer to attached budget neutrality table for information on previous reporting.

Specialty Radiology Frequency 12800 Percentage 32.00 %

Specialty Cardiology Frequency 10000 Percentage 25.00 %

Specialty NeuroSurgery Frequency 5200 Percentage 13.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36216

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36224 Tracking Number S4 Original Specialty Recommended RVU: **7.55**
Presented Recommended RVU: **7.55**
Global Period: 000 RUC Recommended RVU: **7.55**

CPT Descriptor: Selective catheter placement, internal carotid artery, unilateral, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male has sudden onset of severe headache with a brief period of unconsciousness. A CT scan shows diffuse subarachnoid hemorrhage in the basal cisterns suspicious for an anterior communicating artery aneurysm. A diagnostic cerebral arteriogram is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 88%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Description of Pre-Service Work:
• A targeted H&P is performed.
• The planned procedure is discussed with the patient/family and consent is obtained for the procedure and moderate sedation.
• In the procedure room, the patient's identity and the nature of the procedure are confirmed.
• The patient is placed supine on the procedure table, monitoring equipment is attached, and the femoral region is prepared and draped in usual sterile fashion.
• Conscious sedation is administered.

Description of Intra-Service Work:
• Right common femoral arterial access is obtained and an arterial sheath placed
• A wire is inserted and a pigtail catheter is advanced over the wire retrograde into the ascending aorta.
• Contrast is injected through the catheter with digital subtraction imaging over the area of interest in multiple projections to evaluate the aortic arch, great vessel origins, and cervical carotid arteries.
• A guide wire is introduced through the pigtail catheter and the catheter is exchanged for a selective catheter.
• The selective catheter is guided into the right common carotid artery under fluoroscopic guidance
• Multiple contrast material injections are made and digital imaging of the cervical carotid distribution is acquired in AP, oblique, and lateral projections.

• A steerable guidewire is inserted and the catheter is advanced into the internal carotid artery over the guidewire under fluoroscopic guidance.
• Multiple contrast material injections are made and digital imaging of the intracranial carotid distribution is acquired in AP, oblique, and lateral projections into the arterial, capillary and venous phases.
• Contrast material is injected with imaging over the common femoral artery to insure that no vessel injury, dissection, pseudoaneurysm, or significant iatrogenic vasospasm has occurred.
• The sheath is removed.
• Closure of the arteriotomy by pressure or application of an arterial closure device, as appropriate

Description of Post-Service Work:
• All imaging sequences are reviewed frame by frame. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.
• Appropriate care orders are entered in the electronic medical record.
• The procedure is documented in the chart.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA

angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Post Time

Carotid and cerebral angiography are performed as a problem solving procedure in patients with complex atherosclerotic carotid and companion cerbrovascular disease, work-up of intra- and extracranial tumors, and vasculopathies. The number or main vessels, multitude of small caliber *named* branch vessels, clinically important potential collateral pathways, and additionally complex venous anatomy translate to a 3-6 fold increase in the the: number of necessary angiographic runs (each with 10-60 frames/second), intensity of cognitive interpretation, and physician effort and time. The multi-disciplinary expert panel realizes this significant effort and that it was not reflected in the responses of our survey respondents. We believe this is due to their lack of understanding of the post-service period as suggested by exactly similar response times for all 8 codes. We believe that 40 minutes of post service time more accurately reflects the additional work involved.

36224/36226 Preamble

The expert panel believes that there are significant similarities between 36236224 and 36236226; Both diagnostic angiographic codes involve second or third order cervico-cerebral vessel selection. Furthermore both codes involve extensive angiography. Multiple S&I codes are now bundled with the corresponding surgical codes to describe this work. Specifically in addition to arch aortography, this new code now also includes at a minimum and AP and lateral projections of the extra-cranial circulation. The catheter is then navigated into a higher order vessel that is smaller in caliber and primarily supplies central nervous system structures. These factors significantly increase the risk of vessel injury and dissection and subsequently increase the risk of stroke. AP and lateral projections of the intracranial circulation are obtained and depending on the pathology multiple oblique projections at possibly higher frame rate acquisitions will also be obtained. These images also require immediate preliminary interpretation to confirm that the relevant imaging has been acquired. Based on the significant changes compared to current coding convention, survey respondents may not have completely understood the ramifications of code bundling. Survey respondents reported similar median intra-service times of 50 minutes for each code and the expert panel will recommend below median value of 36224 and 36226 (wRVU 7.55) for both codes.

Survey Results

A multi-specialty survey of 55 respondents yielded a median of 8.00 (25th percentile, wRVU 6.50) and median intra-procedural time was 50 minutes. 88% of the survey respondents found the vignette to be typical. After considerable discussions considering magnitude estimation both within this family and other related families, the expert panel recommends for 36236224 the below median surveyed for 36236224 and the similar code within this family 36236226: wRVU of 7.55.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. 88% of the survey respondents found CS to be typical in the facility setting. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure

(including securing the head), and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views involved with the complex nature of the intra- and extra- cranial vasculature. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

The key reference service chosen was 36253 Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral (wRVU 7.55, intra- time 60 minutes, total time 131).

This is similar to 36236224 in the sense that they are both diagnostic angiographic procedures. The reference service involves shorter catheters and abdominal imaging as well as a sub-selective second order (or higher) vessel catheterization. 36236224 involves longer catheters as well as second or third order sub-selective vessel catheterization. The aortic arch, braciocephalic artery, common and internal carotid arteries are typically more tortuous requiring more work in the opinion of the multidisciplinary expert panel. Additionally there is increased stroke risk secondary to the smaller caliber of vessels being catheterized whose primary outflow leads essentially solely into the central nervous system. There is also significantly more imaging secondary to the complexity of cerebrovascular disorders. Overall, the expert panel and the surveyed respondents found 36236224 to be of greater complexity than the key reference code. The intensity measures were all more complex for the surveyed code compared to the reference code. Given the level of intensity, it is unclear why the median time value for the surveyed code was 10 minutes less than the key reference unless the respondents did not understand the full impact of significant code bundling. Despite the 10 minutes intra-procedural time difference, the expert panel felt the intensity factor more than accounted for the time difference.

Despite these similarities and differences, the two codes compare reasonably. Although time comparisons are not exact, the expert panel believes that since 36236224 involves a similar degree of selective vessel catheterization, increased imaging, and increased risk. The expert panel believes wRVU 7.55 is supported and maintains rank order within this code family and similar diagnostic angiographic code families.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36236224	7.55	0.113	138	40	3	5	50	40
36253	7.55	0.101	131	33	3	5	60	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in

the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to attached budget neutrality table for information on previous reporting.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty NeuroSurgery How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
40,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Please refer to attached budget neutrality table for information on previous reporting.

Specialty Radiology Frequency 21600 Percentage 54.00 %

Specialty NeuroSurgery Frequency 7200 Percentage 18.00 %

Specialty Cardiology Frequency 4800 Percentage 12.00 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36225 Tracking Number S5 Original Specialty Recommended RVU: **6.50**
Presented Recommended RVU: **6.50**
Global Period: 000 RUC Recommended RVU: **6.50**

CPT Descriptor: Selective catheter placement, subclavian or innominate artery, unilateral, with angiography of the ipsilateral vertebral circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed.

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old man presents with a recent posterior circulation stroke. A diagnostic vertebral arteriogram is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 89%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Description of Pre-Service Work:
• A targeted H&P is performed.
• The planned procedure is discussed with the patient/family and consent is obtained for the procedure and moderate sedation.
• In the procedure room, the patient's identity and the nature of the procedure are confirmed.
• The patient is placed supine on the procedure table and monitoring equipment is attached. The head is secured. Leads and IVs are positioned away from the field of interest and out of the way of the C-arm. The equipment is tested to assure attainability of desired obliquities. The right groin is prepared and draped in usual sterile fashion.
• Conscious sedation is administered.

Description of Intra-Service Work:
• Right common femoral arterial access is obtained and an arterial sheath placed
• A wire is inserted and a pigtail catheter is advanced over the wire retrograde into the ascending aorta. Test injection of contrast is performed.
• After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the area of interest in multiple projections to evaluate the aortic arch, great vessel origins, and cervical carotid arteries.
• A guide wire is introduced through the pigtail catheter and the catheter is exchanged for a selective catheter.
• The selective catheter is guided into the right subclavian artery under real time fluoroscopic guidance and/or roadmap imaging guidance using either guide wire technique or contrast puff technique.

• A test injection of contrast is performed. After all tubing is checked to ensure that no air bubbles or blood products are present, contrast is injected through the catheter with digital subtraction imaging over the areas of interest. Multiple contrast injections are made and digital subtraction imaging of the cervical and intracranial vertebrobasilar distributions is acquired in AP, oblique, and lateral projections. If necessary, oblique views are obtained to profile the vertebral origin and the intracranial pathology.
• The selective catheter is removed
• Contrast material is injected with imaging over the common femoral artery to insure that no vessel injury, dissection, pseudoaneurysm, or significant iatrogenic vasospasm has occurred.
• The sheath is removed.
• Closure of the arteriotomy by pressure or application of an arterial closure device, as appropriate

Description of Post-Service Work:
• All imaging sequences are reviewed frame by frame. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.
• Appropriate care orders are entered in the electronic medical record.
• The procedure is documented in the chart.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.

Intra-Service intensity/complexity	3.29	3.06
Post-Service intensity/complexity	2.63	2.56

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Post Time

Carotid and cerebral angiography are performed as a problem solving procedure in patients with complex atherosclerotic carotid and companion cerbrovascular disease, work-up of intra- and extracranial tumors, and vasculopathies. The number or main vessels, multitude of small caliber *named* branch vessels, clinically important potential collateral pathways, and additionally complex venous anatomy translate to a 3-6 fold increase in the the: number of necessary angiographic runs (each with 10-60 frames/second), intensity of cognitive interpretation, and physician effort and time. The multi-disciplinary expert panel realizes this significant effort and that it was not reflected in the responses of our survey respondents. We believe this is due to their lack of understanding of the post-service period as suggested by exactly similar response times for all 8 codes. We believe that 40 minutes of post service time more accurately reflects the additional work involved.

36223/36225 Preamble

The expert panel believes that there are significant similarities between 36236223 and 36236225; Both diagnostic angiographic codes involve second or third order cervico-cerebral vessel selection. Furthermore both codes involve extensive angiography. Multiple S&I codes are now bundled with the corresponding surgical codes to describe this work. Specifically in addition to arch aortography, this new code now also includes 2 DSA runs of the extra-cranial circulation in addition to 3 DSA runs of intra-cranial circulation. Based on the significant changes compared to current coding convention, survey respondents may not have completely understood the ramifications of code bundling. Survey respondents reported similar median intra-service times of 45 minutes for each code and the expert panel will recommend median value of 36225 (wRVU 6.50) for both codes.

Survey Results

A multi-specialty survey of 55 respondents yielded a median wRVU of 6.50 (25^{th} percentile, wRVU 5.60) and median intra-procedural time was 45 minutes. 85% of the survey respondents found the vignette to be typical. After considerable discussions considering magnitude estimation both within this family and other related families, the expert panel recommends the median surveyed of 36236225: wRVU of 6.50.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. 89% of the survey respondents found CS to be typical in the facility setting. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure (including securing the head), and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views involved with the

complex nature of the intra- and extra- cranial vasculature. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

The key reference service chosen was 36251 Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral (wRVU 5.35, intra- time of 45, total time 116).

This is similar to 36236225 in the sense that they are both diagnostic angiographic procedures. The reference service involves shorter catheters and abdominal imaging and a first order vessel catheterization. 36236225 involves longer catheters as well as a first or second order cervico-cerebral vessel catheterization. The aortic arch, braciocephalic artery, and common carotid artery are typically more tortuous requiring more work in the opinion of the multidisciplinary expert panel. Additionally there is increased stroke risk and significantly more imaging. Overall, the expert panel and the surveyed respondents (true?) found 36236225 to be of greater complexity than the key reference code. Therefore it is unclear why the median time value for the surveyed code was similar to the key reference unless the respondents did not understand the full impact of significant code bundling.

Despite these similarities and differences, the two codes compare reasonably. Although times are similar, the expert panel believes that since 36236225 involves a similar or greater degree of selective vessel catheterization, increased imaging, and increased risk, the median wRVU 6.50 is supported and maintains rank order within this code family and similar diagnostic angiographic code families.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36236225	6.50	0.102	133	40	3	5	45	40
36251	5.35	0.085	116	33	3	5	45	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to attached budget neutrality table for information on previous reporting.

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 91%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Description of Pre-Service Work:
• A targeted H&P is performed.
• The planned procedure is discussed with the patient/family and consent is obtained for the procedure and moderate sedation.
• In the procedure room, the patient's identity and the nature of the procedure are confirmed.
• The patient is placed supine on the procedure table, monitoring equipment is attached, and the right groin is prepared and draped in usual sterile fashion.
• Conscious sedation is administered.

Description of Intra-Service Work:
• Right common femoral arterial access is obtained and an arterial sheath placed
• A wire is inserted and a pigtail catheter is advanced over the wire retrograde into the ascending aorta.
• Contrast is injected through the catheter with digital subtraction imaging over the area of interest in multiple projections to evaluate the aortic arch, great vessel origins, and cervical carotid arteries.
• A guide wire is introduced through the pigtail catheter and the catheter is exchanged for a selective catheter.
• The selective catheter and guidewire combination are guided into the right subclavian artery under fluoroscopic guidance.
• Multiple contrast material injections are made and digital imaging of the cervical vertebral artery distribution is acquired in multiple projections.

• A steerable guidewire is inserted and the catheter is advanced into the right vertebral artery over the guidewire under fluoroscopic guidance.
• Multiple contrast material injections are made and digital imaging of the intracranial vertebral artery distribution is acquired in AP, oblique, and lateral projections in arterial, capillary, and venous phases.
• The selective catheter is removed
• Contrast material is injected with imaging over the common femoral artery to insure that no vessel injury, dissection, pseudoaneurysm, or significant iatrogenic vasospasm has occurred.
• The sheath is removed.
• Closure of the arteriotomy by pressure or application of an arterial closure device, as appropriate

Description of Post-Service Work:
• All imaging sequences are reviewed frame by frame. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.
• Appropriate care orders are entered in the electronic medical record.
• The procedure is documented in the chart.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team

Intra-Service intensity/complexity	4.28	3.78
Post-Service intensity/complexity	2.88	2.82

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA

angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Post Time

Carotid and cerebral angiography are performed as a problem solving procedure in patients with complex atherosclerotic carotid and companion cerbrovascular disease, work-up of intra- and extracranial tumors, and vasculopathies. The number or main vessels, multitude of small caliber *named* branch vessels, clinically important potential collateral pathways, and additionally complex venous anatomy translate to a 3-6 fold increase in the the: number of necessary angiographic runs (each with 10-60 frames/second), intensity of cognitive interpretation, and physician effort and time. The multi-disciplinary expert panel realizes this significant effort and that it was not reflected in the responses of our survey respondents. We believe this is due to their lack of understanding of the post-service period as suggested by exactly similar response times for all 8 codes. We believe that 40 minutes of post service time more accurately reflects the additional work involved.

36224/36226 Preamble

The expert panel believes that there are significant similarities between 36236224 and 36236226; Both diagnostic angiographic codes involve second or third order cervico-cerebral vessel selection. Furthermore both codes involve extensive angiography. Multiple S&I codes are now bundled with the corresponding surgical codes to describe this work. Specifically in addition to arch aortography, this new code now also includes at a minimum and AP and lateral projections of the extra-cranial circulation. The catheter is then navigated into a higher order vessel that is smaller in caliber and primarily supplies central nervous system structures. These factors significantly increase the risk of vessel injury and dissection and subsequently increase the risk of stroke. AP and lateral projections of the intracranial circulation are obtained and depending on the pathology multiple oblique projections at possibly higher frame rate acquisitions will also be obtained. These images also require immediate preliminary interpretation to confirm that the relevant imaging has been acquired. Based on the significant changes compared to current coding convention, survey respondents may not have completely understood the ramifications of code bundling. Survey respondents reported similar median intra-service times of 50 minutes for each code and the expert panel will recommend below median value of 36224 and 36226 (wRVU 7.55) for both codes.

Survey Results

A multi-specialty survey of 55 respondents yielded a median of 8.00 (25th percentile, wRVU 7.25) and median intra-procedural time was 50 minutes. 86% of the survey respondents found the vignette to be typical. After considerable discussions considering magnitude estimation both within this family and other related families, the expert panel recommends for 36236226 the below median surveyed for 36236226 and the similar code within this family 36236224: wRVU of 7.55.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. 91% of the survey respondents found CS to be typical in the facility setting. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure

(including securing the head), and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views involved with the complex nature of the intra- and extra- cranial vasculature. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

The key reference service chosen was 36253 Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral (wRVU 7.55, intra- time 60 minutes, total time 131).

This is similar to 36236226 in the sense that they are both diagnostic angiographic procedures. The reference service involves shorter catheters and abdominal imaging as well as a sub-selective second order (or higher) vessel catheterization. 36236226 involves longer catheters as well as second or third order sub-selective vessel catheterization. The aortic arch, braciocephalic artery, subclavian artery and vertebral arteries are typically more tortuous requiring more work in the opinion of the multidisciplinary expert panel. Additionally there is increased stroke risk secondary to the smaller caliber of vessels being catheterized whose primary outflow leads essentially solely into the central nervous system. There is also significantly more imaging secondary to the complexity of cerebrovascular disorders. Overall, the expert panel and the surveyed respondents found 36236226 to be of greater complexity than the key reference code. The intensity measures were all more complex for the surveyed code compared to the reference code. Given the level of intensity, it is unclear why the median time value for the surveyed code was 10 minutes less than the key reference unless the respondents did not understand the full impact of significant code bundling. Despite the 10 minutes intra-procedural time difference, the expert panel felt the intensity factor more than accounted for the time difference.

Despite these similarities and differences, the two codes compare reasonably. Although time comparisons are not exact, the expert panel believes that since 36236226 involves a similar degree of selective vessel catheterization, increased imaging, and increased risk. The expert panel believes wRVU 7.55 is supported and maintains rank order within this code family and similar diagnostic angiographic code families.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
36236226	7.55	0.113	138	40	3	5	50	40
36253	7.55	0.101	131	33	3	5	60	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code

in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to attached budget neutrality table for information on previous reporting.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty NeuroSurgery How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
13,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Please refer to attached budget neutrality table for information on previous reporting.

Specialty Radiology Frequency 8320 Percentage 64.00 %

Specialty NeuroSurgery Frequency 2340 Percentage 18.00 %

Specialty Cardiology Frequency 1560 Percentage 12.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36217

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36227 Tracking Number S7 Original Specialty Recommended RVU: **3.18**
Presented Recommended RVU: **2.32**
Global Period: ZZZ RUC Recommended RVU: **2.32**

CPT Descriptor: Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male has sudden onset of severe headache with a brief period of unconsciousness. A non-contrast CT scan demonstrates diffuse subarachnoid hemorrhage. Angiography of the intracranial circulation fails to demonstrate etiology of hemorrhage. A diagnostic external carotid arteriogram is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 86%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work:

Description of Intra-Service Work:
• A steerable guidewire is inserted and the catheter is advanced into the external carotid artery over the guidewire under fluoroscopic guidance.
• Multiple contrast material injections are made and digital imaging of the extracranial carotid distribution is acquired in AP, oblique, and lateral projections.
• The selective catheter is removed
• A formal report including image interpretation of the external carotid is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.

Description of Post-Service Work:

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
61641	ZZZ	4.33	**RUC Time**

CPT Descriptor Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
13133	ZZZ	2.19	**RUC Time**	11,022

CPT Descriptor 1 Repair, complex, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands and/or feet; each additional 5 cm or less (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
63048	ZZZ	3.47	**RUC Time**	121,058

CPT Descriptor 2 Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
37250	ZZZ	2.10	**RUC Time**

CPT Descriptor Intravascular ultrasound (non-coronary vessel) during diagnostic evaluation and/or therapeutic intervention; initial vessel (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 6 **% of respondents:** 17.1 **%**

TIME ESTIMATES (Median)	**CPT Code: 36227**	**Key Reference CPT Code:** 61641	**Source of Time** **RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	15.00	30.00	

Median Immediate Post-service Time	0.00	0.00
Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**15.00**	**30.00**

Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.50	3.33
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

These codes were part of the original "Codes Reported Together 75% of More Screen" by the Joint CPT/RUC Workgroup.

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address complex clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Background
Code 362X36227 (*Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure) (Use 362X36227 in conjunction with 362362236222, 362X36223, or 362X36224))* is an add-on code to report unilateral selective arterial catheter placement and diagnostic imaging of the ipsilateral external carotid circulation.

Recommendation
The societies are recommending 2.32 RVUs with an intra-time of 15 minutes. This is considerably less than the median or 25th percentile survey responses. 36227 is currently reported using 36218 (1.01 RVUs; *Selective catheter placement, arterial system; additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate))* and 75660 (1.31 RVUs; *Angiography, external carotid, unilateral, selective, radiological supervision and interpretation*) for a total RVU of 2.32. Our recommended RVU is based on a crosswalk from this previous value as well as comparison with the key reference service as well as additional codes in the RUC database. Our expert panel compared the survey responses as well as the key reference service selected. The survey median time of 15 minutes is half of the intra-service time of the key reference code. It was judged that although the difficulty of catheterizing multiple tortuous branches of the external carotid artery would be similar in intensity to the work of the key reference service (61641), we could not support that 36227 was significantly more intense than 61641.

Selective catheterization and angiography of the external carotid artery, as currently coded, allows for reporting of the code pair for each additional vessel catheterized within the vascular family. 36227 can only be coded once per operative session despite the fact that the typical patient will require catheterization of multiple external carotid branches. These result in a significant reduction in reimbursement for the typical procedure performed on the typical patient. Similarly, all base codes in the overall family of cerebral codes are either being recommended for a large reduction in reimbursement (36236222-36236226) or no change in reimbursement (36236221). The revision of the family of cerebral codes is expected to result in a net savings to CMS.

Our expert panel believes that the technique, patient population and specialties performing the procedure have changed. Noninvasive imaging techniques have become the preferred method of evaluating the vascular anatomy of patients demonstrated by the significant decrease in the volume of angiographic procedures being performed. The patients who ultimately undergo catheter angiography are as a result more complex with more difficult problems. Physicians who normally perform this procedure encounter wide variability among the various branches of the external carotid artery (which supply blood to the face, pharynx, thyroid, tongue, etc.), increasing the complexity relative to catheterization and imaging in the common carotid artery. Because of their size, tortuosity and rapid arborization, there is a higher risk of catheter-induced vasospasm, intimal flap and vessel dissection than for the common or internal carotid arteries, resulting in the work requiring a greater level of skill and having a high level of intensity.

The external carotid artery, in addition to supplying critical, often unforgiving territory like the tongue, dura and cranial nerves, has dangerous anastamoses between its branches and the blood vessels of the brain. These dangerous anastamoses require sophistication to recognize, thereby increasing the intensity of the work provided. The expert panel felt that the 15 minutes intra-time reported by the survey respondents underestimated the time and work involved in the typical patient. The typical patient and procedure will require super-selective catherterization of multiple external carotid branches under the current coding paradigm. This additional work would be captured by multiple instances of coding the current code pair. We feel it is likely that the survey respondents did not take into account the fact that 36227 can only be coded once per side.

Post Times

The consensus panel recommends 10 minutes of post time for 36227 and 10 minutes of post time for 36228. The majority of the surveying societies used the "ZZZ (with pre/post time if necessary)" survey instrument, which collected pre/post times from the survey respondents. ASNR and ACR used the standard ZZZ survey tool that did not collect pre/post data.

The median post service time for the survey respondents that used the ZZZ (with pre/post) was 10 minutes for 36227 and 20 minutes for 36228. It is important to note that these surveys were from what is expected to be the dominant provider.

In the post service period the imaging sequences are reviewed frame by frame through the arterial, capillary and venous phases of the angiographic run. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts.

Key Reference Service

Our recommendation is bracketed by the two most commonly chosen Key Reference Services, each chosen by 6 respondents: 61641 (4.33 RVUs; 30 min. intra-service time; *Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in same vascular family (List separately in addition to code for primary procedure))* and 37250 (2.10 RVUs; 23 min. intra-service time; *Intravascular ultrasound (non-coronary vessel) during diagnostic evaluation and/or therapeutic intervention; initial vessel (List separately in addition to code for primary procedure)).* The external carotid artery has complex anatomy with dangerous anastamoses; it supplies crucial structures of the face and neck. Procedures within this anatomy inherently have great intensity. Even though the time for 37250 is higher (23 minutes), our panel felt that working in the complexity of the external carotid circulation justified a greater intensity for 36236227 relative to 37250. With its multiple branches, critical structural supply and dangerous anastomoses, the external carotid circulation is more complex and has great intensity.

MPC Codes

Our recommendation is also bracketed by two ZZZ MPC codes 13133 (2.19 RVUs; 30 min. intra-service time; *Repair, complex, forehead, cheeks, chin , mouth, neck, axillae, genitalia, hands and/or feet; each additional 5 cm or less (List separately in addition to code for primary procedure))* and 63048 (3.47 RVUs, 45 min. intra-service time, *Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [eg, spinal or lateral recess stenosis]), single vertebral segment; each additional segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)).* The external carotid artery has complex anatomy with dangerous anastamoses; it supplies crucial structures of the face and neck. Procedures within this anatomy inherently have great intensity. Even though the time for 13133 is higher (30 minutes), our panel felt that working in the complexity of the external carotid circulation justified a greater intensity for 36236227 relative to 13133.

Comparison to other ZZZ codes

Our recommendation also compares favorably to other ZZZ codes including 61782 (3.18 RVUs, 25 minutes intra-service time (40 min total time); *Stereotactic computer-assisted (navigational) procedure; cranial, extradural (List separately in addition to code for primary procedure))* a code which also involves the brain.

In summary, our expert panel is recommending 2.32 RVUs, 15 minutes of intra-time and a post time of 10 minutes based on the comparisons detailed above.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to the attached budget neutrality table for information on previous reporting.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty NeuroSurgery How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 18,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Please refer to the attached budget neutrality table for estimated reporting.

Specialty Radiology Frequency 9900 Percentage 55.00 %

Specialty NeuroSurgery Frequency 3420 Percentage 19.00 %

Specialty Cardiology Frequency 1980 Percentage 11.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36218

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:36228 Tracking Number S8 Original Specialty Recommended RVU: **5.50**
Presented Recommended RVU: **4.25**
Global Period: ZZZ RUC Recommended RVU: **4.25**

CPT Descriptor: Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure).

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old woman presents with sudden onset of severe headache with a brief period of unconsciousness. A CT scan demonstrates a right frontal hemorrhage and findings suspicious for a 4 cm arteriovenous malformation. A diagnostic cerebral arteriogram is requested. Initial angiography confirms an anterior circulation arteriovenous malformation supplied by the right middle cerebral artery. Selective angiography of right middle cerebral artery is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 74%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work:

Description of Intra-Service Work:
• Under fluoroscopic guidance an exchange length guidewire is navigated into the distal internal carotid artery and the selective catheter is exchanged for a guide catheter. The guide catheter is attached to a Touhy-Borst adapter and a heparinized flush.
• A baseline activated clotting time is obtained. Heparin based on the patient's weight is administered intra-venously and a repeat activated clotting time is obtained to insure that adequate anti-coagulation has been established. If necessary additional heparin is administered and subsequent activated clotting times are obtained.
• A microcatheter over a microguidewire is inserted into the guide catheter and is navigated into a distal branch of the middle cerebral artery under roadmap fluoroscopic guidance. Multiple roadmaps may be required. The microwire is removed and the microcatheter is flushed with normal saline.
• Contrast material is injected and digital imaging of the distal middle cerebral artery territory in at least two projections into the arterial, capillary, and venous phases is performed. If necessary, additional oblique views are obtained to delineate the pathology

• Contrast material is injected manually or with a power injector into the guide catheter and digital imaging of the intracranial carotid distribution is acquired in AP and lateral projections into the arterial, capillary, and venous phases in order to rule out thromboembolic complications, contrast extravasation, or vascular injury.
• A post-procedure activated clotting time is obtained
• A formal report including image interpretation of the right middle cerebral artery is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Preamble

Advances in cross sectional imaging (e.g., CTA and MRA) of the cervicocerebral arteries have revolutionized vascular radiology. Previously, invasive catheter-based diagnostic angiography was routinely utilized in the evaluation of vascular malformations, cerebrovascular occlusive pathology, tumor anatomy, and aneurismal disease. Non-invasive imaging has been widely accepted as first line in evaluation of such patients. This technological advance has resulted in a change of the patient population who requires catheter-based cerebral imaging. Catheter angiography of the cervicocerebral vasculature is now typically used to address specific clinical questions that persist following non-invasive imaging.

There have also been significant technical advances in the equipment required to perform catheter-based cerebral angiography. The actual catheters, guidewires, and coaxial systems now allow for superselective intracranial vessel catheterization that was not imaginable in the early 1990's when these CPT codes were valued. Although technical advances have been vast, the intensity has not lessened and remains plagued by a significant risk of thromboembolic stroke, vasospasm, and dissection.

These new bundled CPT codes were surveyed by a multidisciplinary population including radiology, vascular surgery, cardiology, neurosurgery, and neurology. The expert panel has discussed these code sets and believes that there is a rank order present with respect to clinical work, stroke risk/vessel injury, and involved imaging. We are presenting recommendations based on this magnitude estimation with some recommendations at maintenance of current value, some recommendations at median survey value, and some recommendations below the median surveyed value.

The bundled codes now describe both the selective arterial catheterization and the diagnostic angiography required to accurately image specific areas of the cervicocerebral vascular tree. This includes gaining vascular access, placement of an intra-arterial sheath, and retrograde navigation of a guidewire and catheter from puncture site to the artery in question. It also includes application of pressure or placement of a closure device upon completion.

- 36221 describes the placement of an arterial catheter non-selectively in the ascending aorta along with imaging of the cervicocerebral arch. 36221 may be reported by itself when no other selective cerebral imaging is necessary for diagnosis. If a more selective catheterization is required, the work included in 36221 becomes part of the more selective code and 36221 is not separately reported.

- 36222, 36223, and 36224 describe ipsilateral selective arterial catheterization with extracranial and/or intracranial carotid angiography with incremental time and intensity as listed in the code description.

- 36222 bundles the work of second order right common carotid artery selective catheterization (36216) with cervical carotid angiography (75676) as well as arch aortography (75650), if performed.

- 36223 includes all of the work of 36222 plus the addition of unilateral cerebral carotid angiography (75665), performed from the catheter in the common carotid artery.

- 36224 encompasses all the work of 36223 as well as further selection of the internal carotid artery bringing it to a third order vessel (36217) and follow-up intracranial imaging in multiple projections (75774), performed from the catheter in the internal carotid artery.

- Add-on code 36228 describes further microcatheter selection of the intracranial ICA branches such as the ACA or MCA. These selections were previously reported with codes 36217 or 36218 for catheterization and code 75774 for the angiography of each arterial bed.

- Add-on code 36227 describes external carotid artery selection for imaging which may be appropriate in specific clinical scenarios. All further manipulation in the ECA is bundled as is all further follow-up selective ECA angiography. Previously, this included 36218 for the additional catheter selection and 75660 for the additional selective imaging.

- 36225 and 36226 describes a bundled assessment of the posterior circulation, whether the actual vertebral artery is selected or if the catheter is placed in a lower order vessel in the vascular family. The codes include ipsilateral selective arterial catheterization with extracranial and/or intracranial vertebral angiography with increasing time and intensity as listed in the code description. Vertebral imaging from a non-selective catheterization of the aorta would be reported with 36221.

- 36225 describes the second order selective catheterization of the right subclavian artery (36216) and both intracranial and extracranial vertebral artery angiography (75685) as well as arch aortography (75650), if performed.

- 36226 encompasses all the work of 36225 as well as further selection of the vertebral artery itself bringing it to a third order vessel (36217) and follow-up imaging in multiple projections (75774).

Bilateral procedures would require the -50 modifier if the same vessel selection and imaging were performed.

Background
Code 362X36228 (*Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure). (Use 362X36228 in conjunction with 362X36224 or 362X36226))* is an add-on code to report unilateral selective arterial catheter placement and diagnostic imaging of the initial and each additional intracranial branch of the internal carotid or vertebral arteries.

Recommendation
The societies are recommending 4.25 RVUs (the 25th percentile) and an intra-time of 30 minutes. The revised code structure does not have direct equivalents in the current code structure that are parallel or able to be directly cross-walked, having different base code values and different descriptions of work, so our recommendation does not necessarily represent an increase in value for this procedure. An intracranial selective catherterization(s) and imaging would be currently reported using a combination of three codes 36217 (6.29 RVUs; *Selective catheter placement, arterial system; initial third order or more selective thoracic or brachiocephalic branch, within a vascular family*) or 36218 (1.01 RVUs; *Selective catheter placement, arterial system; additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate))* and 75774 (0.36 RVUs and *Angiography, selective, each additional vessel studied after basic examination, radiological supervision and interpretation (List separately in addition to code for primary procedure)).* 36218 would be reported for each additional vessel catheterized within a vascular family. 36228 can only be reported a maximum of twice per hemisphere regardless of the number of vessels supra-selectively catheterized. This will result in a significant reduction in reimbursement for the typical procedure performed on the typical patient. Similarly, all base codes in the overall family of cerebral codes are either being recommended for a large reduction in reimbursement (36236222-36236226) or no change in reimbursement (36236221). The revision of the family of cervicocarotid codes should result in a net savings to CMS.

Our expert panel believes and our survey results confirm that the additional work required for super-selective angiography of the ACA, MCA, PCA, etc. is a big step up from work that is in first and second order carotid arteries. The utilization of a microcatheter and microwire through a guide catheter requires more time and technical expertise than the equipment and technique used for first and second order vessels. Almost every injection for this procedure is a hand-run injection through a microcatheter of 1-3 CCs, as opposed to automated power injection. Working in the smaller intracranial blood vessels, which have little elasticity and muscularity, has a much higher level of intensity and stress, and requires a higher level of skill.

Post Times
The consensus panel recommends 10 minutes of post time for 36227 and 10 minutes of post time for 36228. The majority of the surveying societies used the "ZZZ (with pre/post time if necessary)" survey instrument, which collected pre/post times from the survey respondents. ASNR and ACR used the standard ZZZ survey tool that did not collect pre/post data.

The median post service time for the survey respondents that used the ZZZ (with pre/post) was 10 minutes for 36227 and 20 minutes for 36228. It is important to note that these surveys were from what is expected to be the dominant provider. The consensus panel agreed that there is additional immediate post procedure time required for the interpretation of the highly detailed and numerous angiographic images obtained of the distal cerebral vasculature. The interpretation of these images require a high level of skill and significant time above and beyond what is accounted for by the additional time in the base codes. In the post service period, the imaging sequences are reviewed frame by frame through the arterial, capillary and venous phases of the angiographic run. The various projections are compared to each other to detect pathology as opposed to normal anatomy as overlapping and tortuous vessels are typical. Subtracted and unsubtracted images are compared to assess for motion and other artifacts. However, the expert panel did not feel that the immediate post service time would be greater for 36228 than for 36227 and therefore have recommended reducing the survey immediate post service time to 10 minutes from the 20 minutes suggested by the survey.

Key Reference Service

Our recommendation compares favorably to the most commonly chosen Key Reference Service: 61642 (8.66 RVUs, 60 minutes intra-service time; *Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular family (List separately in addition to code for primary procedure)).* Even though the time for 61642 is higher (60 minutes), both codes involve working in the super-selective intracerebral vascular bed. The mean intensity/complexity survey responses for 36236228 were greater than or equal to the mean responses for 61642 for all but one of the eleven intensity/complexity survey questions. Catheterization with a microcatheter and microwire of the middle, anterior and posterior cerebral arteries, is intense, as challenges in this circulation are devastating, including stroke, intracranial hemorrhage and death. Interpretation of these microcatheter arteriograms is time intensive and requires great skill.

MPC Codes

Our recommendation also compares favorably to MPC code 35600 (4.94 RVUs, 40 minutes intra service time; *Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure (List separately in addition to code for primary procedure)*). 36228 intra service time is 10 minutes less but contains additional 10 minutes of immediate post service time that is not present in 35600. Furthermore, 36228 is recommended at 0.69 RVUs less than 35600. 35600 is an open procedure on a peripheral artery requiring significant technical skill and care to preserve the integrity of this vascular graft which will be used as a conduit for coronary artery bypass procedure. Our panel felt that working in the complex super-selective cerebral circulation justifies the greater intensity of 36228. Catheterization with a microcatheter and microwire of the middle, anterior and posterior cerebral arteries, is intense, as challenges in this circulation are devastating, including stroke, intracranial hemorrhage and death. Interpretation of these microcatheter arteriograms is time intensive and requires great skill.

Additionally, MPC code 63295 (5.25 RVUs; 45 minutes intra-service time; *Osteoplastic reconstruction of dorsal spinal elements, following primary intraspinal procedure (List separately in addition to code for primary procedure))* further supports the value recommended. Our panel felt that as noted above, working in the complex super-selective cerebral circulation justifies the greater intensity demonstrated by the fact that 63295 has only one additional RVU despite 15 minutes additional intra service time (although 36228 has 10 minutes immediate post procedure time which is not present in 63295).

Comparison to other ZZZ codes

Our recommendation also compares favorably to ZZZ code 33924 (5.49 RVUs; 30 minutes intra-service time; *Ligation and takedown of a systemic-to-pulmonary artery shunt, performed in conjunction with a congenital heart procedure (List separately in addition to code for primary procedure))* a code which also involves work in a complex vascular bed. Another comparison code is ZZZ code 33572 (4.44 RVUs, 30 minutes intrs-service time; *Coronary endarterectomy, open, any method, of left anterior descending, circumflex, or right coronary artery performed in conjunction with coronary artery bypass graft procedure, each vessel (List separately in addition to primary procedure)*).

In summary, our expert panel is recommending 4.25 RVUs (the 25th percentile), intra service period of 30 minutes and 10 minutes of post service based on the comparisons detailed above.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. While other services might be reported on the same date of service, there is no 'typical' scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Please refer to the attached budget neutrality table for information on previous reporting.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty NeuroSurgery How often? Commonly

Specialty Cardiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
15,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Please refer to the attached budget neutrality table for estimated reporting.

Specialty Radiology Frequency 8250 Percentage 55.00 %

Specialty NeuroSurgery Frequency 2850 Percentage 19.00 %

Specialty Cardiology Frequency 1650 Percentage 11.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36218

Global Period: ZZZ

+36227 Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)

+**36228** Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure).

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A multispecialty group (SIR, ACR, SVS, ACC/SCAI, ASNR, AANS/CNS) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these newly created CPT codes.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

We selected CPT code 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* as our reference code. CPT code 36251 was reviewed by the RUC/PEAC in April 2011. The process of care is similar for the newly created codes to the reference code.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Phone calls & prescriptions
- Retrieve prior imaging exams, hang for MD review, verify orders, review chart to incorporate relevant clinical information, confirm contrast protocol with interpreting MD
-

Service Clinical Labor Activities:

The patient is greeted, gowning is provided and patient is escorted to procedure room. The nurse obtains vital signs, interviews the patient for allergies, medications and coagulopathy. Procedure is explained and informed consent is witnessed. The rad tech prepares the room, equipment and supplies after consulting with the M.D regarding the supplies to be used. The angio tech prepares the back table. IV access is established. The patient is positioned, including securing the patient's head into the appropriate position. The patient's skin is prepped and the patient is draped, all in routine sterile fashion. The rad tech also verifies that patient and equipment are properly positioned for bi-plane imaging. RN administers conscious sedation. The angio tech assists the M.D. performing procedure. The rad tech assists the MD with flouro, contrast, image acquisition, etc. The patient is escorted to the observation area. RN performs sequential vital signs over 4 hour observation. Rad Tech processes the bi-plane images and completes all the necessary paperwork. The angio tech cleans the room. The patient is given discharge instructions.

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

Meeting Date: 04/2012

Global Period: 000

36221 Non-selective catheter placement, thoracic aorta, with angiography of the extracranial carotid, vertebral, and/or intracranial vessels, unilateral or bilateral, and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed

36222 Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed

36223 Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed

36224 Selective catheter placement, internal carotid artery, unilateral, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed

36225 Selective catheter placement, subclavian or innominate artery, unilateral, with angiography of the ipsilateral vertebral circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed

36226 Selective catheter placement, vertebral artery, unilateral, with angiography of the ipsilateral vertebral circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed

Global Period: ZZZ

+36227 Selective catheter placement, external carotid artery, unilateral, with angiography of the ipsilateral external carotid circulation and all associated radiological supervision and interpretation (List separately in addition to code for primary procedure)

+**36228** Selective catheter placement, each intracranial branch of the internal carotid or vertebral arteries, unilateral, with angiography of the selected vessel circulation and all associated radiological supervision and interpretation (eg, middle cerebral artery, posterior inferior cerebellar artery) (List separately in addition to code for primary procedure).

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A multispecialty group (SIR, ACR, SVS, ACC/SCAI, ASNR, AANS/CNS) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these newly created CPT codes.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

We selected CPT code 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* as our reference code. CPT code 36251 was reviewed by the RUC/PEAC in April 2011. The process of care is similar for the newly created codes to the reference code.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Schedule space and equipment in facility

Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together- 75% or More Screen

January/April 2012

Bundle Thrombolysis

In 2010, the Relativity Assessment Workgroup identified two codes through the 75% reported together screen: 37201 *transcatheter therapy, infusion for thrombolysis other than coronary* and 75896 *transcatheter therapy, infusion, any method (eg thrombolysis other than coronary), radiological supervision and interpretation*. In October 2011, the CPT Editorial Panel created four new codes (37211-4) to describe transcatheter therapy for thrombolysis bundled with radiologic supervision and interpretation and Evaluation and Management services. In January 2012, the specialty societies requested deferment of this family of services due to late CPT changes that expanded the number of codes; the continued questions about CPT guideline text, descriptors, and parentheticals; and the imprecision of the 000-day global survey instrument to accurately survey these codes. The Research Subcommittee approved a modified 000-day global survey instrument to be used to survey this family at the RUC meeting in April 2012.

37211 ***Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day***
The RUC reviewed the survey data from 50 vascular surgeons and interventional/diagnostic radiologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 60 minutes and post-service time= 30 minutes. In accordance with prior analogous recommendations (e.g. lower extremity revascularization) additional pre-service time was added, 9 minutes, for proper positioning and additional evaluation necessary for selection and verification of numerous supplies and equipment. The RUC also noted that the post-service time, and the work value, includes the work of a subsequent hospital care service, CPT code 99233, which was previously separately reportable on the same date of service.

The RUC reviewed the survey's estimated work values and agreed with the specialty society that 8.00 work RVUs, the survey's 25th percentile, accurately reflects the physician work involved in this service. To justify this value, the RUC compared the surveyed code to reference CPT code 93460 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right and left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed* (work RVU= 7.35) and agreed that while the services have comparable work, 37211 should be valued slightly higher due to greater intra-service time, 60 minutes compared to 50 minutes. In addition, the RUC reviewed CPT code 36254 *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; bilateral (work RVU= 8.15) and agreed that this reference code should be valued slightly higher because it has slightly greater intra-service time compared to the surveyed code, 68 minutes and 60 minutes, respectively. **The RUC recommends a work RVU of 8.00 for CPT code 37211.**

37212 ***Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day***

The RUC reviewed the survey data from 50 vascular surgeons and interventional/diagnostic radiologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 60 minutes and post-service time= 30 minutes. In accordance with prior analogous recommendations (e.g. lower extremity revascularization) additional pre-service time was added, 9 minutes, for proper positioning and additional evaluation necessary for selection and verification of numerous supplies and equipment. The RUC also noted that the post-service time, and the work value, includes the work of a subsequent hospital care service, CPT code 99233, which was previously separately reportable on the same date of service.

The RUC reviewed the survey's estimated work values and agreed with the specialty society that 7.06 work RVUs, the survey's 25th percentile, accurately reflects the physician work involved in this service. To justify this value, the RUC compared the surveyed code to key reference service 37187 *Percutaneous transluminal mechanical thrombectomy, vein(s), including intraprocedural pharmacological thrombolytic injections and fluoroscopic guidance* (work RVU= 8.03) and agreed that reference code should be valued higher due to greater intra-service time and slightly greater total time, 145 minutes and 138 minutes, respectively. In addition, the RUC reviewed CPT code 93460 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right and left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed* (work RVU= 7.35) and agreed that while the services have comparable work, the surveyed code should be valued lower because it is a less intense and complex service. Finally, the RUC reviewed 37211 in comparison to 37212 and noted that while the two service have identical time, 37212 should be valued lower because the arterial system involved in 37211 has greater intensity due to higher risk for complication compared to the venous infusion code. **The RUC recommends a work RVU of 7.06 for CPT code 37212.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

37213 ***Transcatheter therapy, arterial other than coronary or venous infusion for thrombolysis, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed***

The RUC reviewed the survey data from 50 vascular surgeons and interventional/diagnostic radiologists and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 33 minutes and post-service time= 25 minutes. In accordance with prior analogous recommendations (e.g. lower extremity revascularization) additional pre-service time was added, 2 minutes, for proper positioning to obtain necessary views to treat the lesion. The RUC also noted that the post-service time, and the work value, includes the work of a subsequent hospital care service, CPT code 99233, which was previously separately reportable on the same date of service. Finally, the specialty discussed that this service includes continued treatment only if the care continues into the third day. This service is not typical, and will be billed only a fraction of the time compared to CPT code 37214, which describes continued care concluded on the second day of care.

