AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
RUC RECOMMENDATIONS FOR CPT 2013

TABLE OF CONTENTS

New/Revised CPT Codes CPT 2013	TAB
Presacral Lumbar Interbody Fusion	1
Shoulder Arthroplasty	2
Elbow Arthroplasty and Implant Removal	3
Denis-Browne Splint Revision	4
Bronchial Valve Procedures	5
Bronchial Thermoplasty	6
Chest Tube Thoracostomy	7
Chest Tube Interventions	8
Transcatheter Aortic Valve Replacement	9
Stereotactic Body Radiation	10
Insertion of Percutaneous Ventricular Assist Device	11
Cervicocerebal Angiography	12
Bundle Thrombolysis	13
Transcather Retrieval Intravascular Foreign Body	14
Bone Marrow Stem Cell Transplant	15
Optical Endomicroscopy	16
Fecal Bacteriotherapy	17
Bladder Chemodenervation	18
Chemodenervation for Chronic Migraine and Related Family	19
Paracentesis of the Eye	20
Biopsy of Eyelid	21

X-ray of Cervical Spine 22

Thyroid Uptake/Imaging 23

Parathyroid Imaging 24

Molecular Pathology – Adenomatous Polyposis Coli 25

Molecular Pathology-Tier 1 26

Cell Enumeration Circulating Tumor Cells 27

Psychotherapy 28

Wireless Motility Capsule 29

Anterior Segment Imaging 30

Percutaneous Coronary Intervention 31

Bundling EPS and Transcatheter Ablation 32

Percutaneous Allergy Testing 33

Allergen Ingestion Test 34

Pediatric Polysomnography 35

EMG in Conjunction with Nerve Testing 36

Autonomic Function Testing 37

Intraoperative Neurophysiology Monitoring 38

Neonatal Pediatric Transport 39

CMS Requests and Relativity Assessment Issues **TAB**

Shaving of Epidermal or Dermal Lesions 40

Complex Wound Repair 41

Arthrocentesis – PE Only 42

Valve Replacement and CABG Procedures 43

Repair of Arterial and Venous Blockage 44

Cholecystectomy 45

Lithotripsy 46

Transurethral Destruction of Prostate Tissue 47

CT Angiography - PE Only 48

CT Abdomen 49

Transvaginal and Transrectal Ultrasound 50

Radiotherapy Dose Plan IMRT 51

Visual Field Exams 52

Cardiovascular Stress Tests 53

Extremity Studies 54

Immunotherapy Injections - PE Only 55

Evoked Potentials and Reflex Studies – PE Only 56

New/Revised CPT Codes CPT 2012 **TAB**

Molecular Pathology Tier I – May 2011 57

Molecular Pathology Tier I – October 2011 58

Molecular Pathology Tier II – October 2011 59

HCPAC Recommendation **TAB**

Pharmacologic Management with Psychotherapy 60

CPT 2013 RUC Recommendations

Subject: RUC Recommendations

Dear Mr. Blum:

The American Medical Association (AMA)/Specialty Society RVS Update Committee (RUC) submits the enclosed recommendations for work relative values and direct practice expense inputs to the Centers for Medicare and Medicaid Services (CMS). These recommendations relate to new and revised codes for *CPT 2013*, as well as to existing services identified by the RUC's Relativity Assessment Workgroup and CMS. If implemented, the RUC recommendations should result in a positive adjustment to the Medicare conversion factor.

CPT 2013 New and Revised Codes

Enclosed are two binders containing RUC recommendations, including those for new and revised CPT codes. The total number of coding changes for *CPT 2013* is 375, including 142 additions, 134 revisions, and 99 deletions. In addition, 25 new codes were identified as part of the family for review in relationship to the new/revised codes. The 301 new/revised/related family CPT codes are summarized as follows:

- 39 services are not payable on the RBRVS or do not require physician work at this time (eg, laboratory services and vaccines), and accordingly, the RUC does not submit any information on these codes.

- One new and revised code was addressed by the RUC HCPAC Review Board and that recommendation is submitted directly by the HCPAC.

- For 2 codes (22586 and 95943), the RUC offers no recommendation at this time. However, for CPT code 95943 the RUC will be offering recommendations to CMS in October 2012.

- The RUC recommends that 9 codes be carrier priced.

- 62 codes were modified editorially to specify "physician or other qualified healthcare professional" and reporting of these codes is not expected to change.

The RUC submits work value and/or practice expense inputs for 188 new/ revised/related family CPT codes.

Nearly seventy-five percent of the CPT code revisions for CPT 2013 originated from the potentially misvalued services process.

Molecular Pathology Services

The RUC appreciates CMS's continued dialogue about the valuation of Molecular Pathology services. The RUC continues to assert that regardless of the Agency's decision to pay for these services under the Clinical Laboratory Fee Schedule or the Medicare Physician Fee Schedule, the relative value units for these services should be published in the Medicare Final Rule to ensure all stakeholders, including private payers, have accurate valuation information for these new services. Therefore, the entire set of Molecular Pathology services with RUC recommendations have been included in this submission. The attached materials include previously submitted Molecular Pathology Tier 1 and 2 RUC recommendations from April 2011 and Tier 1 and 2 RUC recommendations from October 2011. These are included in addition to the RUC recommendations for the Molecular Pathology Tier 1 and Adenomatous Polyposis Coli set of codes reviewed during the CPT 2013 cycle.