The RUC reviewed the survey's estimated work values and agreed with the specialty society that 5.00 work RVUs, the survey's 25th percentile, accurately reflects the physician work involved in this service. To justify this value, the RUC compared the surveyed code to reference CPT code 93452 *Left heart catheterization including intraprocedural injection(s) for left ventriculography, imaging supervision and interpretation, when performed* (work RVU= 4.75) and agreed that while the two services are similar services, the surveyed code should be valued slightly higher due to greater intra-service time, 33 minutes and 30 minutes, respectively. In addition, the RUC reviewed CPT code 93455 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with catheter placement(s) in bypass graft(s) (internal mammary, free arterial, venous grafts) including intraprocedural injection(s) for bypass graft angiography* (work RVU= 5.54) and the reference code should be valued slightly higher due to greater intra-service time compared to 37213. Finally, the RUC compared this service to the base arterial infusion service, 37211, and concurred that 37213 is appropriately valued relative to the family of services. **The RUC recommends a work RVU of 5.00 for CPT code 37213.**

37214 ***Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed; cessation of thrombolysis including removal of catheter and vessel closure by any method***

The RUC reviewed the survey data from 48 vascular surgeons and interventional/diagnostic radiologists and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 38 minutes and post-service time= 23 minutes. In accordance with prior analogous recommendations (e.g. lower extremity revascularization) additional pre-service time was added, 2 minutes, for proper positioning to obtain necessary views to treat the lesion. The RUC also noted that the post-service time, and the work value, includes the work of a subsequent hospital care service, CPT code 99233, which was previously separately reportable on the same date of service. Finally, the specialty discussed that this service includes continued treatment when the thrombolysis is concluded on the second day, which is the typical clinical scenario.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that the respondents overestimated the physician work involved in this service. To value this service accurately, the previously billed codes that are now bundled into this procedure (75898 work RVU= 1.65 and 99233 work RVU= 1.39) were summated to obtain a work RVU of 3.04. The RUC agreed that a work RVU of 3.04, below the survey's 25th percentile, is an accurate value for this service. To justify this value, the RUC compared the surveyed code to reference code 36200 *Introduction of catheter, aorta* (work RVU= 3.02) and agreed that while 37214 has 8 minutes more intra-service time compared to 36200, the reference code is a more intense procedure and the two services should be valued similarly. In addition, the RUC reviewed CPT code 31630 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with tracheal/bronchial dilation or closed reduction of fracture* (work RVU= 3.81) and agreed that the reference code should be valued higher due to greater intra-service time compared to the surveyed code, 45 minutes and 38 minutes, respectively. Finally, the RUC reviewed code 37214 in relation to the family of services and noted that the intensity and complexity of 37214 is much less compared to 37213 and is appropriately valued lower than 37213. **The RUC recommends a work RVU of 3.04 for CPT code 37214.**

The RUC discussed the need to survey CPT codes 75896 *Transcatheter therapy, infusion other than for thrombolysis, radiological supervision and interpretation* and CPT code 75898 *Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis* since the inherent physician work has changed due to CPT Editorial Panel revisions. The specialty explained that these codes will see large utilization shifts into the new bundled codes. The specialty societies have indicated that CPT code 75898 will be addressed in the upcoming Embolization code change proposal to the CPT Editorial Panel in CPT 2013. The specialties will be providing a further recommendation for CPT code 75896 at the October 2012 RUC meeting and the resulting RUC recommendation will be sent to CMS immediately for inclusion in the CY 2013 MPFS Final Rule. **However, until recommendations are provided, the RUC recommends carrier pricing for CPT codes 75896 and 75898.**

Practice Expense: The RUC reviewed and accepted the direct practice expense inputs with minor modifications by the Practice Expense Subcommittee.

Work Neutrality: The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Chicago, IL 60610

Re: Tab 14 Bundle Thrombolysis – 75896/75898

Dear Dr. Levy,

Tab 14 Bundle Thrombolysis is on the agenda for the upcoming April RUC meeting. The genesis of this tab was the identification of CPT code 37201 *Transcatheter therapy, infusion for thrombolysis other than coronary* and 75896 *Transcatheter therapy, infusion, any method (eg, thrombolysis other than coronary), radiological supervision and interpretation* in a "Billed Together more than 75% of the time" screen.

This issue was discussed at CPT, where 4 new codes were developed to replace 37201 and 75896. The four new CPT codes were surveyed by a multi-specialty group and recommendations will be presented at the upcoming meeting.

There were two additional codes 75896 *Transcatheter therapy, infusion, any method (eg, thrombolysis other than coronary), radiological supervision and interpretation* and 75898 *Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion* listed on the LOI. We included the following note on our LOI "The two orphan S&I codes here 75896 and 75898 follow a similar pattern of our other orphan codes that have come through the RUC recently. It is not suitable to survey them at this time. As such we will be surveying the 4 new codes only." Those codes should remain in their current format in the CPT book until Medicare data are available from the new thrombolysis codes.

Please let us know if you have any questions.

Respectfully,

Gary Seabrook, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37211 Tracking Number I1 Original Specialty Recommended RVU: **8.00**
Presented Recommended RVU: **8.00**
Global Period: 000 RUC Recommended RVU: **8.00**

CPT Descriptor: Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old man with a right femoral-popliteal bypass presents to the emergency room with a painful, ischemic leg. Physical exam shows absent graft and distal pulses. Motor/sensory exam shows mild sensory deficit, but no motor deficit. The patient is taken to the procedure room where aortogram and runoff angiography exams are performed. (Diagnostic angiography reported separately). Acute thrombosis of the graft is shown, as well as thrombosis of the popliteal artery. Arterial thrombolysis is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 98%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 8%

Description of Pre-Service Work:
• The patient is evaluated.
• A targeted H&P is performed.
• The proposed procedure is discussed with the patient/family and consent is obtained and documented.
• The patient is transported to the procedure room and placed supine on the procedure table.
• Moderate sedation is administered.

Description of Intra-Service Work:
• Monitor the patient for moderate sedation.
• An exchange length guidewire is inserted into the diagnostic catheter and the diagnostic catheter is removed under fluoroscopic guidance.
• Under fluoroscopic guidance a coaxial infusion catheter system is introduced over the guidewire and positioned with the distal tip in the popliteal artery and with the proximal sideholes in the thrombosed fem-pop graft.
• Angiography is performed to document location of catheter and status of runoff vessels.
• The catheters and access sheath are sutured in position at the skin entrance site.
• Bolus injection of thrombolytic agent is performed.
• Thrombolysis infusion is initiated.

Description of Post-Service Work:
• Dressings are applied.
• Moderate sedation post procedure work.
• The patient is transferred from the angio suite to the ICU for care during thrombolysis.
• Appropriate care orders are entered in the electronic medical record.
• The procedure is documented in the chart.
• Procedural imaging is post processed and a permanent record is created for the PACS archive.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.
• Ongoing evaluation and management care is provided in the ICU during the infusion which includes management of thrombolysis dose, anticoagulation, monitoring of appropriate blood levels (e.g. fibrinogen, coagulation studies, etc) and clinical assessment of limb perfusion and access site.

Intra-Service intensity/complexity	4.27	4.44
Post-Service intensity/complexity	3.18	3.11

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Why is this code being reviewed?

Code 37211 "Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day" is a new code bundling the work of arterial thrombolysis. This service was previously reported with 37201 "Transcatheter therapy, infusion for thrombolysis other than coronary" (wRVU 4.99), 75896 "Transcatheter therapy, infusion, any method (eg, thrombolysis other than coronary), radiological supervision and interpretation" (wRVU 1.31), and 75898 "Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion" (wRVU 1.65). It also bundles all evaluation and management service provided on the same day. These patients require ICU care and the most frequent E&M code would be 99233 "Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit" (wRVU 2.00).

Work RVU Recommendation

We are recommending the 25th percentile from our multispecialty survey, a work RVU of 8.00.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure, and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views to treat the lesion in question. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

Clinical Comparison with Key Reference

The key reference service chosen by 22% of survey respondents is 37184 "Primary percutaneous transluminal mechanical thrombectomy, noncoronary, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injection(s); initial vessel." This is similar to 37211 in the sense that they are both endovascular procedures performed on occluded arteries. Key differences are that 37184 involves the use of a mechanical device to remove thrombus whereas 37211 only uses pharmacologic means. The addition of a mechanical device adds a significant amount of time to the procedure. In addition, all of the evaluation and management services provides on the same day are also bundled into 37211 but they are not included in 37184.

Work Comparison with Key Reference

The primary differences between 37184 "Primary percutaneous transluminal mechanical thrombectomy, noncoronary, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injection(s); initial vessel." and 37211 are the intra-service time, the intensity, and the bundled E&M services. 37184 requires 30 minutes MORE intra-time than 37211 (90 min compared to 60). Otherwise, the two services have the similar pre-time and immediate post-service times. The increased intra-time for 37184 is accounted for by the preparation and use of the mechanical device to remove thrombus from a vessel. 37211 is more intense than 37184 because it involves the initial diagnosis and decision making to treat the problem while 37814 is more technical. 37211 also includes all E&M services provided on the same day while the patient is in the intensive care unit receiving pharmacologic thrombolysis.

Given these similarities, the two codes compare favorably and support our recommended 25th percentile survey value of 8.00.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37211	8.00	0.105	138	40	3	5	60	30
37184	8.66	0.080	160	20	10	10	90	30

Comparison to MPC codes

Comparison with MPC List Code 1, CPT 43269 – RVW 8.20

43269 "Endoscopic retrograde cholangiopancreatography (ERCP); with endoscopic retrograde removal of foreign body and/or change of tube or stent" is a 0-day MPC service with 141 minutes total time, including 40 minutes pre-time and 30 minutes post-time. Both 43269 and 37211 are invasive procedures requiring technical skill to perform successfully. Both 43269 and 37211 have similar of intra-service times (71min vs. 60 min) and very similar IWPUTs (0.0934 vs. 0.105). RVW for 43269 is 8.20 and the major adjustment to estimate an RVW for 37211 from this reference service lies in the pre-service and intra-service times. The difference in intra-service time can be accounted for by subtracting 11 minutes multiplied by the IWPUT for 43269 (11 x 0.0934 = 1.0274) and adding 8 minutes of pre-service time at 0.0224 RVW per minute (8 x 0.0224 = 0.1792).

Thus, the estimated RVW of 37211 should be 8.20 (MPC RVW) + 0.1792 (pre-service adjustment) – 1.0274 (intra-service adjustment) = 7.35. Comparison with this MPC code with very similar time and intensity inputs supports our recommended 25th percentile survey value of 8.00.

Comparison with MPC List Code 1, CPT 31600 – RVW 7.17

31600 "Tracheostomy, planned (separate procedure);" is a 0-day MPC service with 156 minutes total time including 50 minutes pre-time and 66 minutes post-time. Both 31600 and 37211 are procedures requiring technical skill to complete successfully. Both 31600 and 37211 have similar total times and intensities but different distribution of times. RVW for 31600 is 7.17 and the adjustments to estimate an RVW for 37211 from this reference service lies in the pre-, intra- and post-service times. The difference in intra-service time can be accounted for by adding 20 minutes multiplied by the IWPUT for 31600 (20 x 0.1134 = 2.268) and subtracting 38 minutes of pre- and post-service time at 0.0224 RVW per minute (38 x 0.0224 = 0.8512).

Thus, the estimated RVW of 37211 should be 7.17 (MPC RVW) + 2.268 (intra-service adjustment) – 0.8512 (pre- and post-service adjustment) = 8.59. Comparison with this MPC code with very similar time and intensity inputs supports our recommended 25th percentile survey value of 8.00.

In conclusion, our recommended 25th percentile survey value of 8.00 lays nicely between the wRVU for MPC codes 31600 and 43269, both raw and adjusted.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
43269	Endo cholangiopancreatograph	8.20	0.093	141	40			71	30
37211	Thrombolysis, arterial, init day	8.00	0.105	138	40	3	5	60	30
31600	Incision of windpipe	7.17	0.113	156	50			40	66

Additional points of comparison

We find four other codes in the RUC database that further support our recommended 25th percentile survey value of 8.00 for 37211. They are 93460 "Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right and left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed", 52345 "Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)", 93461 "Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right and left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed, catheter placement(s) in bypass graft(s) (internal mammary, free arterial, venous grafts) with bypass graft angiography", 36254 "Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; bilateral", and 52346 "Cystourethroscopy with ureteroscopy; with treatment of intra-renal stricture (eg, balloon dilation, laser, electrocautery, and incision)." The table below compares these codes to 37211.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post	RUC reviewed
52345	Cysto/uretero w/up stricture	7.55	0.128	135	45	10	15	45	20	2008
93460	R&I hrt art/ventricle angio	7.35	0.113	128	40	3	5	50	30	2010
37211	Thrombolysis, arterial, init day	8.00	0.105	138	40	3	5	60	30	2012

93461	R&l hrt art/ventricle angio	8.10	0.095	153	45	3	5	65	35	2010
36254	Ins cath ren art 2nd+ bilat	8.15	0.098	139	33	3	5	68	30	2011
52346	Cystouretero w/renal strict	8.58	0.116	140	40	10	10	60	20	2008

Summary
Based on all the above data and comparisons, we believe the 25th percentile survey RVW of 8.00 is appropriate for 37211.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Thrombolysis infusion can occur in any vessel, both arterial and venous. The work required for thrombolysis infusion will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more vascular catheterization codes in addition to the arterial or venous thrombolysis infusion code. This reflects current coding practice and appropriately represents the highly variable work required for thrombolysis of different vessels.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37201, 75896 and 99233

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Interventional Radiology How often? Commonly

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,062
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The specialty mix is based on the specialty mix in the reference service code 37184.

Specialty Vascular Surgery Frequency 1855 Percentage 23.00 %

Specialty Interventional Surgery Frequency 3225 Percentage 40.00 %

Specialty Cardiology Frequency 1290 Percentage 16.00 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37212 Tracking Number I2 Original Specialty Recommended RVU: **7.06**
Presented Recommended RVU: **7.06**
Global Period: 000 RUC Recommended RVU: **7.06**

CPT Descriptor: Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old woman presents with sudden onset of a severely swollen and painful left leg. Duplex ultrasound shows acute left leg deep vein thrombosis affecting the femoral vein. Diagnostic venography confirms thrombosis and also demonstrates thrombosis extending to the common iliac vein (venography reported separately). Venous thrombolysis is performed using a popliteal vein approach.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 96%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 10%

Description of Pre-Service Work:
• The patient is evaluated.
• A targeted H&P is performed.
• The proposed procedure is discussed with the patient/family and consent is obtained and documented.
• The patient is transferred from her hospital room to the angiographic suite and placed prone on the angiographic table.
• Moderate sedation is administered.

Description of Intra-Service Work:
• Monitor the patient for moderate sedation.
• An exchange length guidewire is inserted into the diagnostic catheter and the diagnostic catheter is removed under fluoroscopic guidance.
• Under fluoroscopic guidance a coaxial infusion catheter system is introduced over the guidewire and positioned with the distal tip in the inferior vena cava and with the proximal sideholes in the thrombosed vein.
• Angiography is performed to document location of catheter.
• The catheters and access sheath are sutured in position at the skin entrance site.
• Bolus injection of thrombolytic agent is performed.
• Thrombolysis infusion is initiated.

Description of Post-Service Work:
• Dressings are applied.
• Moderate sedation post procedure work.
• The patient is transferred from the angio suite to the ICU for care during thrombolysis.
• Appropriate care orders are written.
• The procedure is documented in the chart.
• Procedural imaging is post processed and a permanent record is created for the PACS archive.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.
• Ongoing evaluation and management care is provided in the ICU during the infusion which includes management of thrombolysis dose, anticoagulation, monitoring of appropriate blood levels (e.g. fibrinogen, coagulation studies, etc) and clinical assessment of venous return and access site.

Intra-Service intensity/complexity	4.00	4.00
Post-Service intensity/complexity	3.50	3.15

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Why is this code being reviewed?

Code 37212 "Transcatheter therapy, venous infusion for thrombolysis any method, including radiological supervision and interpretation, initial treatment day" is a new code bundling the work of venous thrombolysis. This service was

previously reported with 37201, "Transcatheter therapy, infusion for thrombolysis other than coronary" (wRVU 4.99), Code 75896 "Transcatheter therapy, infusion, any method (eg, thrombolysis other than coronary), radiological supervision and interpretation" (wRVU 1.31), and 75898 "Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion" (wRVU 1.65). It also bundles all evaluation and management service provided on the same day. These patients require ICU care and the most frequent E&M code would be 99233 "Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit" (wRVU 2.00).

Work RVU Recommendation

We are recommending the 25th percentile from our multispecialty survey, a work RVU of 7.06.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. We believe it is fully justified to add 7 minutes to pre-service evaluation to account for selection and verification of numerous supplies and devices, review and set-up of significant imaging necessary for the procedure, and to coordinate all technical personnel. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views to treat the lesion in question. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

Clinical Comparison with Key Reference

The key reference service chosen by 30% of survey respondents is 37187 "Percutaneous transluminal mechanical thrombectomy, vein(s), including intraprocedural pharmacological thrombolytic injections and fluoroscopic guidance." This is similar to 37212 in the sense that they are both vascular interventions performed on veins for thrombosis. Key differences are that 37187 only involves mechanical thrombectomy while 37212 involves the initial diagnostic exam, decision to perform thrombolysis, and all evaluation and management services provided that day.

Work Comparison with Key Reference

The primary differences between 37187 "Percutaneous transluminal mechanical thrombectomy, vein(s), including intraprocedural pharmacological thrombolytic injections and fluoroscopic guidance" and 37212 lay in the intra-service time and the pre- and post-service times. Code 37187 requires 25 minutes MORE intra-time than 37212 (85 min compared to 60). The pre-service time is longer for 37212 (48 min vs. 40) and the post-service time is longer for 37212 (30 min vs. 20). The increased intra-time for 37187 is accounted for by the preparation and use of the mechanical device to remove thrombus from the vein.

Given these similarities, the two codes compare favorably and support our recommended 25th percentile survey value of 7.06.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37212	7.06	0.090	138	40	3	5	60	30
37187	8.03	0.080	145	26	5	9	85	20

Comparison to MPC codes

Comparison with MPC List Code 1, CPT 31600 – RVW 7.17

31600 "Tracheostomy, planned (separate procedure);" is a 0-day MPC service with 156 minutes total time including 50 minutes pre-time and 66 minutes post-time. Both 36100 and 37212 are procedures requiring technical skill to complete successfully. Both 31600 and 37212 have similar total times and intensities but different distribution of times. RVW for 36100 is 7.17 and the adjustments to estimate an RVW for 37212 from this reference service lies in the pre-, intra- and post-service times. The difference in intra-service time can be accounted for by adding 20 minutes multiplied by the

IWPUT for 31600 (20 x 0.1134 = 2.268). The difference in pre- and post-service time can be accounted for by subtracting 38 minutes at 0.0224 RVW per minute (38 x 0.0224 = 0.8512).

Thus, the estimated RVW of 37212 should be 7.17 (MPC RVW) + 2.268 (intra-service adjustment) – 0.8512 (pre- and post-service adjustment) = 8.59. Comparison with this MPC code with very similar time and intensity inputs supports our recommended 25th percentile survey value of 7.06.

Comparison with MPC List Code 1, CPT 58560 – RVW 6.99

58560 "Hysteroscopy, surgical; with division or resection of intrauterine septum (any method)" is a 0-day MPC service with 125 minutes total time, including 40 minutes pre-time and 25 minutes post-time. Both 58560 and 37212 are invasive procedures requiring technical skill to perform successfully. 58560 and 37212 have identical intra-service times and very similar IWPUTs (0.0922 vs. 0.090). RVW for 58560 is 6.99 and the major adjustment to estimate an RVW for 37212 from this reference service lies in the pre-service and post-service times. The difference in pre- and post-service times can be accounted for by adding 8 minutes of pre-service time at 0.0224 RVW per minute (8 x 0.0224 = 0.1792) and adding 5 minutes of post-service time at 0.0224 RVW per minute (5 x 0.0224 = 0.112).

Thus, the estimated RVW of 37212 should be 6.99 (MPC RVW) + 0.1792 (pre-service adjustment) + 0.112 (post-service adjustment) = 7.28. Comparison with this MPC code with very similar time and intensity inputs supports our recommended 25th percentile survey value of 7.06.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
31600	Incision of windpipe	7.17	0.113	156	50			40	66
37212	Thrombolysis, vein, init day	7.06	0.090	138	40	3	5	60	30
58560	Hysteroscopy resect septum	6.99	0.092	125	40			60	25

In conclusion, our recommended 25th percentile survey value of 7.06 lays nicely between the wRVU for MPC codes 36100 and 58560, both raw and adjusted.

Additional points of comparison

We find four other codes in the RUC database that further support our recommended 25th percentile survey value of 7.06 for 37212. They are 31545 "Laryngoscopy, direct, operative, with operating microscope or telescope, with submucosal removal of non-neoplastic lesion(s) of vocal cord; reconstruction with local tissue flap(s)", 36475 "Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated", 93460 "Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with right and left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed.", and 52345 "Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)" The table below compares these codes to 37212.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post	RUC reviewed
31545	Remove vc lesion w/scope	6.30	0.069	154	40	10	10	60	34	2004
36475	Endovenous rf 1st vein	6.72	0.075	159	40	10	15	60	34	2004
37212	Thrombolysis, vein, init day	7.06	0.090	138	40	3	5	60	30	2012
93460	R&I hrt art/ventricle angio	7.35	0.114	128	40	3	5	50	30	2010
52345	Cysto/uretero w/up stricture	7.55	0.128	153	45	10	15	45	20	2008

Summary

Based on all the above data and comparisons, we believe the 25th percentile survey RVW of 7.06 is appropriate for 37212.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Thrombolysis infusion can occur in any vessel, both arterial and venous. The work required for thrombolysis infusion will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more vascular catheterization codes in addition to the arterial or venous thrombolysis infusion code. This reflects current coding practice and appropriately represents the highly variable work required for thrombolysis of different vessels.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37201, 75894 and 99233

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37184

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37213 Tracking Number I3 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: 000 RUC Recommended RVU: **5.00**

CPT Descriptor: Transcatheter therapy, arterial other than coronary or venous infusion for thrombolysis, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old man with an occluded right femoral-popliteal bypass had thrombolysis infusion started the prior day. He has been managed in the intensive care unit overnight. He undergoes follow-up angiography which demonstrates a residual thrombus. A catheter exchange is performed and thrombolytic infusion is resumed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 96%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 10%

Description of Pre-Service Work:
• Ongoing evaluation and management care is provided which includes management of thrombolysis dose,
• The patient is transferred from his hospital room to the angiographic suite and placed on the angiographic table.
• Clinical assessment of the patient includes evaluation of extremity perfusion, as well as motor/sensory exam of the affected leg.
• Moderate sedation is administered.

Description of Intra-Service Work:
• Monitor the patient for moderate sedation.
• Thrombolytic infusion is temporarily stopped.
• Contrast is injected through the infusion catheter and angiography is performed, studying the area that is being infused.
• Angiography shows partial success in clot dissolution. The decision is made to exchange the infusion catheter and advance the tip further down the graft. The dressings at the catheter site are removed, and the area is prepped and draped.
• Over a guidewire the existing catheter is removed and exchanged for a replacement.
• Angiography is performed to confirm correct catheter tip position, and to ensure that catheter exchange has not altered the clot position.
• The catheter and access sheath are re-sutured in position at the skin entrance site.
• The catheter and access sheath side-arm are connected to infusion pumps.
• Thrombolysis infusion is re-started.

Description of Post-Service Work:
• Dressings are applied.
• Moderate sedation post procedure work.
• The patient is transferred from the angio suite to the ICU for continued care during thrombolysis.
• Appropriate care orders are written.
• The procedure is documented in the chart.
• Procedural imaging is post processed and a permanent record is created for the PACS archive.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.
• Ongoing evaluation and management care is provided in the ICU during the infusion which includes management of thrombolysis dose, anticoagulation, monitoring of appropriate blood levels (e.g. fibrinogen, coagulation studies, etc) and clinical assessment of limb perfusion and access site.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.67	3.11
Intra-Service intensity/complexity	3.89	3.33
Post-Service intensity/complexity	3.44	3.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Why is this code being reviewed?

Code 37213, Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed; is a new code bundling the subsequent day work of arterial or venous thrombolysis. This service was previously reported with 37209, Exchange of a previously placed intravascular catheter during thrombolytic therapy (wRVU 2.27), 75898, Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion (wRVU 1.65), and 75900, Exchange of a previously placed intravascular catheter during thrombolytic therapy with contrast monitoring, radiological supervision and interpretation (wRVU 0.49). It also bundles all evaluation and management service provided on the same day. These patients require ICU care and the most frequent E&M code would be 99233, Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit (wRVU 2.00).

Work RVU Recommendation

We are recommending the 25th percentile from our multispecialty survey, a work RVU of 5.00.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views to treat the lesion in question. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

Clinical Comparison with Key Reference

The key reference service chosen by 20% of survey respondents is 36521 "Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s)." This is similar to 37213 in the sense that they are both vascular interventions. Key differences are that 3625 is a first-order diagnostic code whereas 37213 is an interventional code with likely higher order selective catheter placement.

Work Comparison with Key Reference

The primary differences between 36521 "Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s)." and 37213 are that 36251 has more intra-service time, and more post-service time but a lower intensity. There is less intra-service than key reference 36251 (33 min compared to 45). Otherwise, the two services have the identical pre-service and similar immediate post-service time.

Given these similarities, the two codes compare favorably and support our recommended 25th percentile survey value of 5.00 wRVUs.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37213	5.00	0.109	99	33	3	5	33	25
36251	5.35	0.085	116	33	3	5	45	30

Comparison to MPC codes

Comparison with MPC List Code 1, CPT 52276 – RVW 4.99

52276 "Cystourethroscopy with direct vision internal urethrotomy)" is a 0-day MPC service with 95 minutes total time including 30 minutes pre-time and 30 minutes post-time. Both 52276 and 372X3 are procedures requiring technical skill to complete successfully. Both 52276 and 37213 have similar total times and intensities but different distribution of times. RVW for 52276 is 4.99 and the adjustments to estimate an RVW for 372X3 from this reference service lies in the pre-, intra- and post-service times. The difference in intra-service time can be accounted for by adding 2 minutes multiplied by the IWPUT for 52276 (2 x 0.1042 = 0.2084). The difference in pre- and post-service time can be accounted for by adding 3 minutes at 0.0224 RVW per minute (3 x 0.0224 = 0.0672).

Thus, the estimated RVW of 37212 should be 4.99 (MPC RVW) + 0.2084 (intra-service adjustment) + 0.0672 (pre- and post-service adjustment) = 5.27. Comparison with this MPC code with very similar time and intensity inputs supports our recommended 25th percentile survey value of 5.00.

Comparison with MPC List Code 1, CPT 45385 – RVW 5.30

45385 "Colonoscopy, flexible, proximal to splenic flexure; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique" is a 0-day MPC service with 74 minutes total time, including 16 minutes pre-time and 15 minutes post-time. Both 45385 and 37212 are invasive procedures requiring technical skill to perform successfully. 45385 and 372X2 have similar intra-service times and very similar IWPUTs (0.1071 vs. 0.109). RVW for 45385 is 5.30 and the major adjustment to estimate an RVW for 37213 from this reference service lies in the pre-, intra- and post-service times. The difference in intra-service time can be accounted for by subtracting 10 minutes multiplied by the IWPUT for 45385 (10 x 0.1071 = 1.071). The difference in pre- and post-service times can be accounted for by adding 32 minutes at 0.0224 RVW per minute (32 x 0.0224 = 0.7168).

Thus, the estimated RVW of 37213 should be 5.30 (MPC RVW) - 1.071 (intra-service adjustment) + 0.7168 (pre- and post-service adjustment) = 4.95. Comparison with this MPC code with very similar time and intensity inputs supports our recommended 25th percentile survey value of 5.00.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
52276	Cystoscopy and treatment	4.99	0.104	95	30			35	30
37213	Continue thrombolysis, subseq day	5.00	0.109	99	33	3	5	33	25
45385	Lesion removal colonoscopy	5.30	0.107	74	16			43	15

In conclusion, our recommended 25th percentile survey value of 5.00 lays nicely between the wRVU for MPC codes 52276 and 45385, both raw and adjusted.

Additional points of comparison

We find four other codes in the RUC database that further support our recommended 25th percentile survey value of 5.00 for 37213. They are 43246 "Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube", 93452 "Left heart catheterization including intraprocedural injection(s) for left ventriculography, imaging supervision and interpretation, when performed", 59070 "Transabdominal amnioinfusion, including ultrasound guidance", and 93455 "Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with catheter placement(s) in bypass graft(s) (internal mammary, free arterial venous grafts) including intraprocedural injection(s) for bypass graft angiography" The table below compares these codes to 37213.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post	RUC reviewed
43246	Place gastrostomy tube	4.32	0.075	106	35	8	5	38	20	2005
93452	Left hrt cath w/ventrclgrphy	4.75	0.102	108	40	3	5	30	30	2010
37213	Continue thrombolysis, subseq day	5.00	0.109	99	33	3	5	33	25	**2012**
59070	Transabdom amnioinfus w/us	5.24	0.109	125	40	15	10	30	30	2003
93455	Coronary art/grft angio s&i	5.54	0.094	123	45	3	5	40	30	2010

Summary

Based on all the above data and comparisons, we believe the 25th percentile survey RVW of 5.00 is appropriate for 37213.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37209, 75898, 75900 and 99233

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Interventional Radiology How often? Commonly

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,230
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The specialty mix is based on the specialty mix in the reference service code 37184.

Specialty Vascular Surgery Frequency 610 Percentage 23.01 %

Specialty Interventional Radiology Frequency 1060 Percentage 40.00 %

Specialty Cardiology Frequency 424 Percentage 16.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37184

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37214 Tracking Number I4 Original Specialty Recommended RVU: **3.04**
Presented Recommended RVU: **3.04**
Global Period: 000 RUC Recommended RVU: **3.04**

CPT Descriptor: Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed, and cessation of thrombolysis including removal of catheter and vessel closure by any method

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old man with an occluded right femoral-popliteal bypass has been treated by continuous infusion of thrombolysis for 2 days. He is clinically improved, and there is no longer evidence of leg ischemia. He undergoes follow-up angiography which demonstrates successful thrombolysis. The catheter is removed and vessel closed.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 92%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 8%

Description of Pre-Service Work:
• Ongoing evaluation and management care is provided which includes management of thrombolysis dose.
• The patient is transferred from his hospital room to the angiographic suite and placed on the angiographic table.
• Clinical assessment of the patient includes evaluation of extremity perfusion, as well as motor/sensory exam of the affected leg.
• Moderate sedation is administered.

Description of Intra-Service Work:
• Moderate sedation is monitored.
• Thrombolytic in fusion is temporarily stopped.
• Contrast is injected through the infusion catheter and angiography is performed, studying the area that is being infused.
• Angiography shows completed therapy.
• The infusion catheter is removed.
• Hemostasis obtained with manual compression, closure device, or standard closure of the arteriotomy.

Description of Post-Service Work:

• Dressings are applied.
• Moderate sedation post procedure work.
• The patient is transferred from the angio suite to the ICU for continued care during thrombolysis.
• Appropriate care orders are written.
• The procedure is documented in the chart.
• Procedural imaging is post processed and a permanent record is created for the PACS archive.
• A formal report including image interpretation is dictated, transcribed, edited, and authenticated for archival in the permanent medical record.
• The procedural findings and treatment plans are discussed with the patient, family, and referring medical team.
• Ongoing evaluation and management care is provided which includes anticoagulation, monitoring of appropriate blood levels (e.g. fibrinogen, coagulation studies, etc) and clinical assessment of limb perfusion and access site.

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 8 **% of respondents:** 16.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 37214**	**Key Reference CPT Code:** 36251	**Source of Time** RUC Time
Median Pre-Service Time	41.00	40.00	
Median Intra-Service Time	38.00	45.00	
Median Immediate Post-service Time	23.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	

Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	
Median Total Time	**102.00**	**115.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.56	3.22
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.44	3.22
Urgency of medical decision making	3.22	3.11
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.56	3.67
Physical effort required	3.56	3.56
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.11	3.67
Outcome depends on the skill and judgment of physician	4.22	4.00
Estimated risk of malpractice suit with poor outcome	3.89	3.69

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.67	3.11
Intra-Service intensity/complexity	3.89	3.33
Post-Service intensity/complexity	3.44	3.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Why is this code being reviewed?

Code 37214 "Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed; cessation of thrombolysis including removal of catheter and vessel closure by any method" is a new code bundling the final day work of arterial or venous thrombolysis. This service was previously reported with 75898 "Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion" (wRVU 1.65), and 99233 "Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication" (wRVU 1.39).

Work RVU Recommendation

We are recommending the existing values, a work RVU of 3.04.

Pre-time

Pre-time package 2b (facility- difficult patient/straightforward procedure with sedation/anesthesia) is appropriate, with modifications to the package positioning time. We recommend adding 2 minutes for appropriate positioning on the table in order to be able to obtain all appropriately necessary views to treat the lesion in question. These additional minutes were added to the lower extremity revascularization codes for the same reasons and accepted by the RUC.

Comparison to key reference code

Clinical Comparison with Key Reference

The key reference service chosen by 17% of survey respondents is 36521 "Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s)." This is similar to 37214 in the sense that they are both vascular interventions. Key differences are that 36521 is a first-order diagnostic code whereas 37214 is an interventional code with completion of treatment and closure of the access site.

Work Comparison with Key Reference

The primary differences between 36521 "Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s)." and 37214 are that 36251 has more intra-service time, and more post-service time but a lower intensity. There is less intra-service than key reference 36251 (38 min compared to 45). Otherwise, the two services have the identical pre-service and similar immediate post-service time.

Given these similarities, the two codes compare favorably and support our recommended value of 3.04 wRVUs.

CPT	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
37214	3.04	0.044	102	33	3	5	38	23
36251	5.35	0.085	116	33	3	5	45	30

Comparison to MPC codes

Comparison with MPC List Code 1, CPT 31622 – RVW 2.78

31622 "Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)" is a 0-day MPC service with 65 minutes total time, including 20 minutes pre-time and 15 minutes post-time. Both 31622 and 37214 are invasive procedures requiring technical skill to perform successfully. Both 31622 and 37214 have similar of intra-service times (30 min vs. 38 min). RVW for 31622 is 2.78 and the major adjustment to estimate an RVW for 37214 from this reference service lies in the pre-service and intra-service times. The difference in intra-service time can be accounted for by adding 8 minutes multiplied by the IWPUT for 31622

(8 x 0.0688 = 0.5504) and adding 26 minutes of pre- and post-service time at 0.0224 RVW per minute (26 x 0.0224 = 0.5824).

Thus, the estimated RVW of 37214 should be 2.78 (MPC RVW) + 0.5504 (intra-service adjustment) + 0.5824 (pre- and post-service adjustment) = 3.91. Comparison with this MPC code with very similar intra-service time more than supports our recommended value of 3.04.

Comparison with MPC List Code 1, CPT 45378 – RVW 3.69

45378 "Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)" is a 0-day MPC service with 75 minutes total time including 30 minutes pre-time and 15 minutes post-time. Both 45378 and 37214 are procedures requiring technical skill to complete successfully. Both 45378 and 37214 have similar intra-service times. RVW for 45378 is 3.69 and the adjustments to estimate an RVW for 37214 from this reference service lies in the pre-, intra- and post-service times. The difference in intra-service time can be accounted for by adding 8 minutes multiplied by the IWPUT for 45378 (8 x 0.0917 = 0.7336) and adding 16 minutes of pre- and post-service time at 0.0224 RVW per minute (16 x 0.0224 = 0.3584).

Thus, the estimated RVW of 37214 should be 3.69 (MPC RVW) + 0.7336 (intra-service adjustment) + 0.3584 (pre- and post-service adjustment) = 4.782. Comparison with this MPC code with very similar time supports our recommended value of 3.04.

In conclusion, our recommended value of 3.04 lays nicely between the wRVU for MPC codes 31622 and 45378.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
31622	Dx bronchoscope/wash	2.78	0.069	65	10	5	5	30	15
37214	End thrombolysis, remov cath	3.04	0.044	102	33	3	5	38	23
45378	Diagnostic colonoscopy	3.69	0.092	75	20	5	5	30	15

Additional points of comparison

We find four other codes in the RUC database that further support our recommended value of 3.04 for 37214. They are 51729 "Complex cystometrogram (ie, calibrated electronic equipment); with voiding pressure studies (ie, bladder voiding pressure) and urethral pressure profile studies (ie, urethral closure pressure profile), any technique", 12007 "Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); over 30.0 cm", 49446 "Conversion of gastrostomy tube to gastro-jejunostomy tube, percutaneous, under fluoroscopic guidance including contrast injection(s), image documentation and report" and 31630 "Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with tracheal/bronchial dilation or closed reduction of fracture." The table below compares these codes to 37214.

CPT	DESC	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post	RUC reviewed
51729	Cystometrogram w/vp&up	2.51	0.043	75	20	0	0	40	15	2006
12007	Repair superficial wound(s)	2.90	0.071	54	8	2	1	35	8	2010
36200	Place catheter in aorta	3.02	0.058	91	33	3	5	30	20	2011
37214	End thrombolysis, remov cath	3.04	0.044	102	33	3	5	38	23	2012
49446	Change g-tube to g-j perc	3.31	0.055	93	25	8	5	40	15	2007
31630	Bronchoscopy dilate/fx repr	3.81	0.050	125	20	15	15	45	30	2003

Summary

Based on all the above data and comparisons, we believe the RVW of 3.04 is appropriate for 37214.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. There is a possibility that a patient will have a stenosis identified after clot dissolution and would benefit from either an endovascular intervention or open surgical revascularization that may be done on the same day or a subsequent date (same hospitilization).

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 75898 and 99232

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Interventional Radiology How often? Commonly

Specialty Cardiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
13,436 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The specialty mix is based on the specialty mix in the reference service code 37184.

Specialty Vascular Surgery Frequency 3091 Percentage 23.00 %

Specialty Interventional Radiology Frequency 5375 Percentage 40.00 %

Specialty Cardiology Frequency 2150 Percentage 16.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37184

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

37211 Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day

37212 Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day

37213 Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed

37214 Transcatheter therapy, arterial or venous infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, continued treatment on subsequent day during course of thrombolytic therapy, including follow-up catheter contrast injection, position change, or exchange, when performed, and cessation of thrombolysis including removal of catheter and vessel closure by any method

Global Period: 000 **Meeting Date:** April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus committee including SVS, SIR, and ACR members discussed practice expense details for codes 37211-37214.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

We used CPT code 37182 *Insertion of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation)* as a reference code. CPT 37182 was reviewed by the RUC in Feb 2002.

The typical patient for 37211 and 37212 would present to the hospital emergency room and therefore we are not requesting pre-service clinical staff time. The patient will remain in the hospital; therefore, post-service clinical staff time does not apply.

The typical patient for 37213 and 37214 is already in the hospital. We are requesting pre time for scheduling space and equipment in the hospital for 37213 and 37214. We are also requesting 3 post service minutes in 37214 for phone calls.

Pre-Service Clinical Labor Activities:
Schedule space and equipment in facility

Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities:
Conduct phone calls/call in prescriptions

CPT Code: 37211-37214
Specialty Society('s): SVS, ACR, SIR

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More Screen

September 2011

Transcath Retrieval Intravascular Foreign Body

In 2010, the RUC's Relativity Assessment Workgroup identified the code pair *37620 Interruption, partial or complete, of inferior vena cava by suture, ligation, plication, clip, extravascular, intravascular (umbrella device)* and 75940 *Percutaneous placement of IVC filter, radiological supervision and interpretation* and 36010 *Introduction of catheter, superior or inferior vena cava* billed together more than 75% of the time according to 2009 Medicare claims data. In February 2011, the CPT Editorial Panel created four new codes to bundle the services together. In April 2011, three new codes 37191, 37192 and 37193 were surveyed and reviewed by the RUC. However, one code 37197 *Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed* was held for survey for the September 2011 RUC meeting.

The RUC reviewed the survey results from 69 practicing physicians and agreed with the specialty that the survey's median physician time components as follows: pre-service time of 41 minutes, intra-service time of 60 minutes and post-service time of 20 minutes. The RUC also reviewed the survey's estimated work values and disagreed that the median work RVU of 8.00 was an accurate valuation for the typical physician work involved. The RUC did not agree that this service reflected the same work as 37183 *Revision of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recanulization/dilatation, stent placement and all associated imaging guidance and documentation)* (work RVU= 7.99). However, the RUC understands that the easier patients will be reported under the new IVC filter code 37193 *Retrieval (removal) of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* leaving an increase in intensity of patients for 37197.

To find an appropriate value, the RUC compared the surveyed code to CPT code 36475 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated* (work RVU= 6.72) and agreed that the two service have highly similar intra-service work, and identical time of 60 minutes. Given that these service are so similar, the RUC agreed that 37197 should be directly crosswalked to 36475. For additional reference, 37197 was compared to CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

code 36478 *Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, laser; first vein treated* (work RVU= 6.72) and the RUC agreed that the two services should be valued identically, due to analogous physician work and intra-service time, 55 minutes and 60 minutes, respectively. Finally, to ensure a work RVU of 6.72 is accurate, the RUC took the median survey of 8.00 work RVUs and backed out the introduction service, 36013 *Introduction of catheter, right heart or main pulmonary artery* (work RVU= 1.26), adjusted for multiple procedure reduction). The resulting work RVU of 6.74 is an accurate value for the physician work involved in 37197, providing an additional level of validation for the recommended work RVU of 6.72 (a direct crosswalk to 36475). **The RUC recommends a work RVU of 6.72 for CPT code 37197.**

Practice Expense
The RUC accepted the direct practice expense inputs recommended by the specialty and made minor modifications to the equipment to align with the revised moderate sedation equipment guidelines.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (●New)	Track-ing Number	CPT Descriptor	Global Period	Work RVU Recommendation
⦿37191		Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed (For open surgical interruption of the inferior vena cava through a laparotomy or retroperitoneal exposure, use 37619)	000	4.71 (RUC Recommended Value from April 2011 Meeting)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

⦿37192		Repositioning of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed (Do not report 37192 in conjunction with 37191)	000	8.00 (RUC Recommended Value from April 2011 Meeting)
⦿37193		Retrieval (removal) of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed (Do not report 37193 in conjunction with ~~37203,~~ 37197)~~75961)~~	000	8.00 (RUC Recommended Value from April 2011 Meeting)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:37197 Tracking Number Original Specialty Recommended RVU: **8.00**
Presented Recommended RVU: **8.00**
Global Period: 000 RUC Recommended RVU: **6.72**

CPT Descriptor: Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed. (For percutaneous retrieval of a vena cava filter, use (37193)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59-year-old woman with metastatic breast cancer has a fractured venous catheter related to her indwelling venous port. The catheter fragment has migrated to the right ventricle, and the distal tip is in the main pulmonary artery. Catheter fragment retrieval is performed from a percutaneous femoral vein approach.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 87%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 75%

Description of Pre-Service Work: The physician reviews the patient signs and symptoms, physical findings, medical/operative history and available diagnostic studies. The physician then assesses venous access options and estimates the range of sheaths, guidewires, catheters, and dilators that may be required, and ensures availability. Additional physician work includes: assess need for stand-by devices that might be needed emergently (e.g. crash cart), review results of recent laboratory testing, with special attention to anticoagulant or antiplatelet therapy, contrast allergy, electrolytes, BUN, creatinine, and CBC to assure patient suitability for planned procedure. The patient is reexamined to make sure that physical findings have not changed and the H&P is updated. The physician discusses procedure plan in detail, including alternatives and risks with patient and family. Obtain informed consent for procedure and conscious sedation. Mark access sites and record presence/absence of distal pulses, capillary refill, and severity of lower extremity edema bilaterally. Check interventional suite to ensure proper function and configuration of imaging equipment including compliance with radiation safety issues. Ensure all technical personnel have been familiarized with the planned procedure, techniques, and all required devices. Ensure the patient is appropriately positioned on the table and intravenous access has been established. Don radiation protection gear and ensure that all who will be in the interventional suite do likewise. Supervise sterile prep of access site(s) and subsequent draping. Perform pre-procedural "time-out."

Description of Intra-Service Work: Administer or supervise administration of conscious sedation. The location of the access vessel (common femoral vein) is determined with palpation of the adjacent common femoral artery. Superficial and deep local anesthesia is administered. Using Seldinger technique, the access vessel is punctured and a guidewire is advanced. Serial 4 and 5 Fr dilators are passed and an 8 French vascular sheath is placed into the accessed common

femoral vein. A second guidewire is placed, the 8 Fr sheath is removed, and the sheath is replaced over one of the guidewires (leaving the second wire external to the sheath). A guide catheter is manipulated centrally into the heart adjacent to the foreign body fragment. The coaxial wire is removed and a snare is placed through the guide catheter. The guide catheter and snare combination are used to capture the foreign body fragment in the snare under fluoroscopic guidance. When captured, the fragment is firmly gripped in the snare/guide catheter system. The fragment and guide/snare system are retracted to the sheath. The sheath and fragment/guide/snare are removed as a unit leaving the safety wire in position. The fragment is inspected to judge completeness of removal. The chest is fluoroscopically evaluated to assure no remaining catheter fragments are present. The safety guide wire is removed. Manual compression is utilized for closure of the venotomy to achieve hemostasis.