Existing Services Identified by RUC and CMS for Review

In addition to the new/revised CPT code submission, the RUC submits recommendations for 62 services identified by the RUC or CMS as potentially misvalued and reviewed at the April 2012 RUC meeting. These recommendations are in addition to the 104 recommendations for existing services submitted to CMS following the RUC's September 2011 and January 2012 meetings.

Revised Multi-Specialty Points of Comparison (MPC) List

The RUC continues to develop processes and methods to improve our recommendations to improve relativity within the RBRVS. One methodological improvement is the increased use of reference services on the RUC's Multi-Specialty Points of Comparison (MPC) List. In August 2010, the RUC's MPC Workgroup began a systematic review and restructuring of the MPC list. The primary objective of this review was to create a MPC list of codes that have been recently RUC reviewed and significantly performed by multiple specialties. The Workgroup defined "significantly performed" as either 10% of a service's total utilization or an absolute number of 10,000 performed by each of one or more specialties.

The Workgroup used four separate stages to determine codes to be on the new cross-specialty MPC list:

1. The Workgroup collected a list of 348 codes reviewed by the RUC since 2000 which have two or more specialties performing the services at a significant level.

2. The Workgroup then addressed two issues related to this initial list of 348 codes. First, there was a lack of codes above 10.00 work RVUs. Second, there was significant redundancy in work values below 2.00. To address these two issues, specialty societies were queried to submit their recommendations on which codes were redundant and could be removed and which of the current MPC codes above 10.00 work RVUs should be put on the new cross-specialty MPC list. This review resulted in a revised list that included 223 services.

3. From this revised list of 223 codes, the members noted a lack of services in the 5.00-10.00 work RVU range. To strengthen this portion of the cross-specialty list, the members looked at all codes reviewed by the RUC since 2007 with at least two specialties performing the service. The Workgroup chose 33 codes to add to the list.

4. Finally, the MPC Workgroup re-examined set of 35 codes that were added to the list in Step 2 due to address the inclusion of higher work RVUs. However these codes were clearly not multi-specialty or billed frequently in Medicare as they were either performed over 95% by one specialty or performed less than 1,000 times. To ensure that the list of codes are truly multi-specialty, the Workgroup deleted the 35 codes.

The resulting list of 221 services was adopted by the RUC in April 2012. This list of codes will enhance the RUC's ability to conduct and analyze inter-specialty comparisons for codes under review. The MPC Workgroup is committed to further refinement of the revised MPC list and will conduct, with specialty society input, a process to review appropriate codes to be added to the list. The RUC appreciates the continued involvement of CMS staff in this lengthy process. We are hopeful that the new MPC list will be useful to CMS in conducting your review of RUC recommendations and during annual refinement panel meetings.

Practice Expense Subcommittee

The attached materials include direct expense input (medical staff, supplies and equipment) recommendations for each code reviewed. As a reminder, cost estimates for medical supplies and equipment not listed on the "CMS labor, Supply, and Equipment List for the Year 2012" are based on provided source(s) as noted, such as manufacturer's catalogue prices and may not reflect the wholesale prices, quantity, or cash discounts, prices for used equipment or any other

factors that may alter the cost estimates. The RUC shares this information with CMS without making specific recommendations on the pricing for supplies and equipment.

In addition to recommendations related to the specific CPT codes under review, the PE Subcommittee reviewed a few global issues during this cycle. One issue reviewed was the inputs required to clean and disinfect endoscopes. In January 2012, the Subcommittee noted that the pack included in supplies for cleaning the endoscope, CMS supply item SA042, includes gluteraldehyde (disinfecting/sanitizing agent) and does not contain a basin for the gluteraldehyde. The Practice Expense Subcommittee recommends that the irrigation basin, CMS code SJ009, be added to the endoscope cleaning and disinfecting pack. The recommendation is included in this submission.

The RUC and Practice Expense Subcommittee have concluded that the typical mode for imaging is now digital and, therefore will engage in a process to transition expenses related to film technology to digital technology. A Migration of Radiologic Images from Film to Digital Workgroup will be formed and will develop the appropriate practice expense inputs and process to replace practice expense inputs related to film for the appropriate imaging services. The Workgroup will present their initial recommendations to the Practice Expense Subcommittee at the October 2012 RUC meeting. Background information related to this issue is included in the attached submission.

Enclosed Recommendations and Supporting Materials:

Included in these binders, and on the enclosed CD are:

- RUC Recommendation Status Report for New and Revised Codes

- RUC Recommendation Status Report for more than 1,300 services identified to date by the Relativity Assessment Workgroup and CMS as potentially misvalued. In addition, a spreadsheet containing the codes specific to this submission is included.

- RUC Referrals to the CPT Editorial Panel – both for CPT nomenclature revisions and *CPT Assistant* articles.

- Physician Time File: A list of the physician time data for each of the CPT codes reviewed at the September 2011, January 2012, and April 2012 RUC meetings. In addition, a new physician time file for all services within the RBRVS is enclosed.

- Pre-Service Time Packages Definitions: The RUC developed physician pre-service time packages which have been incorporated into these recommendations. The intent of these packages is to streamline the RUC review process as well as create standard pre-service time data for all codes reviewed by the RUC.

- PLI Crosswalk Table: The RUC has committed to selecting appropriate professional liability insurance crosswalks for new and revised codes and existing codes under review. We have provided a PLI Crosswalk Table listing the reviewed code and its crosswalk code for easy reference. We hope that the provision of this table will assist CMS in reviewing and implementing the RUC recommendations.

- Source Code Utilization Crosswalk Table – A table estimating the flow of claims data from existing codes to the new/revised codes. This information is used to project the work relative value savings to be included in the 2013 conversion factor increase.

- New Technology List and Flow Chart – In April 2006, the RUC adopted a process to identify and review codes that represent new technology or services that have the potential to change in value. To date, the RUC has identified 401 of these procedures through the review of new CPT codes. A table of these codes identified as new technology services and the date of review is enclosed, as well as a flow chart providing a detailed description of the process to be utilized to review these services.

- Revised Multi-Specialty Points of Comparison (MPC) List – The revised MPC list is attached to this submission. For your convenience, the list is provided in both CPT code and RVU order.

- Practice Expense Subcommittee recommendation to add CMS code SJ009 to the endoscope cleaning and disinfecting pack SA042. Background information on the migration of film to digital technology for imaging services is also included.

We appreciate your consideration of these RUC recommendations. If you have any questions regarding the attached materials, please contact Sherry Smith at (312) 464-5604.

Sincerely,

Barbara Levy, MD

Subject: HCPAC Recommendations

Dear Mr. Blum:

The RUC Health Care Professionals Advisory Committee (HCPAC) Review Board submits the enclosed recommendation to the Centers for Medicare and Medicaid Services (CMS). The HCPAC reviewed CPT code 90863 *Pharmacologic management, including prescription and review of medication, when performed with psychotherapy services* identified through the Fourth Five-Year Review process, at its April 26, 2012 meeting.

The RUC and HCPAC are fully committed to this ongoing effort to improve relativity in the work, practice expense, and professional liability insurance values. The HCPAC appreciates the opportunity to provide recommendations related to the 2013 Medicare Physician Payment Schedule. If you have any questions regarding this submission, please contact Susan Clark via (202) 789-7495 or Susan.Clark@ama-assn.org at the AMA for clarification regarding these recommendations.

Sincerely,

Arthur Traugott, MD

The RUC Relativity Assessment Workgroup Progress Report

In 2006, the RUC established the Five-Year Identification Workgroup (now referred to as the Relativity Assessment Workgroup) to identify potentially misvalued services using objective mechanisms for reevaluation prior to the next Five-Year Review. The RUC formed this Workgroup in response to criticisms that, despite reducing the work RVUs for nearly 400 services in the past, the process contains "bias in the 5-year review in favor of undervalued codes as compared to overvalued codes."[1] Since the inception of the Relativity Assessment Workgroup, the Workgroup and CMS have identified over 1,300 services through eleven different screening criteria for further review by the RUC. Additionally, the RUC charged the Workgroup with maintaining the "new technology" list of services that will be re-reviewed by the RUC as reporting and cost data become available.

New Technology

As the RUC identifies new technology services that should be re-reviewed, a list of these services is maintained and forwarded to CMS. Currently, codes are identified as new technology based on recommendations from the specialty society and consensus among RUC members at the time of the RUC review for these services. RUC members consider several factors to evaluate potential new technology services, including: recent FDA-approval, newness or novelty of the service, use of an existing service in a new or novel way, and migration of the service from a Category III to Category I CPT code. The Workgroup maintains and develops all standards and procedures associated with the list, which contains 301 services. In September 2010, the re-review cycle began and since then the RUC has recommended 4 services to be re-examined. The remaining services are rarely performed (ie, less than 500 times per year in the Medicare population) and will not be re-examined. The Workgroup will continue to review the remaining 338 services every September after three years of Medicare claims data is available for each service.

Site of Service Anomalies

The Workgroup initiated its effort by reviewing services with anomalous sites of service when compared to Medicare utilization data. Specifically, these services are performed less than 50% of the time in the inpatient setting, yet include inpatient hospital Evaluation and Management services within their global period.

The RUC identified 194 services through the site of service anomaly screen. The RUC required the specialties to resurvey 129 services to capture the appropriate physician work involved. These services were reviewed by the RUC between April 2008 and February 2011. CMS implemented 124 of these recommendations in the 2009, 2010 and 2011 Medicare Physician Payment Schedules. The RUC submitted another 5 recommendations as well as re-reviewed and submitted 44 recommendations to previously reviewed site-of-service identified codes to CMS for the 2012 Medicare Physician Payment Schedule.

Of the remaining 65 services that were not re-surveyed, the RUC modified the discharge day management for 46 services, maintained 3 codes and removed 2 codes from the screen as the

[1] MedPAC comments to CMS regarding the 2008 Medicare Physician Payment Schedule proposed rule, submitted August 30, 2007.

typical patient was not a Medicare beneficiary and would be an inpatient. The CPT Editorial Panel deleted 13 codes and will re-review 1 service in the CPT 2014 cycle.

During this review, the RUC uncovered several services that are reported in the outpatient setting, yet, according to several expert panels and survey data from physicians who performed the procedure, the service, typically requires a hospital stay of greater than 23 hours. The RUC maintains that physician work that is typically performed, such as visits on the date of service and discharge work the following day, should be included within the overall valuation. Subsequent observation day visits and discharge day management service as appropriate proxies for this work.

High Volume Growth

The Workgroup assembled a list of all services with a total Medicare utilization of 1,000 or more that have increased by at least 100% from 2004 through 2006. The query resulted in the identification of 81 services, expanded by 15 services to include the family of services. Specialty societies submitted comments to the Workgroup in April 2008 to provide feedback or explanations for the growth in reporting. Following this review, the RUC required the specialties to survey 35 services to capture the appropriate work effort and/or practice expense inputs. These services were reviewed by the RUC between February 2009 and April 2010.