Description of Post-Service Work: Apply sterile dressings. Assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Dictate complete procedure note. Repeat patient exam and assessment of vital signs and lower extremity perfusion multiple times in recovery area, as needed. Monitor groin puncture site for hematoma. Discuss findings and treatment with family and patient (when awake). Write orders for follow-up physician encounter, labs, and additional diagnostic studies or therapeutic procedures as indicated. The patient is transferred to an appropriate inpatient care setting or discharged to home when recovery area discharge criteria are met. Discharge or admission/transfer orders are completed. All appropriate medical records are completed, with copy to referring physician.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.12	2.64
Intra-Service intensity/complexity	4.00	3.24
Post-Service intensity/complexity	2.72	2.44

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 37197 (*Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed*) is a new bundled code which resulted from the parent codes being identified through the "codes reported together 75% or more" screen. The new code is similar to the IVC retrieval code created during the recent restructuring of the IVC filter codes. The surveyed code 37197 consists of a complex venous intervention in which an intravascular foreign body is secured and retrieved. Wires, catheters, and endovascular devices are placed into the peripheral vasculature, heart, and pulmonary artery. In addition, this code describes the work of explanting a foreign body (example: catheter fragment). The intervention is intense, and potential complications, including acute cardiac arrhythmia, are significant.

IVC retrieval was previously reported with component coding as 37203 (*Transcatheter retrieval, percutaneous, of intravascular foreign body*) with an intra-service time of 80 minutes (RVW 5.02) and 75961 (*Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), radiological supervision and interpretation*), (RVW 4.24) resulting in a cumulative RVW of 9.26. Code 37203 was frequently utilized to report IVC filter retrieval. The IVC filter codes have been restructured for CPT 2012 and filter removal is now a bundled code, reviewed by the RUC in April 2011 with an intra-time of 60 minutes and RUC recommended RVW of 8.00. The physician activity involved with the new bundled code and the current surveyed code (37197) is very similar in that large vascular access sheaths and endovascular retrieval devices are employed to remove a foreign body from the central venous system. The multidisciplinary survey results from 37197 reflect significant similarity between this new code and the recently RUC evaluated IVC filter retrieval code. The multidisciplinary expert consensus panel concluded that these codes are technically very similar based on magnitude estimation.

A multi-specialty survey with 69 respondents was completed for 37197. 91% of the respondents indicated the vignette was typical. The survey median intra-service time was 60 minutes and median RVW was 8.00.

Pre-time

Pre-time package 2B (Facility- Difficult Patient/Straightforward Procedure - With sedation/anesthesia care) is appropriate with the addition of 2 minutes to the positioning time to permit imaging and movement of monitors and wires/lines in the radiographic field.

Comparison to key reference codes

The most frequent reference code chosen by survey respondents was 36595 (*Mechanical removal of pericatheter obstructive material (eg, fibrin sheath) from central venous device via separate venous access*) with an intra-service time of 45 minutes and RVW of 3.59. This is now reported with the S&I code 75901 (*Mechanical removal of pericatheter obstructive material (eg, fibrin sheath) from central venous device via separate venous access, radiologic supervision and interpretation*) with an RVW of 0.49) for cumulative RVW of 4.08. CPT code 36595 is technically similar to 37197 in that an endovascular retrieval device is deployed into the venous system, however there are significant differences between 36595 and 37197. The survey respondents rated 36595 to have lesser complexity and intensity, mental effort and judgment, as well as technical skill/physical effort than 37197. It is the consensus of the expert panel that the survey respondents took these differences into account when estimating work RVU of 37197 relative to those provided in the key reference code. Code 37197 vignette involves selective catheterization of the right heart and pulmonary arteries whereas 36595 describes a direct inline access from the IVC into the SVC. The size of venous access is typically smaller for 36595, since only pericatheter material rather than larger foreign bodies are removed. Moderate sedation is included in the pre-time work for 37197 and is not for 36595.

Mod Sed?	CPT	Glob	RVW	Total Time	EVAL	POSIT	SDW	INTRA	POST
No	**36595**	000	3.59	90	30			45	15
Yes	**37197**	000	8.00	121	33	3	5	60	20

37183 (*Revision of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recanulization/dilatation, stent placement and all associated imaging guidance and documentation*) with an intra-service time of 77.5 minutes and RVW of 7.99 was the second most frequently selected reference code in this survey. The surveyed respondents rated 37183 to have similar complexity and intensity, mental effort and judgment, as well as technical skill/physical effort than the surveyed code. Code 37183 is also a bundled service and is technically similar to 37197 in that large access sheaths are introduced into the vascular system and branches arising from the SVC/IVC are selected to perform an intervention.

Mod Sed?	CPT	Glob	RVW	Total Time	EVAL	POSIT	SDW	INTRA	POST
Yes	**37183**	000	7.99	135	27.5			77.5	30
Yes	**37197**	000	8.00	121	33	3	5	60	20

The multidisciplinary expert consensus recommends the median values for time and RVW (8.00). Median time and RVU values accurately reflect the physician work and complexity of intervention. The survey values are supported by the key reference codes. The work is analogous to the recently RUC reviewed filter removal code (372X3).

Mod Sed?	CPT	Glob	RVW	Total Time	EVAL	POSIT	SDW	INTRA	POST
Yes	**372x3**	000	8.00	116	33	3	5	60	15
Yes	**37197**	000	8.00	121	33	3	5	60	20

Comparison to MPCs:
CPT Code 372X1 is also appropriately placed relative to MPC codes 31600 and 43269.

	CPT	DESC	GLOB	RVW	Total Time	eval	pos	s,d,w	INTRA	sd-im

Recommendations
We recommend a work RVU of 8.00 for CPT Code 37197

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Retrieval of a foreign body can occur in any vessel, both arterial and venous. The work required for retrieval will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more vascular catheterization codes in addition to the retrieval code.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT code 37203 and S&I CPT code 75961

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Specialty Interventional Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 1260
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that approximately half of the foreign body retrievals will be for Medicare patients.

Specialty Radiology Frequency 600 Percentage 47.61 %

Specialty Interventional Radiology Frequency 160 Percentage 12.69 %

Specialty Vascular Surgery Frequency 200 Percentage 15.87 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 630
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Foreign Body Retrieval was previously reported with CPT code 37203 (2010-4,214). The RUC made recommendations for new IVC Filter codes at the April 2011 RUC meeting for CY 2012. We estimated that 85% of the 37203s would now be coded with the IVC filter retrieval code and 15% will be coded with this new FBR code 372XX1.

Specialty Radiology Frequency 302 Percentage 47.93 %

Specialty Interventional Radiology Frequency 88 Percentage 13.96 %

Specialty Vascular Surgery Frequency 113 Percentage 17.93 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37183

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptors:

37197 Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed

(For percutaneous retrieval of a vena cava filter, use 37193)

Global Periods: 000 **Meeting Date:** September 2011

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The multispecialty organizations (SIR, ACR, SVS, ACC and SCAI) convened a panel that included a number of experts familiar with this service to evaluate the direct practice expense inputs for this newly created CPT code.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

We selected CPT code 37193 *Retrieval (removal) of intravascular vena cava filter, endovascular approach inclusive of vascular access, vessel selection, and all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy)* as our comparison code. The procedures, processes and resources are comparable. The RUC and PE Subcommittee approved CPT code 37193 in April 2011.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Schedule space and equipment in facility

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptors:

37197 Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed

(For percutaneous retrieval of a vena cava filter, use 37193)

Global Periods: 000 **Meeting Date:** September 2011

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The multispecialty organizations (SIR, ACR and SVS) convened a panel that included a number of experts familiar with this service to evaluate the direct practice expense inputs for this newly created CPT code.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

We selected CPT code 37193 *Retrieval (removal) of intravascular vena cava filter, endovascular approach inclusive of vascular access, vessel selection, and all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy)* as our comparison code. The procedures, processes and resources are comparable. The RUC and PE Subcommittee approved CPT code 37193 in April 2011.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Phone calls & prescriptions
- Retrieve prior imaging exams, hang for MD review, verify orders, review chart to incorporate relevant clinical information, confirm contrast protocol with interpreting MD

Intra-Service Clinical Labor Activities:

The patient is greeted, gowning is provided and patient is escorted to procedure room. The nurse obtains vital signs, interviews the patient for allergies, medications and coagulopathy. Procedure is explained and informed consent is witnessed. The rad tech prepares the room, equipment and supplies after consulting with the M.D regarding the supplies to be used. The angio tech prepares the back table. IV access is established. The patient is positioned, skin is prepped and the patient is draped. RN administers conscious sedation. The angio tech assists the M.D. performing procedure. The rad tech assists the MD with flouro, contrast, image acquisition, etc. The patient is escorted to the observation area. RN performs sequential vital signs over 4 hour

observation. RT processes the images and completes all the necessary paperwork. The angio tech cleans the room. The patient is given discharge instructions.

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Bone Marrow Stem Cell Transplant

In February 2011, the RUC had a extensive discussion regarding the appropriate Evaluation and Management billing for CPT code 38240 *Bone marrow or blood-derived peripheral stem cell transplantation; per allogenic donor*. The specialties explained that the physician work involved in the management of infusion, including managing a reaction, is included in the intra-service work of code 38240. The RUC expressed concern that implementing CCI edits to preclude reporting an Evaluation and Management service on the same date of service would limit the ability for physicians to report the separately identifiable visit prior to the procedure on the same date. Given this, the RUC, and the specialty agreed, that this service should be referred back to the CPT Editorial Panel along with the family of services, CPT codes 38241 and 38242, to examine the current descriptors and descriptions of physician work to ensure these services are currently reported correctly and can be properly valued by the RUC.

In October 2011, the CPT Editorial Panel added introductory language, created one new code to describe hematopoietic progenitor cell boost and revised three existing codes to clarify this family of services.

The specialty societies indicated and the RUC agreed that there is compelling evidence that these services have changed since 1992. The majority of allogeneic transplants are now from unrelated donors which have much greater risk to the patient. Additionally, the typical patient has changed, the population receiving transplants now have acute diseases, such as acute myologic leukemia, acute lympoblastic leukemia, multiple myelomas etc., whereas previously the typical patient had chronic disease.

38240 Hematopoietic progenitor cell (HPC); allogeneic transplantation per donor
The RUC reviewed the survey results from 37 bone and marrow transplant physicians and determined that the survey median work RVU of 4.00 appropriately accounts for the work required to perform this service. The RUC agreed with the surveyed physician time of 30 minutes pre-time, 60 minutes intra-time and 30 minutes post-service time. The specialty society indicated that the physician is a participant in manufacturing of the product, assessing the purity and potency of stem cells and ensuring systems are in place to deliver product properly. As part of the intra-service, the RUC determined that the physician is not checking the patient's vitals, but must be immediately available on-site, typically in the hallway. The RUC noted that the post-service time includes producing the lengthy report to the FDA. The RUC also determined that 38240 is more intense and complex than 38241, the autologous transplantation code.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC compared 38240 to the key reference code 99205 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 3.17 and 45 minutes intra-service time) and determined that 38240 requires much more physician time, technical skill, physical effort and psychological stress to perform. For further support the RUC compared 38240 to codes 99223 *Initial hospital care, per day, for the evaluation and management of a patient* (work RVU = 3.86 and 55 minutes intra-service time) and 36147 *Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection[s] of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava)* (work RVU = 3.72 and 45 minutes intra-service time), both which require less physician work and time than the surveyed service. **The RUC recommends a work RVU of 4.00 for CPT code 38240.**

38241 Hematopoietic progenitor cell (HPC); autologous transplantation
The RUC reviewed the survey results from 33 bone and marrow transplant physicians and determined that the survey 25th percentile work RVU of 3.00 appropriately accounts for the work required to perform this service. The RUC determined physician time of 18 minutes pre-time, 60 minutes intra-time and 30 minutes post-service time were appropriate to perform this service. This service will require less pre-service time than 38240 since the donor and recipient are the same person. The specialty society indicated that the physician is a participant in manufacturing of the product, assessing the purity and potency of stem cells and ensuring systems are in place to deliver product properly. Additionally, regarding the intra-service time, the RUC determined that the physician is not checking the patient's vitals, but must be immediately available on-site, typically in the hallway. The RUC noted that the post-service time includes producing the lengthy report to the FDA.

The RUC determined that a work RVU of 3.00 places this service in the proper rank order compared to the allogeneic code 38240. The RUC compared 38241 to code 95974 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, with or without nerve interface testing, first hour* (work RVU = 3.00 and 60 minutes intra-service time) and determined that both services require the same physician work and time to perform. For further support the RUC compared 38241 to code 75563 *Cardiac magnetic resonance imaging for morphology and function without contrast material(s), followed by contrast material(s) and further sequences; with stress imaging* (work RVU = 3.00 and 60 minutes intra-service time), which requires the same physician work and time as the surveyed service. **The RUC recommends a work RVU of 3.00 for CPT code 38241.**

38243 Hematopoietic progenitor cell (HPC); HPC boost
The RUC reviewed the survey results from 30 bone and marrow transplant physicians and determined that the survey 25th percentile work RVU of 2.13 appropriately accounts for the work required to perform this service. The RUC determined the survey time of 30 minutes pre-time, 45 minutes intra-time and 30 minutes post-service time were appropriate to perform this service. The specialty society indicated that the physician is a participant in manufacturing of the product, assessing the purity and potency of stem cells and ensuring systems are in place to deliver product

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

properly. Additionally, regarding the intra-service time, the RUC determined that the physician is not checking the patient's vitals, but must be immediately available on-site, typically in the hallway. The RUC noted that the post-service time includes producing the lengthy report to the FDA.

The RUC compared 38243 to key reference code 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 2.11 and 35 minutes intra-service time) and determined that 38243 requires the 10 minutes more intra-service time but similar physician work to perform. For additional support the RUC compared 38243 to CPT code 70554 *Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration* (work RVU = 2.11) and determined that the surveyed code required similar physician work to perform. **The RUC recommends a work RVU of 2.13 for CPT code 38243.**

38242 Allogeneic lymphocyte infusion
The RUC reviewed the survey results from 31 bone and marrow transplant physicians and determined that the survey 25th percentile work RVU of 2.11 appropriately accounts for the work required to perform this service. The RUC determined the survey time of 30 minutes pre-time, 45 minutes intra-time and 30 minutes post-service time were appropriate to perform this service. The specialty society indicated that the physician is a participant in manufacturing of the product, assessing the purity and potency of stem cells and ensuring systems are in place to deliver product properly. Additionally, regarding the intra-service time, the RUC determined that the physician is not checking the patient's vitals, but must be immediately available on-site, typically in the hallway. The RUC noted that the post-service time includes producing the lengthy report to the FDA.

The RUC compared 38242 to key reference code 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 2.11 and 35 minutes intra-service time) and determined that 38242 requires the 10 minutes more intra-service time but the same physician work to perform. For additional support the RUC compared 38242 to CPT code 70554 *Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration* (work RVU = 2.11) and determined that the surveyed code required the same physician work to perform. The RUC determined that a work RVU of 2.11 places this service in the proper rank order relative to 38243 (recommended work RVU = 2.13 and same physician time). **The RUC recommends a work RVU of 2.11 for CPT code 38242.**

Practice Expense
This service is performed in the facility only and therefore has no direct practice expense inputs.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

38230 Bone marrow harvesting for transplantation; allogeneic

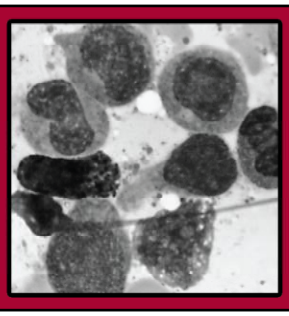
38232 autologous

(For autologous and allogeneic blood-derived peripheral stem cell harvesting for transplantation, see 38205-38206)

(For bone marrow aspiration, use 38220)

Transplantation and Post-Transplantation Cellular Infusions

Hematopoietic cell transplantation (HCT) refers to the infusion of hematopoietic progenitor cells (HPC) obtained from bone marrow, peripheral blood apheresis and/or umbilical cord blood. These procedure codes (38240-38242) include physician monitoring of multiple physiologic parameters, physician verification of cell processing, evaluation of the patient during as well as immediately before and after the HPC/lymphocyte infusion, physician presence during the HPC/lymphocyte infusion with associated direct physician supervision of clinical staff, and management of uncomplicated adverse events (eg, nausea, urticaria) during the infusion, which is not separately reportable.



HCT may be autologous (when the HPC donor and recipient are the same person) or allogeneic (when the HPC donor and recipient are not the same person). Code 38241 is used to report any autologous transplant while 38240 is used to report an allogeneic transplant. In some cases allogeneic transplants involve more than one donor and cells from each donor are infused sequentially whereby one unit of 38240 is reported for each donor infused. Code 38242 is used to report a donor lymphocyte infusion. Code 38243 is used to report a HPC boost from the original allogeneic HPC donor. A lymphocyte infusion or HPC boost can occur days, months or even years after the initial hematopoietic cell transplant. The lymphocyte infusion is used to treat relapse, infection, or post-transplant lymphoproliferative syndrome. HPC boost represents an infusion of hematopoietic progenitor cells from the original donor that is being used to treat a relapse or post-transplant cytopenia(s). Codes 38240, 38243 and 38242 should not be reported together on the same date of service.

If a separately identifiable evaluation and management service is performed on the same date of service, the appropriate E/M service code, including office or other outpatient services, established (99211-99215), initial observation care (99218-99220), observation care discharge services (99217), subsequent observation care (99224-99226), initial hospital care (99221-99223), subsequent hospital care (99231-99233), observation or inpatient hospital care (99234-99236), hospital discharge services (99238, 99239), inpatient neonatal and pediatric critical care (99471, 99472, 99475, 99476) may be reported, using modifier 25, in addition to 38240, 38243 or 38242. Post-transplant infusion management of adverse reactions is reported separately utilizing the appropriate E/M, prolonged service or critical care code(s). In accordance with place of service and facility reporting guidelines, the fluid used to administer the cells and other infusions for incidental hydration (eg, 96360, 96361) are not separately reportable. Similarly, infusion(s) of any medication(s) concurrently with the transplant infusion are not separately reportable. However, hydration or administration of medications (eg, antibiotics, narcotics) unrelated to the transplant are separately reportable using modifier 59.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

April 5, 2012

Barbara Levy, MD.
Chair, AMA/Specialty Society RVS Update Committee
515 North State Street
Chicago, IL 60654

Dear Dr. Levy:

We are pleased to present the Summary of Work for the family of Hematopoietic Progenitor Cell (HPC) infusion codes 38240 – 38242 (Tab 16, J1 – J4). As part of our submission, we are also providing a brief history of how the family of codes came to be surveyed, along with information on how the surveys were conducted (i.e., that the new language added to CPT was included with the survey).

The American Society for Blood and Marrow Transplantation (ASBMT) requested changes for CPT 38240 at the October 2010 meeting of the CPT Editorial Panel for review by the RUC in February 2011. Transplant procedures have evolved to sometimes include the infusion of cells from multiple donor sources. The ASBMT sought, and the CPT Panel agreed, to amend the code description to include "per donor" language (38240 – bone marrow or blood-derived peripheral stem cell transplantation; per allogeneic donor).

This revised CPT code went on to survey and data was presented at the February 2011 RUC meeting. The RUCs summary follows:

The RUC had an extensive discussion regarding the appropriate Evaluation and Management billing for CPT code 38240 Bone marrow or blood-derived peripheral stem cell transplantation; per allogeneic donor. The specialties explained that the physician work involved in the management of infusion, including managing a reaction, is included in the intra-service work of code 38240. The RUC expressed concern that implementing CCI edits to preclude reporting an Evaluation and Management service on the same date of service would limit the ability for physicians to report the separately identifiable visit prior to the procedure on the same date. Given this, the RUC, and the specialty agreed, that this service should be referred back to the CPT Editorial Panel along with the family of services, CPT codes 38241 and 38242, to examine the current descriptors and descriptions of physician work to ensure these services are currently reported correctly and can be properly valued by the RUC.

Subsequently, the ASBMT Coding Committee and staff consulted with CMS and AMA staff and presented changes via a CCP to the CPT descriptors for the full family of CPT Codes 38240 – 38241. This review included the substantial addition of introductory language, updated terminology that corresponds with industry standards, and the addition of a fourth CPT code (3824x1) to differentiate lymphocyte infusion from a stem cell boost. The new language is listed below:

Category I
Surgery
Hemic and Lymphatic Systems
General
Bone Marrow or Stem Cell Services/Procedures

38230 Bone marrow harvesting for transplantation; Allogeneic

38232 Autologous

(For autologous and allogeneic blood-derived peripheral stem cell harvesting for transplantation, see 38205- 38206)

(For bone marrow aspiration, use 38220)

Transplantation and Post-Transplantation Cellular Infusions

Hematopoietic cell transplantation (HCT) refers to the infusion of hematopoietic progenitor cells (HPC) obtained from bone marrow, peripheral blood apheresis and/or umbilical cord blood. These procedure codes (38240-38242) include physician monitoring of multiple physiologic parameters, physician verification of cell processing, evaluation of the patient during as well as immediately before and after the HPC/lymphocyte infusion, physician presence during the HPC/lymphocyte infusion with associated direct physician supervision of clinical staff and management of uncomplicated adverse events (e.g., nausea, urticaria) during the infusion, which is not separately reportable.

HCT may be autologous (when the HPC donor and recipient are the same person) or allogeneic (when the HPC donor and recipient are not the same person). Code 38241 is used to report an autologous transplant while 38240 is used to report an allogeneic transplant. In some cases allogeneic transplants involve more than one donor and cells from each donor are infused sequentially whereby one unit of 38240 is reported for each donor infused. Code 38242 is used to report a donor lymphocyte infusion. Code 3824X1 is used to report a HPC boost from the original allogeneic HPC donor. A lymphocyte infusion or HPC boost can occur days, months or even years after the initial hematopoietic cell transplant. The lymphocyte infusion is used to treat relapse, infection, or post-transplant lymphoproliferative syndrome. HPC boost represents an infusion of hematopoietic progenitor cells from the original donor that is being used to treat a relapse or post-transplant cytopenia(s). Codes 38240, 3824X1 and 38242 should not be reported together on the same date of service.

If a separately identifiable evaluation and management service is performed on the same date of service, the appropriate E/M service code, including office or other outpatient services, established (99211-99215), initial observation care (99218-99220), observation care discharge services (99217), subsequent observation care (99224-99226), initial hospital care (99221-99223), subsequent hospital care (99231-99233), observation or inpatient hospital care (99234-99236), hospital discharge services (99238, 99239), inpatient neonatal and pediatric critical care (99471, 99472, 99475, 99476) may be reported, using modifier 25, in addition to 38240, 3824X1 or 38242. Post-transplant infusion management of adverse reactions is reported separately utilizing the appropriate E/M, prolonged service or critical care code(s). In accordance with place of service and facility reporting guidelines, the fluid used to administer the cells and other infusions for incidental hydration (e.g., 96360, 96361) are not separately reportable. Similarly, infusion(s) of any medication(s) concurrently with the transplant infusion are not separately reportable. However, hydration or administration of medications (e.g., antibiotics, narcotics) unrelated to the transplant are separately reportable using modifier 59.

▲38240 Hematopoietic progenitor cell (HPC); allogeneic transplantation per donor

▲38241 Autologous transplantation

#●3824X1 HPC boost

▲38242 Allogeneic lymphocyte infusion

(For bone marrow aspiration, use 38220)

(For modification, treatment, and processing of hematopoietic progenitor cell specimens for transplantation, use 38210-38215)

(For cryopreservation, freezing, and storage of hematopoietic progenitor cells for transplantation, use 38207)

(For thawing and expansion of hematopoietic progenitor cells for transplantation, see 38208, 38209)

(For compatibility studies, see 81379-81383, 86812-86822)

Category I

Pathology and Laboratory
Transfusion Medicine

86950 Leukocyte transfusion

(For allogeneic lymphocyte infusion use 38242)

The ASBMT feels these changes presented at the October 2011 CPT Editorial Panel further clarify the physicians work and ensure accurate reporting of the services. This new language, in its entirety, was included in the survey for this family of codes. Therefore, ASBMT believes that the survey respondents should have valued these codes appropriately and not included work or time that is part of any evaluation and management service performed on the same date. The language added to CPT specifies the activities included in this family of codes. The work begins when the physician does a transplant-specific patient evaluation and verifies proper cell processing. The work ends when the physician performs an evaluation at the end of the infusion. The CPT language clearly excludes any work performed before the pre-transplant evaluation of the patient and after the end of the transplant infusion. Therefore, there should be no overlap between (1) the work of these codes and work related to an evaluation and management service performed earlier in the day (e.g., a subsequent hospital visit) and (2) any work performed after the infusion (e.g., treatment of adverse events that occur post-transplant infusion).

Thank you for considering this information as you evaluate our SORs. We appreciate the opportunity to review these codes and look forwards to discussing them further at the April RUC Meeting.

Sincerely,

James Gajewski, MD
Chair, ASBMT Committee on Reimbursement

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:38240 Tracking Number J1 Original Specialty Recommended RVU: **3.50**
Presented Recommended RVU: **4.00**
Global Period: XXX RUC Recommended RVU: **4.00**

CPT Descriptor: Hematopoietic progenitor ell (HPC); allogeneneic transplantation per donor

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 40-year old female with acute myelogenous leukemia who has relapsed after obtaining a remission. An allogeneic HPC transplant is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting?

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Description of Pre-Service Work: This services includes physician evaluation of the patient immediately before HPC infusion monitoring of multiple physiologic parameters and physician verification of cell processing. The physician confirms recipient and stem cell product identities, compares donor and recipient HLA typing results with previous records, acknowledges and documents ABO matching or mismatching for each respective donor unit, and reviews transplant cross-match when available. Reviews and confirms donor and recipient infectious disease testing. Confirms cell processing for either RBC or plasma depletion or mononuclear cell concentration given the donor/recipient incompatibility. The nurse, physician and cell processing technologist review cell product label, identity, sterility testing, cell dose, and processing. Signs orders for the preparatory pre-transplant medications for anaphylaxis such as epinephrine, atropine and dopamine are at bedside and immediately available if needed as well as to minimize risk of graft rejection or Graft vs. Host Disease (GVHD) with the infusion.

Description of Intra-Service Work: Supervises initiation of product infusion. Physician is present for the first 15 - 30 minutes and remains immediately available to manage toxicities and complications occurring during the infusion. The physician evaluates the patient at the end of the infusion.

Description of Post-Service Work: The physician documents the entire procedure including the pre-infusion evaluation, verification of cell processing and appropriateness for transplant, the infusion, any intra-infusion adverse events, and the post infusion evaluation.

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.17	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key compontents: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,650,555

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
77427	XXX	3.37	**RUC Time**	1,194,406

CPT Descriptor 2 Radiation treatment management, 5 treatments

Other Reference CPT Code	Global	Work RVU	Time Source
95978	XXX	3.50	**RUC Time**

CPT Descriptor Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 8 **% of respondents:** 21.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 38240**	**Key Reference CPT Code:** 99205	**Source of Time** **RUC Time**

Post-Service intensity/complexity	4.50	4.38

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An ASBMT RVS panel reviewed and discussed the survey results for each code and then reviewed the entire family to address the issue of relativity within the family. There were 37 respondents and 89 percent of the survey respondents indicated that the vignette was typical.

The panel observed that the survey medians for the four codes were high and also did not accurately reflect their relativity. The panel agreed that the survey 25th percentile RVW for 38240 is too low and is a clear rank order anomaly compared to the other 25th percentile values. The panel believed this was due, in part, to the low volume of respondents for this low volume procedure. In addition, physicians performing Hematopoietic Progenitor Cell (HPC) infusions typically work in academic settings and perform only a limited number of services specifically associated with HPC transplant in the Medicare population.

The survey performance rate median of 20 procedures/infusions per year among the 37 respondents is low, but understandable given that this is a low volume procedure. The ASBMT panel agreed that the survey median times of 30 minutes of pre-service, 60 minutes of intra-service, and 30 minutes of post-service accurately represented the time required to perform this service.

The panel also observed that 38240 has never been valued by the RUC and has an assigned RVW of 2.24 with an assigned total time of 53 minutes. The ASBMT panel believed that these assigned values were too low. Therefore, the current change in CPT language to better describe the service as being per allogeneic donor infusion and to better define the distinction between physician work in the management of the infusion(s), and the separately identifiable visit prior to the procedure on the same date was timely and appropriate. Please see our cover letter for a more complete discussion of this issue.

Compelling Evidence for RVW Increase:
Codes 38240 and 38241 currently have a CMS/other value of 2.24 as well as 53 minutes of assigned total time. We are recommending RVW increases in both codes. In addition 38242 was reviewed by the RUC in 2002 and has an RVW of 1.71 with physician time of 30/30/20 and we are recommending an RVW increase for this procedure as well.

With respect to 38240 and 38241, it is important to note that these codes have never had a vignette, a service description, or been surveyed or reviewed by the RUC. The work values are based upon an assigned time of 53 total minutes (which have never been RUC approved either). In our view this code has never been properly valued and we request that the RUC review this code as if it was a new code.

Furthermore, the patient population receiving allogeneic and autologous transplants has changed over the last 10-15 years and is now comprised largely of older patients with leukemia, myeloma and other hematologic malignancies who are in serious or critical condition because they have just received ablative chemotherapy completely wiping out their bone marrow.

The typical patient has changed significantly since the valuation of these codes (1995 for 38240 and 38241; 2002 for 38242). Allogeneic patients prior to 1995 almost always received HLA identical sibling transplants. The recipients were also primarily younger recipients, as the maximum recipient age at that point in time was age 40-45. We now will routinely do transplants on recipients aged 65-80, whether autologous or allogeneic. On the day of transplant, these patients are being actively managed for complications of the chemotherapy and radiation therapy regimens administered on prior days, such as dehydration and electrolyte imbalances as well as for infection management which is a consequence of the pancytopenia and the underlying leukemia, lymphoma or myeloma malignancy for which they are having the transplant. The allogeneic transplant recipients for code 38240 and 3824x1 are already on immunosuppressive drug therapy which routinely causes electrolyte deficiency, hypertension, and the need for antibiotics for infection management. Additionally, these older patients have co-morbidities such as heart disease and

diabetes. Post infusion documentation of the infusion report has increased in complexity due to increasing regulatory reporting requirements. The transplant infusion is the source documentation for this regulatory reporting.

At the time of the 1995 valuation, the unrelated donor registry was very small (approx. 30,000-50,000 donors). It was the rare patient that had an unrelated donor match. Public umbilical cord blood banking for the purposes of allogeneic transplant did not exist. Now, approximately 60% of transplants are from unrelated donors or cord blood donors, with the remainder from HLA identical siblings. We are also seeing a rise in haplo-identical, half-matched relative transplants. With mismatched transplants, we have the additional issues of graft rejection and ABO incompatibility between donor(s) and recipient. Both of these create increased potential for acute toxicity. We also have a greater potential for minor red cell antigen mismatching causing acute febrile reactions. Additionally, as most donors are harvested with peripheral blood stem cell harvest, we also have increased risk of TRALI, an acute white cell reaction causing acute pulmonary decompensation.

These same clinical issues apply for 38242 which is a subsequent infusion of donor lymphocytes to previously transplanted patients for the treatment of relapse after transplantation for a myeloproliferative disorder.

With the changes in technology and patient population, the current RVWs do not adequately describe the physician work effort for any of these procedures. The physician must now be present to identify the recipient and donor, to review donor/recipient HLA typing, review and make sure the correct cell processing has occurred and review infectious disease status in the donor and recipient. A physician is usually at the bedside for the initial 15 minutes to half hour of the infusion and then every five to fifteen minutes thereafter and is immediately available during the entire infusion to manage complications should they occur. Complications can occur during infusion or well after the infusion. Fluid management is now much more important due to the higher volumes of cells being infused (especially during unrelated donor transplants) which results in a higher risk of fluid overload and congestive heart failure in these older patients. For this reason, the typical time for the infusion has increased. Almost all of these patients are on continuous EKG, blood pressure and pulse oximetry monitoring during the infusion. Post infusion documentation has increased in complexity due to more burdensome regulatory reporting requirements. The transplant infusion is the source documentation for this regulatory reporting.

In addition, the consent process has changed considerably since these codes were developed because of the changes in recipients, donors and risks of the transplantation process. Unrelated donors cannot be forced to donate and can back out immediately before transplant. As this leaves the recipient in a precarious state, the infusion consent process requires a lengthy discussion of risks. The use of unrelated donor cells usually means the cells are harvested elsewhere and transported to the center in which the recipient is admitted. Due to the use of fresh cells for infusion, the cells frequently arrive in the evening or in the middle of the night, necessitating an infusion shortly after arrival. We try to get the cells into the recipient's body within 24 hours after taking them from the donor.

The survey results for 38240 were a median RVW of 4.0 and pre, intra and post services times of 30/60/30. The key reference service was CPT 99205, *office or other outpatient visit for the evaluation and management of a new patient*, (RVW 3.17 times 7, 45, 15). The intensity/complexity measures for 38240 were either similar to or greater than those for 99205.

Interestingly, the results of the survey for 38240, done last year were a median RVW of 3.5 and times of 55/60/30. We believe that the reduction in pre-service time from 55 to 30 minutes supports our belief that the clarifying language in CPT enabled respondents to differentiate the work of this code from the E/M. Specifically, it appears that the overlap was in the pre-service time and work because the intra and post service times were unchanged from the last survey. As the panel reviewed this family of codes it kept in mind that even though an E/M has been performed earlier, the physician must evaluate the patient again to make sure the transplant can be performed. This includes chart review, an interim history, and a brief physical exam. The physician then must ensure that the stem cells have been properly processed, tested and handled and then must be present while the infusion is initiated and, at minimum, for the next 15-20 minutes and then must be immediately available to intervene in case of an adverse event. In this respect, the service is similar to critical care, albeit less intense. Therefore, the fact that an E/M has been performed earlier in the day, does not reduce the work of this service which is entirely different than the work of an E/M.

The ASBMT is asking and RVW of 3.5 which is between the median and 25th percentile of the survey. This appropriately values this service and places it in the correct rank order with the other codes in this family, 38241, 38242 and 3824x1. Specifically, 38240 has more pre-service work than 38241 due to review of both donor and recipient data. 38240 also requires more premedication because of the drugs needed to manage graft rejection which is not an issue with 38241 (autologous transplant). Therefore, the work of 38240 is more intense than that of 38241.

This request also puts it in the correct rank order with 99205, the reference service code, which was chosen by 22 percent of survey respondents.

We also looked at other RUC valued codes with XXX globals:

- 99223, Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit, has 3.86 work RVUs and times of 15/55/20
- 99233, Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit, has 2.0 work RVUs and times of 10/30/15
- 99291, Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes, has a work RVU of 4.5 and times of 15/40/15
- 77427, Radiation treatment management, 5 treatments, has a work RVU of 3.37 and times of 7/70/10
- 90962, End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face physician visit per month with a work RVU of 3.15 and 63 minutes of total time (all intra-service)
- 95953, Monitoring for localization of cerebral seizure focus by computerized portable 16 or more channel EEG, electroencephalographic (EEG) recording and interpretation, each 24 hours, unattended with a work RVU of 3.08 and times of 10/45/15
- 95978, Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour with a work RVU of 3.5 and times of 5/60/5
- 36147, Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection[s] of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava) with a work RVU of 3.72 and times of 20/45/15

We believe the times and RVWs from all these codes support our request. Specifically,

- 38240 has longer pre, intra and post times than 99205 (3.17 RVW) and is slightly more intense. This was the key reference service.
- 38240 has longer times than 99223 (3.86 RVW) (30/60/30 vs. 15/55/20) but is less intense.
- 38240 is twice as long as 99233 (2.0 RVW) (30/60/30 vs. 10/30/15) and has similar intensity.
- 38240 has the same intra-service time as 95978 (60 minutes) and is of similar intensity. 95978 involves the analysis and programming of a deep brain neurostimulator. Having the same RVW would place these two services in correct rank order.
- 38240 requires more time than 99291 (4.5 RVW) (30/60/30 vs. 15/40/15) but is less intense.

In addition the requested RVW of 3.5 places it in the current rank order with 77427 (3.37 RVW with 70 minutes of intra-service time) because it has considerably longer pre and post-service time. It is also in the correct rank order with 90962 (3.15 RVW and 63 minutes of total/ intra-service time), 95953 (3.08 RVW with 45 minutes of intra-service time), and 36147, which is a procedure and is more intense than 38240 and has an RVW of 3.72 with 45 minutes of intra-service time.

In summary, to maintain rank order we recommend an RVW of 3.5 which is in-between our median and 25th percentile survey value. Our recommendation is also consistent with our survey data from the February 2011 presentation at the RUC. For service times we recommend the median survey times for 38240 with a pre-service time 30 minutes, intra-service time 60 minutes and post-service time 30 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is not reported using multiple CPT codes. However, an evaluation and management code is typically reported on the same say as the transplant code because these patients are usually hospitalized and are being seen every day by the transplant physician or another physician, who is also the attending physician in charge of that patient's care. For example, these patients have had their bone marrow ablated and are pancytopenic. They need to managed for their pancytopenia, infections and fluid intake. This management is entirely separate from performing a transplant. In those cases where the transplant physician is also the attending physician, that physician will report the transplant code and an evaluation and management code – usually 99232, 99233 or 99291on the same date. On those rare occasions when a transplant is performed on an outpatient basis, no evaluation and management service is reported.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Please see answer to question 1 and the rationale.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 38240

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Hematology/Oncology How often? Commonly

Specialty Medical Oncology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8145
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the Center for International Blood and Marrow Transplant Research (CIBMTR), there are approximately 6000 allogeneic transplants each year in the United States. All of the transplants would require an infusion.

Specialty Hematology/Oncology Frequency 6145 Percentage 75.44 %

Specialty Medical Oncology Frequency 2000 Percentage 24.55 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 377
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database Medicare Claims data

Specialty Hematology/Oncology Frequency 282 Percentage 74.80 %

Specialty Medical Oncology Frequency 95 Percentage 25.19 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:38241 Tracking Number J2 Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: XXX RUC Recommended RVU: **3.00**

CPT Descriptor: Hematopoietic progenitor cell (HPC); autologous transplantation

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 68-year-old man with non Hodgkin's lymphoma in second remission. Patient has co-morbidities of ischemic heart disease, diabetes and a recently treated aspergilloma. An autologous HPC transplant is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting?

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Description of Pre-Service Work: This services includes physician evaluation of the patient immediately before HPC infusion, monitoring of multiple physiologic parameters and physician verification of cell processing. The recipient is placed on bedside telemetry, continuous pulse oximetry and continuous blood pressure monitoring. The attending physician and nurse review the premedication. The nurse, physician and cell processing technologist review cell product label, identity, sterility testing, cell dose, processing, DMSO contamination and precise time of washing as cells must be infused within 1 hour of washing. The physician and nurse ensure medications for anaphylaxis such as epinephrine, atropine and dopamine are at bedside and immediately available if needed.

Description of Intra-Service Work: Supervises initiation of product infusion. Physician is present for the first 15 - 30 minutes and remains immediately available to manage toxicities and complications occurring during the infusion. The physician evaluates the patient at the end of the infusion.

Description of Post-Service Work: The physician documents the entire procedure including the pre-infusion evaluation, verification of cell processing and appropriateness for transplant, the infusion, any intra-infusion adverse events, and the post infusion evaluation.

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.17	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key compontents: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
77427	XXX	3.37	**RUC Time**	1,194,406

CPT Descriptor 1 Radiation treatment management, 5 treatments

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.61	**RUC Time**	7,451,228

CPT Descriptor 2 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
95978	XXX	3.50	**RUC Time**

CPT Descriptor Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An ASBMT RVS panel reviewed and discussed the survey results for each code and then reviewed the entire family to address the issue of relativity within the family. There were 33 respondents and 88 percent of the survey respondents indicated that the vignette was typical.

The panel observed that the survey medians for the four codes were high and also did not accurately reflect their relativity. However, with the exception of 38240, the 25th percentile of the survey accurately valued the codes and their rank order. This observation of relativity within the family of codes lends credibility to the survey data - particularly the 25th percentile, except for 38240. While the median for Code 38240 is in the appropriate rank order as compared to the median values for the other codes, it is too high. On the other hand, the panel agreed that the survey 25th percentile RVW for 38240 is too low and is a clear rank order anomaly compared to the other 25th percentile values. The panel believed this was due, in part, to the low volume of respondents for this low volume procedure. In addition, physicians performing Hematopoietic Progenitor Cell (HPC) infusions typically work in academic settings and perform only a limited number of services specifically associated with HPC transplant in the Medicare population.

The survey performance rate median of 20 procedures/infusions per year among the 33 respondents is an understandable rate give this is a low volume procedure. The ASBMT panel agreed that the survey median time of 30 minutes of pre-service, 60 minutes of intra-service, and 30 minutes of post-service time accurately reflect the time required to perform this service.

The current CPT code 38241 has an assigned RVW of 2.24 with a total time of 53 minutes. The ASBMT panel believed that the assigned value was too low. Therefore, the reasons for the current change in CPT language to better describe the services within the family of HPC infusion codes and to better define the distinction between physician work in the management of the infusion, and the separately identifiable visit prior to the procedure on the same date was timely and appropriate. As the panel reviewed this family of codes it kept in mind that even though an E/M has been performed earlier, the physician must evaluate the patient again to make sure the transplant can be performed. This includes chart review, an interim history, and a brief physical exam. The physician then must ensure that the stem cells have been properly processed, tested and handled and then must be present while the infusion is initiated and, at minimum, for the next 15-20 minutes and then must be immediately available to intervene in case of an adverse event. In this respect, the service is similar to critical care, albeit less intense. Therefore, the fact that an E/M has been performed earlier in the day, does not reduce the work of this service which is entirely different than the work of an E/M.

Compelling Evidence for RVW Increase:
Codes 38240 and 38241 currently have a CMS/other value of 2.24 as well as 53 minutes of assigned total time. We are recommending RVW increases in both codes. In addition, 38242 was reviewed by the RUC in 2002 and has an RVW of 1.71 with physician time of 30/30/20 and we are recommending an RVW increase for this procedure as well.

With respect to 38240 and 38241, it is important to note that these codes have never had a vignette, a service description, or been surveyed or reviewed by the RUC. The work values are based upon an assigned time of 53 total minutes (which have never been RUC approved either). In our view this code has never been properly valued and we request that the RUC review this code as if it was a new code.

Furthermore, the patient population receiving allogeneic and autologous transplants has changed over the last 10-15 years and is now comprised largely of older patients with leukemia, myeloma and other hematologic malignancies who are in serious or critical condition because they have just received ablative chemotherapy completely wiping out their bone marrow.

The typical patient has changed significantly since the valuation of these codes (1995 for 38240 and 38241; 2002 for 38242). Allogeneic patients prior to 1995 almost always received HLA identical sibling transplants. The recipients were

also primarily younger recipients, as the maximum recipient age at that point in time was age 40-45. We now will routinely do transplants on recipients aged 65-80, whether autologous or allogeneic. On the day of transplant, these patients are being actively managed for complications of the chemotherapy and radiation therapy regimens administered on prior days, such as dehydration and electrolyte imbalances as well as for infection management which is a consequence of the pancytopenia and the underlying leukemia, lymphoma or myeloma malignancy for which they are having the transplant. The allogeneic transplant recipients for code 38240 and 3824x1 are already on immunosuppressive drug therapy which routinely causes electrolyte deficiency, hypertension, and the need for antibiotics for infection management. Additionally, these older patients have co-morbidities such as heart disease and diabetes. Post infusion documentation of the infusion report has increased in complexity due to increasing regulatory reporting requirements. The transplant infusion is the source documentation for this regulatory reporting.

At the time of the 1995 valuation, the unrelated donor registry was very small (approx. 30,000-50,000 donors). It was the rare patient that had an unrelated donor match. Public umbilical cord blood banking for the purposes of allogeneic transplant did not exist. Now, approximately 60% of transplants are from unrelated donors or cord blood donors, with the remainder from HLA identical siblings. We are also seeing a rise in haplo-identical, half-matched relative transplants. With mismatched transplants, we have the additional issues of graft rejection and ABO incompatibility between donor(s) and recipient. Both of these create increased potential for acute toxicity. We also have a greater potential for minor red cell antigen mismatching causing acute febrile reactions. Additionally, as most donors are harvested with peripheral blood stem cell harvest, we also have increased risk of TRALI, an acute white cell reaction causing acute pulmonary decompensation.

These same clinical issues apply for 38242 which is a subsequent infusion of donor lymphocytes to previously transplanted patients for the treatment of relapse after transplantation for a myeloproliferative disorder.

With the changes in technology and patient population, the current RVWs do not adequately describe the physician work effort for any of these procedures. The physician must now be present to identify the recipient and donor, to review donor/recipient HLA typing, review and make sure the correct cell processing has occurred and review infectious disease status in the donor and recipient. A physician is usually at the bedside for the initial 15 minutes to half hour of the infusion and then every five to fifteen minutes thereafter and is immediately available during the entire infusion to manage complications should they occur. Complications can occur during infusion or well after the infusion. Fluid management is now much more important due to the higher volumes of cells being infused (especially during unrelated donor transplants) which results in a higher risk of fluid overload and congestive heart failure in these older patients. For this reason, the typical time for the infusion has increased. Almost all of these patients are on continuous EKG, blood pressure and pulse oximetry monitoring during the infusion. Post infusion documentation has increased in complexity due to more burdensome regulatory reporting requirements. The transplant infusion is the source documentation for this regulatory reporting.