The RUC recommended that 23 services be removed from the screen as the volume growth did not impact the resources required to provide the service. The CPT Editorial Panel deleted 16 codes and will review another 10 services in the CPT 2014 cycle. In September 2011, the RUC began review of services after two years of utilization data were collected. The RUC will provide recommendations to CMS for 3 services for the 2013 Medicare Physician Payment Schedule and for 1 service for the 2014 Medicare Physician Payment Schedule, and will continue to review the remaining 6 services after additional utilization data is collected.

CMS Fastest Growing

In 2008, CMS developed the Fastest Growing Screen to identify all services with growth of at least 10% per year over the course of 3 years from 2005-2007. Through this screen, CMS identified 114 fastest growing services and the RUC expanded this screen by an additional 69 services to include the family of services, totaling 183. The RUC required the specialties to survey 72 services to capture the appropriate work effort and/or practice expense inputs. These services were reviewed by the RUC between February 2008 to April 2010 and submitted to CMS for the Medicare Physician Payment Schedule.

The RUC recommended that 49 services be removed from the screen as the volume growth did not impact the resources required to provide the service. The CPT Editorial Panel deleted 24 codes and will review another 3 services in the CPT 2014 cycle. The RUC will submit 21 recommendations to CMS for the 2013 Medicare Physician Payment Schedule and review 14 services after additional utilization data is available.

High IWPUT
The Workgroup assembled a list of all services with a total Medicare utilization of 1,000 or more that have an intra-service work per unit of time (IWPUT) calculation greater than 0.14, indicating an outlier intensity. The query resulted in identification of 32 services. Specialty societies submitted comments to the Workgroup in April 2008 for these services. As a result of this screen, the RUC has reviewed and submitted recommendations to CMS for 28 codes, removing 4 services from the screen as the IWPUT was considered appropriate. The RUC completed review of services under this screen.

Services Surveyed by One Specialty – Now Performed by A Different Specialty
Services that were originally surveyed by one specialty, but now performed predominantly by other specialties were identified and reviewed. The RUC identified 21 services by this screen, adding 19 services to address various families of codes. The majority of these services required clarification within CPT. To date, the CPT Editorial Panel has deleted 18 codes and will review 1 codes in the CPT 2014 cycle. The RUC submitted 21 recommendations for physician work and practice expense to CMS for the 2011-2013 Medicare Physician Payment Schedules.

Harvard Valued
Utilization over 1 Million
CMS requested that the RUC pay specific attention to Harvard valued codes that have a high utilization. The RUC identified 9 Harvard valued services with high utilization (performed over 1 million times per year). The RUC also incorporated an additional 12 Harvard valued codes within the initial family of services identified. The CPT Editorial Panel deleted 1 code. The RUC submitted 20 relative value work recommendations to CMS for the 2011 and 2012 Medicare Physician Payment Schedule. The RUC completed review of services under this screen.

Utilization over 100,000
The RUC continued to review Harvard-only valued codes with significant utilization. The Relativity Assessment Workgroup expanded the review of Harvard codes to those with utilization over 100,000 which totaled 38 services and the RUC expanded by the screen by 101 codes to include the family of services, totaling 139 services. The CPT Editorial Panel deleted 26 codes and will review 1 services in the CPT 2014 cycle. The RUC submitted 109 recommendations to CMS for the 2011-2013 Medicare Physician Payment Schedules. The RUC will review 4 codes in October 2012.

Utilization over 30,000
In April 2011, the RUC continued to identify Harvard-only valued codes with utilization over 30,000, based on 2009 Medicare claims data. The RUC determined that the specialty societies should survey the remaining 36 Harvard codes with utilization over 30,000 for September 2011. The RUC expanded the screen to include the family of services, totaling 64 services. The CPT Editorial Panel deleted 11 codes and will review 6 services in the 2014 cycle. The RUC will submit recommendations for 39 services for the 2013 Medicare Physician Payment Schedule and will review 8 services in the 2014 cycle.

Bundled CPT Services

Reported 95% or More Together

The Relativity Assessment Workgroup solicited data from CMS regarding services inherently performed by the same physician on the same date of service (95% of the time) in an attempt to identify pairings of services that should be bundled together. To that end, the RUC and CPT Editorial Panel created a joint workgroup to discuss the complex coding issues and to ensure that all resource efficiencies are accounted. The Joint Workgroup report to the RUC and CPT Editorial Panel, which was approved by both bodies, called for CPT coding change proposals to collapse code pairings into fewer bundled services. The CPT Editorial Panel deleted 31 codes. The RUC surveyed, reviewed the work and practice expense, and submitted recommendations to CMS for 53 services to account for efficiencies achieved through bundling. The RUC completed review for services identified under this screen.

Reported 75% or More Together

In February 2010, the Workgroup continued review of services provided on the same day by the same provider at a lower threshold. The Workgroup analyzed code pairs provided on the same day by the same physician. The Relativity Assessment Workgroup reviewed the Medicare claims data for these services and found 151 relevant code pairs. These codes were divided into similar "groups" and the 20 code groups, totaling 80 codes with the highest allowed charges were sent to specialty societies to solicit action plans for consideration at the April 2010 RUC meeting. The RUC added 72 additional codes as part of the family of services, totaling 152 services. The CPT Editorial Panel deleted 26 codes and will consider 7 of codes in the CPT 2014 cycle. The RUC reviewed the work and practice expense and submitted recommendations to CMS for 110 services to account for efficiencies when performed together, for the 2011-2013 Medicare Physician Payment Schedules. The RUC will submit recommendations for 9 services for the 2014 Medicare Physician Payment Schedule.

Low Value/Billed in Multiple Units

CMS has requested that services with low work RVUs that are commonly billed with multiple units in a single encounter be reviewed. CMS identified services that are reported in multiples of 5 or more per day, with work RVUs of less than or equal to 0.50 RVUs.

In October 2010, the Workgroup reviewed 12 CMS identified services and determined that 6 of the codes were improperly identified as the services was either not reported in multiple units or was reported in a few units, but that was assumed in original valuation. The RUC submitted recommendations for the remaining 6 services for the 2012 Medicare Physician Payment Schedule. The RUC completed review of services under this screen.

Low Value/High Volume Codes

CMS has requested that services with low work RVUs and high utilization be reviewed. CMS has requested that the RUC review 24 services that have low work RVUs (less than or equal to 0.25) and high utilization. The RUC questioned the criteria CMS used to identify these services as it appeared some codes were missing from the screen criteria indicated. The RUC identified codes with a work RVU ranging from 0.01 - 0.50 and Medicare utilization greater than one million. In February 2011, the RUC reviewed the codes identified by this criteria added 5 codes to review under this screen, totaling 29. The RUC submitted 24 recommendations to CMS for the 2012

Medicare Physician Payment Schedule and 5 recommendations to CMS for the 2013 Medicare Physician Payment Schedule. The RUC completed review of services under this screen.

Multi-Specialty Points of Comparison List
CMS requested that services on the Multi-Specialty Points of Comparison (MPC) list should be reviewed. CMS prioritized the review of the MPC list to 33 codes, ranking the codes by allowed service units and charges based on CY 2009 claims data and as well as those services reviewed by the RUC more than six years ago. The RUC expanded the list to 158 services to include an additional codes as part of a family (105 codes of which are part of the review of GI endoscopy codes). The CPT Editorial Panel deleted 8 codes and will review 1 code for revision. The RUC submitted recommendations for 39 codes for the 2012 and 2013 Medicare Physician Payment Schedules and will review the remaining 110 codes in the 2014 and 2015 cycles.

CMS High Expenditure Procedural Codes
In the July 19, 2011, Proposed Rule for 2012, CMS requests that the RUC review a list of 70 high PFS expenditure procedural codes representing services furnished by an array of specialties. CMS selected these codes based on the fact that they have not been reviewed for at least 6 years, and in many cases the last review occurred more than 10 years ago.

The RUC reviewed the 70 services identified and expanded the list to 117 services to include additional codes as part of the family. The CPT Editorial Panel deleted 7 codes and will review 9 codes for the 2014 cycle. The RUC will submit 47 recommendations to CMS for the 2013 Medicare Physician Payment Schedule and will submit the remaining recommendations for the 2014 Medicare Physician Payment Schedule.

Other Issues
In addition to the above screening criteria, the Relativity Assessment Workgroup performed an exhaustive search of the RUC database for services indicated by the RUC to be re-reviewed at a later date. Three codes were found that had not yet been re-reviewed. The RUC recommended a work RVU decrease for 2 codes and to maintain the work RVU for another code.

CMS also identified 72 services that required further practice expense review. The RUC submitted practice expense recommendations on 67 services and the CPT Editorial Panel deleted 5 services. The RUC also reviewed special requests for 19 audiology and speech-language pathology services, which the RUC submitted recommendations for 10 services for the 2010 Medicare Physician Payment Schedule and the remaining 9 services for the 2011 Medicare Physician Payment Schedule.

CMS Requests and RUC Relativity Assessment Workgroup Code Status

Total Number of Codes Identified*	**1,329**
Codes Completed	**1083**
Work and PE Maintained	348
Work Increased	89
Work Decreased*	357
Direct Practice Expense Revised (beyond work changes)*	121
Deleted from CPT	168
Codes Under Review	**246**
Referred to CPT	46
RUC to Review October 2012	60
Future Review or Re-review	140

**The total number of codes identified will not equal the number of codes from each screen as some codes have been identified in more than one screen.*

Approximately $400 million was redistributed to the 2011 Medicare conversion factor (0.5% increase) to account for the efforts on the work relative values. This lead to $40 million redistribution within the PLI RVUs and combined with other recommendations, $570 million redistribution within the practice expense RVUs, for a total overall redistribution of **$1 billion** in 2011.

In 2009 and 2010 minor increases to the conversion factor and redistribution within the PLI and PE RVUs also occurred. The RUC's efforts for 2009-2012 have resulted in $1.5 billion in redistribution within the Medicare Physician Payment Schedule.

RUC Recommendations to Develop CPT Assistant Articles - Incomplete Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
16030	**Dressings and/or debridement of partial-thickness burns, initial or subsequent; large (eg, more than 1 extremity, or greater than 10% total body surface area)**	Different Performing Specialty from Survey	April 2010	CPT Assistant article	ACEP, ASPS, AAFP, AAPMR, ACS, AAP	Under development by CPT staff (expected publication by Nov 2012).

Background: This service was brought forward as part of the family of 16020 and 16025. April 2010, refer to CPT Assistant for site-of-service clarification.

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
26080	**Arthrotomy, with exploration, drainage, or removal of loose or foreign body; interphalangeal joint, each**	Site of Service Anomaly	October 2009	CPT Assistant Article and Re-review October 2012.	ASSH, AAOS	

Background: A majority of these services are performed in the out-patient hospital setting, though the survey respondents overwhelmingly state that the service is always performed as an in-patient procedure. The only variance among respondents was the length of stay which was estimated to be between one and six days. Based on these differences, the specialty society concluded and the RUC agreed that there is no appropriate typical patient for the code as currently described. The RUC concurred that greater granularity of the CPT descriptor is a more appropriate path.