In addition, the consent process has changed considerably since these codes were developed because of the changes in recipients, donors and risks of the transplantation process. Unrelated donors cannot be forced to donate and can back out immediately before transplant. As this leaves the recipient in a precarious state, the infusion consent process requires a lengthy discussion of risks. The use of unrelated donor cells usually means the cells are harvested elsewhere and transported to the center in which the recipient is admitted. Due to the use of fresh cells for infusion, the cells frequently arrive in the evening or in the middle of the night, necessitating an infusion shortly after arrival. We try to get the cells into the recipient's body within 24 hours after taking them from the donor.

The survey results for 38241 were a median RVW of 3.5 and pre, intra and post services times of 30/60/30. The key reference service was CPT 99205, office or other outpatient visit for the evaluation and management of a new patient (RVW 3.17 times 7, 45, 15). In addition, the intensity/complexity measures for 38241 were either similar to or greater than those for 99205.

The ASBMT is asking for an RVW of 3.0 which is the 25th percentile of the survey. This appropriately values this service and places it in the correct rank order with the other codes in this family, 38241, 38242 and 3824x1. We also believe that this properly values 38241 with respect to the reference service, 99205, which was chosen by 24 percent of survey respondents.

An ASBMT expert panel agreed that that the median work value is too high because 38241 is a less intense service than 38240 and should be valued lower than 38240 for which an RVW of 3.5 is being requested. The intensity of an autologous stem cell infusion carries less risk in terms of the potential for adverse event in terms of infusion reactions or fluid overload (because the volume of an autologous infusion is typically lower than an allogeneic infusion).

An RVW of 3.0 places 38241 in the correct rank order with the following codes:

- 99223, Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit, has 3.86 work RVUs and times of 15/55/20
- 99233, Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit, has 2.0 work RVUs and times of 10/30/15
- 99291, Critical care, evaluation and management of the critically ill or critically injured patient; first 30-74 minutes, has a work RVU of 4.5 and times of 15/40/15
- 77427, Radiation treatment management, 5 treatments, has a work RVU of 3.37 and times of 7/70/10
- 90962, End-stage renal disease (ESRD) related services monthly, for patients 20 years of age and older; with 1 face-to-face physician visit per month with a work RVU of 3.15 and 63 minutes of total time (all intra-service)
- 95953, Monitoring for localization of cerebral seizure focus by computerized portable 16 or more channel EEG, electroencephalographic (EEG) recording and interpretation, each 24 hours, unattended with a work RVU of 3.08 and times of 10/45/15
- 95978, Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour with a work RVU of 3.5 and times of 5/60/5
- 36147, Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection[s] of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava) with a work RVU of 3.72 and times of 20/45/15

Specifically,

- 38241 has longer pre, intra and post times than 99205 (3.17 RVW) but is less intense
- 38241 has longer times than 99223 (3.86 RVW) (30/60/30 vs. 15/55/20) but is less intense
- 38241 is twice as long as 99233 (2.0 RVW) (30/60/30 vs. 10/30/15) and has lower intensity
- 38240 requires more time than 99291 (4.5 RVW) (30/60/30 vs. 15/40/15) but is less intense

In addition the requested RVW of 3.0 places it in the current rank order with 77427 (3.37 RVW with 70 minutes of intra-service time), 90962 (3.15 RVW and 63 minutes of intra-service time), 95953 (3.08 RVW with 45 minutes of intra-service time), 95978 (3.5 RVW with 60 minutes of intra-service time). Lastly, 36147, which is a procedure and is more intense than 38241, has an RVW of 3.72 with 45 minutes of intra-service time.

In summary, to maintain rank order, we believe that the 25th percentile accurately reflects the work performed and recommend an RVW of 3.00 for CPT 38241 with a pre-service time 30 minutes, intra-service time 60 minutes and post-service time 30 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is not reported using multiple CPT codes. However, an evaluation and management code is typically reported on the same say as the transplant code because these patients are usually hospitalized and are being seen every day by the transplant physician or another physician, who is also the attending physician in charge of that patient's care. For example, these patients have had their bone marrow ablated and are pancytopenic. They need to managed for their pancytopenia, infections and fluid intake. This management is entirely separate from performing a transplant. In those cases where the transplant physician is also the attending physician, that physician will report the transplant code and an evaluation and management code – usually 99232, 99233 or 99291 on the same date. On those rare occasions when a transplant is performed on an outpatient basis, no evaluation and management service is reported.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Please see answer to question 1 and the rationale.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 38241

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Hematology/Oncology How often? Commonly

Specialty Medical Oncology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 14073
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. Based on data reported to the Center for International Blood and Marrow Transplant Research

Specialty Hematology/Oncology Frequency 10573 Percentage 75.12 %

Specialty Medical Oncology Frequency 3500 Percentage 24.87 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,394
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database Medicare Claims Data 2010

Specialty Hematology/Oncology Frequency 1045 Percentage 74.96 %

Specialty Medical Oncology Frequency 349 Percentage 25.03 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:38243 Tracking Number J3 Original Specialty Recommended RVU: **2.13**
Presented Recommended RVU: **2.13**
Global Period: XXX RUC Recommended RVU: **2.13**

CPT Descriptor: Hematopoietic progenitor cell (HPC); HPC boost

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 68-year-old who received an allogeneic (unrelated donor) transplant for AML. three months after transplant, the recipient is pancytopenic and transfusion dependednt for red cells and platelets. The blood cells are of donor origin. The remaining peripheral blood progenitor cells from the original transplant donor are infused to treat the pancytopenia.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting?

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Description of Pre-Service Work: This services includes physician evaluation of the patient immediately before HPC infusion monitoring of multiple physiologic parameters and physician verification of cell processing. The physician confirms recipient and stem cell product identities, compares donor and recipient HLA typing results with previous records, acknowledges and documents ABO matching or mismatching for each respective donor unit, and reviews transplant cross-match when available. Reviews and confirms donor and recipient infectious disease testing. Confirms cell processing for either RBC or plasma depletion or mononuclear cell concentration given the donor/recipient incompatibility. The nurse, physician and cell processing technologist review cell product label, identity, sterility testing, cell dose, processing, and when the cells have been stored frozen, the DMSO contamination and precise time of washing as cells must be infused within 1 hour of washing. Signs orders for the preparatory pre-transplant medications for anaphylaxis such as epinephrine, atropine and dopamine are at bedside and immediately available if needed as well as to minimize risk of graft rejection or Graft vs. Host Disease (GVHD) with the infusion.

Description of Intra-Service Work: Supervises initiation of product infusion. Physician is present for the first 15 - 30 minutes and remains immediately available to manage toxicities and complications occurring during the infusion. The physician evaluates the patient at the end of the infusion.

Description of Post-Service Work: The physician documents the entire procedure including the pre-infusion evaluation, verification of cell processing and appropriateness for transplant, the infusion, any intra-infusion adverse events, and the post infusion evaluation.

Post-Service intensity/complexity	4.00	3.83

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

38243 is a new code.
An ASBMT RVS panel reviewed and discussed the survey results for each code and then reviewed the entire family to address the issue of relativity within the family. There were 30 respondents and 83 percent of the survey respondents indicated that the vignette was typical.

The panel observed that the survey medians for the four codes were high and also did not accurately reflect their relativity. However, with the exception of 38240, the 25th percentile of the survey accurately valued the codes and their rank order. This observation of relativity within the family of codes lends credibility to the survey data - particularly the 25th percentile, except for 38240. While the median for Code 38240 is in the appropriate rank order as compared to the median values for the other codes, it is too high. On the other hand, the panel agreed that the survey 25th percentile RVW for 38240 is too low and is a clear rank order anomaly compared to the other 25th percentile values. The panel believed this was due, in part, to the low volume of respondents for this low volume procedure. In addition, physicians performing Hematopoietic Progenitor Cell (HPC) infusions typically work in academic settings and perform only a limited number of services specifically associated with HPC transplant in the Medicare population.

The panel noted that, as with 38240, 38241 and 38242, the work of the E/M performed on the same day is separate from the work of 3824x1. Even though an E/M has been performed earlier, the physician must evaluate the patient again to make sure the lymphocyte infusion can be performed. This includes chart review, an interim history, and a brief physical exam. The physician then must ensure that the cells have been properly processed, tested and handled and then must be present while the infusion is initiated and, at minimum, for the next 15-20 minutes and then must be immediately available to intervene in case of an adverse event. In this respect, the service is similar to critical care, albeit less intense. Therefore, the fact that an E/M has been performed earlier in the day, does not reduce the work of this service which is entirely different than the work of an E/M.

The survey performance rate median of 2 procedures/infusions per year among the 30 respondents is an understandable rate give this is a low volume procedure which, as indicated in the vignette, is only performed on patients having received an HPC transplant.

CPT code 38243 is new. The service was previously reported under the current code 38242. 38243 represents additional granularity and is a further clarification of the services performed within the family of HPC infusions. This code that describes an infusion of hematopoietic progenitor cells that serves as a “boost” for patients who are pancytopenic following an initial stem cell transplant. It is different from 38242 which describes lymphocyte infusions for relapse following an initial stem cell transplant. However, both services are performed on similar patient populations in that all patients have had a previous transplant and are very sick due to relapse or pancytopenia. These patients are usually hospitalized.

The panel believe that 38243 and 38242 are very similar in terms of times and intensity. This was confirmed by the survey median times of 30 minutes of pre-service, 45 minutes of intra-service, and 30 minutes of post-service time which the panel agreed accurately reflect the time required to perform this service.

The survey median RVW was 3.0 which the panel felt was too high. The key reference service was CPT 99215, office or other outpatient visit for the evaluation and management of an established patient, (RVW 2.11 with times of 5/35/15).

ASBMT believes that 99215 is an appropriate comparator code and is recommending a work RVU of 2.13 which is the survey 25th percentile. This value also places 38243 in the proper rank order with 38240, 38241 and 38242 because it is less intense than either 38240 or 38241 but very similar to 38242 which has the same times and a similar 25th percentile work RVU. Additionally, this value places it in the correct rank order with 99215, the reference service code chosen by 20 percent of survey respondents.

Aside from the key reference service, other comparator services include:

- 99233, Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit, has 2.0 work RVUs and times of 10/30/15
- 99292, Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service), with an RVW of 2.25 and 30 minutes of intra-service time (it is an add-on code and has no pre or post service time
- 99357, Prolonged service in the inpatient or observation setting, requiring unit/floor time beyond the usual service; each additional 30 minutes (List separately in addition to code for prolonged service), with an RVW of 1.71 and 30 minutes of intra-service time
- 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family, has a work RVU of 2.11 and times of 5/35/15
- 70554, Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration. Which has an RVW of 2.11 and times of 15/35/10
- 79403, Radiopharmaceutical therapy, radiolabeled monoclonal antibody by intravenous infusion, with an RVW of 2.25 and times of 30/30/15
- 94002, Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day, with an RVW of 1.99 and times of 15/30/15
- 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family, with an RVW of 2.43 and times of 5/30/10

With respect to these codes:

99292 has 30 minutes of intra-service time and no pre or post service time. The proposed RVW of 2.13 for 3824x1 is based on higher survey times (30/45/30) than 99292 but lower intensity.

38243 is less intense than 99233 but has the same intra-service time and substantially longer pre and post service times. Noting that 99292 is more intense than 99233, an RVW of 2.13 for 38243 places it between 99292 and 99233 which is the correct rank order. 94002 is also an appropriate comparator. It was reviewed by the RUC in 2006 with times of 15/30/15 and an RVW of 1.99. 3824x1 is more intense and has significantly longer times (30/45/30). Therefore, an RVW of 2.13 places it in the proper rank order with 94002.

79403 is an important comparator code because it involves infusion of a radiolabeled monoclonal antibody. 79403 was reviewed by the RUC in 2003. Both 38243 and 79403 involve complex infusions and patients who are very ill. Both services also involve substantial risk of complications and have similar intensity. The survey times for 38243 (30/45/30) are longer than the times for 79403 (30/30/15). Arguably, the times and RVW for 79403 support an RVW of 2.25 for 38243. However, the panel believes that the RVW recommendation should be guided by the survey results and therefore believes that an RVW of 2.13 is appropriate.

The panel also believes that 99357 is not a good comparator service because it is significantly less intense and may be reported for patients with a wide variety of illnesses. 38243 is only reported for transplant patients who have relapsed and are extremely ill. In addition, 99357 has not been reviewed since 2002 and has no pre or post service time. Most

importantly, an RVW of 2.13 places 38243 in the correct rank order with 38240 (proposed RVW of 3.5), 38241 (proposed RVW of 3.0) and 38242 (2.11).

In summary, to maintain proper rank order we believe that the 25th percentile accurately reflects the work performed and ASBMT recommend an RVW of 2.13 for 38243 with a pre-service time 30 minutes, intra-service time 45 minutes and post-service time 30 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is not reported using multiple CPT codes. However, an evaluation and management code is typically reported on the same say as the transplant code because these patients are usually hospitalized and are being seen every day by the transplant physician or another physician, who is also the attending physician in charge of that patient's care. For example, these patients have had their bone marrow ablated and are pancytopenic. They need to managed for their pancytopenia, infections and fluid intake. This management is entirely separate from performing a transplant. In those cases where the transplant physician is also the attending physician, that physician will report the transplant code and an evaluation and management code – usually 99232, 99233 or 99291 on the same date. On those rare occasions when a transplant is performed on an outpatient basis, no evaluation and management service is reported.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Please see answer to question 1 and the rationale.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 38242

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Hematology/Oncology How often? Commonly

Specialty Medical Oncology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 50
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. This estimate is based on a review of transplant data reported to the Center for International Blood and Marrow Transplant Research (CIBMTR)

Specialty Hematology/Oncology Frequency 38 Percentage 76.00 %

Specialty Medical Oncology Frequency 12 Percentage 24.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on RUC database Medicare Claims Data for Code 38240 wich represents roughly 5% of total total estimated number of allogeneic transplants reported by the CIBMTR. 5% of of the total estimated number of HPC boosts is 3.

Specialty Hematology/Oncology Frequency 2 Percentage 66.66 %

Specialty Medical Oncology Frequency 1 Percentage 33.33 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

SUMMARY OF RECOMMENDATION

CPT Code:38242 Tracking Number J4 Original Specialty Recommended RVU: **2.11**
Presented Recommended RVU: **2.11**
Global Period: XXX RUC Recommended RVU: **2.11**

CPT Descriptor: Hematopoietic progenitor cell (HPC); allogeneic lymphocyte infusion

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 67-year-old who had a prior allogeneic transplant for B cell chronic lymphocytic leukemia. She has recently relapsed. Her T cell lymphocytes are 50% donor and 50% host. A T lymphocyte infusion using lymphocytes from the original donor is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting?

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Description of Pre-Service Work: This services includes physician evaluation of the patient immediately before HPC infusion monitoring of multiple physiologic parameters and physician verification of cell processing. The physician confirms recipient and stem cell product identities, compares donor and recipient HLA typing results with previous records, acknowledges and documents ABO matching or mismatching for each respective donor unit, and reviews transplant cross-match when available. Reviews and confirms donor and recipient infectious disease testing. Confirms cell processing for either RBC or plasma depletion or mononuclear cell concentration given the donor/recipient incompatibility. The nurse, physician and cell processing technologist review cell product label, identity, sterility testing, cell dose, processing, and when the cells have been stored frozen, the DMSO contamination and precise time of washing as cells must be infused within 1 hour of washing. Signs orders for the preparatory pre-transplant medications for anaphylaxis such as epinephrine, atropine and dopamine are at bedside and immediately available if needed as well as to minimize risk of graft rejection or Graft vs. Host Disease (GVHD) with the infusion.

Description of Intra-Service Work: Supervises initiation of product infusion. Physician is present for the first 15 - 30 minutes and remains immediately available to manage toxicities and complications occurring during the infusion. The physician evaluates the patient at the end of the infusion.

Description of Post-Service Work: The physician documents the entire procedure including the pre-infusion evaluation, verification of cell processing and appropriateness for transplant, the infusion, any intra-infusion adverse events, and the post infusion evaluation.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.17	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key compontents: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.41	**RUC Time**	8,436,133

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

Post-Service intensity/complexity	4.20	4.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An ASBMT RVS panel reviewed and discussed the survey results for each code and then reviewed the entire family to address the issue of relativity within the family. There were 31 respondents and 87 percent of the survey respondents indicated that the vignette was typical.

The panel observed that the survey medians for the four codes were high and also did not accurately reflect their relativity. However, with the exception of 38240, the 25th percentile of the survey accurately valued the codes and their rank order. This observation of relativity within the family of codes lends credibility to the survey data - particularly the 25th percentile, except for 38240. While the median for Code 38240 is in the appropriate rank order as compared to the median values for the other codes, it is too high. On the other hand, the panel agreed that the survey 25th percentile RVW for 38240 is too low and is a clear rank order anomaly compared to the other 25th percentile values. The panel believed this was due, in part, to the low volume of respondents for this low volume procedure. In addition, physicians performing Hematopoietic Progenitor Cell (HPC) infusions typically work in academic settings and perform only a limited number of services specifically associated with HPC transplant in the Medicare population.

This code was resurveyed because it is part of the family that includes 38240, 38241 and 3824x1.

Compelling Evidence for RVW Increase:
Codes 38240 and 38241 currently have a CMS/other value of 2.24 as well as 53 minutes of assigned total time. We are recommending RVW increases in both codes. In addition 38242 was reviewed by the RUC in 2002 and has an RVW of 1.71 with physician time of 30/30/20 and we are recommending an RVW increase for this procedure as well.

With respect to 38240 and 38241, it is important to note that these codes have never had a vignette, a service description, or been surveyed or reviewed by the RUC. The work values are based upon an assigned time of 53 total minutes (which have never been RUC approved either). In our view this code has never been properly valued and we request that the RUC review this code as if it was a new code.

Furthermore, the patient population receiving allogeneic and autologous transplants has changed over the last 10-15 years and is now comprised largely of older patients with leukemia, myeloma and other hematologic malignancies who are in serious or critical condition because they have just received ablative chemotherapy completely wiping out their bone marrow.

The typical patient has changed significantly since the valuation of these codes (1995 for 38240 and 38241; 2002 for 38242). Allogeneic patients prior to 1995 almost always received HLA identical sibling transplants. The recipients were also primarily younger recipients, as the maximum recipient age at that point in time was age 40-45. We now will routinely do transplants on recipients aged 65-80, whether autologous or allogeneic. On the day of transplant, these patients are being actively managed for complications of the chemotherapy and radiation therapy regimens administered on prior days, such as dehydration and electrolyte imbalances as well as for infection management which is a consequence of the pancytopenia and the underlying leukemia, lymphoma or myeloma malignancy for which they are having the transplant. The allogeneic transplant recipients for code 38240 and 3824x1 are already on immunosuppressive drug therapy which routinely causes electrolyte deficiency, hypertension, and the need for antibiotics for infection management. Additionally, these older patients have co-morbidities such as heart disease and diabetes. Post infusion documentation of the infusion report has increased in complexity due to increasing regulatory reporting requirements. The transplant infusion is the source documentation for this regulatory reporting.

At the time of the 1995 valuation, the unrelated donor registry was very small (approx. 30,000-50,000 donors). It was the rare patient that had an unrelated donor match. Public umbilical cord blood banking for the purposes of allogeneic transplant did not exist. Now, approximately 60% of transplants are from unrelated donors or cord blood donors, with the remainder from HLA identical siblings. We are also seeing a rise in haplo-identical, half-matched relative transplants. With mismatched transplants, we have the additional issues of graft rejection and ABO incompatibility between donor(s) and recipient. Both of these create increased potential for acute toxicity. We also have a greater potential for minor red cell antigen mismatching causing acute febrile reactions. Additionally, as most donors are

harvested with peripheral blood stem cell harvest, we also have increased risk of TRALI, an acute white cell reaction causing acute pulmonary decompensation.

These same clinical issues apply for 38242 which is a subsequent infusion of donor lymphocytes to previously transplanted patients for the treatment of relapse after transplantation for a myeloproliferative disorder.

With the changes in technology and patient population, the current RVWs do not adequately describe the physician work effort for any of these procedures. The physician must now be present to identify the recipient and donor, to review donor/recipient HLA typing, review and make sure the correct cell processing has occurred and review infectious disease status in the donor and recipient. A physician is usually at the bedside for the initial 15 minutes to half hour of the infusion and then every five to fifteen minutes thereafter and is immediately available during the entire infusion to manage complications should they occur. Complications can occur during infusion or well after the infusion. Fluid management is now much more important due to the higher volumes of cells being infused (especially during unrelated donor transplants) which results in a higher risk of fluid overload and congestive heart failure in these older patients. For this reason, the typical time for the infusion has increased. Almost all of these patients are on continuous EKG, blood pressure and pulse oximetry monitoring during the infusion. Post infusion documentation has increased in complexity due to more burdensome regulatory reporting requirements. The transplant infusion is the source documentation for this regulatory reporting.

In addition, the consent process has changed considerably since these codes were developed because of the changes in recipients, donors and risks of the transplantation process. Unrelated donors cannot be forced to donate and can back out immediately before transplant. As this leaves the recipient in a precarious state, the infusion consent process requires a lengthy discussion of risks. The use of unrelated donor cells usually means the cells are harvested elsewhere and transported to the center in which the recipient is admitted. Due to the use of fresh cells for infusion, the cells frequently arrive in the evening or in the middle of the night, necessitating an infusion shortly after arrival. We try to get the cells into the recipient's body within 24 hours after taking them from the donor.
The panel noted that, as with 38240 and 38241, the work of the E/M performed on the same day is separate from the work of 38242. Even though an E/M has been performed earlier, the physician must evaluate the patient again to make sure the lymphocyte infusion can be performed. This includes chart review, an interim history, and a brief physical exam. The physician then must ensure that the lymphocytes have been properly processed, tested and handled and then must be present while the infusion is initiated and, at minimum, for the next 15-20 minutes and then must be immediately available to intervene in case of an adverse event. In this respect, the service is similar to critical care, albeit less intense. Therefore, the fact that an E/M has been performed earlier in the day, does not reduce the work of this service which is entirely different than the work of an E/M.

There were 31 respondents to the survey request and 89% thought the vignette was typical. Physicians performing Hematopoietic Progenitor Cell (HPC) infusions typically work in academic settings and perform only a limited number of services specifically associated with HPC transplant. They do not regularly receive survey requests and are therefore, less likely to complete surveys. Therefore, the low number of respondents was expected. Further, this procedure is lower volume than 38240 and 38241 so the survey performance rate median of 5 procedures/infusions per year among the 31 respondents is an understandable rate. This procedure is only performed on patients having previously received an allogeneic HPC transplant.

The current CPT code 38242 was last reviewed by the RUC in 2002 and currently has an RVW of 1.71 with pre, intra and post services times of 30/30/20.

After review of the results of this survey, the ASBMT panel agreed that the survey median time of 30 minutes of pre-service, 45 minutes of intra-service, and 30 minutes of post-service time accurately reflect the time required to perform this service.

The median survey RVW was 2.75. The key reference service was CPT 99205, office or other outpatient visit for the evaluation and management of a new patient which has a work RVU of 3.17 and times of 7/45/15. The panel thought that 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity, was a more comparable service because it has a work RVU of 2.11 and times of

5/35/15. The panel believed that 38242 should be valued similarly to 99215 because it is a little less intense than 99215 but has substantially longer pre and post service times.

Therefore, ASBMT is recommending an RVW of 2.11 which is the survey 25th percentile. This value also places it in correct rank order with 38240 or 38241 because it is less intense and requires less time than those procedures. It also places 38242 in the correct rank order to 3824x1 because it has similar intensity and pre/intra/post service times to 3824x1.

Even though the panel did not believe 99205 was the best reference code, an RVW of 2.11 properly ranks 38242 with the reference code, 99205 which was chosen by 16 percent of survey respondents. 99205 has more intra-service time and is more complex and intense than 38242.

Aside from the key reference service, other comparator services include:

- 99233, Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit, has 2.0 work RVUs and times of 10/30/15
- 99292, Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service), with an RVW of 2.25 and 30 minutes of intra-service time (it is an add-on code and has no pre or post service time
- 99357, Prolonged service in the inpatient or observation setting, requiring unit/floor time beyond the usual service; each additional 30 minutes (List separately in addition to code for prolonged service), with an RVW of 1.71 and 30 minutes of intra-service time
- 99215, Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family, has a work RVU of 2.11 and times of 5/35/15
- 70554, Magnetic resonance imaging, brain, functional MRI; including test selection and administration of repetitive body part movement and/or visual stimulation, not requiring physician or psychologist administration. Which has an RVW of 2.11 and times of 15/35/10
- 79403, Radiopharmaceutical therapy, radiolabeled monoclonal antibody by intravenous infusion, with an RVW of 2.25 and times of 30/30/15
- 94002, Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day, with an RVW of 1.99 and times of 15/30/15
- 99204, Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family, with an RVW of 2.43 and times of 5/30/10

When the RUC valued this code in 2002, it used 99292 and 99357 as the two main comparator codes. At that time the RUC thought that 38242 was less intense than 99292 and had similar times and intensity to 99357. In addition, the RUC thought that an RVW of 1.71 placed 38242 in the correct rank order to 38240 which had a value of 2.24.

What has changed? Since 2002, the value of 99292 has increased and the intensity of 38242 has increased due to the older, sicker patient population. 99292 has 30 minutes of intra-service time and no pre or post service time. The current proposed RVW of 2.11 for 38242 is also based on higher survey times (30/45/30 as compared to 30/30/20 in 2002). The panel also believes that 99357 is not a good comparator service because it is significantly less intense and

may be reported for patients with a wide variety of illnesses. 38242 is only reported for transplant patients who have relapsed and are extremely ill. In addition, 99357 has not been reviewed since 2002 and has no pre or post service time. Most importantly, an RVW of 2.11 places 38242 in the correct rank order with 38240 (proposed RVW of 3.5) and 38241 (proposed RVW of 3.0).

With respect to the other codes listed above, 38242 is less intense than 99233 but has the same intra-service time and substantially longer pre and post service times. Noting that 99292 is more intense than 99233, an RVW of 2.11 for 38242 places it between 99292 and 99233 which is the correct rank order. 94002 is also an appropriate comparator. It was reviewed by the RUC in 2006 with times of 15/30/15 and an RVW of 1.99. 38242 is more intense and has significantly longer times (30/45/30). Therefore, an RVW of 2.11 places it in the proper rank order with 94002.

79403 is an important comparator code because it involves infusion of a radiolabeled monoclonal antibody. 79403 was reviewed by the RUC in 2003, after 38242 was reviewed in 2002. Both codes involve complex infusions and patients who are very ill. Both services also involve substantial risk of complications and have similar intensity. The survey times for 38242 (30/45/30) are longer than the times for 79403 (30/30/15). Arguably, the times and RVW for 79403 support an RVW of 2.25 for 38242. However, the panel believes that the RVW recommendation should be guided by the survey results and therefore believes that an RVW of 2.11 is appropriate.

In summary, to maintain rank order we believe that the 25th percentile accurately reflects the work performed and recommend an RVW of 2.11 for 38242 with a pre-service time 30 minutes, intra-service time 45 minutes and post-service time 30 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is not reported using multiple CPT codes. However, an evaluation and management code is typically reported on the same say as the transplant code because these patients are usually hospitalized and are being seen every day by the transplant physician or another physician, who is also the attending physician in charge of that patient's care. For example, these patients have had their bone marrow ablated and are pancytopenic. They need to managed for their pancytopenia, infections and fluid intake. This management is entirely separate from performing a transplant. In those cases where the transplant physician is also the attending physician, that physician will report the transplant code and an evaluation and management code – usually 99232, 99233 or 99291 on the same date. On those rare occasions when a transplant is performed on an outpatient basis, no evaluation and management service is reported.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Please see answer to question 1 and the rationale.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 38242

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Hematology/Oncology How often? Commonly

Specialty Medical Oncology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 553
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on data reported to the Center for International Blood and Marrow Transplant Research

Specialty Hematology/Oncology Frequency 413 Percentage 74.68 %

Specialty Medical Oncology Frequency 140 Percentage 25.31 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 66 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database Medicare Claims Data 2010

Specialty Hematology/Oncology Frequency 50 Percentage 75.75 %

Specialty Medical Oncology Frequency 16 Percentage 24.24 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 38242

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
MPC List / CMS High Expenditure Procedural Codes

April 2012

Optical Endomicroscopy

In the 2012 Medicare Physician Fee Schedule (MFS) Final Rule the Centers for Medicare and Medicaid Services (CMS) requested that the RUC review CPT codes 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure*). At the February 2012 CPT Editorial Panel meeting, the specialty societies presented two new endoscopic procedures for optical endomicroscopy: 43206 *Esophagoscopy, rigid or flexible; with optical endomicroscopy; and* 43252 *Upper gastrointestinal endoscopy including esophagus, stomach and either the duodenum and/or jejunum as appropriate; with optical endomicroscopy;* as well as one new pathology procedure for optical endomicroscopy: 88375 *Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session.* In the final rule, CMS stated that if new codes are introduced within a family, the entire family should be reviewed in order to maintain relativity and avoid separate valuations of codes within a specific family. Because the existing family of codes were already scheduled for review at either the October 2012 or January 2013 RUC meetings, the RUC agrees with the specialty societies that survey and review of the family of codes should be delayed in order to maintain relativity and meet CMS standards. **The RUC recommends that the specialty societies survey 43206 and the esophagoscopy family of codes for review at the October 2012 RUC meeting, and CPT codes 43252 and 88375 with the Upper Gastrointestinal Endoscopy Codes for review at the January 2013 RUC meeting. In the interim the RUC recommends that CPT codes 43206, 43252 and 88375 be carrier priced for 2013.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

February 17, 2012

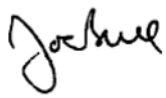
Barbara Levy, MD
Chair, AMA / Specialty Society Relative Value Update Committee
515 N. State St.
Chicago, IL 60657

Dear Dr. Levy,

The American Gastroenterological Association, (AGA), American College of Gastroenterology (ACG) and American Society for Gastrointestinal Endoscopy have proposed an action plan to systematically review and survey gastrointestinal endoscopic services. This is in response to a request made by the Centers for Medicare and Medicaid Services (CMS) in the 2012 Medicare Physician Fee Schedule (MPFS) Final Rule to survey codes 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure*). In the Final Rule, CMS has stated that if new codes are introduced within a family, the entire family should be reviewed to maintain relativity and avoid separate valuations of codes within a specific family. This action plan was reviewed and accepted by the RUC at its January 2012 meeting.

At the February 2012 CPT Editorial Panel meeting, the GI societies presented a coding change application for two endoscopic procedures for optical endomicroscopy:

- *4321X1; Esophagoscopy, rigid or flexible; with optical endomicroscopy*
- *4321X2; Upper gastrointestinal endoscopy including esophagus, stomach and either the duodenum and/or jejunum as appropriate; with optical endomicroscopy*



The RUC's LOI packet dated February 7, 2012 requests survey of these procedures.

We request that the RUC communicate to CMS that codes 4321X1 and 4321X2 should be carrier priced for 2013. We propose to survey code 4321X1 with codes 43200-43232 and present the esophagoscopy family of codes to the RUC at the October 2012 meeting. We propose to

survey code 4321X2 with codes 43235-43259 and present the esophagogastroduodenoscopy family of codes to the RUC at the January 2013 meeting.

We appreciate your consideration of this request. If you have any additional questions please contact Adam Borden, AGA, 301-941-2629 or aborden@gastro.org; Samuel Reynolds, ASGE, 630-570-5643 or sreynolds@asge.org; or Brad Conway, ACG, 301-263-9000 or bconway@gi.org.

Sincerely,

Joel V. Brill, MD
AGA RUC Advisor

Nicholas Nickl, MD
ASGE RUC Advisor

Daniel DeMarco, MD
ACG CPT Advisor

April 3, 2012

Barbara Levy, MD
Chair, AMA / Specialty Society Relative Value Update Committee
American Medical Association
515 N. State St.
Chicago, IL 60657

Dear Doctor Levy,

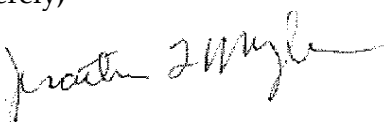
The College of American Pathologists (CAP) recommends that new CPT code 88375 *Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session* be carrier priced for 2013. In February 2012, the American Gastroenterological Association, (AGA), American College of Gastroenterology (ACG) and American Society for Gastrointestinal Endoscopy assisted the AMA CPT Editorial Panel in the creation of the following three new optical endomicroscopy-related CPT codes.

43206; *Esophagoscopy, rigid or flexible; with optical endomicroscopy*
(Report supply of contrast agent separately)
(Do not report 43206 in conjunction with 88375)

43252; *Upper gastrointestinal endoscopy including esophagus, stomach and either the duodenum and/or jejunum as appropriate; with optical endomicroscopy*
(Report supply of contrast agent separately)
(Do not report 43252 in conjunction with 88375)

88375; *Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session*
(Do not report 88375 in conjunction with 43206 or 43252)
(For biopsy specimen pathology use 88305)

Since that time, the AGA, ACG, and the ASGE undertook a proposal to systematically review and survey all gastrointestinal endoscopic services. This action plan introduced by the gastroenterology societies was reviewed and accepted by the RUC at its January 2012 meeting. This is in response to a request made by the Centers for Medicare and Medicaid Services (CMS) in the 2012 Medicare Physician Fee Schedule Final Rule to survey codes 43235 *Upper gastrointestinal endoscopy including esophagus,*



stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure) and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure*). In the Final Rule, CMS has stated that if new codes are introduced within a family, the entire family should be reviewed to maintain relativity and avoid separate valuations of codes within a specific family.

CAP initially indicated on the RUC's LOI that we would survey pathology code 88375 for presentation at the April 2012 RUC meeting. Subsequently, CAP learned of the GI society's action plans and their intentions to postpone surveying for 43206 and 43252, until they had a chance to survey their families of endoscopy codes in response to CMS' request. Because of the relationship between the 43206 and 43252 codes and the pathology service, CAP believes that it is necessary to survey and present recommendations for code 88375 at the same time as the 43206-43252 codes are presented to the RUC. This would also be more consistent with the RUC's and CMS' established policy of reviewing codes. CAP then alerted AMA staff of our intentions to follow the GI society's lead in recommending that all three codes be carrier priced for 2013, and to survey for code 88375 for presentation at the January 2013 RUC meeting.

We request that the RUC communicate to CMS that code 88375 should be carrier priced for 2013. We propose to survey code 88375 and present physician work and practice expense to the RUC at the January 2013 meeting.

We appreciate your consideration of this request. If you have any additional questions please contact Todd Klemp, Associate Director of Economic Affairs and Regulatory at 847-832-7403 or tklemp@cap.org

Sincerely,

Jonathan L. Myles, MD, FCAP
Chair, Economic Affairs Committee

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Fecal Bacteriotherapy

In February 2012, the CPT Editorial Panel created CPT code 44705 *Preparation of fecal microbiota for instillation, including assessment of donor specimen*. The specialty societies conducted a survey of this rarely performed service and only received responses from 11 physicians whom perform the service described. The RUC agreed with the specialty societies that the survey respondents overestimated the physician work involved. The RUC reviewed the results of an expert panel of physicians as presented to the RUC and determined that a work RVU of 1.42, below the 25th percentile, appropriately accounts for the physician work required to perform this service. The RUC agreed with the survey time of 4 minutes pre-service, 20 minutes intra-service and 5 minutes post-service. This service is delivered to the donor and is primarily oriented to establish that the donor is a well patient and suitable to act as a donor. The work is equivalent to a 99203 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 1.42). The RUC compared 44705 to 99203 and determined both services require the same physician work and physician time to perform. The RUC determined a direct crosswalk to CPT code 99203 is appropriate. **The RUC recommends a work RVU of 1.42 for CPT code 44705, a direct crosswalk to CPT code 99203.**

Practice Expense
The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:44705 Tracking Number X1 Original Specialty Recommended RVU: **1.42**
Presented Recommended RVU: **1.42**
Global Period: XXX RUC Recommended RVU: **1.42**

CPT Descriptor: Preparation of fecal microbiota for instillation, including assessment of donor specimen
(Do not report 44705 in conjunction with 74283)
(For fecal instillation by oro-nasogastric tube or enema, use 44799)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old female with refractory, relapsing C. difficile diarrhea despite multiple courses of antibiotic treatment, is referred for evaluation and consideration of treatment options. After assessment (reported separately as E/M) it is elected to utilize fecal microbiota therapy. The physician has selected the potential donor and oversees evaluation and preparation of the specimen.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 45%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician reviews the medical history form completed by the potential donor as well as any available donor health records. The physician reviews the FDA protocol-delineated laboratory tests to determine whether the patient is a suitable candidate for being a fecal donor and if there are contraindications to the stool donation.

Description of Intra-Service Work: The physician conducts a detailed review of the donor's past medical and surgical history and current health status pertaining to recent antibiotic use, travel, immunodeficiency disease, and related issues. The physician reviews the donor's medication list to determine if the patient has used medications that are contraindicated for a trans-faunal donation. The physician conducts a focused physical examination for conditions which may contraindicate donation. The physician reviews the laboratory tests with the donor. The physician makes a final determination of whether the donor is suitable. In the event that pathological conditions are identified by history, physical exam, or laboratory testing, the physician arranges referral of the donor to their primary health care provider(s) or emergency evaluation if appropriate.

Following collection of the fecal specimen, the physician oversees the preparation of the filtered material to be infused into the recipient. A time out relative to the infusion specimen is performed.

Description of Post-Service Work: The physician completes documentation of the donor suitability. The physician is available to answer any questions from the donor patient.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99204	XXX	2.43	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99202	XXX	0.93	**RUC Time**	3,074,347

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 20 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
92004	XXX	1.82	**RUC Time**	2,123,579

CPT Descriptor 2 Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits

Other Reference CPT Code	Global	Work RVU	Time Source
99203	XXX	1.42	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 4 **% of respondents:** 36.3 **%**

TIME ESTIMATES (Median)	**CPT Code: 44705**	**Key Reference CPT Code:** 99204	**Source of Time RUC Time**
Median Pre-Service Time	4.00	5.00	

Median Intra-Service Time	20.00	30.00
Median Immediate Post-service Time	5.00	10.00
Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**29.00**	**45.00**

Time Segments (Mean)		
Pre-Service intensity/complexity	4.75	3.00
Intra-Service intensity/complexity	3.50	4.00
Post-Service intensity/complexity	2.50	2.75

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Infectious Diseases Society of America (IDSA), the American Gastroenterological Association (AGA), and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of 177 physicians who perform the service described by CPT code 44705*; Preparation of fecal microbiota for instillation, including assessment of donor specimen.* We received 18 responses but only 11 responses (6.2 percent) were from physicians familiar with the procedure and the physician work and practice expense involved in performing this service.

A panel of physician reviewers from the surveying societies found the survey data to be flawed for the following reasons:

1) A low response rate (N < 30) to the survey
2) Even with low numbers, 7 respondents reported a zero performance rate for the service, meaning that they had not previously performed the procedure. These responses were eliminated for purposes of analysis reducing the number of responses from N = 18 to the current N = 11.
3) Possibly because this is a rarely performed service, respondents appeared to not understand the elements involved in the procedure that were separate from other associated services resulting in high survey recommendations regarding physician work.

In view of the flawed survey data resulting in values that appeared to be inflated, an expert physician panel was convened by the specialty societies to review the survey results and make recommendations regarding 44705. The panel considered possible reasons that the survey respondents may have misunderstood the survey questions. They noted that while the CPT text descriptor is: "preparation of fecal microbiota for instillation, including assessment of donor specimen," (i.e. work related to the donor specimen), the first two sentences of the three-sentence vignette describes the recipient patient. The panel concluded that this may have misled survey respondents to include work related to the management of the recipient in their work estimates rather than confining their work estimates to those related to specimen preparation.

The key reference code identified in the survey was 99204; *Office or other outpatient visit for the evaluation and management of a new patient*, RVW = 2.43, physician times (5 / 30 / 10). The expert panel did believe this reference code describes a service with a number of similarities in physician work to the surveyed code but believed that 99204 likely describes a greater amount of work than that inherent to this code. In reviewing the pre-, intra-, and post-service work descriptors, the panel determined that this work essentially constituted a new outpatient standard evaluation and management service delivered to the donor, and primarily oriented to establish that the donor is a well patient and suitable to act as a donor. The panel determined that the chosen key reference service, 99204, constituted greater work than would be attributed to such a well patient evaluation (possibly again related to survey respondent inclusion of work services delivered to the recipient patient), and felt that 99203 with RVW = 1.42 and physician times (4 / 20 / 5), more accurately represents the actual work amount in both time and RVW value for this service.

Therefore, the societies recommend that 44705 be cross-walked to code 99203 recommending an RVW value 1.42 and physician times (4 / 20 / 5). This recommendation is significantly lower than the 25th percentile from the limited survey data reported at RVW = 1.63 with intra - service time 27.5 minutes. Further, the recommendation for 44705 results in an IWPUT of 0.0598 which is comparable to the IWPUT for the Key Reference Service code 99204 (IWPUT = 0.0697), the comparison codes from the MPC list 99202 (IWPUT = 0.0516) and 92004 (IWPUT = 0.0594), and the crosswalk code 99203 (IWPUT = 0.0609).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 44799; unlisted procedure, intestine

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Infectious Diseases How often? Rarely

Specialty Gastroenterology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on estimates of the specialty physicians who perform this procedure, we believe that approximately 40% of claims will be reported by infectious diseases physicians and 60% by gastroenterologists.

Specialty Infectious Diseases Frequency 400 Percentage 40.00 %

Specialty Gastroenterology Frequency 600 Percentage 60.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 700
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe this procedure is performed in the Medicare-eligible population approximately 70% of the time.

Specialty Infectious Diseases Frequency 280 Percentage 40.00 %

Specialty Gastroenterology Frequency 420 Percentage 60.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 91065

CPT Long Descriptor:

Preparation of fecal microbiota for instillation, including assessment of donor specimen
(Do not report 44705 in conjunction with 74283)
(For fecal instillation by oro-nasogastric tube or enema, use 44799)

Global Period: **XXX** Meeting Date: **April 2012**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The IDSA, AGA and ASGE consulted with physicians who are familiar with the fecal microbiota transplant procedure to develop the practice expenses for the facility and nonfacility setting.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

While the practice expenses are somewhat different due to the nature of the service, our societies believe the best comparison was to code 99203; *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.*

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

N/A

Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

Staff conducts follow up phone call with donor regarding test results.

Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.*

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Staff schedules the patient for the instillation. Staff assembles the necessary equipment used to produce the material for instillation. Staff receives the stool sample and confirms correct donor.

Service Clinical Labor Activities:

The donor stool is mixed with approximately 50 ml of preservative free normal saline in a blender to create a liquid slurry of fecal microbiota. The slurry is filtered twice to remove any and all particulate matter. The fecal microbiota sample is drawn into a syringe and labeled. The syringe of fecal microbiota is delivered to the procedure site and prepared for instillation into the recipient. Staff proceeds to clean the equipment utilized in the preparation of the fecal microbiota sample. Diagnostic forms and lab requisitions are completed.

Post-Service Clinical Labor Activities:

Staff conducts follow up phone call with donor regarding test results.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Bladder Chemodenervation

In February 2012, the CPT Panel created a new code, 52287 *Cystourethroscopy, with injection(s) for chemodenervation of the bladder* to report physician work related to chemodenervation of the bladder. This procedure was previously reported using an unlisted code.

The RUC reviewed the survey results from 59 urologists and determined the survey respondents overestimated the physician work to perform this service. Additionally, there was consensus among the RUC that the survey median intra service time of 20 minutes was insufficient for a basic cystourethroscopy, which includes the work of CPT code 52000 (work RVU=2.23, intra service time=15 minutes) plus 30 injections. The RUC also agreed that this work was completely different than other chemodenervation treatments (e.g., migraine). The risks, including paralytic bladder, bleeding, perforation and urosepsis are significantly greater.

The RUC attempted to identify CPT codes with similar physician time and intensity. The RUC reviewed 52281 *Cystourethroscopy, with calibration and/or dilation of urethral stricture or stenosis, with or without meatotomy, with or without injection procedure for cystography, male or female* (work RVU=2.75) and 49452 *Replacement of gastro-jejunostomy tube, percutaneous, under fluoroscopic guidance including contrast injection(s), image documentation and report* (work RVU=2.86) and agreed that although theses procedures have the same intra-service time of 20 minutes, the intensity of 52287 is higher. The RUC reviewed 52007 *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service; with brush biopsy of ureter and/or renal pelvis* (work RVU=3.02) and determined that the physician work and intensity were similar. **The RUC recommends that 52287 be resurveyed in October 2012 to validate the intra service time. In the interim, the RUC recommends a work RVU of 3.02, a direct crosswalk to CPT code 52007, for CPT code 52287.**

Practice Expense:
The RUC approved the practice expense inputs as modified and submitted by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Presented Recommended RVU: **3.74**
Global Period: 000 RUC Recommended RVU: **3.02**

CPT Descriptor: CYSTOURETHROSCOPY, WITH INJECTION(S) FOR CHEMODENERVATION OF THE BLADDER

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 46 year old female presents with urinary incontinence due to neurogenic detrusor overactivity. The patient is experiencing urinary urgency, frequency and urgency incontinence several times daily. Prior evaluation has consisted of a negative urine culture and cytology, diagnostic cystoscopy that was consistent with evidence of detrusor hyperactivity, and urodynamics that demonstrated uninhibited detrusor contractions in the absence of anatomical obstruction. The patient has failed oral anticholinergic/antimuscarinic medications and is scheduled for treatment with chemodenervation of the bladder by intravesical injection of a neurotoxic agent.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 40%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 11%

Description of Pre-Service Work:

• Obtain and review records and previous history, laboratory studies and all imaging studies before the procedure;
•Surgical time-out is done identifying the patient, procedure to be done, and appropriate equipment and supplies are in the room
•Place patient on cystoscopy table in dorsal-lithotomy position
•Prep and drape the perineum
•Connect irrigation tubing and light source to flexible cystoscope
•Drain bladder using straight catheter
•Instill 50 ml of 2% Xylocaine into bladder
•Wait 10 minutes for Xylocaine to take effect and numb bladder
•Connect laser and insert through working channel of flexible cystoscope
•Attach camera and “white balance”; check video equipment
•Prepare drug - vacuum-dried, purified onabotulinumtoxinA (100 U per vial) is reconstituted in 10 mL of sterile 0.9% non-preserved saline solution and mixed gently to yield a 10unit/1cc saline dilution. The reconstituted drug is drawn into a sterile 10mL syringe onto the surgical field from the vial of reconstituted drug. This produces one 10 mL syringe of reconstituted onabotulinumtoxinA with a dilution of 10units/1cc saline. Up to 3 vials of

onabotulinumtoxinA may be used, requiring 3 vials be reconstituted and a total dose of 300U drug delivered.