At the Oct 2009 RUC meeting, the Workgroup reviewed this code and recommended that the SS develop a CPT Assistant article to describe the correct coding of 26080, 26070, 24000 and 23107, and the various scenarios of removal of a foreign body and incision and drainage of an infection without exploration of the joint. Workgroup recommends to review this service again after 2 years of claims data. (October 2012).

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
27370	**Injection procedure for knee arthrography**	High Volume Growth / CMS Fastest Growing	October 2009	CPT Assistant Article	AAOS, ACR	ACR clinical examples - under development

Background: The specialty commented that these codes were reviewed through the RUC's high volume growth screen and removed from the screen. The increase in utilization is due to a non-coverage decision for arthroscopic lavage. Physicians using these codes to report different procedures. In February 2009 these procedures were referred to CPT for possible deletion of 73580 and 27370 and creation of a new code accurately describing the procedure that is being performed, including the radiologic guidance in the procedure codes. In Oct 2009, the RUC recommended that the SS develop a CPT Asst article to address misuse reporting of arthrography codes.

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
64450	**Injection, anesthetic agent; other peripheral nerve or branch**	Harvard Valued - Utilization over 100,000	September 2011	0.75	ASA, AAPM, APMA, ASIPP	

Background: In CPT 2009, codes 64455 and 64632 were created and it was expected that podiatrists would frequently use these codes instead of 64450. In the February 2010, the action plan from the specialty societies indicated that a significant drop in the frequency for 64450 was to be expected. The data from 2009 and 2010 indicate that 64450 is steadily increasing as well as additional reporting of 64455 and 64632. However, the increased reporting of 64450 is primarily from primary care. A CPT Assistant article should be developed to clarify the appropriate reporting of this service.

RUC Recommendations to Develop CPT Assistant Articles - Incomplete Issues

		Screen:	RUC Meeting:	RUC Rec:	Specialty Society:	CPT Asst Status:
76513	**Ophthalmic ultrasound, diagnostic; anterior segment ultrasound, immersion (water bath) B-scan or high resolution biomicroscopy**	High Volume Growth	September 2011	CPT Assistant Article and 0.66.	AAO, AOA (optometric)	SS submitted article to AMA staff 5/2/2012

Background: RUC surveyed ultrasound biomicroscopy as a new service in April 2004.The usage increased steadily as the technology diffused into the marketplace. Another technology using optical coherence tomography that provides similar results was introduced and a Category III code was created. AAO submitted to CPT parenthetical changes to note that the new service should not be billed with 76513 and instead should be reported with 0187T. A subsequent CPT Assistant article was published in Nov. 2009. The manufacturer of the optical coherence tomography obtained a category I code in 2010 that went into effect in 2011. Now that there are two distinct category 1 codes for the two different services, AAO suggested and the RUC agreed a follow-up CPT Assistant article be developed to differentiate between the new category I code and the existing code.

76881	**Ultrasound, extremity, nonvascular, real-time with image documentation; complete**	CMS Fastest Growing	April 2010	Develop CPT Assistant article. 0.72	AAPMR, APMA, ACR	SS to develop CCP

Background: In February 2010, the CPT Editorial Panel created this code after deleting 76880. April 2010, the RUC recommended a CPT Assistant article be written to ensure the proper reporting of these two services. It was noted by the RUC that these services should not typically be reported more than once per day. In April 2012, SS indicated they will develop a CCP to address the CPT Executive Committees concerns instead of a CPT Asst article.

88365	**In situ hybridization (eg, FISH), each probe**	CMS Request - NPRM for 2012	September 2011	Review at the RAW		

Background: CMS received comments that unlike the new FISH codes for urinary tract specimens (88120 and 88121), the existing codes (88365-88368) still allow for multiple units of each code as these codes are reported per probe. CMS states that they have reviewed the current work and practice costs associated with 88120 and 88121 and agree at this time that they are accurate. However, the first 6 months of 2011 claims data have been shared with the RUC and CMS requests that additional review of these data be considered to determine if further action is warranted. CMS requested that the RUC review both the direct PE inputs and the work values for codes 88365, 8367 and 88368. The Workgroup determined that these services be tabled until January 2012 in order to review 2011 diagnosis data from CMS. In Jan 2012, the Workgroup reviewed 2011 diagnosis claims data and the American College of Pathologists indicated that they will develop a CPT Assistant article to direct physicians to use the new FISH codes for urinary tract infections (CPT codes 88120 and 88120). The Workgroup indicated that the specialty should specify the number of probes utilized for these services in the CPT Assistant article. The Workgroup recommended that it re-review codes 88365, 88367 and 88368 in 1 year after 2012 utilization is available (January 2013).

RUC Recommendations to Develop CPT Assistant Articles - Incomplete Issues

92287	**Special anterior segment photography with interpretation and report; with fluorescein angiography**	Harvard Valued - Utilization over 30,000	April 2012	Refer to CPT Asst.	AAO, AOA (optometric)	

Background: Added as part of 92286. The AAO indicated that apart from utilizing an image, codes 92286 and 92287 are completely different clinical indications and conditions. These services are also provided by different specialties within ophthalmology. CPT code 92286 is used primarily to follow patients with corneal endothelial dystrophy for progression of their disease, pre-cataract surgery to assess the need for possible corneal transplant at the same time and for follow-up care of post corneal transplant patients. CPT code 92287 is rarely performed (less than 3000 in 2010) and obtaining valid survey responses would be difficult. AAO indicated that CPT code 92287 may be inadvertently being reported in lieu of CPT code 92235 Fluorescein angiography (includes multiframe imaging) with interpretation and report since it is designates that an image was made at the same time as the angiogram. Currently, there is no increased work when that is occurring as both have the same work value. The Academy believes that coding education and publication of a CPT Assistant article may help clarify the difference between codes 92287 and 92235. The RUC recommends that the specialty society develop a CPT Assistant article to clarify the difference between CPT codes 92287 and 92235.