Description of Intra-Service Work:

•Prior to injection, the syringe containing the reconstituted drug is attached to the cystoscopic injection needle which is then primed with approximately 1ml diluted drug to remove any air.

•On the sterile field, the cystoscopic injection needle is loaded into the working channel of the cystoscope.

•The cystoscope is inserted through the patient's urethra into the bladder under direct visualization.

•Document procedure with still photographs from video unit and transfer images to medical record

•The urinary bladder is distended to near capacity with approximately 300cc cystoscopic irrigant using sterile normal saline.

•Under direct vision, the surgeon places the cystoscopic needle at 2-4mm of depth into the bladder detrussor muscle assuring the needle depth has not perforated the bladder. The surgeon holds steady positioning of the needle in the bladder muscle. The surgeon directs the assistant to press 1/2 to 1 cc of drug from the syringe as the surgeon observes the injection bleb of drug delivered to the bladder muscle. (ie, this is a 4-handed maneuver requiring an assistant, the surgeon cannot watch the bladder and the syringe at the same time - thus requiring an assistant.) This injection maneuver is repeated 10-60 times, spacing injections 1cm apart and dispersing injections evenly throughout the bladder muscle taking care to avoid critical landmarks and vascular structures. For the final injection, approximately 1 mL of sterile saline is injected so the full dose is delivered.

•At the end of the injection procedure, the bladder is drained, and the cystoscope is reinserted to refill the bladder and observe for any bleeding and assure no perforations or injuries have occurred. The bladder is redrained at the end of the procedure.

Description of Post-Service Work:

•Remove drapes
•Bring patient's legs out of dorsal-lithotomy position
•Move patient off of table and take to recovery area
•Monitor vital signs as appropriate
•Discuss findings with patient and family as appropriate
•Give post operative instruction sheet
•Write prescriptions
•Schedule follow-up appointment
•Dictate operative report
•Contact referring physician or primary care physician as appropriate

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 53899

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 40000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The information is based on coverage data from the National Ambulatory Care and National Hospital Ambulatory Care payer surveys.

Specialty Urology Frequency 35000 Percentage 87.50 %

Specialty Urogynecology Frequency 5000 Percentage 12.50 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 16,800 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The information is based on coverage data from the National Ambulatory Care and National Hospital Ambulatory Care payer surveys.

Specialty Urology Frequency 11000 Percentage 65.47 %

Specialty Urogynecology Frequency 4800 Percentage 28.57 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 51715

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Cystourethroscopy, with injection(s) for chemodenervation of the bladder

Global Period: 000 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AUA expert panel consists of ten urologists who represent urological practices, both academic and private settings, from across the United States. They represent the states of Washington, Illinois, New York, Kentucky, Florida and Tennessee. The information was also reviewed by a member of the American Urogynecologic Society. The panel reviews current RUC practice expense information, requests input for supplies and equipment from several urology practices, reviews the information, makes recommendations and submits them to the AMA.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: We used the key reference code 51715 Endoscopic injection of implant material into the submucosal tissues of the urethra and/or bladder neck as a comparison code for practice expense inputs.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Chart is reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patient is greeted and a gown is provided.
- Patient education and consent is obtained.
- Review with patient each step of the treatment and answer patient questions.
- Obtain vitals
- Set up the equipment (cystoscope, video, etc.) and sets up the supplies needed for the procedure.
- Assist the physician with positioning and padding of patient in the dorsal lithotomy position.
- Assist the physician with the preparation and draping of the patient.
- Assist the physician with the local anesthesia prior to the procedure.

Service Clinical Labor Activities:

- Performs a time-out with physician to make sure proper procedure and proper patient is being treated.

- Clinical staff person hands supplies and equipment to the physician during procedure.
- Assist the physician with removing padding and repositioning patient after procedure.

Post-Service Clinical Labor Activities:

- Clean the room and disinfect cystoscope in proper sterilizing equipment and according to sterilization protocols.
- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Chemodenervation for Chronic Migraine and Related Family

In February 2012, the CPT Editorial Panel created one new code to describe a new injection paradigm for treatment of chronic migraine as current codes do not describe the totality of the work performed. The Panel also revised 64612 to indicate that this service is unilateral as well as clarify the parenthetical following 64614. The entire family was to be surveyed to avoid any rank order anomalies.

64612 Chemodenervation of muscle(s); muscle(s) innervated by facial nerve, unilateral (eg, for blepharospasm, hemifacial spasm)
The RUC reviewed the survey results from 50 ophthalmologists, neurologists, physical and rehabilitation physicians and interventional pain physicians and determined that the survey median work RVU of 1.41, a decrease from the current value, appropriately accounts for the work required to perform this service. The RUC agreed with the survey respondents that 10 minutes pre-time, 10 minutes intra-service time and 5 minutes post-time are required to perform this service. Although the survey respondents indicated that one 99213 office visit is typically performed in the global period for this service, the RUC agreed with the specialties that one 99212 office visit is more appropriate.

The RUC compared 64612 to key reference service 64611 *Chemodenervation of parotid and submandibular salivary glands, bilateral* (work RVU = 1.03 and 5 minutes intra-service time) and determined that 64612 requires twice as much intra-service time, more physician work and is more intense and complex. The RUC also compared 64612 to MPC code 41100 *Biopsy of tongue; anterior two-thirds* (work RVU = 1.42 and 15 minutes intra-service time) and 68840 *Probing of lacrimal canaliculi, with or without irrigation* (work RVU = 1.30 and 10 minutes intra-service time) and determined that a work RVU of 1.41 places this service in the proper rank order among similar services in the Medicare physician payment schedule. **The RUC recommends a work RVU of 1.41 for CPT code 64612.**

64613 Chemodenervation of muscle(s); neck muscle(s) (eg, for spasmodic torticollis, spasmodic dysphonia)
The American Academy of Neurology (AAN), the American Society of Interventional Pain Physicians (ASIPP), the American Academy of Physical Medicine and Rehabilitation (AAPM&R) and the American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS) surveyed 64613 and indicated that the current parenthetical has a multi-purpose use for spasmodic torticollis and spasmodic dysphonia. The specialties believe that the varied data is due to the different uses of this procedures when performed by an otolaryngologist who is injecting the larynx versus the other three specialties who are injecting into a neck muscle. All specialties agree that injecting into the larynx is substantially different work than injecting the neck muscle. The specialty societies requested and the RUC agreed that code 64613 be referred to the CPT Editorial Panel to create two codes to describe two separate and distinct services. **The RUC recommends that 64613 be referred to the CPT Editorial panel to create two codes, one to describe chemodenervation for spasmodic torticollis and another to describe chemodenervation for spasmodic dysphonia.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

64614 Chemodenervation of muscle(s); extremity and/or trunk muscle(s) (eg, for dystonia, cerebral palsy, multiple sclerosis)
The specialty societies indicated that CPT code 64614 was included to be surveyed as part of this family of services. However, AAN and AAPM&R recently submitted a code change proposal to split 64614 into two new codes. **The specialties requested and the RUC agreed to postpone review of this service until the October 2012 RUC meeting.**

64615 Chemodenervation of muscle(s); muscle(s) innervated by facial, trigeminal, cervical spinal and accessory nerves, bilateral (eg, for chronic migraine)
The RUC reviewed the survey results from 41 ophthalmologists, neurologists, physical and rehabilitation physicians and interventional pain physicians and determined that the survey median work RVU of 1.85 appropriately accounts for the work required to perform this service. The RUC determined that 15 minutes pre-time, 15 minutes intra-service time and 5 minutes post-time are required to perform this service. The survey respondents did not indicate that a post-operative office visit is typical, the specialty societies agreed and requests that CMS change this service to a 000-day global period.

The RUC compared 64615 to 70546 *Magnetic resonance angiography, head; without contrast material(s), followed by contrast material(s) and further sequences* (work RVU = 1.80 and 15 minutes intra-service time) and determined that these services require similar physician work, intensity, complexity and intra-service time to perform. The RUC also compared 64615 to MPC code 92004 *Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits* (work RVU = 1.22 and 25 minutes intra-service time) and determined that a work RVU of 1.85 places this service in the proper rank order among similar services in the Medicare physician payment schedule. **The RUC recommends a work RVU of 1.85 and requests a 000-global period for CPT code 64615.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Category I **Surgery** **Nervous System** **Destruction by Neurolytic Agent (eg, Chemical, Thermal, Electrical or Radiofrequency, Chemodenervation)**				
Codes 64600-64681 include the injection of other therapeutic agents (eg, corticosteroids). Do not report diagnostic/therapeutic injections separately. ~~(For~~ Do not report a code labeled as destruction when using therapies that are not destructive of the target nerve [eg, pulsed radiofrequency], use 64999~~)~~. For codes labeled as chemodenervation, the supply of the chemodenervation agent is reported separately. (For chemodenervation of internal anal sphincter, use 46505) (For chemodenervation of the bladder, use 528XX) (For chemodenervation for strabismus involving the extraocular muscles, use 67345) (For chemodenervation guided by needle electromyography or muscle electrical stimulation, see 95873, 95874)

RE: Tab 20: Chemodenervation for Chronic Migraine, CPT 64613 and 64614

Dear Dr. Levy:

Please accept this letter on behalf of the American Academy of Neurology (AAN), the American Society of Interventional Pain Physicians (ASIPP), the American Academy of Physical Medicine & Rehabilitation (AAMPR), and the American Academy of Otolaryngology – Head and Neck Surgery (AAO-HNS). Together, our societies surveyed a family of three CPT codes; 64612, 64613, and 641X1, representing Tab 20 for the upcoming April Relative Update Committee (RUC) meeting.

We are writing to express our concerns with the survey responses received for CPT 64613 *Chemodenervation of muscle(s); neck muscle(s) (eg, for spasmodic torticollis, spasmodic dysphonia).* Specifically, upon review of the survey responses, it became evident that the responses from AAO-HNS members were markedly different, in work and intensity, than those received from AAN, ASIPP, and AAMPR. As you can see from the descriptor above, CPT 64613 includes a parenthetical which notes it has a multi-purpose use, for torticollis or dysphonia. We believe the varied data from our survey is due to the different uses of this procedure when performed by an Otolaryngologist who is injecting the larynx versus the other three specialties who are injecting a muscle in the neck. As a group, we agree that injecting the larynx is substantially different work than injecting the neck muscle; and therefore we believe new CPT codes for these separate and distinct purposes, spasmodic torticollis and spasmodic dysphonia, is appropriate.

After speaking with AMA staff assigned to this tab, we uniformly agree and respectfully request, that the RUC permit our specialties to table the valuation of CPT 64613 for the April RUC meeting and instead, proceed with code change applications for the October 2012 CPT Editorial panel meeting to request the development of two new CPT codes for Chemodenervation of muscle(s); for spasmodic dysphonia and Chemodenervation of muscle(s); for spasmodic torticollis. The estimated timeline, should the RUC approve this, would be for the respective societies to submit code change proposals (CCP) by the July 13, 2012 deadline for consideration at the October 2012 CPT Editorial Panel meeting. The new codes would then be valued by the RUC at the January 2013 RUC meeting.

While 64614 was also included on the level of interest form, AAN and AAPMR submitted a code change proposal in February to split 64614 into two new codes. For that reason, the societies will not survey that service until after CPT reviews it at the May 2012 meeting. The RUC may prefer that the new codes for existing services in 64613 and 64614 are brought to the same meeting in January 2013.

Thank you in advance for your consideration of this request and urge you to contact us with any questions or concerns regarding this proposal. You may reach the relevant Society staff at: Amanda Becker, AAN, at Abecker@aan.com or 651.695.2718; Melinda Martin, ASIPP, at mmartin@asipp.org or 270-554-9412;

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64612 Tracking Number DD1 Original Specialty Recommended RVU: **1.41**
Presented Recommended RVU: **1.41**
Global Period: 010 RUC Recommended RVU: **1.41**

CPT Descriptor: Chemodenervation of muscle(s); muscle(s) innervated by facial nerve, unilateral (eg, for blepharospasm, hemifacial spasm)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62 year old man presents with nearly constant spasms of the left side of his face including the orbicularis oculi. Chemodenervation is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 2% , In the ASC 6%, In the office 92%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Description of Pre-Service Work: The physician reviews the patient history and confirms the eye for treatment. Effect of prior treatment is reviewed. Consent is obtained. Additional counseling of the patient and any accompanying family about the treatment planned is performed. The duration of expected treatment effect is discussed. The side to be treated is marked and time out taken. The medication is reconstituted with sterile saline by slowly injecting the diluent into the vial.The physician then gently mixes the toxin by rotating the vial. The drug is drawn into the syringe.

Description of Intra-Service Work: The facial muscles are injected in 6 to 8 locations: three in the brow, one in the lateral canthus, one or two in the lower lid, and one in the lateral aspect of the upper lid and when needed one in the nasal aspect of the upper lid. More muscles may be injected such as platysma and zygomaticus.

Description of Post-Service Work: The physician confirms the treatment and discusses necessary follow up. The service is documented in the medical record. Drug accounting is completed.

Intra-Service intensity/complexity	3.33	3.20
Post-Service intensity/complexity	2.13	2.13

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code CPT 64612 *Chemodenervation of muscle(s); muscle(s) innervated by facial nerve (eg, for blepharospasm, hemifacial spasm)* is being presented as part of a family of codes dealing with chemodenervation of the muscles in the head and neck area. This code deals with treatment of spasms

of muscles of the face innervated by the facial nerve. Injection of the botulinum toxin causes paresis of the muscles and reduces the spasms. These facial injections of multiple muscles include the orbicularis oculi responsible for lid closure. There is significant skill and judgment required to determine both the precise locations for injection needed for each patient and the dose required to treat the disease without causing iatrogenic seventh nerve palsy with resulting exposure keratitis in the eye. The American Academy of Ophthalmology, American Academy of Neurology, American Academy of Physical and Rehabilitation Medicine and American society of Interventional Pain Physicians participated in the survey. The dominant specialty for the use of this office-based code is Ophthalmology. There were 50 respondents, 82% of whom felt the rationale accurately represented the typical patient. The code has a 10 day global period and is not typically performed with an EM service.

The current value of the code is 2.01 with times **of 10/20/6** minutes and **one level 99212** in the global period. It has an **IWPUT of .058**. The **median WRVU** from the survey was **1.41** with the **25th percentile 1.03**. Median IST was **10 minutes**. Total **pre-service time** from the survey was **20 minutes** with **5 minutes** of **post-service time**. The survey showed that a post-operative visit within the global period was typical and the expert panel agreed that the current 99212 should remain.

The key reference service was 64611, *Chemodenervation of parotid and submandibular salivary glands, bilateral,* which was reviewed by the RUC in June 2009. It has a 10-day global with one 99212 visit and **work RVU of 1.03**. The times for this code are 10/5/5 minutes. For 9 of 11 intensity measurements, the survey respondents felt that the surveyed code was more complex and intense than the reference code. An expert consensus panel composed of members of the participating societies familiar with the code in question and the RUC process reviewed the results. The panel confirmed the reliability of the survey. It discussed the fact that the nature of the procedure has not changed significantly. The consensus group recommended the **pre-service package 5 with three additional minutes** added prepare the toxin. This is identical to both the package chosen and the RUC-reviewed time allowed for the reference code (10 minutes). The panel also noted that the surveyed code had an IST that was twice as long as the reference code and also higher intensity-complexity metrics. The panel therefore recommended that the **survey median 1.41 RVU** as accurately reflecting the WRVU for the surveyed service**. This is 0.6 RVU lower than the current value**.

The panel used several methods of verifying the recommended value. It first considered the comparison with the reference code 64611. The surveyed code has a longer IST (10 vs 5 min) and involves on average 6 separate injections in six distinct sites around an eye which must be carefully identified. Those surveyed felt that the current code was more complex and intense in 9 of 11 metrics. The iatrogenic risks are higher for facial injections in general and periocular injections in particular. Taking all of these issues into account, the panel felt that the recommended work value of 1.41 represented the proper incremental work increase for the surveyed code when compared with the reference code.

The panel also considered another 10-day global injection code, CPT 64632 *Destruction by neurolytic agent; plantar common digital nerve,* which was reviewed by the RUC in April 2008. This is a single needle placement in the foot with several redirections to spread the medication. It has a 10-day global with one 99212 visit, WRVU of 1.23 with the same pre and post times but only half the IST of the surveyed code. The panel felt that the longer IST, the work involved to identify multiple injection sites and the location of the injections around the eye justified a higher WRVU. CPT 68840 *Probing of lacrimal canaliculi, with or without irrigation* was reviewed by the RUC in 2005. It has virtually identical times and a WRVU of 1.30. The panel felt that this code was less intense and complex than the surveyed code and had a lower chance of developing a serious complication.

Because there are few injection codes with 10-day global periods, the panel also reviewed other injection codes with similar pre and post times but XXX AND 000 global periods. Removing one 99212 visit from our recommended value would give a **WRVU of 0.93** (=1.41-.48). CPT 20526 *Injection, therapeutic (eg, local anesthetic, corticosteroid), carpal tunnel* (RUC reviewed 2002, 000 global, 6/5/5

min) has **a WRVU of 0.94**. The panel felt that the work of the surveyed code was comparable to the work of this code which not only takes less time but involves a single injection of lower risk therapeutic agents (steroid/local anesthetic) in an area other than the face and eye.

We also considered that the current code has an IST of 20 minutes. The current survey showed 10 minutes of IST. The pre and post times are identical and the number and level of post-operative visits is the same. Using the current IWPUT of the code (0.058), removing 10 minutes of time would result in removing 0.58 WRVU. Subtracting this from the current value of the code (2.01) gives a value of 1.43 WRVU which is virtually identical to the recommended survey median (1.41 WRVU). The RUC has accepted this method of confirming the value of a code for which intensity and complexity have not changed, but time has decreased (most recently CPT 66984 in January 2012).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64612

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Commonly

Specialty Neurology How often? Sometimes

Specialty Physical/Rehab How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? Unknown
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 86,957 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Reduction due to utilization shift to new migraine injection code

Specialty Ophthalmology Frequency 60870 Percentage 70.00 %

Specialty Neurology Frequency 24845 Percentage 28.57 %

Specialty Physical/Rehab Frequency 1500 Percentage 1.76 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 64612

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:64615 Tracking Number DD4 Original Specialty Recommended RVU: **1.85**
Presented Recommended RVU: **1.85**
Global Period: 000 RUC Recommended RVU: **1.85**

CPT Descriptor: Chemodenervation of muscle(s); muscle(s) innervated by facial, trigeminal, cervical spinal and accessory nerves, bilateral (eg, for chronic migraine)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 46 year old woman presents with 19 headache days per month of which 15 or more meet the criteria for migraine (headache lasting 4 hours per day or longer). The decision is made to chemodenervate muscles innervated by the facial, trigeminal, cervical spinal and accessory nerves.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 2% , In the ASC 7%, In the office 90%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 7%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 7%

Description of Pre-Service Work: The physician reviews the patient history and consents the patient. Effect of prior treatment is reviewed. Additional counseling of the patient and any accompanying family about the treatment planned is performed. The duration of expected treatment effect is discussed.The medication is reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The physician records the date and time of reconstitution. The drug is drawn into the syringe.

Description of Intra-Service Work: The physician identifies 31 injection sites over 7 muscle groups on each side of the face, head, neck and upper back (the frontalis, corrugator, procerus, occipitalis, temporalis, trapezius, and cervical paraspinal muscle groups). The physician prepares each of the injection sites by cleaning with alcohol. The physician injects, controls bleeding, and ensures patient is stable.

Description of Post-Service Work: Post-injection instructions are provided including expected side effects including pain or weakness in injected areas, The patient is advised to report promptly any shortness of breath, generalized weakness, or weakness outside of the injected regions. The service is documented in the medical record. Drug accounting is completed.

Intra-Service intensity/complexity	3.30	3.10
Post-Service intensity/complexity	2.50	2.60

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Chemodenervation treatment for migraine requires a minimum of 31 injections, and potentially up to 39 injections, in head and neck muscles. The physician must map out specific locations for the 31 sites. Potential side effects include neck

pain/weakness, headache, and migraine. There is significant skill and judgment required to determine both the precise locations for injection needed for each patient and the dose required.

An expert consensus panel composed of members of the participating societies familiar with the code in question and the RUC process reviewed the results. The panel confirmed the reliability of the survey. The group recommended the pre-service package 5 with three additional minutes added to prepare the toxin. This is identical to the pre-service time for code 64612.

When examining the survey times broken out by specialty, the neurology respondents gave a median intra-service time of 20 minutes. Neurology is the dominant provider and this fits with the time our experts state as realistic. The panel recommends an intra-time of 20 minutes.

Since the survey results did not show a follow-up visit was typical within 10 days, the societies recommend the global period change to 000.

The panel recommends the median RVU of 1.85 and times of 10/20/5 minutes.

This service requires more injections, more effort, and more intensity than 64612.

The panel considered code 70546, *Magnetic resonance angiography, head; without contrast material(s), followed by contrast material(s) and further sequences*, as a crosswalk. This service was reviewed by the RUC in April 2000. It has an XXX global with times of 6/15/10 and an RVU of 1.80.

The panels reviewed the times and values for other injection codes, as shown in this table. The high IWPUT support the value of 64615. The value for providing codes 20553, 20550, and 64455 would be 2.25 RVUs, and which comes in higher than 64615.

Code	Short Desc	RVW	Pre	Intra	Post	IWPUT

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Combination of previously existing codes 64612 and 64613, as well as the unlisted procedure code 64999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty Ophthalmology How often? Commonly

Specialty PM&R How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
12,358 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate. We estimate 12% of 64612 was for migraine and 6% of 64999

Specialty Neurology Frequency 7661 Percentage 61.99 %

Specialty Ophthalmology Frequency 3378 Percentage 27.33 %

Specialty PM&R Frequency 1000 Percentage 8.09 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64612

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

Chemodenervation of muscle(s); muscle(s) innervated by facial nerve, unilateral (eg, for blepharospasm, hemifacial spasm)

Global Period: **010** Meeting Date: **April 2012**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The societies convened a panel of experts to review and develop inputs by phone and email.**

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: **This is an existing code and so the current inputs of 64612 should be compared.**

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The RN or tech completes the necessary referral forms from the facility where the procedure is to be performed. They then phone the facility to schedule the time that the patient would be seen for the injections. The informed consent provided by the physician is reiterated by the tech or RN who then assures that the appropriate forms are also signed by the patient.

Service Clinical Labor Activities:

Not applicable

Post-Service Clinical Labor Activities:

The RN or tech phones the patient to go over post-operative instructions regarding the injection sites as well as to reiterate emergent post-operative complications such as nerve palsy or infection the patient should be aware of and reported to the office. Taking care of non-emergent side effects such as dry eye are also discussed. Arrangements for a post-operative visit in order to access the treatment adequacy and ensure no post-operative impact on the eye are also made by the RN or tech.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The patient's appointment is made/confirmed and pre-procedure instructions are conveyed.

Service Clinical Labor Activities:

Verification of appropriate supplies to administer the toxin are made on an ongoing basis. Toxin is ordered from the pharmacy as needed and stored as appropriate for each brand drug. Appropriate storage of the toxin needs to be maintained, including daily monitoring of the refrigerator temperature and log of the drug stored. The drug is stored locked due to its high cost. On the day of the procedure, patient has vital signs done and the patient is put into a room. Medications are reviewed for contraindications to botulinum toxin. Informational material about the toxin is provided to the patient to review. Consent form is provided to the patients and signed. Patient is instructed to change into gown. Botulinum toxin is then reconstituted, and drawn into syringes. Syringes, needles, alcohol swab are then brought to the procedure room for administration.

Pressure apply to ensure bleeding has stopped, if needed. Patient dresses. Room is cleaned.

Post-Service Clinical Labor Activities:

Staff handles any follow-up phone calls from the patient.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The RN or ophthalmic tech reiterates the informed consent provided by the physician and assures that the appropriate forms are signed by the patient.

Service Clinical Labor Activities:

The clinical staff confirms that all the medical records are available. The RN or ophthalmic tech then prepares the screening lane or room to ensure that all supplies and equipment are available. The RN or tech greet the patient, confirm the treatment and correct side for treatment, provide appropriate gowning and obtain the necessary vital signs. The clinical staff will review the injections site and go over post-operative instructions. Following the drug accounting by the physician, the staff then provides appropriate information for the botox drug log. Once the procedure is completed and the patient has been escorted to the administrative area, the clinical staff clean the lane or room.

Post-Service Clinical Labor Activities:

The RN or tech phones the patient to go over post-operative instructions regarding the injection sites as well as to reiterate emergent post-operative complications such as nerve palsy or infection the patient should be aware of and reported to the office. Taking care of non-emergent side effects such as dry eye are also discussed. Arrangements for a post-operative visit in order to access the treatment adequacy and ensure no post-operative impact on the eye are also made by the RN or tech.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued - Utilization over 30,000 screen

April 2012

Paracentesis of the Eye

In April 2011 the RUC identified CPT code 65805 *Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous* through the Harvard-Valued Utilization over 30,000 screen and in September 2011 added 65800 to review as part of this family of services. In February 2012, specialty society brought forth a coding proposal to the CPT Editorial Panel to delete 65805 and revise 65800 as these services describe essentially the same procedure and are currently valued the same.

The RUC reviewed the survey results from 34 ophthalmologists and determined that the survey median work RVU of 1.53, lower than the current value, appropriately accounts for the physician work required to perform this service. The RUC agreed with the survey times of 12 minutes pre-evaluation, 1 minute pre-positioning and 5 minutes scrub, dress, wait time to administer topical anesthesia, insert lead, apply betadine and finally apply the gelatinous anesthetic; 5 minutes intra-service time and 5 minutes immediate post-service time. There are several codes that are similar in work and intensity to 65800. CPT *67028 Intravitreal injection of a pharmacologic agent (separate procedure)* reviewed in 2009 has a WRVU of 1.44 with times of 12/5/5. Both involve penetration of the eye with a needle and the risk of damage to internal structures. The RUC felt that the work of 67028 was similar to that of CPT 67515 *Injection of medication or other substance into Tenon's capsule* (RUC 2005, 000, 11/5/5) which has a WRVU of 1.40. CPT *67500 Retrobulbar injection; medication (separate procedure, does not include supply of medication)* (RUC 2005, 000, 15/5/5) has similar times and intensities with a WRVU of 1.44. Both of these procedures involve extraocular injections. Because the risk of serious damage from an intraocular injection is greater than an extraocular injection, the panel felt that the value of 65800 should be slightly higher. **The RUC recommends the median of the survey WRVU 1.53 as the proper value for the procedure.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:65800 Tracking Number K1 Original Specialty Recommended RVU: **1.53**
Presented Recommended RVU: **1.53**
Global Period: 000 RUC Recommended RVU: **1.53**

CPT Descriptor: Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year old patient presents six months after trabeculectomy with a hypopyon

Percentage of Survey Respondents who found Vignette to be Typical: 65%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 9%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work: Review patient record. Obtain consent. Write preoperative orders for medications, pupillary dilation, and antibiotic prophylaxis. Select appropriate anesthesia. Discuss surgery with patient and family. Verify operative eye and mark. The patient is positioned in the operative chair in the screening lane. Perform surgical 'time out' with the operative team. After appropriate anesthesia is administered, the eye is prepped and draped

Description of Intra-Service Work: The slit lamp is positioned to identify the operative field. The globe is grasped with micro-forceps and a 25 gauge needle on a syringe is positioned at the limbus, parallel to the iris plane. The needle is advanced through the cornea with the bevel oriented up, entering the anterior chamber, while remaining above the iris. A sample of aqueous is aspirated from the eye. The needle is removed. The physician plates samples onto 3-4 prepared culture media and a glass microscope slide.

Description of Post-Service Work: An operative report is prepared. The sample is sent to microbiology for gram stain and culture. Results are relayed to patient and treatment plan is determined.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.85	3.46
Intra-Service intensity/complexity	3.38	2.92
Post-Service intensity/complexity	3.62	3.23

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT 65805 *Paracentesis of anterior chamber of eye (separate procedure); with **therapeutic release** of aqueous* was chosen for RUC review because it had a volume of > 30,000 and was Harvard valued. Prior to surveying the code, the consensus panel of the AAO reviewed two very similar codes CPT 65800 *Paracentesis of anterior chamber of eye (separate procedure); with **diagnostic aspiration** of aqueous* and 65805, with similar CPT descriptors. The panel felt

that the codes were essentially the same procedure (they also had the same WRVU) and that the descriptor terminology was dated. The volume of 65800 was also quite low. The decision was made to try to combine the two codes in a single descriptor using CPT 65800 with a slightly altered descriptor*: Paracentesis of Anterior Chamber of Eye (Separate Procedure); with removal of Aqueous*. This change was approved by CPT and the new code descriptor, which describes the removal of aqueous humor from the anterior chamber of the eye, was surveyed. The code is primarily used to remove intraocular fluid for culture as in the vignette or to decompress the eye if the pressure is too high.

There were 34 respondents (6.8% response rate) to the joint AAO survey and over 2/3 felt that the vignette was typical. The **25th percentile WRVU was 1.48** and the **median WRVU 1.53.** The median is 0.38 RVU less than the current value of the code (WRVU=1.91). The median times were 12.5 minutes pre, 5 minutes each positioning and scrub, dress and wait, 5 minutes IST and 10 minutes post-time. The predominant reference code chosen was CPT 65430 *Scraping of cornea, diagnostic, for smear and/or culture.* The code was RUC reviewed in 1995, is a 000 global, times of 10/10/8 and has **a WRVU of 1.47.** The surveyed code is not typically done with an E/M service.

The expert consensus panel of the AAO, which is familiar with the procedure and the RUC process, reviewed the results. The panel felt that pre-service package 6 (anesthesia is required for the procedure) was proper but removed 5 minutes to reflect the 12 minutes of time that our survey showed was typical for pre-service evaluation. We are recommending 18 minutes pre-time (12 evaluation, 1 position, 5 scrub dress wait), 5 minutes intra- and 5 minutes post- for a total time of 28 minutes.

The work of this code relates most closely in time and intensity to ocular injection codes. In this instance, a needle is placed through the cornea of the eye into the anterior chamber of the eye to remove rather than add material. The risks are the same as an intravitreal injection: bleeding, infection and damage to internal structures such as the iris or lens. These can all lead to rapid loss of vision. The survey respondents felt that the surveyed code was more intense and complex than the reference code, reflecting the fact that the reference code is an external rather than an intraocular procedure. The time for the reference code is longer because multiple scrapings are needed for smear and culture, but the work is of lower intensity.

There are several codes that are similar in work and intensity to 65800. CPT *67028 Intravitreal injection of a pharmacologic agent (separate procedure)* reviewed in 2009 has a WRVU of 1.44 with times of 12/5/5. Both involve penetration of the eye with a needle and the risk of damage to internal structures. The RUC felt that the work of 67028 was similar to that of CPT 67515 *Injection of medication or other substance into Tenon's capsule* (RUC 2005, 000, 11/5/5) which has a WRVU of 1.40. CPT *67500 Retrobulbar injection; medication (separate procedure, does not include supply of medication)* (RUC 2005, 000, 15/5/5) has similar times and intensities with a WRVU of 1.44. Both of these procedures involve extraocular injections. Because the risk of serious damage from an intraocular injection is greater than an extraocular injection, the panel felt that the value of 65800 should be slightly higher. The panel therefore recommends the median of the survey **WRVU 1.53** as the proper value for the procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) The patient is presenting with an infection and the 65800 service is used to remove aqeuous fluid and determine the causative organism in order to administer the appropriate treatment. That course of treatment is typically an injection (most typically intravitreal) of an antibiotic. The secondary injection is appended with the appropriate modifier.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your

scenario. CPT 67028 intravitreal injection -- XXX global, 1.44 wrvu, 12/5/5 for 22 minutes of time and appended with the --51 modifier

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous

Global Period: **000** Meeting Date: **April 2012**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The society convened a panel of experts to review and develop inputs by phone and email.**

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: A**n existing code was revised to encompass two similar services and 65800 as well as 65805 should be compared**

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The RN or tech completes the necessary referral forms from the facility where the procedure is to be performed. They then phone the facility to schedule the patient for the procedure. The informed consent provided by the physician is reiterated by the tech or RN who then assures that the appropriate forms are also signed by the patient.

Service Clinical Labor Activities:

Not applicable.

Post-Service Clinical Labor Activities:

Not applicable.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

Paracentesis of anterior chamber of eye (separate procedure); with removal of aqueous

Global Period: **000** Meeting Date: **April 2012**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The society convened a panel of experts to review and develop inputs by phone and email.**

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: A**n existing code was revised to encompass two similar services and 65800 as well as 65805 should be compared.**

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The ophthalmic tech reiterates the informed consent provided by the physician and assures that the appropriate forms are signed by the patient.

Service Clinical Labor Activities:

The clinical staff confirms that all the medical records are available. The RN or ophthalmic tech then prepares the screening lane or room to ensure that all supplies and materials and equipment are available. Up to four slides are prepared with various media. The RN or tech greets the patient, confirms the treatment and correct side for treatment, provides appropriate gowning and obtains the necessary vital signs. The clinical staff will also review the injections site post-operatively and go over instructions. Once the physician has plated the fluid sample on the slide(s) for examination, the tech will take the slide(s) to the lab area for review or will phone the lab for pick up. The clinical staff cleans the lane after the patient is escorted to the administrative area.

Post-Service Clinical Labor Activities:

The RN or tech phones the patient to go over post-operative instructions regarding the treatment as well as to reiterate emergent post-operative side effects the patient should be aware of and reported to the office.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Fourth Five-Year Review

September 2011

Biopsy of Eyelid

CMS identified CPT code 67810 *Incisional biopsy of eyelid skin including lid margin* as part of the 4th Five-Year Review of the RBRVS as Harvard-Valued - Utilization Over 30,000. In October 2010, the RUC referred code 67810 to the CPT Editorial Panel to expand the descriptor to include the "eyelid margin" as that was the intent, as well as clarify the vignette to also include the eyelid margin.

In September 2011, the RUC reviewed the survey results from 50 dermatologists and ophthalmologists for CPT code 67810 and determined that a decrease in the current work RVU to the survey 25th percentile work RVU of 1.18 appropriately accounts for the work required to perform this service. The RUC agreed with the specialty society recommended pre-service time of 11 minutes and intra-service time of 13 minutes. The RUC acknowledged that the specialty society survey of 20 minutes and the standard of 23 minutes is too high due to the reporting of Evaluation and Management on the same date. The recommended pre-service time of 11 minutes addresses the issue. However, the RUC reduced the post-service time from 10 minutes to 5 minutes, as this service is typically performed with an Evaluation and Management service. The RUC compared 67810 to reference service 11755 *Biopsy of nail unit (eg, plate, bed, matrix, hyponychium, proximal and lateral nail folds) (separate procedure)* (work RVU = 1.31) and determined that the surveyed service was more intense and complex as the biopsy surrounds the eye, however requires less physician time to perform than the reference service, 13 minutes versus 25 minutes, respectively. The RUC also compared 67810 to MPC codes 31231 *Nasal endoscopy, diagnostic, unilateral or bilateral (separate procedure)* (work RVU = 1.10, total time = 30 minutes) and 62270 *Spinal puncture, lumbar, diagnostic* (work RVU = 1.37, total time = 40 minutes). Therefore, the survey 25th percentile work RVU of 1.18 and total physician time of 29 minutes appropriately accounts for the physician work required to perform this service relative to similar services. **The RUC recommends a work RVU of 1.18 for CPT code 67810.**

Practice Expense:
The PE Subcommittee reviewed the direct practice expense inputs recommended by the specialty and made modifications to the medical supplies and equipment time.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Descriptor: Incisional biopsy of eyelid skin including lid margin

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66 year old female with new lesion at the eyelid margin. Malignancy is suspected

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Prior to biopsy of lesion, obtain history related to the present procedure and photos are obtained. Discussion with patient will include: indication for biopsy procedure, risks, and benefits; description of biopsy procedure method, and expected result and/or scarring. The risks and complications of anesthesia such as ptosis and bruising reviewed with the patient. The preoperative interval history and exam are documented in the patient record. In addition, patient agreement/informed consent is obtained. Staff is advised to prepare patient and necessary anesthetic, supplies, and instrument tray is prepared and checked by physician.The head of the patient is positioned using a combination of rolled towels and/or temporary restraints, if needed. Staff is advised to prepare patient and necessary anesthetic, supplies, and instrument tray is prepared and checked by physician. The need for a regional field or nerve block is discussed, and administered as needed.

Nerve Block: Gloves are donned and the upper lip is retracted. Topical local anesthesia (5% lidocaine gel) is applied to the upper gingival sulcus. Three minutes are allowed to ensure topical anesthesia. The block is achieved with a #27 guage one-inch needle which is inserted just lateral to the upper second bicuspid at the gingival sulcus. The needle is advanced approximately 1.5 cm toward the infraorbital foramen in the mid-pupillary line. The syringe is aspirated to ensure that the tip of the needle is not in the infraorbital artery or vein, and 2 cc of 1% lidocaine is introduced taking care not to inject the infraorbital nerve directly. The needle is removed and gauze is applied to control bleeding at injection site. The nerve block takes approximately five minutes to take hold, at which time local anesthesia is instilled.

Should anesthesia be required for the upper eyelid, nerve block of the supraorbital and and infratrochlear nerve may be performed. Gloves are donned and a 27 guage one inch needle is inserted along the orbital rim at both the mid papillary line and medial brow. The syringe is aspirated to ensure that the tip of the needle is not in the supraorbital/infratrochelar artery or vein, and 1 cc of 1% lidocaine per site is introduced taking care not to inject the nerves directly. The needle is removed and gauze is applied to control bleeding at injection site. The nerve block takes approximately five minutes to take hold, at which time local anesthesia is instilled.

Description of Intra-Service Work: Inspection and palpation of the lesion to assess depth and to select most representative site to obtain specimen. The lesion is identified and a time out is performed. Cleanse biopsy site with suitable antiseptic. Local anesthesia is achieved using Lidocaine with epinephrine is drawn with a new needle infiltrated around the lesion for anesthesia and hemostasis. A drop of topical proparacaine is placed in the involved eye. Eye shield is inserted. Apply sterile drapes The lesion is sharply removed depending on depth and amount of tissue needed. Collect specimen in labeled formalin container. Hemostasis is achieved with cautery. Eye shield is removed. The adequacy of eyelid closure and blink are determined. Apply antibiotic ointment and sterile dressing.

Description of Post-Service Work: The specimen obtained is sent for pathologic analysis and necessary forms are completed. Post-service work includes: instruction of patient and/or family on postoperative wound care, dressing changes, and follow-up. Patient and family are again informed of the immediate side-effects and complications of anesthesia. Patient advised how to recognize significant complications, eg, bleeding, infection or allergic reaction to antibiotic ointment or adhesive dressings. Patient advised when results will be available and how they will be communicated; completion of medical record; and communication of results to referring physician as appropriate.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.23	3.00
Intra-Service intensity/complexity	4.15	3.38
Post-Service intensity/complexity	3.30	3.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As required by the Centers for Medicare and Medicaid Services, the American Academy of Dermatology (AAD) and the American Academy of Opthlalmology (AAO) have surveyed this code via random selection method as a pilot of the AMA RUC Survey capability. The data collected has been reviewed by the respective societies RUC Advisors and RBRVS committees. The survey data results do not meet any of the compelling evidence requirements. The societies propose accepting the 25th percentile of the survey data of 1.18 RVU and is presented here as their recommendation

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Per CMS data, performed on same day as an E&M service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Commonly

Specialty Ophthalmology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 100000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Dermatology Frequency 70000 Percentage 70.00 %

Specialty Ophthalmology Frequency 23000 Percentage 23.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 50,277 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CMS Data

Specialty Dermatology Frequency 34948 Percentage 69.51 %

Specialty Ophthalmology Frequency 11262 Percentage 22.39 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 67810

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Low Value/High Volume Screen

January 2012

X-ray of Cervical Spine

In October 2010, cervical spine code 72040 was identified by the RAW as part of the CMS Low Value/High Volume screen. At the specialty societies' request, the cervical spine x-ray family of codes, CPT codes, 72040, 72050 and 72052, was referred to the CPT Editorial Panel for clarification of the descriptors and number of views. In October, 2011, the CPT Editorial Panel revised these codes to clarify the number of views for each examination. The ACR and ASNR surveyed these three codes, and convened an expert panel of physicians familiar with the services.

72040 *Radiologic examination, spine, cervical; three views or less* was surveyed for the January 2012 RUC meeting. The RUC reviewed the survey results from 43 radiologists and neuroradiologists on the expert panel and noted that the recommended RVU of 0.22, which is the current work RVU, appropriately accounts for the physician work required to perform this service. The RUC accepted the median survey times, but adjusted the pre-service time to 1 minute which is consistent with the chosen key reference code. The key reference CPT code 72100 *Radiologic examination, spine, lumbosacral; 2 or 3 views* (work RVU=0.22), 6 minutes of total time (1 min pre, 3 min intra and 2 min post) was reviewed and the RUC noted that these two services have virtually identical physician work and should be the same. **The RUC recommends a work RVU of 0.22 for CPT code 72040.**

72050 *Radiologic examination, spine, cervical; 4 or 5 views* was surveyed for the January 2012 RUC meeting. The RUC reviewed the survey results from 42 radiologists and neuroradiologists on the expert panel and noted that the recommended RVU of 0.31, which is the current work RVU, appropriately accounts for the physician work required to perform this service. The RUC accepted the median survey times, but adjusted the pre-service time to 1 minute which is consistent with the chosen key reference code. The key reference CPT code 72110 *Radiologic examination, spine, lumbosacral; minimum of 4 view*s (work RVU=0.31) 8 minutes total time (1 min pre, 5 min intra, 2 min post) was reviewed and the RUC noted that these two services have virtually identical physician work and should be the same. **The RUC recommends a work RVU of 0.31 for CPT code 72050.**

72052 *Radiologic examination, spine, cervical; 6 or more views* was surveyed for the January 2012 RUC meeting. The RUC reviewed the survey results from 43 radiologists and neuroradiologists on the expert panel and noted that the recommended RVU of 0.36, which is the current work RVU, appropriately accounts for the physician work required to perform this service. The RUC accepted the median survey times, but adjusted the pre-service time to 1 minute which is consistent with the chosen key reference code. The key reference CPT code 72114 *Radiologic examination, spine, lumbosacral; complete, including bending views* (work RVU=0.32) 8 minutes total time (1 min pre, 5 min intra, 2 min post) was reviewed and the specialty society notified the RUC that the work value for 72114 was listed incorrectly as 0.36 on the survey that respondents completed. The RUC

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

determined that the respondents were not biased by the inaccurate information and agrees with survey respondents whom consistently indicate that cervical spine examinations are more intense than those in the lumbar spine. To further justify the recommendation it is below the 25th percentile and the median and 25th percentile survey values were all higher than the corresponding services in the lumbar spine. The difference in intensity warrants the slightly higher RVU for 72052 as compared to its reference service 72114 and maintains proper relativity for this code as compared to the lumbar region. Specifically 72052 is typically performed on a patient complaining of pain or whom has had a fall in the outpatient setting. These patients are considered trauma patients even in the outpatient setting and they have a greater possibility of rotational injuries which are not a concern in the lumbar spine. **The RUC recommends a work RVU of 0.36 for CPT code 72052.**

Practice Expense:
The Practice Expense (PE) was reviewed by Practice Expense Subcommittee and it was determined that a laser printer is a indirect expense of a physicians' office and should not be listed as a direct input for practice expense. The modification was made and the RUC approved the PE for CPT codes 72040, 72050 and 72052.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Category I **Radiology** **Diagnostic Radiology (Diagnostic Imaging)** **Spine and Pelvis**				
▲72040	L1	Radiologic examination, spine, cervical; ~~2 or~~ 3 views or less	XXX	0.22 (No Change)
▲72050	L2	~~minimum of~~ 4 or 5 ~~or more~~ views	XXX	0.31 (No Change)
▲72052	L3	~~complete, including oblique and flexion and/or extension studies,~~ 6 or more views	XXX	0.36 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:72040 Tracking Number Original Specialty Recommended RVU: **0.22**
Presented Recommended RVU: **0.22**
Global Period: XXX RUC Recommended RVU: **0.22**

CPT Descriptor: Radiologic examination, spine, cervical; three views or less

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Fifty-five-year-old female with cervical pain and no history of trauma. Rule out arthritis.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:
- Review the reason for the exam and any pertinent clinical history.
- Review any prior applicable plain film or imaging studies.

Description of Intra-Service Work:
- Supervise technologist performing the examination.
- Interpret radiographs of the cervical spine.
- Compare with prior studies, if applicable.
- Dictate report for medical record.

Description of Post-Service Work:
- Review, edit and sign final report.
- Discuss findings with referring physician.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

The three cervical spine x-ray codes: 72040 (*Radiologic examination, spine, cervical; three views or less), 72050 (Radiologic examination, spine, cervical; four or five or more views*), and 72052 (*Radiologic examination, spine, cervical; six or more views*) have been revised by the CPT Editorial Panel, clarifying the number of views for each examination.

The codes were initially captured by the CMS Low RVU-High Volume screen, and an action plan was submitted to the RAW (April 2011 RUC Meeting). At the societies' request, the family of codes was referred to the CPT Editorial Panel for clarification of the number of views, and to maintain consistency with the recently RUC-reviewed lumbar spine family of codes. The ACR and ASNR surveyed these three codes, and convened an expert panel of physicians familiar with the services.

The Reference Services were reviewed by the RUC in February 2011 and the societies' recommendations were accepted. However, there was an error in our Reference Service List provided to the respondents. The RUC should note that the RSL value for 72114 was listed as 0.36 RVU instead of the RUC-approved / CMS-accepted value of value of 0.32 RVU and that this code was chosen by the respondents as the reference service for 72052. There were no other errors in the RSL. We believe that the second most commonly chosen reference service 72110 with a value 0.31 RVU also serves as an adequate reference; however, it was chosen by only 19% of the respondents. The RUC should note that both the median and 25%tile values are higher than either reference service code and while one might argue that the respondents were biased at the median level, our recommendation is below the 25%tile and as such we do not believe the error created enough bias to invalidate the survey.

Work RVU Recommendation
We recommend maintaining the existing value of all three codes: 72040 - 0.22 RVU, 72050 - 0.31 RVU; 72052 - 0.36 RVU. The recommended values are lower than the survey median, but the societies find no compelling evidence supporting change in the work since the original valuation (72052) and/or RUC review in the First Five Year Review (72040 and 72050).

Pre, Intra, and Post Service Times
The societies are recommending the median survey times for all three codes. The societies recommend pre, intra, and post times of 1, 3, and 2 minutes, respectively for 72040 (three or less views); pre, intra, and post times of 1, 5, and 2 minutes, respectively for 72050 (four or five views); and pre, intra, and post times of 1, 5, and 2 minutes respectively for 72052 (six or more views). These times are consistent with the recently RUC-reviewed reference services and other plain radiography services.

Summary Of Recommendation
The societies' recommendations are supported by the most commonly chosen key reference services, 72100 (*Radiologic examination, spine, lumbosacral; 2 or 3 views)* with 0.22 RVU and 6 minutes of total time (1 min pre, 3 min intra and 2 min post), 72110 (*Radiologic examination, spine, lumbosacral; minimum of 4 views)* with 0.31 RVU and 8 minutes total time (1 min pre, 5 min intra, 2 min post) and 72114 (*Radiologic examination, spine, lumbosacral; complete, including bending views*) with 0.32 RVU and 8 minutes total time (1 min pre, 5 min intra, 2 min post),which were reviewed by the RUC in January 2011. The survey respondents consistently ranked examination of the cervical spine as more intense and complex than the reference lumbar spine services in all 11/11 intensity and complexity measures for 72050 and 72052 and 9/11 measures for 74040 which had 2 measures that were the same as the reference service. We believe this demonstrates the belief among the respondents that cervical spine examinations are more intense than those in the lumbar spine. The median and 25%tile survey values were all higher than the corresponding services in the lumbar spine. The difference in intensity and the slight increase in total time warrant the slightly higher RVU for 72052 as compared to its reference service 72114 and maintains proper relativity for this code as compared to the lumbar region.

The recommendation is also effectively bracketed by MPC code 71020 (*Radiologic examination, chest, 2 views, frontal and lateral*) with 0.22 RVU and 3 minutes of intra time on the lower end and MPC code 95900 (*Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study*) with 0.42 RVU and 6 minutes of intra time on the higher end. The recommended values fit appropriately within the rank order of other spine codes, as well as the entire family of plain radiography.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 72040

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1722696
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services for 72040 in one year period is estimated to be 1,722,696.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 571,186 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data shows that code 72040 was billed approximately 571,186.

Specialty Diagnostic Radiology Frequency 93789 Percentage 16.42 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 72040

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Description of Pre-Service Work:
- Review the reason for the exam and any pertinent clinical history.
- Review any prior applicable plain film or imaging studies.

Description of Intra-Service Work:
- Supervise technologist performing the examination.
- Interpret radiographs of the cervical spine.
- Compare with prior studies, if applicable.
- Dictate report for medical record.

Description of Post-Service Work:
- Review, edit and sign final report.
- Discuss findings with referring physician.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

The three cervical spine x-ray codes: 72040 (*Radiologic examination, spine, cervical; three views or less), 72050 (Radiologic examination, spine, cervical; four or five or more views*), and 72052 (*Radiologic examination, spine, cervical;*

six or more views) have been revised by the CPT Editorial Panel, clarifying the number of views for each examination. The codes were initially captured by the CMS Low RVU-High Volume screen, and an action plan was submitted to the RAW (April 2011 RUC Meeting). At the societies' request, the family of codes was referred to the CPT Editorial Panel for clarification of the number of views, and to maintain consistency with the recently RUC-reviewed lumbar spine family of codes. The ACR and ASNR surveyed these three codes, and convened an expert panel of physicians familiar with the services.

The Reference Services were reviewed by the RUC in February 2011 and the societies' recommendations were accepted. However, there was an error in our Reference Service List provided to the respondents. The RUC should note that the RSL value for 72114 was listed as 0.36 RVU instead of the RUC-approved / CMS-accepted value of value of 0.32 RVU and that this code was chosen by the respondents as the reference service for 72052. There were no other errors in the RSL. We believe that the second most commonly chosen reference service 72110 with a value 0.31 RVU also serves as an adequate reference; however, it was chosen by only 19% of the respondents. The RUC should note that both the median and 25%tile values are higher than either reference service code and while one might argue that the respondents were biased at the median level, our recommendation is below the 25%tile and as such we do not believe the error created enough bias to invalidate the survey.

Work RVU Recommendation
We recommend maintaining the existing value of all three codes: 72040 - 0.22 RVU, 72050 - 0.31 RVU; 72052 - 0.36 RVU. The recommended values are lower than the survey median, but the societies find no compelling evidence supporting change in the work since the original valuation (72052) and/or RUC review in the First Five Year Review (72040 and 72050).

Pre, Intra, and Post Service Times
The societies are recommending the median survey times for all three codes. The societies recommend pre, intra, and post times of 1, 3, and 2 minutes, respectively for 72040 (three or less views); pre, intra, and post times of 1, 5, and 2 minutes, respectively for 72050 (four or five views); and pre, intra, and post times of 1, 5, and 2 minutes respectively for 72052 (six or more views). These times are consistent with the recently RUC-reviewed reference services and other plain radiography services.

Summary Of Recommendation
The societies' recommendations are supported by the most commonly chosen key reference services, 72100 (*Radiologic examination, spine, lumbosacral; 2 or 3 views)* with 0.22 RVU and 6 minutes of total time (1 min pre, 3 min intra and 2 min post), 72110 (*Radiologic examination, spine, lumbosacral; minimum of 4 views)* with 0.31 RVU and 8 minutes total time (1 min pre, 5 min intra, 2 min post) and 72114 (*Radiologic examination, spine, lumbosacral; complete, including bending views*) with 0.32 RVU and 8 minutes total time (1 min pre, 5 min intra, 2 min post),which were reviewed by the RUC in January 2011. The survey respondents consistently ranked examination of the cervical spine as more intense and complex than the reference lumbar spine services in all 11/11 intensity and complexity measures for 72050 and 72052 and 9/11 measures for 74040 which had 2 measures that were the same as the reference service. We believe this demonstrates the belief among the respondents that cervical spine examinations are more intense than those in the lumbar spine. The median and 25%tile survey values were all higher than the corresponding services in the lumbar spine. The difference in intensity and the slight increase in total time warrant the slightly higher RVU for 72052 as compared to its reference service 72114 and maintains proper relativity for this code as compared to the lumbar region.

The recommendation is also effectively bracketed by MPC code 71020 (*Radiologic examination, chest, 2 views, frontal and lateral*) with 0.22 RVU and 3 minutes of intra time on the lower end and MPC code 95900 (*Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study*) with 0.42 RVU and 6 minutes of intra time on the higher end. The recommended values fit appropriately within the rank order of other spine codes, as well as the entire family of plain radiography.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 72050

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1381101
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services for 72050 in one year period is estimated to be 1,381,101.

Specialty Diagnostic Radiology Frequency 597049 Percentage 43.22 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 454,961 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that code 72050 was billed approximately 454,961.

Specialty Diagnostic Radiology Frequency 196180 Percentage 43.12 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 72050

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:72052 Tracking Number Original Specialty Recommended RVU: **0.36**
Presented Recommended RVU: **0.36**
Global Period: XXX RUC Recommended RVU: **0.36**

CPT Descriptor: Radiologic examination, spine, cervical; six or more views

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Forty-three-year-old male presents with trauma to the cervical spine from auto accident. Clinical concern for instability.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:
- Review the reason for the exam and any pertinent clinical history.
- Review any prior applicable plain film or imaging studies.

Description of Intra-Service Work:
- Supervise technologist performing the examination.
- Interpret radiographs of the cervical spine.
- Compare with prior studies, if applicable.
- Dictate report for medical record.

Description of Post-Service Work:

- Review, edit and sign final report.
- Discuss findings with referring physician.

Intra-Service intensity/complexity	3.44	3.15
Post-Service intensity/complexity	2.15	2.03

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

The three cervical spine x-ray codes: 72040 (*Radiologic examination, spine, cervical; three views or less), 72050 (Radiologic examination, spine, cervical; four or five or more views*), and 72052 (*Radiologic examination, spine, cervical; six or more views*) have been revised by the CPT Editorial Panel, clarifying the number of views for each examination. The codes were initially captured by the CMS Low RVU-High Volume screen, and an action plan was submitted to the

RAW (April 2011 RUC Meeting). At the societies' request, the family of codes was referred to the CPT Editorial Panel for clarification of the number of views, and to maintain consistency with the recently RUC-reviewed lumbar spine family of codes. The ACR and ASNR surveyed these three codes, and convened an expert panel of physicians familiar with the services.

The Reference Services were reviewed by the RUC in February 2011 and the societies' recommendations were accepted. However, there was an error in our Reference Service List provided to the respondents. The RUC should note that the RSL value for 72114 was listed as 0.36 RVU instead of the RUC-approved / CMS-accepted value of value of 0.32 RVU and that this code was chosen by the respondents as the reference service for 72052. There were no other errors in the RSL. We believe that the second most commonly chosen reference service 72110 with a value 0.31 RVU also serves as an adequate reference; however, it was chosen by only 19% of the respondents. The RUC should note that both the median and 25%tile values are higher than either reference service code and while one might argue that the respondents were biased at the median level, our recommendation is below the 25%tile and as such we do not believe the error created enough bias to invalidate the survey.

Work RVU Recommendation
We recommend maintaining the existing value of all three codes: 72040 - 0.22 RVU, 72050 - 0.31 RVU; 72052 - 0.36 RVU. The recommended values are lower than the survey median, but the societies find no compelling evidence supporting change in the work since the original valuation (72052) and/or RUC review in the First Five Year Review (72040 and 72050).

Pre, Intra, and Post Service Times
The societies are recommending the median survey times for all three codes. The societies recommend pre, intra, and post times of 1, 3, and 2 minutes, respectively for 72040 (three or less views); pre, intra, and post times of 1, 5, and 2 minutes, respectively for 72050 (four or five views); and pre, intra, and post times of 1, 5, and 2 minutes respectively for 72052 (six or more views). These times are consistent with the recently RUC-reviewed reference services and other plain radiography services.

Summary Of Recommendation
The societies' recommendations are supported by the most commonly chosen key reference services, 72100 (*Radiologic examination, spine, lumbosacral; 2 or 3 views)* with 0.22 RVU and 6 minutes of total time (1 min pre, 3 min intra and 2 min post), 72110 (*Radiologic examination, spine, lumbosacral; minimum of 4 views)* with 0.31 RVU and 8 minutes total time (1 min pre, 5 min intra, 2 min post) and 72114 (*Radiologic examination, spine, lumbosacral; complete, including bending views*) with 0.32 RVU and 8 minutes total time (1 min pre, 5 min intra, 2 min post),which were reviewed by the RUC in January 2011. The survey respondents consistently ranked examination of the cervical spine as more intense and complex than the reference lumbar spine services in all 11/11 intensity and complexity measures for 72050 and 72052 and 9/11 measures for 74040 which had 2 measures that were the same as the reference service. We believe this demonstrates the belief among the respondents that cervical spine examinations are more intense than those in the lumbar spine. The median and 25%tile survey values were all higher than the corresponding services in the lumbar spine. The difference in intensity and the slight increase in total time warrant the slightly higher RVU for 72052 as compared to its reference service 72114 and maintains proper relativity for this code as compared to the lumbar region.

The recommendation is also effectively bracketed by MPC code 71020 (*Radiologic examination, chest, 2 views, frontal and lateral*) with 0.22 RVU and 3 minutes of intra time on the lower end and MPC code 95900 (*Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study*) with 0.42 RVU and 6 minutes of intra time on the higher end. The recommended values fit appropriately within the rank order of other spine codes, as well as the entire family of plain radiography.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 72052

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 292104
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services for 72052 in one year period is estimated to be 292,104.

Specialty Diagnostic Radiology Frequency 99140 Percentage 33.93 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 96,026 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that code 72052 was billed approximately 96,026.

Specialty Diagnostic Radiology Frequency 32736 Percentage 34.09 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 72052

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued – Utilization over 30,000

April 2012

Thyroid Uptake/Imaging

In April 2011 CPT Code 78007, *Thyroid imaging, with uptake; multiple determinations* was identified in the Harvard Valued-Utilization over 30,000 screen. In February 2012, the CPT Editorial Panel approved a plan to consolidate seven thyroid codes into three new CPT codes.

78012 ***Thyroid uptake, single or multiple quantitative measurement(s) (including stimulation, suppression or discharge, when performed)***
The RUC reviewed the survey results of 118 respondents and determined that the survey respondents overestimated the physician work involved in this service. The RUC agreed with the specialty that the 25th percentile in intra-service time of 5 minutes was a more accurate depiction of the work involved. The RUC also noted that the survey's work values were overestimated and agreed that a work RVU of 0.19 which is below the 25th percentile is appropriate. This procedure is currently reported using CPT codes 78000 *Thyroid uptake; single determination* (work RVU=0.19), 78001 *Thyroid uptake; multiple determinations* (work RVU=0.33) and 78003 *Thyroid uptake; stimulation, suppression or discharge (not including initial uptake studies)* (work RVU=0.33) and will be bundled into 78012. The RUC agreed with the specialty that the work value of 78012 is identical to the physician work of CPT 78000 and should have an identical work RVU of 0.19. The RUC compared 78012 to key reference service 78226 *Hepatobiliary system imaging, including gallbladder when present* (work RVU=0.74) and determined 78226 requires more time and intensity and should therefore be valued higher. The RUC also reviewed CPT Code 73560 *Radiologic examination, knee; 1 or 2 views* (work RVU=0.17) and 71020 *Radiologic examination, chest, 2 views, frontal and lateral* (work RVU=0.22) and agreed that 78012 should be valued between these two services. **The RUC recommends a work RVU of 0.19 for CPT code 78012.**

78013 ***Thyroid imaging (including vascular flow, when performed)***
The RUC reviewed the survey results of 113 respondents and determined that the survey respondents overestimated the physician work involved in this service. The RUC agreed with the specialty that the 25th percentile intra-service time of 10 minutes was a more accurate depiction of the time involved and maintains rank order with the family of services. The RUC also noted that the survey's work values were overestimated and agreed that a work RVU of 0.37, which is below the 25th percentile, is more appropriate. This procedure is currently reported using CPT codes 78010 *Thyroid imaging; only* (work RVU=0.39) and 78011 *Thyroid imaging; with vascular flow* (work RVU=0.45). The RUC agreed that the valuation of 78013 should be based on the most commonly reported current code, 78010; however the RUC made slight adjustments to preserve work neutrality across the family. Therefore, a work RVU of 0.37 for 78013 is relative to the family of services. The RUC compared 78013 to key reference service 78226 *Hepatobiliary system imaging, including gallbladder when present* (work RVU=0.74) and agreed that although the times are the same, the intensity of 78226 is higher. The RUC also reviewed 77071 *Manual application of stress performed by physician for joint radiography, including contralateral joint if indicated* (work RVU=0.41) and determined that although 78013 has more physician time, the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intensity of 77071 is greater and should therefore be valued slightly higher. The RUC agreed that a work RVU of 0.37 would maintain proper rank order and budget neutrality within this family of service. **The RUC recommends a work RVU of 0.37 for CPT code 78013.**

78014 ***Thyroid imaging (including vascular flow, when performed); with single or multiple uptake(s) quantitative measurement(s) (including stimulation, suppression or discharge, when performed)***

The RUC reviewed the survey results of 129 respondents and determined that the survey respondents overestimated the physician work involved in this service. The RUC agreed with the specialty that in order to maintain rank order within the family of services the intra-service time should be crosswalked to 78013, 10 minutes. The RUC also noted that the survey's work values were overestimated and agreed that a work RVU of 0.50, which is below the 25th percentile, is more appropriate. This procedure is currently reported using CPT codes 78006 *Thyroid imaging, with uptake; single determination* (work RVU=0.49) and 78007 *Thyroid imaging, with uptake; multiple determinations* (RVU=0.50) and will be bundled into 78014. The RUC agreed with the specialty that no compelling evidence for an increase exists. As such, the work value of 78014 should be equivalent to the most commonly reported service currently, CPT 78007 and should have an identical work RVU of 0.50. The RUC compared 78014 to code 78227 *Hepatobiliary system imaging, including gallbladder when present; with pharmacologic intervention, including quantitative measurement(s) when performed* (work RVU=0.90) and determined that 78227 has a higher work intensity and requires more physician time. The RUC also reviewed CPT codes 77300 *Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician* (work RVU=0.62) and 78306 *Bone and/or joint imaging; whole body* (work RVU=0.86) and determined that although these services require similar physician work, the intensity of 77300 and 78306 is higher. Finally, the RUC compared 78014 to 78013 and noted that while the physician time is the same, 78014 should be valued higher because it has greater intensity and complexity since it includes the work of 78012 and 78013. The RUC determined that a work RVU of 0.50 maintains proper rank order and budget neutrality within this family of services. **The RUC recommends a work RVU of 0.50 for CPT Code 78014.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense:
The RUC reviewed and approved practice expense inputs with minor modifications recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

SUMMARY OF RECOMMENDATION

CPT Code:78012 Tracking Number T1 Original Specialty Recommended RVU: **0.19**
Presented Recommended RVU: **0.19**
Global Period: XXX RUC Recommended RVU: **0.19**

CPT Descriptor: Thyroid uptake, single or multiple quantitative measurement(s) (including stimulation, suppression or discharge, when performed)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32-year-old woman with clinical symptoms of hyperthyroidism, blood thyroid function tests indicative of hyperthyroidism, and a diffusely enlarged non-nodular thyroid gland on physical examination.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work: The physician reviews the reason for the exam, pertinent clinical history including available prior imaging studies and determines the appropriateness of the requested study; prescribes, oversees and directs the oral administration of the radiopharmaceutical dose.

Description of Intra-Service Work: The physician directs the technologist to adjust the acquisition protocol, as necessary, for the individual patient. The physician is available to answer questions for the technologist, review components of the study and provide regulatory oversight throughout the procedure
The study typically consists of a single 24 hour uptake and at times multiple measurements at early 4 to 6 hours plus the typical 24 hours are collected. A second standard capsule is maintained for comparison measurements. The patient should sit or lie with neck extended; an open-faced collimated detector probe should be directed at the neck. Counts of the patient neck and mid-thigh are obtained and repeated at varying time intervals as necessary. The physician verifies the adequacy of the data before completion of the study, and directs the technologist to obtain counts or re-process data, when necessary.
The measurements are compared to relevant prior studies, and formally interpreted, i.e., a report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. The physician provides mandatory NRC regulatory review and oversight of the radiopharmaceutical throughout the procedure.

Intra-Service intensity/complexity	2.61	2.78
Post-Service intensity/complexity	2.04	1.92

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As a result of the RUC Relativity Assessment Workgroup (RAW), formerly the Five-Year Review Identification Workgroup, CPT 78007 *(Thyroid imaging, with uptake; multiple determinations)* was identified as a potentially misvalued code through the Harvard-valued, volume greater than 30,000 utilization screen. The joint societies, ACNM, SNM and ACR, presented an action plan to revise the thyroid family CPT 78000 to 78010 in the Nuclear Medicine section under the Endocrine System in CPT, stating this section would greatly benefit from revisions to modernize and consolidate the codes

prior to performing an AMA RUC survey. The pre-revision CPT codes representing the thyroid family consisted of seven codes: three for uptakes only, two for uptakes with imaging, and two for imaging only. The new thyroid family of codes was consolidated from these seven CPT codes into three CPT codes for simplicity and grouping by the major resource similarities.

78012 Thyroid uptake, single or multiple quantitative measurement(s) (including stimulation, suppression or discharge, when performed)

78012 is a new code describing uptake-only procedures, where the typical and most common procedure based on the Medicare data base and our expert panel is a ***single thyroid uptake measurement.*** The difference in physician work for performance of a single uptake versus multiple uptakes is minimal; therefore, the panel felt it was appropriate to represent both procedures as a single procedure code. Suppression, discharge and stimulation uptake studies are rare, as evidenced by the Medicare claims data for 2010 of 78003 at 19 in total; and supported by the multisociety expert panel, again warranting a consolidation of the three codes into a single multi-procedure CPT code. Based on the 2010 data in which 78000 is the more common service, we considered single thyroid uptake to be typical for the purposes of the survey. Ninety-seven percent of the survey respondents stated that the vignette was typical.

A joint ACNM, SNM and ACR RVS panel (ACNM/SNM/ACR) reviewed the survey results. There were 118 responses to the survey request. The survey performance rate median of 50 studies per year among the 118 respondents is a reasonable rate given this is a relatively low volume procedure. The panel agreed that the survey physician median times of 5 minutes pre-service, 5 minutes post-service accurately reflect the time required to perform this service. Therefore, we selected pre-service XXX global package and adjusted the time to our recommended value of 5 minutes. We believe the survey median 10 minutes intra-service time is excessive for a single uptake study; therefore, we recommend reducing the intra time to the 25 percentile time of 5 minutes.

The panel felt that the median and 25th percentile RVW appropriately capture the relativity between the procedures in the family; however, the values from this family did not correlate well with RVW values of other nuclear medicine code families that have been RUC and CMS valued. The crosswalk current CPT codes 78000 (RVW-0.19) 78001 (RVW-0.26) and 78003 (RVW-0.33) will now be reported with code (78012). The ACNM/SNM/ACR panel discussed at length compelling evidence arguments to support the survey median or 25th percentile results. The ACNM/SNM/ACR panel believed that the original Harvard value had likely undervalued this procedure. However, the reason for the current change in coding was to better describe the services and simplify the coding structure for these low volume procedures. These codes were surveyed in response to the RAW request, but we believe these procedures have not fundamentally changed over the years. As there was insufficient compelling evidence for higher values for 78012 or the whole family of thyroid codes, we are recommending to maintain the current RVWs of the highest volume crosswalked CPT code for valuation (78000 - .19 RVW). We continue to urge the RUC to accept "Harvard valued" as a criterion for compelling evidence, which we believe would apply to CPT 78012 and which we believe our survey data supports.

We believe the reference service code chosen by the survey respondents, CPT 78226 (*Hepatobiliary system imaging, including gallbladder when present);* (RVW 0.74) has higher work intensity and complexity than 78012, with 78226 having a longer intra-service time of 10 minutes and being ranked higher on the intensity factors for medical decision making, risk of significant complications and risk of malpractice.

We compared 78012 to MPC code CPT 73560 (*Radiologic examination, knee; 1 or 2 views),* (RVW 0.17). While we believe these procedures are comparable in intensity and complexity, the panel would agree that 78012 should be valued slightly higher (RVW 0.19) than 73560 and slightly lower than CPT 71020 (*Radiologic examination, chest, 2 views, frontal and lateral*) (RVW 0.22).

In summary, to maintain rank order and remain within budget neutrality we recommend a RVW of 0.19 for 78012with a pre service time of 5 minutes, an intra service time of 5 minutes, and post time of 5 minutes, for a total time of 15 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 78000, 78001, 78003

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Nuclear Medicine How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7653
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the number of times this service might be provided to Medicare patients nationally in a one-year period, it is estimated that 780X01 might be provided 7,653 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 2074 Percentage 27.10 %

Specialty Nuclear Medicine Frequency 613 Percentage 8.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,551
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Codes 78000, 78001, and 78003 are currently used to report the procedure described by 780X01. The 2010 Medicare frequency for code 78000 is 1,402, the frequency for 78001 is 1,130, and the frequency for 78003 is 19. To calculate the frequency for code 780X01, we summed the frequencies for the three codes to get 2,551. Then, multiply the frequency for each code, 78000, 78001, and 78003, by the appropriate frequency (percent) for each specialty, Diagnostic Radiology or Nuclear Medicine, to estimate the number of times the specialty might provide the service described by 78012 to Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 691 Percentage 27.08 %

Specialty Nuclear Medicine Frequency 204 Percentage 7.99 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 78000

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

Description of Pre-Service Work: The physician reviews the reason for the exam, pertinent clinical history including available prior imaging studies and determines the appropriateness of the requested study; prescribes, oversees and directs the oral administration of the radiopharmaceutical dose.

Description of Intra-Service Work: The physician directs the technologist to adjust the acquisition protocol, as necessary, for the individual patient. The physician is available to answer questions for the technologist, review components of the study and provide regulatory oversight throughout the procedure.
Thyroid scintigraphy facilitates the detection of focal and/or global abnormalities of thyroid anatomy, correlation of anatomy with function, and detection of aberrant or residual normal tissue after therapy. Under the supervision of the physician, the technologist administers the radiopharmaceutical following the protocol determined. The complete study consists of administration of the radiopharmaceutical by oral or typically by intravenous injection, acquisition of multiple images in a variety of projections, and documentation of patient position. Radioactive sources or lead markers may be used to identify anatomic landmarks such as the sternal notch and thyroid cartilage. When appropriate, the location of palpable nodules should be confirmed with radioactive point source or lead marker image for anatomic correlation. The physician palpates and localizes any palpable nodules. The physician verifies the adequacy of the imaging data before completion of the study, and directs the technologist to obtain additional views or re-process data, when necessary.
The data are formatted for film and/or digital display and analysis. The physician reviews the study for artifacts and abnormal distribution. The raw images (eg, upright or supine, anterior, obliques, etc.) of the imaging are compared to any additional relevant prior studies, and formally interpreted, i.e., a report is dictated for the medical record. The data are formatted for film and/or digital display and analysis.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. Imaging data is normally reviewed with the referring physician when surgery is anticipated and may be discussed with the patient. The physician provides mandatory NRC regulatory review and oversight of the radiopharmaceutical throughout the procedure.

Intra-Service intensity/complexity	2.80	2.96
Post-Service intensity/complexity	2.16	2.28

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As a result of the RUC Relativity Assessment Workgroup (RAW), formerly the Five-Year Review Identification Workgroup, CPT 78007 *(Thyroid imaging, with uptake; multiple determinations)* was identified as a potentially misvalued code through the Harvard-valued, volume greater than 30,000 utilization screen. The joint societies, ACNM, SNM and ACR, presented an action plan to revise the thyroid family CPT 78000 to 78010 in the Nuclear Medicine section under the Endocrine System in CPT, stating this section would greatly benefit from revisions to modernize and consolidate the codes prior to performing an AMA RUC survey. The pre-revision CPT codes representing the thyroid family consisted of seven codes: three for uptakes only, two for uptakes with imaging, and two for imaging only. The new thyroid family of codes was consolidated from these seven CPT codes into three CPT codes for simplicity and grouping by the major resource similarities.

78013 Thyroid imaging (including vascular flow, when performed);
78013 is a new code describing thyroid imaging-only procedures, where the typical and most common procedure based on Medicare data and based on our expert panel is a ***thyroid imaging study without vascular flow.*** The difference in physician work necessary for performing a thyroid imaging study *with flow* versus *without flow* is minimal; therefore, the panel felt it was appropriate to represent both procedures as a single procedure code. Thyroid imaging studies with vascular flow are rare as evidenced by the Medicare claims data for 2010 at 188 in total, and supported by the multisociety expert panel, again warranting a consolidation of the two codes into a single multi-procedure CPT code. Based on the 2010 data in which 78010 is the more common service, we considered thyroid imaging without vascular flow to be typical for the purposes of the survey. Eighty-nine percent of the survey respondents stated that the vignette was typical.
A joint ACNM, SNM and ACR RVS panel (ACNM/SNM/ACR) reviewed and discussed the survey results. There were 113 responses to the survey request. The survey performance rate median of 40 studies per year among the 113 respondents is a reasonable rate given this is a relatively low volume procedure. The panel agreed that the survey physician median times of 5 minutes pre-service and 5 minutes post-service accurately reflect the time required to perform this service. The panel recommends pre-service package XXX. We believe the survey median of 12 minutes intra-service time is excessive for a thyroid imaging only study; therefore, we recommend reducing the intra time to the 25 percentile time of 10 minutes.

The panel felt that the median and 25th percentile RVW appropriately capture the relativity between the procedures in the family; however, the values from this family did not correlate well with RVWs of other nuclear medicine code families that have been RUC and CMS valued. The crosswalk current CPT codes 78010 (RVW-0.39) and 78011 (RVW-0.45) will now be reported as code 78013. The panel discussed at length compelling evidence arguments to support the survey median or 25th percentile results. The panel believed that the original Harvard value had likely undervalued this procedure. However, the reason for the current change in coding was to better describe the services and simplify the coding structure for low volume procedures. These codes were surveyed in response to the RAW request, but we believe these procedures have not fundamentally changed over the years. As there was insufficient compelling evidence for higher values for 78013 or the whole family of thyroid codes, we are basing our recommendation on the current RVWs of the highest volume crosswalked CPT code for valuation (78010 - .39 RVWs). We recommend subtracting .02 RVWs to preserve budget neutrality across the thyroid family. Therefore, our RVW recommendation for 78013 is .37 RVW. We continue to urge the RUC to accept "Harvard valued" as a criterion for compelling evidence, which we believe would apply to CPT 78013 and which we believe our survey data supports.

We believe the reference service code chosen by the survey respondents, CPT 78226 (*Hepatobiliary system imaging, including gallbladder when present);* (RVW 0.74) has higher work intensity and complexity than 78013, with 78226 having a longer intra-service time of 10 minutes and being ranked higher on the intensity factors for medical decision making, risk of significant complications and risk of malpractice.

We compared 78013 to a MPC code CPT 99212 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self-limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family),* (RVW 0.48). While we believe these procedures are comparable in intensity and complexity the panel agreed that 78013 should be valued lower (RVW 0.37) than both MPC codes 99212 and CPT 77300 (*Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician*), (RVW 0.62).
In summary, to maintain rank order and remain within budget neutrality we recommend a RVW of 0.37 for 78013with a pre service time of 5 minutes, an intra service time of 10 minutes, and post time of 5 minutes, for a total time of 20 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 78010, 78011

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Nuclear Medicine How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 19776
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the number of times this service might be provided to Medicare patients nationally in a one-year period, it is estimated that 78013 might be provided 19,776 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 6020 Percentage 30.44 %

Specialty Nuclear Medicine Frequency 3427 Percentage 17.32 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,592
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Codes 78010 and 78011 are currently used to report the procedure described by 78013. The 2010 Medicare frequency for code 78010 is 6,404 and the frequency for 78011 is 188. To calculate the frequency for code 78013, we summed the frequencies for the two codes to get 6,592.

Then, multiply the frequency for each code, 78010 and 78011, by the appropriate frequency (percent) for each specialty, Diagnostic Radiology or Nuclear Medicine, to estimate the number of times the specialty might provide the service described by 78013 to Medicare patients nationally in a one-year period

Specialty Diagnostic Radiology Frequency 2007 Percentage 30.44 %

Specialty Nuclear Medicine Frequency 1142 Percentage 17.32 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 78010

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: The physician reviews the reason for the exam, pertinent clinical history including available prior imaging studies and determines the appropriateness of the requested study; prescribes, oversees and directs the oral administration of the radiopharmaceutical dose.

Description of Intra-Service Work: Thyroid imaging with single or typically multiple uptakes is a combination of two radionuclide diagnostic imaging procedures that record both the detection of focal and/or global abnormalities of thyroid anatomy, correlation of anatomy with function, and detection of aberrant or residual normal tissue after therapy. Under the supervision of the physician, the technologist administers the radiopharmaceutical(s) following the protocol determined. The complete study consists of administration of the radiopharmaceutical(s) typically by oral or at times by intravenous injection, acquisition of multiple images in a variety of projections, and documentation of patient position. Radioactive sources or lead markers may be used to identify anatomic landmarks such as the sternal notch and thyroid cartilage. When appropriate, the location of palpable nodules should be confirmed with radioactive point source or lead marker image for anatomic correlation. The physician palpates and localizes any palpable nodules. The physician verifies the adequacy of the imaging data before completion of the study, and directs the technologist to obtain additional views or re-process data, when necessary.
The data are formatted for film and/or digital display and analysis. The physician reviews the study for artifacts and abnormal distribution. The raw images (eg, upright or supine, anterior, obliques, etc.) of the imaging are compared to any additional relevant prior studies, as well as the single or multiple uptakes. The data are formatted for film and/or digital display and analysis. Additionally single or typically multiple measurements at early 4 to 6 hours and or 24 hours are collected.
The patient should sit or lie with neck extended; an open-faced collimated detector probe should be directed at the neck. The study consists of single or typically multiple counts of the patient neck and mid-thigh, repeated at varying time

intervals as necessary. A second standard capsule is maintained for comparison measurements. The physician verifies the adequacy of the data before completion of the study, and directs the technologist to obtain counts additional imaging or re-process data, when necessary. The quantitative evaluations of measurements are compared to relevant prior and current studies, and formally interpreted, i.e., a report is dictated for the medical record.
The physician verifies the adequacy of the data before completion of the study, and directs the technologist to obtain counts or re-process data, when necessary. The measurements are compared to relevant prior studies, and formally interpreted, i.e., a report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. Imaging data is normally reviewed with the referring physician when surgery is anticipated and may be discussed with the patient. The physician provides mandatory NRC regulatory review and oversight of the radiopharmaceutical throughout the procedure.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
78227	XXX	0.90	**RUC Time**

CPT Descriptor Hepatobiliary system imaging, including gallbladder when present; with pharmacologic intervention, including quantitative measurement(s) when performed

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
77300	XXX	0.62	**RUC Time**	1,706,082

CPT Descriptor 1 Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
78306	XXX	0.86	**RUC Time**	412,804

CPT Descriptor 2 Bone and/or joint imaging; whole body

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 24 **% of respondents:** 18.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 78014**	**Key Reference CPT Code:** 78227	**Source of Time RUC Time**
Median Pre-Service Time	5.00	6.00	
Median Intra-Service Time	10.00	15.00	
Median Immediate Post-service Time	5.00	5.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**20.00**	**26.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.04	2.88
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.08	3.00
Urgency of medical decision making	2.13	2.78
Technical Skill/Physical Effort (Mean)		
Technical skill required	2.74	2.73
Physical effort required	2.43	2.27
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.29	2.70
Outcome depends on the skill and judgment of physician	3.25	3.04
Estimated risk of malpractice suit with poor outcome	2.17	2.30

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.43	2.36
Intra-Service intensity/complexity	3.09	3.17
Post-Service intensity/complexity	2.33	2.33

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As a result of the RUC Relativity Assessment Workgroup (RAW), formerly the Five-Year Review Identification Workgroup, CPT 78007 *(Thyroid imaging, with uptake; multiple determinations)* was identified as a potentially misvalued

code through the Harvard-valued, volume greater than 30,000 utilization screen. The joint societies, ACNM, SNM and ACR, presented an action plan to revise the thyroid family CPT 78000 to 78010 in the Nuclear Medicine section under the Endocrine System in CPT, stating this section would greatly benefit from revisions to modernize and consolidate the codes prior to performing an AMA RUC survey. The pre-revision CPT codes representing the thyroid family consisted of seven codes: three for uptakes only, two for uptakes with imaging, and two for imaging only. The new thyroid family of codes was consolidated from these seven CPT codes into three CPT codes for simplicity and grouping by the major resource similarities.

78014 Thyroid imaging (including vascular flow, when performed); with single or multiple uptake(s) quantitative measurement(s) (including stimulation, suppression or discharge, when performed)

78014 is a new code describing thyroid uptake plus imaging procedures, where the typical and most common procedure based on Medicare data and based on our expert panel is a ***thyroid imaging plus multiple uptake measurements.*** The difference in physician work necessary for performing a single uptake versus multiple uptakes is minimal; therefore, the panel felt it was appropriate to represent both procedures as a single procedure code. Based on the 2010 data in which 78007 is the more common service, we considered thyroid imaging without multiple uptakes to be typical for the purposes of the survey. Ninety-five percent of the survey respondents stated that the vignette was typical.

A joint ACNM, SNM and ACR RVS panel (ACNM/SNM/ACR) reviewed and discussed the survey results. There were 129 responses to the survey request. The survey performance rate median of 70 studies per year among the 129 respondents is a reasonable rate given the higher volume of the 2010 codes which make up 78014 compared to those which make up 78012 and 78013, the other two surveyed thyroid procedure codes. The panel recommends pre-service package XXX, and adjusted both the pre and post service times from 6 minutes to our recommended value of 5 minutes. We believe the survey median 15 minutes intra-service time is excessive for a single uptake study; therefore, the panel elected to assign an intra-service time of 10 minutes, between the 25th and median to maintain relativity with 78013. The 25th percentile intra service time of 8 minutes would have created a rank order anomaly with the 10 minutes of intra-service time for 78013. While our RVW recommendation is higher for 78014 than 78013, the additional intensity is warranted, considering that 78014 includes the activities of 78012 and 78013.

The panel felt that the median and 25th percentile RVW appropriately capture the relativity between the procedures in the family; however, the RVW values for this family did not correlate well with RVW values of other nuclear medicine code families that have been RUC and CMS valued. The crosswalk current CPT codes 78006 (RVW-0.49) and 78007 (RVW-0.50) will now be reported with code (78014). The panel discussed at length compelling evidence arguments to support the survey median or 25th percentile results. The ACNM/SNM/ACR panel believed that the original Harvard value had likely undervalued this procedure. However, the reason for the current change in coding was to better describe the services and simplify the coding structure for these low volume procedures. These codes were surveyed in response to the RAW request, but we believe these procedures have not fundamentally changed over the years. As there was insufficient compelling evidence for higher values for 78014 or the family of thyroid codes, we are recommending to maintain the current RVWs of the highest volume crosswalked CPT code for valuation. We continue to urge the RUC to accept "Harvard valued" as a criterion for compelling evidence, which we believe would apply to CPT 78014 and which we believe our survey data supports.

We believe the reference service code chosen by the survey respondents, CPT 78227 (*Hepatobiliary system imaging, including gallbladder when present; with pharmacologic intervention, including quantitative measurement(s) when performed*) (RVW 0.90) has higher work intensity and complexity than 78014, and with 78227 having a longer intra-service time of 15 minutes and being ranked higher on the intensity factors for medical decision making, risk of significant complications and risk of malpractice.

We compared 78014 to a MPC code CPT 77300 (*Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician),* (RVW 0.62). While we believe these procedures are comparable in intensity and complexity, the panel agreed that 78014 should be valued slightly lower than both 77300 and CPT 78306 (*Bone and/or joint imaging; whole body)*, (RVW 0.86).
In summary, to maintain rank order and remain within budget neutrality we recommend a RVW of 0.50 for 78014 with a pre service time of 5minutes, intra service time of 10 minutes, and post service time of 5 minutes, for a total time of 20 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 78006, 78007

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Nuclear Medicine How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 149073
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the number of times this service might be provided to Medicare patients nationally in a one-year period, it is estimated that 78014 might be provided 149,073 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 97261 Percentage 65.24 %

Specialty Nuclear Medicine Frequency 18251 Percentage 12.24 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 49,691 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Codes 78006 and 78007 are currently used to report the procedure described by 78014. The 2010 Medicare frequency for code 78006 is 20,307 and the frequency for 78007 is 29,384. To calculate the frequency for code 78014, we summed the frequencies for the two codes to get 49,691.
Then, multiply the frequency for each code, 78006 and 78007, by the appropriate frequency (percent) for each specialty, Diagnostic Radiology or Nuclear Medicine, to estimate the number of times the specialty might provide the service described by 78014 to Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 32420 Percentage 65.24 %

Specialty Nuclear Medicine Frequency 6084 Percentage 12.24 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 78007

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.

Hide columns and rows that do not contain data.

REF = Key Reference code data

CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.

SVY = Survey data - as it appears on the Summary of Recommendation form.

REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

78014 - Thyroid imaging (including vascular flow, when performed); with single or multiple uptake(s) quantitative measurement(s) (including stimulation, suppression or discharge, when performed)

Global Period: XXX Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel was utilized to finalize the practice expense data for codes 78012, 78013, and 78014. Specialty societies that were involved include the Society of Nuclear Medicine, the American College of Radiology, and the American College of Nuclear Medicine.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Practice expense inputs for relevant nuclear medicine codes were used as a reference to provide practice expense inputs for codes 78012, 78013, and 78014.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Review x-ray, lab and past test to confirm appropriateness with physician, confirm technique to be used, obtain physician written directive, determine radiopharmaceutical dose, and order radiopharmaceutical from central/commercial nuclear pharmacy.
- QC Planar Equipment
- Prepare radiopharmaceutical (prepare and QC dose) delivered by central/commercial nuclear pharmacy with NRC required check-in of RP, survey, package, wipe test of syringe, and recording all regulatory required documentation. Ready dose for potential injection with in-house labels and records.

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent including mandatory radiation education
- Prepare room, equipment, supplies (additional change collimator and set up protocol)
- Prepare and position patient/ monitor patient
- Obtain RP from RP storage/preparation area, recheck dose, record, reassay, and ensure dose would be appropriate (following protocols) based on the written directive (correct test and patient weight)
- Administer RP oral 2 minutes IV 5 minutes procedure
- Acquire images/ uptake(s) and review for completeness and quality
- Complete diagnostic forms, lab & X-ray requisitions, image processing uptake calculation, development hard copy or complete calculation template, archive and obtain approval to discharge patient
- Clean room/equipment by physician staff
- Specific room clean up of RP injection/administration areas with mandatory defacement of labels for proper RP residual disposal
- Regulatory compliance - NRC required wipe tests and survey areas used including regulatory documentation.

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued-Utilization over 30,000

April 2012

Parathyroid Imaging

In April 2011, CPT Code 78007 *Thyroid imaging, with uptake; multiple determinations* was identified in the Harvard Valued-Utilization over 30,000 screen. As part of the review of the entire endocrine family, the specialty societies determined that revisions to the parathyroid imaging procedures were necessary to reflect current bundling policies, guideline changes and new technology.

78070 *Parathyroid planar imaging (including subtraction, when performed);*
The RUC reviewed survey results from 102 radiologists and nuclear medicine physicians and recommends a work RVU of 0.80, the survey 25th percentile. The RUC noted that 78070 was editorially revised to clarify imaging by planar technique and has a current work RVU of 0.82. However, the RUC agreed that the 25th percentile work RVU of 0.80 should be assigned. The RUC compared code 78070 to CPT code 78226 *Hepatobiliary system imaging, including gallbladder when present* (work RVU=0.74) and noted that although these two procedures require the same physician time, 78070 is a dual-phase study which requires more physician work. The RUC also reviewed 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work RVU=0.81) and determined that the physician times are similar and they are comparable tests. **The RUC recommends a work RVU of 0.80 for CPT Code 78070**.

78071 *Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT)*
The RUC reviewed survey results from 94 radiologists and nuclear medicine physicians and determined that a work RVU of 1.20, the survey median, is appropriate. The RUC noted that currently this procedure is reported using CPT codes 78070 *Parathyroid imaging* (work RVU=0.82) and 78803 *Radiopharmaceutical localization of tumor or distribution of radiopharmaceutical agent(s); tomographic (SPECT)* (work RVU=1.09). The RUC compared 78071 to key reference service 78452 *Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection* (work RVU=1.62) and determined that 78452 requires more physician time and should be valued higher than 78071. The RUC also reviewed 78494 *Cardiac blood pool imaging, gated equilibrium, SPECT, at rest, wall motion study plus ejection fraction, with or without quantitative processing* (work RVU=1.19) and agreed that physician times and work are comparable. To further support a work RVU of 1.20, the RUC also reviewed 70470 *Computed tomography, head or brain; without contrast material, followed by contrast material(s) and further sections* (work RVU=1.27) and 78454 *Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution and/or rest reinjection* (work

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RVU=1.34) and determined these procedures require similar physician time and intensity. **The RUC recommends a work RVU of 1.20 for CPT Code 78071.**

78072 ***Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT), and concurrently acquired computed tomography (CT) for anatomical localization***
This service reflects new technology currently reported with unlisted codes. The RUC reviewed survey results from 86 radiologists and nuclear medicine physicians and determined that a work RVU of 1.60, the survey median, is appropriate. The RUC reviewed key reference service 78814 *Positron emission tomography (PET) with concurrently acquired computed tomography (CT) for attenuation correction and anatomical localization imaging; limited area (eg, chest, head/neck)* (work RVU=2.20) and agreed that with 30 additional total minutes and higher intensity, the reference code should be valued higher. The RUC also reviewed 73721 *Magnetic resonance (eg, proton) imaging, any joint of lower extremity; without contrast material* (work RVU=1.35) and determined that this was a less intense procedure compared to the surveyed code. There was consensus among the RUC that, giving these comparators, a work RVU of 1.60 would maintain proper rank order among this family of services. **The RUC recommends a work RVU of 1.60 for CPT Code 78072.**

Work Neutrality:
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense:
The RUC reviewed and approved practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

SUMMARY OF RECOMMENDATION

CPT Code:78070 Tracking Number U1 Original Specialty Recommended RVU: **0.82**
Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: Parathyroid planar imaging (including subtraction, when performed);

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57-year-old woman with elevated calcium levels and elevated PTH, presents for evaluation of suspected hyperfunctioning parathyroid glands.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 8%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Description of Pre-Service Work: The physician reviews the reason for the exam, pertinent clinical history including available prior imaging studies and determines the appropriateness of the requested study; prescribes, oversees and directs the administered radiopharmaceutical(s) dose(s).