29590	**Denis-Browne splint strapping**	Harvard Valued - Utilization over 100,000	April 2012	APMA	February 2012	08	

Background: This service was identified as part of the family for code 29540 identified through the Harvard Valued – Utilization Over 100,000 screen. In April 2010, The American Podiatric Medical Association (APMA) indicated that 29590 Denis-Browne splint strapping technique is no longer used. Additionally, the survey response had a zero median performance rate for this service. APMA requested and the HCPAC agreed that code 29590 be referred to the CPT Editorial Panel for deletion. In June 2011, the CPT Editorial Panel indicated they would reach out to other specialties performing this service to confirm deleting 29590 is appropriate. In February 2012, the CPT Editorial Panel accepted a request from the specialty societies to revise CPT code 29590 Denis-Browne splint strapping (work RVU=0.76) to more accurately describe the use of the Denis-Browne bar and to differentiate this service from other currently described services. Upon specialty survey, respondents indicated that the revised 29590 descriptor was problematic in that this code now describes manipulation and cast application. According to the specialty presenters, this service is no longer provided, as the prefabricated appliance is applied without manipulation and without casting. The RUC recommends that the current value of code be maintained pending CPT Editorial Panel action to delete this code as originally proposed.

C	Pre-Service Scrub, Dress and Wait (IWPUT =0.0081)	6	5	6	5	15	20	0	5
	DETAILS								
A	History and Exam (Performance and review of appropriate Pre-Tests)	5	5	10	10	10	15	4	9
A	Prepare for Procedure (Check labs, plan, assess risks, review procedure)	2	2	2	2	2	4	1	1
A	Communicate with patient and/or family (Discuss procedure/ obtain consent)	3	3	3	5	5	5	2	3
A	Communicate with other professionals	0	1	0	3	5	5	0	2
A	Check/set-up room, supplies and equipment	1	1	1	1	5	5	0	1
A	Check/ prepare patient readiness (Gown, drape, prep, mark)	1	1	1	1	5	5	0	1
A	Prepare/ review/ confirm procedure	1	1	1	1	1	1	0	0
A	Administer moderate sedation/observe (wait) anesthesia care	0	5	0	10	0	0	0	0
B	Perform/ supervise patient positioning	1	1	1	1	3	3	0	1
C	Administer local anesthesia	1	0	1	0	0	0	0	5
C	Observe (wait anesthesia care)	0	0	0	0	10	15	0	0
C	Dress and scrub for procedure	5	5	5	5	5	5	0	0

* Indicates packages that contain moderate sedation

1A Straightforward Patient/Straightforward Procedure (No sedation/anesthesia care)
1B* Straightforward Patient/Straightforward Procedure (With sedation/anesthesia care)
2A Difficult Patient/Straightforward Procedure (No sedation/anesthesia care)
2B* Difficult Patient/Straightforward Procedure (With sedation/anesthesia care)
3 Straightforward Patient/Difficult Procedure
4 Difficult Patient/Difficult Procedure
5 Procedure without sedation/anesthesia care
6 Procedure with sedation/anesthesia care

Additional Positioning Times for Spinal Surgical Procedures

SS1	Anterior Neck Surgery (Supine) (eg ACDF)	15 Minutes
SS2	Posterior Neck Surgery (Prone) (eg laminectomy)	25 Minutes
SS3	Posterior Thoracic/Lumbar (Prone) (eg laminectomy)	15 Minutes
SS4	Lateral Thoracic/Lumbar (Lateral) (eg corpectomy)	25 Minutes
SS5	Anterior Lumbar (Supine) (eg ALIF)	15 Minutes

Additional Positioning Times for Spinal Injection Procedures

SI1	Anterior Neck Injection (Supine) (eg discogram)	7 Minutes
SI2	Posterior Neck Injection (Prone) (eg facet)	5 Minutes
SI3	Posterior Thoracic/Lumbar (Prone) (eg epidural)	5 Minutes
SI4	Lateral Thoracic/Lumbar (Lateral) (eg discogram)	7 Minutes

Notes:

*Roll-over cells for additional detail where available

***Straightforward procedure: Integumentary, Non-incisional endoscopy, natural orifice**

*For building block IWPUT purposes whenever the procedure is on Appendix G – (Summary of CPT codes that include moderate (conscious) sedation) the IWPUT should be .0224 for the administration of moderate sedation line item because the physician is responsible for the administration of conscious sedation. If the procedure is one where conscious sedation is not inherent the same line item should have an IWPUT of .0081.

straightforward patient undergoing a straightforward procedure (Package 1B), if the procedure is performed under general anesthesia and the surveys support additional pre-service time.

Tab 14:

Utilization crosswalk for deleted code 37203 reflects utilization transitioning to code 37193 (RUC recommendation in April 2011)

Tab 25

Represents left over utilization from 83912 from CPT 2012 Molecular Pathology recommendations

Tab 28

90845 reflects the 2011 RUC recommendation

Tab 30

92287 - Referring to CPT Assistant

Tab 31

New coding structure results in percentages greater than 100. Please see specialty rationale located in the tab for further explanatio

Tab 32

93620 represents a work RVU of 5.79 reduced by the MPPR rule.