Description of Intra-Service Work: The physician directs the technologist to adjust the acquisition protocol, as necessary, for the individual patient. The physician is available to answer questions for the technologist, review components of the study and provide regulatory oversight throughout the procedure.
The complete study consists of a minimum of two separate sets of planar imaging data encompassing the lower neck and the mediastinum, and techniques to differentiate radiopharmaceutical accumulation in anomalous or abnormal parathyroid glands from in the thyroid gland. The typical method is injection of a single radiopharmaceutical (99mTc-sestamibi) that is accumulated by both endocrine glands, but washes out of the thyroid gland faster than from parathyroid hyperplastic and adenomatous tissue. Anterior and bilateral anterior oblique images of the neck and anterior mediastinal images are acquired 10 -30 minutes and again at 90 -240 minutes after injection. A dual radiopharmaceutical technique is less commonly done acquiring similar but pre-timed sequential images for 5 minutes each over a 30-minute period without moving the patient.
Whichever technique is used, thyroid and parathyroid imaging data are qualitatively compared to detect tissue uptake that is seen on the latter but is not present on the former, to reveal discordant parathyroid uptake and its relative location. The physician verifies the adequacy of the imaging data before completion of the study, and directs the technologist to obtain additional views or reprocess data, when necessary.
The data are formatted for film and/or digital display and analysis. The physician reviews the study for artifacts and abnormal distribution. The imaging data are compared to relevant prior studies, and formally interpreted, i.e., a report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. Imaging data is normally reviewed with the referring physician when surgery is anticipated and may be discussed with the patient. The physician provides mandatory NRC regulatory review and oversight of the radiopharmaceutical throughout the procedure.

SURVEY DATA

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As a result of the RUC Relativity Assessment Workgroup (RAW), formerly the Five-Year Review Identification Workgroup, CPT 78007 *(Thyroid imaging, with uptake; multiple determinations)* was identified as a potentially mis-valued code through the Harvard-valued, volume greater than 30,000 utilization screen. The joint societies, ACNM, SNM, and ACR, presented an action plan to revise the thyroid family, CPT codes 78000 to 78010 in the Nuclear Medicine section

under the Endocrine System in CPT. CPT changes with survey results are presented in Tab 22. As part of this review of the entire endocrine system section, the joint societies determined that the parathyroid imaging procedures would benefit from revisions that would bring the coding structure current with bundling policies, guideline changes, and new technology. The new parathyroid family of codes editorially modifies one existing CPT code, creates one bundled code from two existing CPT codes, and creates a second new technology procedure code to report the varying procedures, and to conform to recently updated society procedure guidelines.

78070 Parathyroid planar imaging (including subtraction, when performed);
78070 is an existing code (RVW 0.82, 15 minutes total time), which was editorially revised to clarify imaging by planar technique. Our expert panel considered a two-phase early and late planar imaging study that includes subtraction by either visual or by computer processing to be typical for 78070. 94% percent of the survey respondents stated that the vignette was typical.

There were 102 responses to the survey request. The survey performance rate median of 25 studies per year among the 102 respondents is a reasonable rate given this is a relatively low volume procedure (27,900 in 2010). The panel agreed that the survey physician median times of 5 minutes pre-service, and 5 minutes post-service accurately reflect the time required to perform this service. Therefore, we selected pre-service XXX global package and adjusted the times to our recommended value of 5 minutes. We believe the survey median of 10 minutes of intra-service time for this dual-phase planar parathyroid study to be appropriate and comparable with other similar nuclear medicine studies.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 78070

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Nuclear Medicine How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 83700
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the number of times this service might be provided to Medicare patients nationally in a one-year period, it is estimated that 78070 might be provided 83,700 times nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 55250 Percentage 66.00 %

Specialty Nuclear Medicine Frequency 14262 Percentage 17.03 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 27,900 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare frequency for code 78070 is 27,900. To estimate the number of times the specialty, Diagnostic Radiology or Nuclear Medicine, might provide the service described by 78070 to Medicare patients nationally in a one-year period, multiply 27,900 by the appropriate frequency (percent) for each specialty.

Specialty Diagnostic Radiology Frequency 18417 Percentage 66.01 %

Specialty Nuclear Medicine Frequency 4754 Percentage 17.03 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

SUMMARY OF RECOMMENDATION

CPT Code:78071 Tracking Number U2 Original Specialty Recommended RVU: **1.20**
Presented Recommended RVU: **1.20**
Global Period: XXX RUC Recommended RVU: **1.20**

CPT Descriptor: Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 47-year-old man with chronic renal failure and clinical evidence for hyperparathyroidism. Ultrasound shows suspicious nodule posterior to the right lobe of the thyroid.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 7%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Description of Pre-Service Work: The physician reviews the reason for the exam, pertinent clinical history including available prior imaging studies and determines the appropriateness of the requested study; prescribes, oversees and directs the administered radiopharmaceutical(s) dose(s).

Description of Intra-Service Work: The physician directs the technologist in the timing of the SPECT study and to adjust the acquisition protocol, as necessary, for the individual patient. The physician is available to answer questions for the technologist, review components of the study and provide regulatory oversight throughout the procedure.
The complete study consists of a minimum of two separate sets of planar imaging data encompassing the lower neck and the mediastinum, and techniques to differentiate radiopharmaceutical accumulation in anomalous or abnormal parathyroid glands from in the thyroid gland; plus a SPECT study of the same regions. The most commonly employed method is injection of a single radiopharmaceutical (99mTc-sestamibi) that is accumulated by both endocrine glands, but washes out of the thyroid gland faster than from parathyroid hyperplastic and adenomatous tissue. Anterior and bilateral anterior oblique planar images of the neck and anterior mediastinal images are acquired 10 -30 minutes and again at 90 - 240 minutes after injection. A SPECT study of the neck and mediastinum is acquired. A dual radiopharmaceutical technique is less commonly done acquiring similar but pre-timed sequential images for 5 minutes each over a 30-minute period without moving the patient, followed by a SPECT study of the neck and mediastinum.
Whichever technique is used (single or dual radiopharmaceutical), thyroid and parathyroid imaging data are qualitatively compared to detect tissue uptake that is seen on the latter but is not present on the former, to reveal discordant parathyroid uptake and its relative location for possible excision. The SPECT data are reconstructed in transaxial, sagittal and coronal planes to facilitate localization of abnormal parathyroid radiopharmaceutical accumulation.
The physician verifies the adequacy of the imaging data before completion of the study, and directs the technologist to obtain additional views or re-process data, when necessary.

The data are formatted for film and/or digital display and analysis. The physician reviews the study for artifacts and abnormal distribution. The imaging data are compared to relevant prior studies, and formally interpreted, i.e., a report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. Imaging data is normally reviewed with the referring physician and may be discussed with the patient. The physician provides mandatory NRC regulatory review and oversight of the radiopharmaceutical throughout the procedure.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As a result of the RUC Relativity Assessment Workgroup (RAW), formerly the Five-Year Review Identification Workgroup, CPT 78007 *(Thyroid imaging, with uptake; multiple determinations)* was identified as a potentially mis-valued

code through the Harvard-valued, volume greater than 30,000 utilization screen. The joint societies, ACNM, SNM, and ACR, presented an action plan to revise the thyroid family, CPT codes 78000 to 78010 in the Nuclear Medicine section under the Endocrine System in CPT. CPT changes with survey results are presented in Tab 22. As part of this review of the entire endocrine system section, the joint societies determined that the parathyroid imaging procedures would benefit from revisions that would bring the coding structure current with bundling policies, guideline changes, and new technology. The new parathyroid family of codes editorially modifies one existing CPT code, creates one bundled code from two existing CPT codes, and creates a second new technology procedure code to report the varying procedures, and to conform to recently updated society procedure guidelines.

78071 Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT)
78071 is a new bundled procedure code reflecting the current billing of 78070 plus 78803 *(Radiopharmaceutical localization of tumor or distribution of radiopharmaceutical agent(s); tomographic (SPECT))*. Even though 78803 has other utilization outside of parathyroid imaging and the code combination for this indication did not appear on the CMS 75 percent list, we believe there is a significant percentage of these two codes being billed together. We also have received numerous member coding questions regarding billing for parathyroid imaging with SPECT, which prompted the societies to bring this family forward.

For the purpose of this RUC survey, the 2010 predominant "typical" procedure is a two-phase early and late planar imaging including subtraction by one of two methods, visually or by computer processing, plus a SPECT study. Eighty percent of the survey respondents stated that the vignette was typical.

A joint ACNM/SNM/ACR panel reviewed the survey results. There were 94 responses to the survey request. The survey performance rate median of 30 studies per year among the 94 respondents is a reasonable rate given the volume for these procedures. The panel agreed that the survey physician median times of 5 minutes pre-service and 5 minutes post-service accurately reflect the time required to perform this service. Therefore, we selected pre-service XXX global package and adjusted the times to our recommended value of 5 minutes. We believe the survey median of 15 minutes intra-service time is appropriate and comparable with other similar nuclear medicine studies.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 78070, 78803

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Nuclear medicine How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 93054
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the number of times this service might be provided to Medicare patients nationally in a one-year period, it is estimated that 7807X1 might be provided 93,054 times in a one-year period.

Specialty Diagnostic Radiology Frequency 61462 Percentage 66.04 %

Specialty Nuclear Medicine Frequency 16592 Percentage 17.83 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 31,018 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Codes 78070 and 78803 are currently used to report the procedure described by 78071. The 2010 Medicare frequency for code 78070 is 27,900 and 14,173 for code 78803. To calculate the frequency for code 78071, we took the frequency for code 78070 plus part of the frequency for code 78803 (NM accounts for 22% of 78803, which is equal to 3,118).
Then, multiply the frequency for each code, 78070 and 78803, by the appropriate frequency (percent) for each specialty, Diagnostic Radiology or Nuclear Medicine, to estimate the number of times the specialty might provide the service described by 78071 to Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 20487 Percentage 66.04 %

Specialty Nuclear Medicine Frequency 5531 Percentage 17.83 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Description of Pre-Service Work: The physician reviews the reason for the exam, pertinent clinical history including available prior imaging studies and determines the appropriateness of the requested study; prescribes, oversees and directs the administered radiopharmaceutical(s) dose(s).

Description of Intra-Service Work: The physician directs the technologist in the timing of the SPECT/CT study and to adjust the acquisition protocol, as necessary, for the individual patient. The physician is available to answer questions for the technologist, review components of the study and provide regulatory oversight throughout the procedure.
The complete study consists of a minimum of two separate sets of planar imaging data encompassing the lower neck and the mediastinum, and techniques to differentiate radiopharmaceutical accumulation in anomalous or abnormal parathyroid glands from in the thyroid gland; plus a SPECT/CT study of the same regions. The typical protocol is injection of a single radiopharmaceutical (99mTc-sestamibi) that is accumulated by both endocrine glands, but washes out of the thyroid gland faster than from parathyroid hyperplastic and adenomatous tissue. Anterior and bilateral anterior oblique planar images of the neck and anterior mediastinal images are acquired 10-30 minutes and again at 90-240 minutes after injection. A limited CT study of the neck and mediastinum is acquired, and without moving the patient a SPECT study of the same regions is acquired. A dual radiopharmaceutical technique is less commonly done acquiring similar but pre-timed sequential images for 5 minutes each over a 30-minute period without moving the patient, followed by a limited CT study of the neck and mediastinum and again without moving the patient acquisition of a SPECT study of the same regions.
Whichever technique is used (single or dual radiopharmaceutical), thyroid and parathyroid imaging data are qualitatively compared to detect tissue uptake that is seen on the latter but is not present on the former, to reveal discordant parathyroid uptake and its relative location for possible excision. The SPECT and CT data are reconstructed in transaxial, sagittal and coronal planes to facilitate localization of abnormal parathyroid radiopharmaceutical accumulation. CT data is also used to

generate attenuation corrected images in all three planes. Additional fused images from the SPECT and CT images are constructed to correlate the anatomic position of radiopharmaceutical accumulation with the current patient anatomy.
The physician verifies the adequacy of the imaging data before completion of the study, and directs the technologist to obtain additional views or re-process data, when necessary.
The data are formatted for film and/or digital display and analysis. The physician reviews the study for artifacts and abnormal distribution. The imaging data are compared to relevant prior studies, and formally interpreted, i.e., a report is dictated for the medical record.

Description of Post-Service Work: The physician reviews and signs the report for the medical record. Imaging data is normally reviewed with the referring physician and may be and may be discussed with the patient. The physician provides mandatory NRC regulatory review and oversight of the radiopharmaceutical throughout the procedure.

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 28 **% of respondents:** 32.5 **%**

TIME ESTIMATES (Median)	**CPT Code: 78072**	**Key Reference CPT Code:** 78814	**Source of Time RUC Time**
Median Pre-Service Time	5.00	15.00	
Median Intra-Service Time	20.00	30.00	
Median Immediate Post-service Time	5.00	15.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	

Median Total Time	**30.00**	**60.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.43	3.89
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	4.43
Urgency of medical decision making	2.79	3.29
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.22	4.43
Physical effort required	2.75	2.86
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.07	3.50
Outcome depends on the skill and judgment of physician	4.11	4.37
Estimated risk of malpractice suit with poor outcome	3.00	3.61

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.14	3.43
Intra-Service intensity/complexity	4.07	4.25
Post-Service intensity/complexity	3.04	3.36

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

As a result of the RUC Relativity Assessment Workgroup (RAW), formerly the Five-Year Review Identification Workgroup, CPT 78007 *(Thyroid imaging, with uptake; multiple determinations)* was identified as a potentially mis-valued code through the Harvard-valued, volume greater than 30,000 utilization screen. The joint societies, ACNM, SNM, and

ACR, presented an action plan to revise the thyroid family, CPT codes 78000 to 78010 in the Nuclear Medicine section under the Endocrine System in CPT. CPT changes with survey results are presented in Tab 22. As part of this review of the entire endocrine system section, the joint societies determined that the parathyroid imaging procedures would benefit from revisions that would bring the coding structure current with bundling policies, guideline changes, and new technology. The new parathyroid family of codes editorially modifies one existing CPT code, creates one bundled code from two existing CPT codes, and creates a second new technology procedure code to report the varying procedures, and to conform to recently updated society procedure guidelines.

78072 Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT), and concurrently acquired computed tomography (CT) for anatomical localization

78072 is a new procedure, analogous to the PET/CT procedure codes. The CT component of this imaging exam is not a fully diagnostic CT, but rather a low-radiation dose, low-resolution CT used for the purposes of attenuation correction and anatomic localization. This procedure is more sensitive for parathyroid localization than the planar and/or SPECT imaging procedures above. Seventy-six percent of the survey respondents stated that the vignette describing a post-surgical patient was typical.

A joint ACNM, SNM, and ACR RVS expert panel reviewed and discussed the survey results. There were 86 responses to the survey request. The survey performance rate median of 30 studies per year among the 86 respondents is a reasonable rate given the low volume for this new procedure code. The panel agreed that the survey physician median times of 5 minutes pre-service, and 5 minutes post-service accurately reflect the time required to perform this service. The panel recommends pre-service XXX global package and adjusted the time to our recommended value of 5 minutes. We believe the survey median of 20 minutes intra-service time is appropriate and relative to the other codes in this family and to other nuclear medicine procedure codes that have been RUC reviewed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 78999, 78099

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Sometimes

Specialty Nuclear Medicine How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 491
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the number of times this service might be provided to Medicare patients nationally in a one-year period, it is estimated that 78072 might be provided 491 times in a one-year period.

Specialty Diagnostic Radiology Frequency 27 Percentage 5.49 %

Specialty Nuclear Medicine Frequency 10 Percentage 2.03 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 164
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Unlisted procoedure codes 78999 and 78099 are currently used to report the procedure described by 78072. We based our estimate on only 50% of the Medicare frequency, 160 for 78999 and 4 for 78099, for a total of 164.
To estimate the number of times the specialty, Diagnostic Radiology or Nuclear Medicine, might provide the service described by 78072 to Medicare patients nationally in a one-year period, multiply the frequency for each code, 78999 and 78099, by the appropriate frequency (percent) for each specialty.

Specialty Diagnostic Radiology Frequency 9 Percentage 5.48 %

Specialty Nuclear Medicine Frequency 3 Percentage 1.82 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 78452

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.

Hide columns and rows that do not contain data.

REF = Key Reference code data

CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.

SVY = Survey data - as it appears on the Summary of Recommendation form.

REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
78070 – Parathyroid planar imaging (including subtraction, when performed);
78071 – Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT)
78072 - Parathyroid planar imaging (including subtraction, when performed); with tomographic (SPECT), and concurrently acquired computed tomography (CT) for anatomical localization

Global Period: XXX Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel was utilized to finalize the practice expense data for codes 78070, 78071, and 78072. Specialty societies that were involved include the Society of Nuclear Medicine, the American College of Radiology, and the American College of Nuclear Medicine.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

The existing code 78003 is being replaced, and 78070 has been editorially revised through the creation of new parathyroid imaging codes, 78070, 78071, and 78072.The practice expense inputs for the existing codes are similar to the practice expense inputs for the new codes.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Review x-ray, lab and past test to confirm appropriateness with physician, confirm technique to be used, obtain physician written directive, determine radiopharmaceutical dose, and order radiopharmaceutical from central/commercial nuclear pharmacy.
- QC Planar Equipment
- QC SPECT Equipment
- Prepare radiopharmaceutical (prepare and QC dose) delivered by central/commercial nuclear pharmacy with NRC required check-in of RP, survey, package, wipe test of syringe, and recording all regulatory required documentation. Ready dose for potential injection with in-house labels and records.

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available

- Provide pre-service education/obtain consent including mandatory radiation education
- Prepare room, equipment, supplies (additional change collimator and set up protocol)
- Prepare and position patient/ monitor patient
- Obtain RP from RP storage/preparation area, recheck dose, record, reassay, and ensure dose would be appropriate (following protocols) based on the written directive (correct test and patient weight)
- Administer RP oral 2 minutes IV 5 minutes procedure
- Acquire images/ uptake(s) and review for completeness and quality
- Complete diagnostic forms, lab & X-ray requisitions, image processing uptake calculation, development hard copy or complete calculation template, archive and obtain approval to discharge patient
- Clean room/equipment by physician staff
- Specific room clean-up of RP injection/administration areas with mandatory defacement of labels for proper RP residual disposal
- Regulatory compliance - NRC required wipe tests and survey areas used including regulatory documentation.

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Molecular Pathology-Adenomatous Polyposis Coli

The College of American Pathologists explained to the RUC that these three Molecular Pathology codes, 81201, 81202 and 81203, are among the last and lowest volume Tier 1 molecular pathology codes developed by the CPT Editorial Panel. Previous attempts to survey low volume Molecular Pathology services have resulted in surveys with inadequate responses and it is suspected that these codes, performed by ultra-specialized molecular pathologists, would yield much less than adequate survey responses. At the September 2011 RUC meeting, the RUC agreed to crosswalk other low volume Tier 1 Molecular Pathology codes to Tier 2 molecular pathology codes. In February 2012 the RUC approved the Research Subcommittee and specialty request to use direct crosswalks to obtain credible values and time for these services.

The RUC reviewed CPT code 81201 *APC (adenomatous polyposis coli) (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; full gene sequence* and agreed to directly crosswalk this service to the Molecular Pathology Tier 2 code 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)* (work RVU= 1.40). This reference service is an accurate comparator for 81201 because Level 7 is the Tier 2 level to which 81201 would have been assigned had it been placed on Tier 2 based on the physician work and practice expense involved in sequencing the 15 coding exons of the APC gene. . **The RUC recommends a work RVU of 1.40 and intra-service time of 60 minutes for CPT code 81201.**

The RUC reviewed CPT code 81202 *APC (adenomatous polyposis coli) (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; known familial variants* and agreed to directly crosswalk this service to the Molecular Pathology Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (work RVU= 0.52). The RUC agreed that 81202 involves the physician work of DNA sequence analysis of a single exon, and not a full gene sequence analysis, compared to 81201. Therefore, 81202 should be valued the same as reference code 81403, which also describes the physician work of analyzing a single exon by DNA sequence analysis. **The RUC recommends a work RUV of 0.52 and intra-service time of 28 minutes for CPT code 81202.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed CPT code 81203 *APC (adenomatous polyposis coli) (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; duplication/deletion variants* and agreed to directly crosswalk this service to the Molecular Pathology Tier 2 code 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* (work RVU= 0.80).Level 6 is the Tier 2 level to which 81203 would have been assigned had it been placed on Tier 2 based on the physician work and practice expense involved in duplication/deletion analysis of the 15 coding exons of the APC gene, and the RUC agreed that 81203 represents the physician work involved with duplication deletion analysis of 11 – 25 exons. The RUC noted that this service has physician work that is more complex than 81202 but less complex than 81201 and is correctly valued in between the two services. **The RUC recommends a work RVU of 0.80 and intra-service time of 30 minutes for CPT code 81203.**

Practice Expense: The RUC reviewed and accepted the direct practice expense inputs as approved by the Practice Expense Subcommittee.

New Technology: These services will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●81201	V1	*APC (adenomatous polyposis coli)* (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; full gene sequence	XXX	1.40
●81202	V2	known familial variants	XXX	0.52
●81203	V3	duplication/deletion variants	XXX	0.80

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RE: Additional Tier 1 Molecular Pathology CPT Codes

Dear Doctor Lewis;

The College of American Pathologists (CAP) will be presenting physician work and practice expense for three new category I molecular pathology services at the RUC's April 2012 meeting in Chicago. These three new services are among the last and lowest volume of the Tier 1 codes developed by the AMA CPT Molecular Pathology Coding Workgroup (MPCW). Earlier, in a separate letter to the RUC dated February 17, 2012, CAP recommended that these new codes be surveyed for their physician work involving physician interpretation.

After further consideration and reflection upon our previous survey efforts last year when CAP performed a survey of 68 new molecular pathology services, CAP's RBRVS workgroup believes that a full survey of these three codes which are performed by ultra-specialized molecular pathologists would yield much less than the typical minimum number of 30 survey respondents that the RUC typically desires.

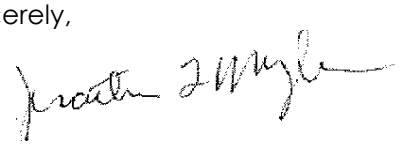
At the September 2011 RUC meeting, CAP cross walked the values for low volume Tier 1 Molecular Pathology codes for which we did not receive adequate survey data to the Tier 2 Molecular Pathology level codes. This was done by comparing the exons requiring interpretation included in the Tier 2 level codes with the new Tier 1 code. As the remaining Tier 1 codes under consideration represent even lower volume services, we believe that cross walking the new codes to Tier 2 level codes represents the best option to maintain relativity and rank order in this new code family. If surveyed, we would anticipate a very low physician work survey response rate for these three services.

CAP requests that the RUC's Research Subcommittee accept the following relative value cross walks for the three new molecular pathology services to value the professional component for these services. The practice expense subcommittee will determine the practice expense recommendations for these codes.

New molecular pathology services with direct crosswalk codes listed below:

The following codes represent gene-specific and genomic procedures:

- 81201 *APC (adenomatous polyposis coli)* (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; full gene sequence **(Cross walk to 81406, see below)**
- 81202 known familial variants **(Cross walk to 81403, see below)**
- 81203 duplication/deletion variants **(Cross walk to 81405, see below)**



81406 Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia) (RUC Recommended Work RVU = 1.40, Intra-service Work Time = 60 minutes, IWPUT = 0.023)

81403 Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons) (RUC Recommended Work RVU = 0.52, Intra-service Work Time = 28 minutes, IWPUT = 0.019)

81405 Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons) (RUC Recommended Work RVU = 0.80, Intra-service Work Time = 30 minutes, IWPUT = 0.027)

If you have any questions or concerns, please contact, Todd Klemp, Assistant Director of Economic and Regulatory Affairs at (202) 354-7403 or tklemp@cap.org

Sincerely,

Jonathan L. Myles, MD, FCAP

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81201 Tracking Number V1 Original Specialty Recommended RVU: **1.40**
Presented Recommended RVU: **1.40**
Global Period: XXX RUC Recommended RVU: **1.40**

CPT Descriptor: APC (adenomatous polyposis coli) (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; full gene sequence

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male patient presents to his physician with episodic hematochezia. The patient undergoes colonoscopy. A very large number of adenomatous polyps and a left sided mass consistent with adenocarcinoma of the colon are identified. The patient's family history is positive for colon cancer in several relatives. Familial adenomatous polyposis (FAP) is suspected, and an anticoagulated peripheral blood sample is submitted for APC gene sequencing.

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 15 individual PCR amplification reactions whose products encompass the entire coding sequence, intron-exon boundaries, and portions of the 5'and 3'-untranslated regions of the APC gene. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist or other qualified healthcare professional evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist or other qualified healthcare professional compares this evaluation with possible variants suggested by computer software to ensure that all abnormalities are identified. The pathologist or other healthcare professional composes a report which specifies the patient's mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: N/A

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered		
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed		
Urgency of medical decision making		
Technical Skill/Physical Effort (Mean)		
Technical skill required		
Physical effort required		
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality		
Outcome depends on the skill and judgment of physician		
Estimated risk of malpractice suit with poor outcome		

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity		
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The College of American Pathologists (CAP) recommends a cross walk of the physician work and practice expense for this service. These three new services are among the last and lowest volume of the Tier 1 codes developed by the AMA

CPT Molecular Pathology Coding Workgroup (MPCW). The RUC's Research Subcommittee agreed to this crosswalk methodology in February 2012.

CAP considered surveying for these services, however after further consideration and reflection upon our previous survey efforts last year when CAP performed a survey of 68 new molecular pathology services, CAP's RBRVS workgroup believes that a full survey of these three codes which are performed by ultra-specialized molecular pathologists would yield far fewer than the minimum number of 30 survey respondents that the RUC typically desires.

At the September 2011 RUC meeting, CAP cross walked the values for low volume Tier 1 Molecular Pathology codes for which we did not receive adequate survey data to the Tier 2 Molecular Pathology level codes. This was done by comparing the exons requiring interpretation included in the Tier 2 level codes with the new Tier 1 code. As the remaining Tier 1 codes under consideration represent even lower volume services, we believe that cross walking the new codes to Tier 2 level codes represents the best option to maintain relativity and rank order in this new code family.

CAP recommends the following relative value cross walks for the three new molecular pathology services to value the professional component for these services.

New molecular pathology services with direct crosswalk codes listed below:

The following codes represent gene-specific and genomic procedures:

- 81201 *APC (adenomatous polyposis coli)* (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; full gene sequence **(Cross walk to 81406, see below)**

- 81202 known familial variants **(Cross walk to 81403, see below)**

- 81203 duplication/deletion variants **(Cross walk to 81405, see below)**

81406 Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia) (RUC Recommended Work RVU = 1.40, Intra-service Work Time = 60 minutes, IWPUT = 0.023)

81403 Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons) (RUC Recommended Work RVU = 0.52, Intra-service Work Time = 28 minutes, IWPUT = 0.019)

81405 Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons) (RUC Recommended Work RVU = 0.80, Intra-service Work Time = 30 minutes, IWPUT = 0.027)

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 83912

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The College of American Pathologists (CAP) recommends a cross walk of the physician work and practice expense for this service. These three new services are among the last and lowest volume of the Tier 1 codes developed by the AMA CPT Molecular Pathology Coding Workgroup (MPCW). The RUC's Research Subcommittee agreed to this crosswalk methodology in February 2012.

CAP considered surveying for these services, however after further consideration and reflection upon our previous survey efforts last year when CAP performed a survey of 68 new molecular pathology services, CAP's RBRVS workgroup believes that a full survey of these three codes which are performed by ultra-specialized molecular pathologists would yield far fewer than the minimum number of 30 survey respondents that the RUC typically desires.

At the September 2011 RUC meeting, CAP cross walked the values for low volume Tier 1 Molecular Pathology codes for which we did not receive adequate survey data to the Tier 2 Molecular Pathology level codes. This was done by comparing the exons requiring interpretation included in the Tier 2 level codes with the new Tier 1 code. As the remaining Tier 1 codes under consideration represent even lower volume services, we believe that cross walking the new codes to Tier 2 level codes represents the best option to maintain relativity and rank order in this new code family

CAP recommends the following relative value cross walks for the three new molecular pathology services to value the professional component for these services.

New molecular pathology services with direct crosswalk codes listed below:

The following codes represent gene-specific and genomic procedures:

- 81201 *APC (adenomatous polyposis coli)* (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; full gene sequence **(Cross walk to 81406, see below)**
- 81202 known familial variants **(Cross walk to 81403, see below)**
- 81203 duplication/deletion variants **(Cross walk to 81405, see below)**

81406 Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia) (RUC Recommended Work RVU = 1.40, Intra-service Work Time = 60 minutes, IWPUT = 0.023)

81403 Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons) (RUC Recommended Work RVU = 0.52, Intra-service Work Time = 28 minutes, IWPUT = 0.019)

81405 Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons) (RUC Recommended Work RVU = 0.80, Intra-service Work Time = 30 minutes, IWPUT = 0.027)

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81203 Tracking Number V3 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: APC (adenomatous polyposis coli) (eg, familial adenomatosis polyposis [FAP], attenuated FAP) gene analysis; duplication/deletion variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old male patient presents with episodic hematochezia. The patient undergoes colonoscopy. A very large number of adenomatous polyps and a left sided mass consistent with adenocarcinoma of the colon are identified. Germline sequencing for the presence of an APC mutation does not reveal a mutation. Duplication/deletion analysis is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 0%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality genomic DNA previously isolated from whole blood is subjected to multiplex ligation probe ligation analysis (MLPA), which involves hybridization and ligation of multiple pairs of oligonucleotide probes specific for the 15 exons of the APC gene to assess dosage of each exon. The pathologist or other qualified healthcare professional examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the APC gene. The pathologist or other qualified health care professional composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

3 New Molecular Pathology Services

Global Period:_XXX Meeting Date: _April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011). CAP's expert panel reviewed these cross-walked PE inputs and made minor edits in supplies for 81201 and 81203 to account for the difference in the typical service procedures.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Molecular DNA analyses based on specific code.

Intra-Service Clinical Labor Activities:

NONE

Post-Service Clinical Labor Activities:
Clean up, document filing, and other activities, see spreadsheet

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2011

Molecular Pathology Tier 1

The CPT Editorial Panel has developed a new coding structure to describe molecular pathology services, based on the efforts and recommendations of the Molecular Pathology Coding Workgroup which commenced in October 2009. In October 2010 and February 2011, the CPT Panel accepted 92 Tier 1 codes, which are analyte specific CPT codes for relatively high-volume molecular pathology services. These services were previously reported with a series of "stacking codes." The RUC understands that payment for these services is currently based on a mixture of payment methodologies, including the physician fee schedule and the clinical lab fee schedule. CMS requested that the RUC review data provided by the College of American Pathologists to provide the agency with more information, as CMS develops a policy to determine which payment schedule is appropriate for these services. In April 2011, the RUC recommended physician work and time values for 18 Tier I codes. In September 2011, the specialty presented data for the remaining services which are typically performed by a physician.

81235 EGFR (epidermal growth factor receptor) (eg, non-small cell lung cancer) gene analysis, common variants (eg, exon 19 LREA deletion, L858R, T790M, G719A, G719S, L861Q)

The RUC reviewed the survey data from 49 molecular pathologists for CPT code 81235 *EGFR (epidermal growth factor receptor) (eg, non-small cell lung cancer) gene analysis, common variants (eg, exon 19 LREA deletion, L858R, T790M, G719A, G719S, L861Q)* and noted that the reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (work RVU=0.52) required the same amount of time to perform as the surveyed code, 20 minutes. Further, the RUC noted that the reference code and the surveyed code are similarly intense and complex services to perform. In addition the, RUC compared the surveyed code to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (work RVU=0.38) and noted that the surveyed code requires more time to perform than this reference codes, 20 minutes and 15 minutes, respectively. Based on these comparisons, the RUC agreed with the specialty society's recommendation of 0.51 work RVUs for this service. **The RUC recommends 0.51, the survey's 25th percentile, for 81235.**

81252 GJB2 (gap junction protein, beta 2, 26kDa; connexin 26) (eg, nonsyndromic hearing loss) gene analysis; full gene sequence

The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81404 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* which the RUC recommended at this meeting 0.65 work RVUs for 30 minutes of intra-service time. The RUC agreed that physician time and work effort of 81404 should be accurately assimilated to the time and work of 81252. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.65 for CPT code 81252.**

81253 GJB2 (gap junction protein, beta 2, 26kDa; connexin 26) (eg, nonsyndromic hearing loss) gene analysis; known familial variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons),* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that the physician time and work effort of 81403 should be accurately assimilated to the time and work of 81253. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is less complex and requires less physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81253.**

81254 GJB6 (gap junction protein, beta 6, 30kDa, connexin 30) (eg, nonsyndromic hearing loss) gene analysis; common variants (eg, 309kb [del(GJB6-D13S1830)] and 232kb [del(GJB6-D13S1854)])
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)* which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. The RUC agreed that the physician time and work effort of 81401 should be accurately assimilated to the time and work of 81254. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is similarly complex and requires similar physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.40 for CPT code 81254.**

81321 PTEN (phosphatase and tensin homolog) (eg, Cowden syndrome, PTEN hamartoma tumor syndrome) gene analysis; full sequence analysis
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* which the RUC recommended at this meeting 0.80 work RVUs for 30 minutes of intra-service time. The RUC agreed that the physician time and work effort of 81405 should be accurately assimilated to the time and work of 81321. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52),

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.80 for CPT code 81321.**

81322 PTEN (phosphatase and tensin homolog) (eg, Cowden syndrome, PTEN hamartoma tumor syndrome) gene analysis; known familial variant

The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that the physician time and work effort of 81403 should be accurately assimilated to the time and work of 81322. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is less complex and requires less physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81322.**

81323 PTEN (phosphatase and tensin homolog) (eg, Cowden syndrome, PTEN hamartoma tumor syndrome) gene analysis; duplication/deletion variant

The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81404 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* which the RUC recommended at this meeting 0.65 work RVUs for 30 minutes of intra-service time. The RUC agreed that the physician time and work effort of 81404 should be accurately assimilated to the time and work of 81323. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.65 for CPT code 81323.**

Practice Expense

The specialty society provided data based on assumed batch sizes and modified these batch size estimates to ensure maximum efficiency for today's practice. However the RUC agreed that the batch sizes should be re-examined when greater experience is available for these services. Further, The specialty society explained that the majority of these services are being crosswalked with minor differences to the practice expense inputs associated with the molecular pathology services that were approved at the April 2011 RUC Meeting. The PE Subcommittee reviewed all the recommended practice expense inputs over a conference call and during the PE Subcommittee meeting and made minor changes mostly pertaining to duplication in supplies and equipment, which were all subsequently approved by the RUC.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Work Neutrality
Reviewing the Medicare utilization data for 83912 *Molecular diagnostics; interpretation and report* (work RVU = 0.37) and the specialty's estimate of utilization of these individual services, the RUC understands that these recommendations will be work neutral to the family.

New Technology
The entire set of molecular pathology codes should be re-reviewed after claims data are available and there is experience with the new coding system. The physician time, work, and practice expense inputs should all be reviewed again in the future as these estimates are based on a good faith effort using available information in 2011.

Flagging in the RUC Database
The RUC recommends that all of the molecular pathology services with less than 30 survey responses should be flagged in the RUC database so that they are not used to validate the proposed work associated with any CPT codes under RUC review.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
●81235	C1	EGFR (epidermal growth factor receptor) (eg, non-small cell lung cancer) gene analysis, common variants (eg, exon 19 LREA deletion, L858R, T790M, G719A, G719S, L861Q)	XXX	0.51

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81235 Tracking Number C1 Original Specialty Recommended RVU: **0.51**
Presented Recommended RVU: **0.51**
Global Period: XXX RUC Recommended RVU: **0.51**

CPT Descriptor: EGFR (epidermal growth factor receptor) (eg, non-small cell lung cancer) gene analysis, common variants (eg, exon 19 LREA deletion, L858R, T790M, G719A, G719S, L861Q)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman with no history of tobacco use presents to her physician complaining of a chronic cough. A chest x-ray reveals a right-sided peripheral lung mass, which is determined by biopsy to be adenocarcinoma of the lung. An abdominal CT scan demonstrates liver opacities, which are confirmed to be metastatic lung cancer. A tissue block is submitted for EGFR mutation testing.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: Paraffin is removed and DNA is isolated from the patient's tumor tissue. DNA is subjected to 4 PCR amplification reactions for exons 18-21 of the EGFR gene. The PCR products from each exon undergo bidirectional dideoxynucleotide chain termination sequencing on a capillary electrophoresis instrument. The pathologist evaluates the electropherograms to identify nucleotide sequence variants. The pathologist composes a report which specifies the patient's EGFR mutation status, including a comment on the implications of the lower limit of detection of the test relative to the tumor content of the sample. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 15 **% of respondents:** 30.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 81235**	**Key Reference CPT Code:** 88291	**Source of Time** **RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	20.00	20.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**20.00**	**20.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.73	3.93
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.67	3.60
Urgency of medical decision making	3.80	3.67
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.13	3.93
Physical effort required	3.07	3.13
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.80	3.67
Outcome depends on the skill and judgment of physician	3.93	3.87
Estimated risk of malpractice suit with poor outcome	3.87	3.60

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.20	4.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81235 is greater, or as intense and complex as 88291 in 7 out of 9 measures. All intensity and complexity measures indicated a high intensity and complexity. The expert panel agreed that the median physician time of 20 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.51 appropriately values 81235 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
10,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88182

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS

Global Period: XXX RUC Recommended RVU: **0.65**

CPT Descriptor: GJB2 (gap junction protein, beta 2, 26kDa; connexin 26) (eg, nonsyndromic hearing loss) gene analysis; full gene sequence

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An otherwise healthy 2-month-old boy was found to have moderate hearing loss on newborn hearing screening. He has normal vestibular function, does not display radiographic abnormalities of the inner ear, and does not have a family history of congenital deafness or hearing loss. His physical examination is otherwise unremarkable. His physician suspects a GJB2 mutation as a possible genetic cause for his hearing loss. An anticoagulated peripheral blood sample is submitted for GJB2 sequencing to assess for the presence of DFNB1 nonsyndromic hearing loss-related mutations.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 3 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherogram for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report which specifies the patient's GJB2 mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.67	3.50
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work with that of new tier 2 service 81404 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* (Recommended Work RVU = 0.65, 30 minutes). CAP recommends a direct crosswalk of 81252 to the physician work and time of CPT code 81404, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

SUMMARY OF RECOMMENDATION

CPT Code:81253 Tracking Number C3 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: GJB2 (gap junction protein, beta 2, 26kDa; connexin 26) (eg, nonsyndromic hearing loss) gene analysis; known familial variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An otherwise healthy 1-month-old girl was found to have moderate hearing loss on newborn screening. Her older brother was found to have DFNB1 nonsyndromic hearing loss caused by 2 mutations in exon 2 of the GJB2 gene. Her physician suspects she has the same congenital hearing disorder as her brother. An anticoagulated peripheral blood sample is submitted for GJB2 exon 2 sequencing to assess for the presence of the known familial GJB2 mutations.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to PCR amplification. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherogram for the known familial variants, as well as other potential nucleotide sequence variants that may be present. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologis composes a report which specifies the patient's GJB2 mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81254 Tracking Number C4 Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: GJB6 (gap junction protein, beta 6, 30kDa; connexin 30) (eg, nonsyndromic hearing loss) gene analysis; common variants (eg, 309kb [del(GJB6-D13S1830)] and 232kb [del(GJB6-D13S1854)])

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An otherwise healthy 2-month-old boy was found to have moderate hearing loss on newborn hearing screening. He has normal vestibular function, does not display radiographic abnormalities of the inner ear, and does not have a family history of congenital deafness or hearing loss. His physical examination is otherwise unremarkable. His physician suspects a GJB2 mutation as a possible genetic cause for his hearing loss. An anticoagulated peripheral blood sample was previously submitted for GJB2 sequencing to assess for the presence of DFNB1 nonsyndromic hearing loss-related mutations, and only a single GJB2 mutation was identified. Targeted mutation testing for common GJB6 deletion mutations is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
93016	XXX	0.45	**RUC Time**	1,112,086

CPT Descriptor 1 Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; physician supervision only, without interpretation and report

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
94060	XXX	0.31	**RUC Time**	1,112,086

CPT Descriptor 2 Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; physician supervision only, without interpretation and report

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 4 **% of respondents:** 57.1 **%**

TIME ESTIMATES (Median)	**CPT Code: 81254**	**Key Reference CPT Code:** 88291	**Source of Time** RUC Time
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	15.00	20.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**15.00**	**20.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.75	3.50
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.50	3.25
Urgency of medical decision making	3.00	3.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.00	4.00
Physical effort required	3.00	3.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.50	3.25
Outcome depends on the skill and judgment of physician	4.50	4.25
Estimated risk of malpractice suit with poor outcome	3.75	4.00

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.75	3.75
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work with that of new tier 2 service 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)* (Recommended Work RVU = 0.40, 15 minutes). CAP recommends a direct crosswalk of 81254 to the physician work and time of CPT code 81401, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed)

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

SUMMARY OF RECOMMENDATION

CPT Code:81321 Tracking Number C5 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: PTEN (phosphatase and tensin homolog) (eg, Cowden syndrome, PTEN hamartoma tumor syndrome) gene analysis; full sequence analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old woman presents to her physician complaining of facial growths. On physical examination she is found to have multiple papular lesions in her perioral and perinasal areas, as well as on her oral mucosa. She is also noted to have macrocephaly and bilateral breast nodules. She reports having a sister with similar facial lesions. Her physician suspects she may have Cowden Syndrome. An anticoagulated peripheral blood sample is submitted for PTEN gene sequencing to assess for the presence of a Cowden Syndrome-related mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 9 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherogram for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report which specifies the patient's PTEN mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 1 **% of respondents:** 100.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 81322**	**Key Reference CPT Code:** 88182	**Source of Time** **RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	28.00	20.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	

Median Total Time	**28.00**	**20.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.00	3.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.00	3.00
Urgency of medical decision making	2.00	2.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.00	3.00
Physical effort required	1.00	1.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.00	2.00
Outcome depends on the skill and judgment of physician	3.00	3.00
Estimated risk of malpractice suit with poor outcome	1.00	1.00

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.00	3.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81322 with that of new tier 2 service 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (Recommended Work RVU = 0.52, 28 minutes). CAP recommends a direct crosswalk of 81322 to the physician work and time of CPT code 81403, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81323 Tracking Number C7 Original Specialty Recommended RVU: **0.65**
Presented Recommended RVU: **0.65**
Global Period: XXX RUC Recommended RVU: **0.65**

CPT Descriptor: PTEN (phosphatase and tensin homolog) (eg, Cowden syndrome, PTEN hamartoma tumor syndrome) gene analysis; duplication/deletion variant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old man presents to his physician with multiple papular facial and oral lesions, macrocephaly, palmar and plantar keratosis, and colorectal polyposis. He reports having a sister with similar facial lesions who developed breast cancer at age 38. His physician suspects he may have PTEN Hamartoma Tumor Syndrome. PTEN gene sequencing performed to assess the patient for the presence of a PTEN Hamartoma Tumor Syndrome-related mutation did not identify a mutation. Deletion/duplication analysis of the PTEN gene is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA previously isolated from whole blood is subjected to multiplex ligation probe ligation analysis (MLPA), which involves hybridization and ligation of multiple pairs of oligonucleotide probes specific for the 9 exons of the PTEN gene to assess dosage of each exon. The pathologist examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the PTEN gene. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

59 New Molecular Pathology Services

Global Period:_XXX Meeting Date: _September 2011

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

TAB 5 – All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011), except for the HLA code set where CAP surveyed several large and small labs throughout the United States. Survey responses were compiled; questions and clarifications were followed up with lab managers and directors. CAP's expert panel reviewed compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment for all codes.

TAB 9 – All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011).

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Molecular DNA analyses based on specific code.

Intra-Service Clinical Labor Activities:

NONE

Post-Service Clinical Labor Activities:
Clean up, document filing, and other activities, see spreadsheet

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Cell Enumeration Circulating Tumor Cells

In February 2012, the CPT Editorial Panel created two new CPT codes 86152 and 86153 to describe cell enumeration of circulating tumor cells in fluid specimens using an immunologic method and deleted the previous category III codes that described this service (0279T and 0280T). CPT code 86152 will be paid on the Clinical Laboratory Fee Schedule.

86153 ***Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood):*** **physician interpretation and report, when required**
The RUC reviewed the survey data from 36 pathologists and recommends the following physician work time components: intra-service time= 20 minutes and post-service time= 5 minutes. The specialty explained that the methodology used to survey this procedure involved a general subset of the College of American Pathologists (CAP) membership and a specified list of users supplied by the vendor of the test. Of the 36 survey respondents, 21 were from the vendor list. The RUC agreed that the survey results obtained from the vendor list is more representative of the typical practice of the interpretation and report of circulating tumor cells. Physicians' in this group are experienced and more attuned to the service provided than the group of 15 randomly selected CAP members. Therefore, the RUC agreed that a work RVU of 0.69, the 25th percentile survey results from the vendor's list, accurately reflects the physician work involved in this service.

To justify a work value of 0.69, the RUC reviewed CPT code 88305 *Level IV Surgical pathology, gross and microscopic examination* (work RVU= 0.75) and agreed that the reference code should be valued slightly higher due to greater intra-service time compared to 86153, 25 minutes and 20 minutes, respectively. In addition, the RUC compared the surveyed code to CPT code 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site* (work RVU= 0.69) and agreed that these two similar pathology services should be valued the same given analogous physician work and intensity. **The RUC recommends a work RVU of 0.69 for CPT code 86153.**

Practice Expense: The RUC reviewed and accepted the direct practice expense inputs with minor modifications as approved by the Practice Expense Subcommittee.

New Technology: This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
● 86152		Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood); (For physician interpretation and report, use 86153. For cell enumeration with interpretation and report, use 86152 and 86153)	XXX	Paid on the Clinical Lab Fee Schedule
● 86153	W1	physician interpretation and report, when required (For cell enumeration use 86152. For cell enumeration with interpretation and report, use 86152 and 86153) (For flow cytometric immunophenotyping see 88184-88189 or flow cytometric quantitation see 86355, 86356, 86357, 86359, 86360, 86361, 86367)	XXX	0.69
(e)86148		Anti-phosphatidylserine (phospholipid) antibody (To report antiprothrombin [phospholipid cofactor] antibody, use Category III code 0030T) (~~For cell enumeration using immunologic selection and identification in fluid specimen [eg, tumor cells in blood, see 0279T, 0280T~~)		
D0279T		~~Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood);~~	XXX	Carrier Price

RE: Survey Methodology for 8615X2

Dear Doctor Lewis;

The CAP requests that the Research Subcommittee approve a panel survey methodology for code 86153 *Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood); physician interpretation and report, when required.* This service is not typically performed by general pathologists but is currently performed mainly by specialized pathologists in academic settings. This is a service that is performed by very few pathologists. Rather than send surveys to a completely random sample of our membership, we believe that our society will be able to provide the RUC with the most accurate data by surveying physicians that we know perform this service, and supplement with that list a random subset of our membership. This would not be then considered a complete random sample, however it will enable us to obtain a useful number of survey responses and identify how frequently the service is performed by our general membership.

We have obtained a user list from the manufacturers of the equipment used in performing this service. The physicians on this list are familiar with, and best able to measure the physician work of performing this service. We request that we be permitted to include this group as survey participants.

If you have any questions or concerns, please contact, Todd Klemp, Assistant Director of Economic and Regulatory Affairs at (202) 354-7403 or tklemp@cap.org

Sincerely,

Jonathan L. Myles, MD, FCAP
RUC Advisor
College of American Pathologists

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:86153 Tracking Number W1 Original Specialty Recommended RVU: **0.69**
Presented Recommended RVU: **0.69**
Global Period: XXX RUC Recommended RVU: **0.69**

CPT Descriptor: Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood); physician interpretation and report, when required

(For cell enumeration use 86152. For cell enumeration with interpretation and report, use 86152 and 86153)
(For flow cytometric immunophenotyping see 88184-88189 or flow cytometric quantitation see 86355, 86356, 86357, 86359, 86360, 86361, 86367)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A woman with metastatic breast cancer presents to her physician for follow-up. Results of the cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood) require interpretation by physician.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The physician examines the entire image file and classifies circulating cells as epithelial tumor cells, white blood cells, or other, based on strict cytomorphological criteria and experience in fluorescent microscopy and reviews relevant findings in the patient's case history. The physician prepares and signs an interpretive written report.

Description of Post-Service Work: Written and telephone communications with patients and/or referring physician and arranging for further studies or other services after finalization of report.

CPT Descriptor Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 8 **% of respondents:** 22.2 **%**

TIME ESTIMATES (Median)	**CPT Code: 86153**	**Key Reference CPT Code:** 88361	**Source of Time RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	20.00	40.00	
Median Immediate Post-service Time	5.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**25.00**	**40.00**	

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.44	3.58
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.44	3.50
Urgency of medical decision making	3.64	3.53
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.78	3.88
Physical effort required	3.22	3.33
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.28	3.61
Outcome depends on the skill and judgment of physician	3.83	3.81
Estimated risk of malpractice suit with poor outcome	3.00	3.36

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	0.00	0.00
Intra-Service intensity/complexity	3.58	3.64
Post-Service intensity/complexity	3.58	3.61

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This service is not typically performed by general pathologists but is currently performed mainly by specialized pathologists in academic settings. This is a service that is performed by very few pathologists. Rather than send surveys to a completely random sample of our membership, we believed that our society will be able to provide the RUC with the most accurate data by surveying physicians that we know perform this service, and supplement with that list a

random subset of our membership. Therefore, our survey was not completely random. It did however enable us to obtain a useful number of survey responses.

In February 2012, the RUC's Research Subcommittee agreed with CAP's survey methodology. CAP surveyed a large subset of its membership (4,974) and a user list supplied by the vendor of the test used in performing this service (91). CAP obtained a total of 36 responses to the survey. 15 responses were from the random CAP membership lists and 21 from the manufacturer's user list. The survey results were robust in total and among the two groups of participants.

CAP's relative value workgroup, CAP's RUC advisor, and representatives from the general and academic pathology practice settings reviewed the survey results. The survey results obtained from the random CAP membership proved to be slightly higher in time and estimated physician work than pathologists most familiar to this service (vendor group). CAP's expert panel believes the data obtained from the latter group is more representative of the typical practice of the interpretation and report of circulating tumor cells. Physicians' in this group may be more experienced and more attuned to the service provided than the group of 15 randomly selected CAP members.

CAP's expert panel recommends to the RUC a physician work relative value of 0.69. 0.69 RVW is the 25th percentile survey result from the vendor's user list of respondents and provides proper rank order of this service with other services within pathology and across other specialty services on the physician fee schedule. A work RVU of 0.69 is between than the 25th percentile and the low of the combined survey results.

CAP recommends; a work RVU = 0.69, intra-service time = 20 minutes, and immediate post time = 5 minutes.

CAP's expert panel believes a work RVU of 0.69 for CPT code 86153 is appropriate as it provides proper rank order with the following CPT codes:
88305 Level IV - Surgical pathology, gross and microscopic examination… **(work RVU = 0.75, intra-service time = 25, IWPUT = 0.300)**

88334 Pathology consultation during surgery; cytologic examination (eg, touch prep, squash prep), each additional site (List separately in addition to code for primary procedure) **(work RVU = 0.73, intra-service time = 20 minutes, IWPUT = 0.0365)**

88172 Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site **(work RVU = 0.69, intra-service time = 20 minutes, IWPUT = 0.0345)**

88387 Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); each tissue preparation (eg, a single lymph node) **(work RVU = 0.62, intra-service time = 20, IWPUT = 0.0310)**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) 86152 is used to report only the physician interpretation and report for the Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood); physician interpretation and report, when required.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This service would follow 8615X1 Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood); which has been proposed to be valued on the Clinical Lab Fee Schedule.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 86849 Immunology procedure
89240 Unlisted miscellaneous pathology
S3711 Circulating tumor cell test

Effective January 1, 2012, Category III codes are being used.
0279T Cell enumeration using immunologic selection and identification in fluid specimen (e.g., circulating tumor cells in blood);
0280T Interpretation and report

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty Oncology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 157500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on current product sales and forecasts

Specialty Pathology Frequency 141750 Percentage 90.00 %

Specialty Oncology Frequency 15750 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimates in 2010 are: 89240- 4700 & 86849-1300

Specialty Pathology Frequency 5400 Percentage 90.00 %

Specialty Oncology Frequency 600 Percentage 10.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88361

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Cell enumeration using immunologic selection and identification in fluid specimen (eg, circulating tumor cells in blood); physician interpretation and report, when required

Global Period:__XXX Meeting Date:__April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Individuals with expertise in this service were consulted through a series of conference calls in order to develop the typical practice expense inputs. CAP's expert panel reviewed and compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment. These inputs were further reviewed with individual pathologists who perform this service.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

No other pathology comparison code comes close to the minimum inputs shown here.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

NA -

Service Clinical Labor Activities:

NA - **No direct practice expense inputs in the facility setting**

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Fourth Five-Year Review
CMS High Expenditure Procedural Codes screen

April 2012

Psychotherapy

In the 4th Five-Year Review of the RBRVS, CMS received comment letters from the providers of psychotherapy, CPT codes 90801-90880 as potentially misvalued. CMS forwarded these services to the RUC to be included in the fourth Five-Year Review process. CPT code 90849 was withdrawn by the original commenter as the specialties indicated that very few of their members provide this service. This specialty recommendation was supported by the Medicare utilization data for this service which was very low in 2008, 343 claims. In April and May 2010, the Research Subcommittee met to review vignettes and reference service lists. The Subcommittee recommended that 90801 and 90802 be removed from the list of codes to be reviewed and be referred to the CPT Editorial Panel so that modifications could be made to the descriptors to reflect the different work performed by the physician and non-physician providers. In June 2010, a RUC Facilitation Committee met with the sponsoring specialty societies. The Pre-Facilitation Committee agreed with the Research Subcommittee's recommendations to refer 90801 and 90802 to the CPT Editorial Panel. The Pre-Facilitation Committee recommended that all of the psychotherapy codes with Evaluation and Management components (90805, 90807, 90809, 90811, 90813, 90815, 90817, 90819, 90822, 90824, 90827, 90829, and 90862) be referred to the CPT Editorial Panel to potentially create a new coding structure based on the varying levels of evaluation and management within each code. The remainder of the CPT codes identified were surveyed for the October 2010 RUC Meeting.

At the October 2010 RUC Meeting, the specialties presented compelling evidence arguments to change the current value of the remaining psychotherapy services. The specialties indicated that the patient population receiving these services has dramatically changed since the codes were previously reviewed. Currently, according to a National Comorbidity Survey, 56% of patients receiving psychotherapy have multiple comorbid conditions, meaning having more than one mental or physical disorder, including substance abuse. Due to the prevalence of comorbid patients, the work of the provider has changed as most research treatment protocols were originally designed for patients with single disorders. Further, the specialties indicated that the site of service for patients receiving many of these services has changed. Patients, who were once treated in the hospital setting, are now more frequently being treated in the office setting as the number of psychiatric beds has dropped by more than 60% between 1970 and 2000. The RUC accepted these compelling evidence arguments to potentially modify the current value of these services.

However, the RUC review of survey data presented at the October 2010 meeting , concluded that the entire section of psychotherapy services would benefit from a restructuring within CPT. A CPT Workgroup was created to address these concerns and a coding proposal was issued from the Workgroup to the CPT Editorial Panel for review. In February 2012, after a year of analysis and participation by all providers of the services, the CPT

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Editorial Panel replaced the current psychotherapy section with a new structure allowing separate reporting of E/M codes, eliminating site of service differential and creation of series of add-on codes to psychotherapy to describe interactive complexity and medication management.

The new coding framework, allows all codes to be used in all settings instead of describing site specific services. There are four groupings of services. First, code 90801 *Psychiatric diagnostic interview examination* will be deleted and replaced by two new codes 90791 *Psychiatric diagnostic evaluation* and 90792 *Psychiatric diagnostic evaluation with medical service*. CPT code 90791 is a service without medical work and describes comprehensive psychiatric diagnostic evaluation of psychological and psychosocial conditions often in collaboration with referring primary care physicians. CPT code 90792 is to be reported when a complete comprehensive diagnostic evaluation involves medical work, capturing the work and teasing out medical causes of psychiatric symptoms such as those caused by thyroid disease or metabolic infectious conditions. The next family has two groupings, psychotherapy stand alone codes without medical services (CPT codes 90832, 90834 and 90837) and the psychotherapy add-on codes, which are used only in conjunction with Evaluation and Management services (90833, 90836 and 90838). The current psychotherapy with E/M inpatient or outpatient codes contain one fixed low level E/M service combined with three levels of time-based psychotherapy services. These fixed E/M components were inadequate for today's patient and are replaced by the psychotherapy add-on codes. Thereby, using the existing E/M structure and a choice of one add-on psychotherapy time-based code, 30, 45 or 60 minutes. The selection of the time increment is based both on patient characteristics and the work to be accomplished in certain types of psychotherapy. Some patients are more resistant to open-up in a session and may require longer sessions. Additionally, some forms of psychotherapy are more geared toward 45 minute sessions (psychodynamic or cognitive behavioral therapy), whereas others are more geared towards 30 minute sessions (brief focused supportive therapy). The add-on codes will be new to many professionals and the American Psychiatric Association will offer extensive education on the use of these codes and to ensure that physicians understand that the time on E/M services is not used to determine the time of the psychotherapy service. The third grouping, psychotherapy inpatient and outpatient services that do not include E/M services (90832, 90834 and 90837) are likely to be reported by psychologists and clinical social workers in all clinical settings. The last grouping are family psychotherapy codes, with and without the patient and in a group setting, remain essentially unchanged (90845, 90846, 90847 and 90853).

90791 Psychiatric diagnostic evaluation

The RUC reviewed the survey results from 202 adult and child psychiatrists, psychologists and social workers for CPT code 90791 and determined that the median work RVU of 3.00 appropriately accounts for the physician work required to perform this service. The RUC agreed with the survey times of 10 minutes pre-service, 60 minutes intra-service and 20 minutes post-service. The RUC compared the surveyed service to key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 3.17 and 45 minutes intra-service time) and agreed with the survey respondents that 90791 requires more physician time to perform but is less intense and complex than 99205. The RUC also compared the surveyed service to similar services 95974 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); complex cranial nerve neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, with or without nerve interface testing, first hour* (work RVU = 3.00 and 60 minutes intra-service time) and 75559 *Cardiac magnetic resonance imaging for morphology and function without contrast material; with stress imaging* (work RVU = 2.95 and 50 minutes intra-service time) and

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 3.00 for CPT code 90791.**

90792 Psychiatric diagnostic evaluation with medical services

The RUC reviewed the survey results from 82 adult and child psychiatrists for CPT code 90792 and determined that the median work RVU of 3.25 appropriately accounts for the physician work required to perform this service. The RUC agreed with the survey times of 10 minutes pre-service, 60 minutes intra-service and 20 minutes post-service. The RUC compared code 90792 to 90791, which does not include medical services, and determined that the survey respondents appropriately valued the additional work required to perform this service. The RUC compared the surveyed service to key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 3.17 and 45 minutes intra-service time) and agreed with the survey respondents that 90792 requires more physician time and is more intense and complex to perform than 99205. For additional support, the RUC also compared the surveyed service to similar services 99350 *Home visit for the evaluation and management of an established patient* (work RVU = 3.28 and 75 minutes intra-service time) and 99235 *Observation or inpatient hospital care, for the evaluation and management of a patient including admission and discharge on the same date* (work RVU = 3.24 and 50 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 3.25 for CPT code 90792.**

90832 Psychotherapy, 30 minutes with patient and/or family member

The RUC reviewed the survey results from 185 adult and child psychiatrists, psychologists and social workers for CPT code 90832 and determined that the median work RVU of 1.50 appropriately accounts for the work required to perform this service. The RUC determined 5 minutes pre-service, 30 minutes intra-service and 10 minutes post-service is appropriate to perform this service. Pre-time activities include completing checklists in anticipation of the service depending on the type of therapy and post-service activities include documenting the visit, documentation of therapy notes and treatment plans, follow-up with the primary care physician or therapists and setting up the next visit. The RUC compared the surveyed service to key reference service 96152 *Health and behavior intervention, each 15 minutes, face-to-face; individual* (work RVU = 0.46 and 15 minutes intra-service time) and agreed with the survey respondents that 90832 requires more time and is more intense and complex to perform than 96152. For additional support, the RUC also compared the surveyed service to similar services 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 1.50 and 25 minutes intra-service time) and 94005 *Home ventilator management care plan oversight of a patient (patient not present) in home, domiciliary or rest home (eg, assisted living) requiring review of status, review of laboratories and other studies and revision of orders and respiratory care plan (as appropriate), within a calendar month, 30 minutes or more* (work RVU = 1.50 and 25 minutes intra-service time) and determined that the recommended work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 1.50 for CPT code 90832.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

90833 Psychotherapy, 30 minutes with patient and/or family member when performed with an Evaluation and Management service
The specialty societies reiterated that there are specific guidelines that indicate the Evaluation and Management service is to be billed separately with this service. The RUC reviewed the survey results from 114 adult and child psychiatrists for CPT code 90833 and determined that the median work RVU of 1.50 appropriately accounts for the physician work required to perform this service. The RUC determined 0 minutes pre-service, 30 minutes intra-service and 3 minutes post-service is appropriate to perform this service. The specialty indicated and the RUC agreed that any pre-time work will be captured in the separately reported Evaluation and Management service and the 3 minutes of post-service include activities specific to documentation of the symptoms and behaviors that are the focus of the treatment as well as documentation of the specific psychotherapeutic intervention performed. The RUC compared the surveyed service to key reference service 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 1.50 and 25 minutes intra-service time) and agreed with the survey respondents that 90833 requires the same physician work, slightly more physician time and similar intensity and complexity to perform compared to 99214. For additional support, the RUC also compared the surveyed service to similar service 94005 *Home ventilator management care plan oversight of a patient (patient not present) in home, domiciliary or rest home (eg, assisted living) requiring review of status, review of laboratories and other studies and revision of orders and respiratory care plan (as appropriate), within a calendar month, 30 minutes or more* (work RVU = 1.50 and 25 minutes intra-service time) and determined that the recommended work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 1.50 for CPT code 90833.**

90834 Psychotherapy, 45 minutes with patient and/or family member
The RUC reviewed the survey results from 183 adult and child psychiatrists, psychologists and social workers for CPT code 90834 and determined that the median work RVU of 2.00 appropriately accounts for the work required to perform this service. The RUC determined 5 minutes pre-service, 45 minutes intra-service and 10 minutes post-service is appropriate to perform this service. Pre-time activities include completing checklists in anticipation of the service depending on the type of therapy and post-service activities include documenting the visit, documentation of therapy notes and treatment plans, follow-up with the primary care physician or therapists and setting up the next visit. The RUC compared the surveyed service to similar services 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 2.11 and 35 minutes intra-service time) and 94002 *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; hospital inpatient/observation, initial day* (work RVU = 1.99 and 30 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 2.00 for CPT code 90834.**

90836 Psychotherapy, 45 minutes with patient and/or family member when performed with an Evaluation and Management service
The specialty societies reiterated that there are specific guidelines that indicate the Evaluation and Management service is to be billed separately with this service. The RUC reviewed the survey results from 114 adult and child psychiatrists for CPT code 90836 and determined that the median work RVU of 1.90 appropriately accounts for the physician work required to perform this service. The RUC determined 0 minutes pre-service, 45 minutes intra-service and 3 minutes post-service is appropriate to perform this service. The specialty indicated and the RUC agreed that any pre-time work will be captured in the separately reported Evaluation and Management service and the 3 minutes of post-service include activities specific to

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

documentation of the symptoms and behaviors that are the focus of the treatment as well as documentation of the specific psychotherapeutic intervention performed. The RUC compared the surveyed service to key reference service 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 1.50 and 25 minutes intra-service time) and agreed with the survey respondents that 90836 requires more physician work and time and is more intense and complex to perform compared to 99214. For additional support, the RUC also compared the surveyed service to similar service 99221 *Initial hospital care, per day, for the evaluation and management of a patient* (work RVU = 1.92 and 30 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 1.90 for CPT code 90836.**

90837 Psychotherapy, 60 minutes with patient and/or family member

The RUC reviewed the survey results from 185 adult and child psychiatrists, psychologists and social workers for CPT code 90837 and determined that the survey 75th percentile work RVU of 3.00 appropriately accounts for the work required to perform this service. The RUC determined that the survey median work RVU of 2.25 would be too low in relation to 90834 and 0.25 difference in work RVU would not appropriately account for an additional 15 minutes of intra-service time and additional intensity and complexity required to perform 90837. The RUC determined 5 minutes pre-service, 60 minutes intra-service and 10 minutes post-service is appropriate to perform this service. Pre-time activities include completing checklists in anticipation of the service depending on the type of therapy and post-service activities include documenting the visit, documentation of therapy notes and treatment plans, follow-up with the primary care physician or therapists and setting up the next visit. The RUC compared the surveyed service to similar services 99205 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 3.17 and 45 minutes intra-service time), 96111 *Developmental testing, (includes assessment of motor, language, social, adaptive, and/or cognitive functioning by standardized developmental instruments) with interpretation and report* (work RVU = 2.60 and 60 minutes intra-service time) and 99222 *Initial hospital care, per day, for the evaluation and management of a patient* (work RVU = 2.61 and 40 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 3.00 for CPT code 90837.**

90838 Psychotherapy, 60 minutes with patient and/or family member when performed with an Evaluation and Management service

The specialty societies reiterated that there are specific guidelines that indicate the Evaluation and Management service is to be billed separately with this service. The RUC reviewed the survey results from 114 adult and child psychiatrists for CPT code 90838 and determined that the survey 75th percentile work RVU of 2.50 appropriately accounts for the physician work required to perform this service. The RUC determined that the survey median work RVU of 2.10 would be too low in relation to 90836 and 0.20 difference in work RVU would not appropriately account for an additional 15 minutes of intra-service time and additional intensity and complexity required to perform 90838. The RUC determined 0 minutes pre-service, 60 minutes intra-service and 3 minutes post-service is appropriate to perform this service. The specialty indicated and the RUC agreed that any pre-time work will be captured in the separately reported Evaluation and Management service and the 3 minutes of post-service include activities specific to documentation of the symptoms and behaviors that are the focus of the treatment as well as documentation of the specific psychotherapeutic intervention performed. The RUC compared the surveyed service to key reference service 99354 *Prolonged service in the office or other outpatient setting requiring direct patient contact beyond the usual service; first hour* (work RVU = 1.77 and 60 minutes intra-service time) and agreed with the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

survey respondents that 90838 requires more physician work and is more intense and complex to perform compared to 99354. For additional support, the RUC also compared the surveyed service to similar service 96111 *Developmental testing, (includes assessment of motor, language, social, adaptive, and/or cognitive functioning by standardized developmental instruments) with interpretation and report* (work RVU = 2.60 and 60 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 2.50 for CPT code 90838.**

90785 Interactive Complexity (List separately in addition to the code for primary procedure)
90839 Psychotherapy for crisis, first 60 minutes;
90840 Psychotherapy for crisis, first 60 minutes; each additional 30 minutes
The specialty societies indicated and the RUC agreed that codes 90785, 90839 and 90840 be carrier priced to allow for education and experience with a significantly different coding structure. This will allow providers to gain experience with the codes prior to conducting a RUC survey. After a year of experience with the new coding structure the specialties will conduct RUC surveys for these services.

90845 Psychoanalysis
October 2011 RUC recommendation
Multiple specialty societies submitted public comment to CMS to review code 90845 *Psychoanalysis* as part of the 4th Five-Year Review. In September 2010, recommendations regarding code 90845 were submitted along with 16 additional codes. During that presentation the specialties requested that the entire tab be referred to the CPT Editorial Panel to revised the code descriptors to more accurately describe these services. During the CPT review process, CPT recommended to remove psychoanalysis, as revisions to the descriptor were unnecessary because the work inherent in providing this service was the same regardless of the provider.

In September 2011, the RUC reviewed 90845 and agreed with the specialty society that there is compelling evidence that the patient population has changed and that the technique employed in psychoanalytic practice has changed. Psychoanalysis traditionally treated a wide variety of conditions which included a considerable number of high functioning patients who were treated for relatively minor psychological problems by current standards. Patients with these conditions are now often treated in a variety of newer treatment modalities rather than psychoanalysis. Given this, patients now receiving psychoanalysis are more complex and typically require a more active approach on part of the psychoanalyst due to the increased number of co-morbidities. In addition, in the past psychoanalysts tended to be silent during the treatment, intervening infrequently. Current practice emphasizes the importance of interaction between the psychoanalyst and the patient. As a result of this technical change the psychoanalyst is required to be much more intently focused on the minute to minute interaction during the session and considerably more active during the session. This substantially increases the psychoanalyst's intensity and complexity effort during the session, when compared with the earlier model.

The RUC reviewed CPT code 90845 and agreed with the specialty societies that the typical service is one hour, 5 minute pre-service, 50 minutes intra-service and 5 minutes immediate post-service time. The RUC reviewed the survey results and agreed that the median survey work RVU of 2.10

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

accurately values the typical physician work involved in the procedure. To justify this value, the RUC compared CPT code 90845 to key reference service 99404 *Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 60 minutes* (work RVU = 1.95, total time = 60 minutes). Although the reference code has greater intra service time compared to the surveyed code, the survey respondents indicated and the RUC agreed that intensity and complexity to perform 90845 is greater in every measure compared to reference service 99404. The RUC also compared 90845 to reference code 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 2.11, total time = 55 minutes). The respondents indicated 90845 was more intense and complex than 99215, specifically the technical skill required to perform 90845 indicated the greatest difference. Finally, the RUC compared 90845 to MPC code 99233 *Subsequent hospital care, per day, for the evaluation and management of a patient* (work RVU = 2.00, total time = 55 minutes). The RUC determined that these comparison codes coupled with the median survey results support a recommendation of 2.10 work RVUs for CPT code 90845. **The RUC recommends a work RVU of 2.10 for CPT code 90845.**

90846 Family psychotherapy (without the patient present)
The RUC reviewed the survey results from 123 adult and child psychiatrists, psychologists and social workers for CPT code 90846 and determined that the survey median work RVU of 2.40 appropriately accounts for the work required to perform this service. The RUC determined 5 minutes pre-service, 50 minutes intra-service and 10 minutes post-service is appropriate to perform this service. Pre-time activities include completing checklists in anticipation of the service depending on the type of therapy and post-service activities include documenting the visit, documentation of therapy notes and treatment plans, follow-up with the primary care physician or therapists and setting up the next visit. The RUC compared the surveyed service to key reference service 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 2.11 and 35 minutes intra-service time) and agreed with the survey respondents that 90846 requires more work and time and to perform than 99215. For additional support, the RUC also compared the surveyed service to similar services 99204 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 2.43 and 30 minutes intra-service time) and 99349 *Home visit for the evaluation and management of an established patient* (work RVU = 2.33 and 40 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 2.40 for CPT code 90846.**

90847 Family psychotherapy (conjoint psychotherapy) (with patient present)
The RUC reviewed the survey results from 123 adult and child psychiatrists, psychologists and social workers for CPT code 90847 and determined that the survey median work RVU of 2.50 appropriately accounts for the work required to perform this service. The RUC determined 5 minutes pre-service, 55 minutes intra-service and 10 minutes post-service is appropriate to perform this service. Pre-time activities include completing checklists in anticipation of the service depending on the type of therapy and post-service activities include documenting the visit, documentation of therapy notes and treatment plans, follow-up with the primary care physician or therapists and setting up the next visit. The RUC compared the surveyed service to key reference service 99205 *Office or other outpatient visit for the evaluation and management of a new patient,* (work RVU = 3.17 and 45 minutes intra-service time) and agreed with the survey respondents that although 90847 requires 10 more minutes of intra-service time, it requires slightly less work to perform than 99205. For additional support, the RUC also compared the surveyed service to similar services 99222 *Initial*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

hospital care, per day, for the evaluation and management of a patient (work RVU = 2.61 and 40 minutes intra-service time) and 99336 *Domiciliary or rest home visit for the evaluation and management of an established patient* (work RVU = 2.46 and 40 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 2.50 for CPT code 90847.**

90853 Group psychotherapy (other than of a multiple-family group)
The RUC reviewed the survey results from 82 adult and child psychiatrists, psychologists and social workers for CPT code 90853 and determined that the current work RVU of 0.59 be maintained. The survey median work RVU of 3.00, for the entire group session divided by 5 the typical number of patients in a group equals 0.60 and maintaining the value appropriately accounts for the work required to perform this service. The RUC agreed with the survey times divided by the typical number of patients resulting in 3 minutes pre-service, 10 minutes intra-service and 3 minutes post-service is appropriate to perform this service. The RUC compared the surveyed service to key reference service 96153 *Health and behavior intervention, each 15 minutes, face-to-face; group (2 or more patients)* (work RVU = 0.10 and 5 minutes total time) and agreed with the survey respondents that 90853 requires more work, time, intensity and complexity to perform than 96153. For additional support, the RUC also compared the surveyed service to MPC code 97002 *Physical therapy re-evaluation* (work RVU = 0.60 and 18 minutes intra-service time) and 76881 *Ultrasound, extremity, nonvascular, real-time with image documentation; complete* (work RVU = 0.63 and 15 minutes intra-service time) and determined that the recommended physician work and time place this service in the proper rank order relative to other services on the physician payment schedule. **The RUC recommends a work RVU of 0.59 for CPT code 90853.**

Practice Expense
The RUC reviewed the direct practice expense inputs submitted by the specialty societies and recommends no modifications.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Psychiatry				
Psychiatry services include diagnostic services, psychotherapy, and other services to an individual, family, or group. Patient condition, characteristics, or situational factors may require services described as being with interactive complexity. Services may be provided to a patient in crisis. Services are provided in all settings of care and psychiatry services codes are reported without regard to setting. Services may be provided by a physician or other qualified health care professional. Some psychiatry services may be reported with **Evaluation and Management Services** (99201-99255, 99281-99285, 99304-99337, 99341-99350) or other services when performed. **Evaluation and Management Services** (99201-99285, 99304-99337, 99341-99350) may be reported for treatment of psychiatric conditions, rather than using **Psychiatry Services** codes, when appropriate.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Hospital care ~~by the attending physician~~ in treating a psychiatric inpatient or partial hospitalization may be initial or subsequent in nature (see 99221-99233) ~~and may include exchanges with nursing and ancillary personnel. Hospital care services involve a variety of responsibilities unique to the medical management of inpatients, such as physician hospital orders, interpretation of laboratory or other medical diagnostic studies and observations~~.

Some patients receive hospital evaluation and management services only and others receive hospital evaluation and management services and other procedures. If other procedures such as electroconvulsive therapy or psychotherapy are rendered in addition to hospital evaluation and management services, these ~~should~~may be listed separately (~~ie~~eg, hospital care services (99221-99223, 99231-99233) plus electroconvulsive therapy (90870), or when psychotherapy is done, ~~an~~with appropriate code(s) defining psychotherapy ~~with medical evaluation and management~~ services~~). Modifier 22 may be used to indicate a more extensive service. Modifier 52 may be used to signify a service that is reduced or less extensive than the usual procedure~~.

~~Other evaluation and management services, such as office medical service or other patient encounters, may be described as listed in the section on **Evaluation and Management,** if appropriate.~~

~~The evaluation and management services should not be reported separately, when reporting codes 90805, 90807, 90809, 90811, 90813, 90815, 90817, 90819, 90822, 90824, 90827, 90829.~~

Consultation for psychiatric evaluation of a patient includes examination of a patient and exchange of information with the primary physician and other informants such as nurses or family members, and preparation of a report. These ~~consultation~~ services ~~(99241-99255) are limited to initial evaluation and do not involve psychiatric treatment. Follow-up visits in the consultant's office or other outpatient facility that are initiated by the physician consultant or patient are~~may be reported using ~~the appropriate codes for established patients, office visits (99211-99215), domiciliary, rest home (99334-99337), or home (99347-99350). If an additional request for an opinion or advice regarding the same or a new problem is received from another physician or other appropriate source and documented in the medical record, the office~~ consultation codes ~~may be used again. Services that constitute transfer of care (ie, are provided for the management of the patient's entire care or for the care of a specific condition or problem~~see **Consultations**~~) are reported with the appropriate new or established patient codes for office or other outpatient visits, domiciliary, rest home services, or home services~~.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Interactive Complexity

Code 90785 is an add-on code for interactive complexity to be reported in conjunction with codes for diagnostic psychiatric evaluation (90791, 90792), psychotherapy (90832, 90834, 90837), psychotherapy when performed with an Evaluation and Management service (90833, 90836, 90838, 99201-99255, 99304-99337, 99341-99350), and group psychotherapy (90853).

Interactive complexity refers to specific communication factors that complicate the delivery of a psychiatric procedure. Common factors include more difficult communication with discordant or emotional family members and engagement of young and verbally undeveloped or impaired patients. Typical patients are those who have third parties, such as parents, guardians, other family members, interpreters, language translators, agencies, court officers, or schools involved in their psychiatric care.

These factors are typically present with patients who:

- Have other individuals legally responsible for their care, such as minors or adults with guardians, or
- Request others to be involved in their care during the visit, such as adults accompanied by one or more participating family members or interpreter or language translator, or
- Require the involvement of other third parties, such as child welfare agencies, parole or probation officers, or schools.

Psychiatric procedures may be reported "with interactive complexity" when at least one of the following is present:

1. The need to manage maladaptive communication (related to, eg, high anxiety, high reactivity, repeated questions, or disagreement) among participants that complicates delivery of care.
2. Caregiver emotions or behavior that interferes with the caregiver's understanding and ability to assist in the implementation of the treatment plan.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

3. Evidence or disclosure of a sentinel event and mandated report to third party (e.g., abuse or neglect with report to state agency) with initiation of discussion of the sentinel event and/or report with patient and other visit participants.
4. Use of play equipment, other physical devices, interpreter or translator to communicate with the patient to overcome barriers to therapeutic or diagnostic interaction between the physician or other qualified health care professional and a patient who:

- Is not fluent in the same language as the physician or other qualified health care professional, or
- Has not developed, or has lost, either the expressive language communication skills to explain his/her symptoms and response to treatment, or the receptive communication skills to understand the physician or other qualified health care professional if he/she were to use typical language for communication.

When provided in conjunction with the psychotherapy codes 90832-90838, the amount of time spent by a physician or other qualified health care professional providing interactive complexity services should be reflected in the timed service code for psychotherapy (90832, 90834, 90837) or the psychotherapy add-on code performed with an Evaluation and Management service (90833, 90836, 90838, 99201-99255, 99304-99337, 99341-99350) and must relate to the psychotherapy service only. Interactive complexity is not a factor for Evaluation and Management Services selection (99201-99255, 99281-99285, 99304-99337, 99341-99350), except as it directly affects key components as defined in Evaluation and Management Services Guidelines (ie, history, examination and medical decision making).

+●90785	LL1	Interactive Complexity (List separately in addition to the code for primary procedure) (Use 90785 is conjunction with codes for diagnostic psychiatric evaluation (90791, 90792), psychotherapy (90832, 90834, 90837), psychotherapy when performed with an Evaluation and Management service (90833, 90836, 90838, 99201-99255, 99304-99337, 99341-99350), and group psychotherapy (90853)) (Do not use 90785 in conjunction with 90839, 90840 or in conjunction with E/M services when no psychotherapy service is also reported)	ZZZ	Carrier Price

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Psychiatric Diagnostic ~~or Evaluative Interview~~ Procedures

Psychiatric diagnostic ~~interview examination includes a~~evaluation is an integrated biopsychosocial assessment, including history, mental status, and ~~a disposition, and~~recommendations. The evaluation may include communication with family or other sources~~, ordering~~ and review and ~~medical interpretation~~ordering of ~~laboratory or other medical~~ diagnostic studies~~. In certain circumstances other informants will be seen in lieu of the patient~~.

Psychiatric diagnostic evaluation with medical services is an integrated biopsychosocial and medical assessment, including history, mental status, other physical examination elements as indicated, and recommendations. The evaluation may include communication with family or other sources, prescription of medications, and review and ordering of laboratory or other diagnostic studies.

In certain circumstances one or more other informants (family members, guardians, or significant others) may be seen in lieu of the patient. Codes 90791, 90792 may be reported more than once for the patient when separate diagnostic evaluations are conducted with the patient and other informants. Report services as being provided to the patient and not the informant or other party in such circumstances. Codes 90791, 90792 may be reported once per day and not on the same day as an Evaluation and Management service performed by the same individual for the same patient.

~~Interactive psychiatric diagnostic interview examination is typically furnished to children. It involves the use of physical aids and non-verbal communication to overcome barriers to therapeutic interaction between the clinician and a patient who has not yet developed, or has lost, either the expressive language communication skills to explain his/her symptoms and response to treatment, or the receptive communication skills to understand the clinician if he/she were to use ordinary adult language for communication.~~

The psychiatric diagnostic evaluation may include interactive complexity services when factors exist that complicate the delivery of the psychiatric procedure. These services should be reported with add-on code 90785 used in conjunction with the diagnostic psychiatric evaluation codes 90791, 90792.

Codes 90791, 90792 are used for the diagnostic assessment(s) or reassessment(s), if required, and do not include psychotherapeutic services. Psychotherapy services, including for crisis, may not be reported on the same day.

D90801		~~Psychiatric diagnostic interview examination~~	XXX	N/A

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

D90802		~~Interactive psychiatric diagnostic interview examination using play equipment, physical devices, language interpreter, or other mechanisms of communication~~ (90801 and 90802 have been deleted. To report diagnostic evaluations, see 90791, 90792)	XXX	N/A

●90792	LL3	Psychiatric diagnostic evaluation with medical services (Do not report 90791 or 90792 in conjunction with 99201-99337, 99341-99350, 99366-99368, 99401-99444) (Use 90785 in conjunction with 90791, 90792 when the diagnostic evaluation includes interactive complexity services)	XXX	3.25

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~Psychiatric Therapeutic Procedures~~

~~Psychotherapy is the treatment for mental illness and behavioral disturbances in which the clinician establishes a professional contract with the patient and, through definitive therapeutic communication, attempts to alleviate the emotional disturbances, reverse or change maladaptive patterns of behavior, and encourage personality growth and development. The codes for reporting psychotherapy are divided into two broad categories: Interactive Psychotherapy; and Insight Oriented, Behavior Modifying and/or Supportive Psychotherapy.~~
~~Interactive psychotherapy is typically furnished to children. It involves the use of physical aids and nonverbal communication to overcome barriers to therapeutic interaction between the clinician and a patient who has not yet developed, or has lost, either the expressive language communication skills to explain his/her symptoms and response to treatment, or the receptive communication skills to understand the clinician if he/she were to use ordinary adult language for communication.~~

~~Insight oriented, behavior modifying and/or supportive psychotherapy refers to the development of insight or affective understanding, the use of behavior modification techniques, the use of supportive interactions, the use of cognitive discussion of reality, or any combination of the above to provide therapeutic change.~~

~~Some patients receive psychotherapy only and others receive psychotherapy and medical evaluation and management services. These evaluation and management services involve a variety of responsibilities unique to the medical management of psychiatric patients, such as medical diagnostic evaluation (eg, evaluation of comorbid medical conditions, drug interactions, and physical examinations), drug management when indicated, physician orders, interpretation of laboratory or other medical diagnostic studies and observations.~~

~~In reporting psychotherapy, the appropriate code is chosen on the basis of the type of psychotherapy (interactive using non-verbal techniques versus insight oriented, behavior modifying and/or supportive using verbal techniques), the place of service (office versus inpatient), the face-to-face time spent with the patient during psychotherapy, and whether evaluation and management services are furnished on the same date of service as psychotherapy. Face-to-face time when providing psychotherapy with medical evaluation and management services includes time spent providing both psychotherapy and evaluation and management services (ie, 90809, 90811, 90813, 90815, 90817, 90819, 90822, 90824, 90827, 90829).~~
~~To report medical evaluation and management services furnished on a day when psychotherapy is not provided, select the appropriate code from the **Evaluation and Management Services Guidelines.**~~

Psychotherapy

Psychotherapy is the treatment of mental illness and behavioral disturbances in which the physician or other qualified health care professional, through definitive therapeutic communication, attempts to alleviate the emotional disturbances, reverse or change maladaptive patterns of behavior, and encourage personality growth and development.

The psychotherapy service codes 90832–90838 include ongoing assessment and adjustment of psychotherapeutic interventions, and may include involvement of family member(s) or others in the treatment process.

Psychotherapy times are for face-to-face services with patient and/or family member. The patient must be present for all or some of the service. For family psychotherapy without the patient present, use 90846. In reporting, choose the code closest to the actual time (ie, 16-37 minutes for 90832 and 90833, 38-52 minutes for 90834 and 90836, and 53 or more minutes for 90837 and 90838). Do not report psychotherapy of less than 16 minutes duration. (See instructions for the usage of Time in the Introduction of the CPT code set).

Psychotherapy provided to a patient in a crisis state is reported with codes 90839 and 90840 and cannot be reported in addition to the psychotherapy codes 90832-90838. For psychotherapy for crisis, see "Other Psychotherapy".

Code 90785 is an add-on code to report interactive complexity services when provided in conjunction with the psychotherapy codes 90832-90838. The amount of time spent by a physician or other qualified health care professional providing interactive complexity services should be reflected in the timed service code for psychotherapy (90832, 90834, 90837) or the psychotherapy add-on code performed with an Evaluation and Management service (90833, 90836, 90838).

Some psychiatric patients receive a medical evaluation and management (E/M) service on the same day as a psychotherapy service by the same physician or other qualified health care professional. To report both E/M and psychotherapy, the two services must be significant and separately identifiable. These services are reported by using codes specific for psychotherapy when performed with Evaluation and Management services (90833, 90836, and 90838) as add-on codes to the Evaluation and Management service.

Medical symptoms and disorders inform treatment choices of psychotherapeutic interventions, and data from therapeutic communication are used to evaluate the presence, type, and severity of medical symptoms and disorders. For the purposes of reporting, the medical and psychotherapeutic components of the service may be separately identified as follows:

1. The type and level of E/M service is selected first based upon the key components of history, examination, and medical decision-making.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

2. Time associated with activities used to meet criteria for the E/M service is not included in the time used for reporting the psychotherapy service (ie, time spent on history, examination and medical decision making **when used for the E/M service** is not psychotherapy time). Time may not be used as the basis of E/M code selection and Prolonged Services may not be reported when psychotherapy with E/M (90833, 90836, 90838) are reported. 3. A separate diagnosis is not required for the reporting of E/M and psychotherapy on the same date of service.

Other Psychotherapy
Psychotherapy for Crisis

Psychotherapy for crisis is an urgent assessment and history of a crisis state, a mental status exam, and a disposition. The treatment includes psychotherapy, mobilization of resources to defuse the crisis and restore safety, and implementation of psychotherapeutic interventions to minimize the potential for psychological trauma. The presenting problem is typically life threatening or complex and requires immediate attention to a patient in high distress.

Codes 90839, 90840 are used to report the total duration of time face-to-face with the patient and/or family spent by the physician or other qualified health care professional providing psychotherapy for crisis, even if the time spent on that date is not continuous. For any given period of time spent providing psychotherapy for crisis state, the physician or other qualified health care professional must devote his or her full attention to the patient and, therefore, cannot provide services to any other patient during the same time period. The patient must be present for all or some of the service. Do not report with 90791 or 90792.

Code 90839 is used to report the first 30-74 minutes of psychotherapy for crisis on a given date. It should be used only once per date even if the time spent by the physician or other health care professional is not continuous on that date. Psychotherapy for crisis of less than 30 minutes total duration on a given date should be reported with 90832 or 90833 (when provided with Evaluation and Management services).

(90840 is used to report additional block(s) of time, of up to 30 minutes each beyond the first 74 minutes)

Sherry L. Smith, MS, CPA, Director, AMA Physician Payment Policy and Systems
American Medical Association
515 North State Street
Chicago, Illinois 60654

Re: Tab 26, Psychotherapy

Dear Dr. Levy and Ms. Smith,

The American Psychiatric Association (APA), American Academy of Child and Adolescent Psychiatry (AACAP), American Psychological Association (APA-HCPAC), and National Association of Social Workers are submitting recommendations on 16* new or revised codes within the Psychiatry section of CPT.

As you know, the above organizations originally put forward 36 codes as part of the fourth Five Year Review process in 2010. These codes comprised the bulk of the codes within the Psychiatry section of CPT. A pre-facilitation committee was assigned early in the process to assist the societies in their efforts. In June 2010 the pre-facilitation committee concurred with the recommendation of the RUC Research Subcommittee that the codes describing the psychiatric diagnostic examinations and psychotherapy with evaluation and management services be referred to the CPT Editorial Panel for review and revision to address changes in work.

Seventeen of the remaining codes were surveyed by the above named organizations, as well as by the American Psychiatric Nurses Association, and recommendations were presented for review by the RUC in October 2010. The RUC accepted the compelling evidence arguments put forward by the specialties as to a change in the work for these codes (see minutes of the October 2010 RUC meeting tab 52 page 87, Attachment 1). The specialties then requested that the 17 psychotherapy services that were to be reviewed at the October 2010 RUC meeting instead be referred to the CPT Editorial Panel for review and possible revision to address differences in work. This request was granted, and these codes were added to the work of a CPT Editorial Panel workgroup that was formed to address the earlier referral for revision of the CPT codes describing the psychiatric diagnostic exams and the codes describing the work when psychotherapy is performed in conjunction with an evaluation and management service.