Utilization for 93462 represents specialty estimate from April 2010 RUC Meeting

Tab 35

While the pediatric polysomnography codes are currently billed under the adult codes (non-Medicare population), the pediatric codes will not be performed in the Medicare population and thus will not affect the utilization levels for the current adult codes.

Tab 36

Utilization for 95860 reflects modified utilization from bundled code 95886 reviewed in Tab 31 from April 2011
Utilization for 95861 reflects modified utilization from bundled code 95886 reviewed in Tab 31 from April 2011
Utilization for 95863 reflects modified utilization from bundled code 95886 reviewed in Tab 31 from April 2011
Utilization for 95867 reflects modified utilization from bundled code 95887 reviewed in Tab 31 from April 2011
Utilization for 95868 reflects modified utilization from bundled code 95887 reviewed in Tab 31 from April 2011
Utilization for 95869 reflects modified utilization from bundled code 95887 reviewed in Tab 31 from April 2011

Tab 37

CPT code 95943 will be reviewed by the RUC in October 2012. The update crosswalk will be provided in the October Submission

New Technology/Services Timeline

1. Code is identified as a new technology/service at the RUC meeting in which it is initially reviewed.
2. Code is flagged in the next version of the RUC database with date to be reviewed
3. Code will be reviewed in 5 years (depending on what meeting in the CPT/RUC cycle it is initially reviewed) after at least three years of data are available.

Example

Revised April 2010

Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Physicians typically spend 15 minutes at the bedside and on the patient's hospital floor or unit.

Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 15 minutes at the bedside and on the patient's facility floor or unit.

Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Presacral Lumbar Interbody Fusion

In February 2012, the CPT Editorial Panel created CPT code 22586 *Arthrodesis, pre-sacral interbody technique, including disc space preparation, discectomy with posterior instrumentation, with image guidance, includes bone graft when performed, L5-S1* interspace. The following Level of Interest process did not generate any specialty society willing to develop relative value recommendations for CPT code 22586. **Therefore, the RUC offers no recommendation for CPT code 22586.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
22586	Z1	Arthrodesis, pre-sacral interbody technique, including disc space preparation, discectomy with posterior instrumentation, with image guidance, includes bone graft when performed, L5-S1 interspace (Do not report 22586 in conjunction with 20930-20938, 22840, 22848, 72275, 77003, 77011, 77012)	090	RUC Recommends "No Recommendation"
▲0195T		Arthrodesis, pre-sacral interbody technique, ~~including~~ disc space preparation, discectomy, without instrumentation, with image guidance ~~ing (when performed)~~, includes bone graft when performed, and discectomy to prepare interspace~~,~~; L5-S1 ~~lumbar; single~~ interspace *(Do not report 0195T, 0196T in conjunction with 22558, 22845, 22851, 76000,* 76001, 77002, 77003, 77011, 77012, *76380, 76496, 76497)*	XXX	Carrier Price

Presacral Lumbar Interbody Fusion(Tab 6)
Staff Note

The Level of Interest process did not generate any specialty willing to develop relative value recommendations for CPT Code 225XX1 *Arthodesis, pre-sacral interbody technique, including disc space preparation, disectomy with posterior instrumentation, with image guidance, includes bone graft when performed, L5-S1 interspace*. There has, to the best of staff's recollection and record review, one other instance where a specialty was not willing/able to develop a recommendation. In this past situation, the RUC submitted the following recommendation to CMS:

20970 *Low intensity ultrasound stimulation to aid bone healing, noninvasive (nonoperative)*
The CPT Editorial Panel at its August 1998 meeting approved CPT code 20979 Low intensity ultrasound stimulation to aid bone healing, noninvasive (nonoperative). Throughout the remaining RUC and CPT cycles for CPT 2000, no specialty society indicated an interest in surveying the new code for work or practice expense values. At its May RUC 1999 meeting, specialty societies did discuss and comment on potential values despite the absence of formal survey data. Many physicians agreed that the work described in CPT code 20979 was very similar to the procedure reported under CPT 20974 Electrical stimulation to aid bone healing; noninvasive (nonoperative) (work RVU= .62). Other RUC members indicated that the code was very similar to CPT 76880 Echography, extremity, non-vascular, B-Scan and/or real time with image documentation (work RVU = .59). The RUC recommends that HCFA consider this information when formulating a final work relative value unit. However, based on the absence of formal survey data, the RUC is unable to make a final recommendation regarding physician work at this time. CMS published a work RVU of 0.62.

The RUC has also periodically recommended that a code be carrier priced when it is an uncommon procedure and difficult to value at that particular point in time. The CPT application estimated that 10,000 of these procedures are performed each year. The applicant is aware that the RUC will not be receiving survey data/recommendation from a specialty society for this issue.

The RUC's Rules and Procedures that are relevant to this issue are included below:

RUC's Rules and Procedures

In the event that the RUC has not accepted Specialty Society recommendation(s) in the timeframe(s) necessary to notify CMS (in order for CMS to comply with the annual cycle to assign relative values to new CPT codes), the RUC, at its option may forward to CMS:

1. all of the records concerning the outstanding recommendation(s) for CMS's independent evaluation and assignment of relative values to new CPT codes, or

2. forward a portion of the records concerning the outstanding recommendation(s) for CMS's independent evaluation and assignment of relative values to new CPT codes, or

3. the RUC may choose by a two thirds majority vote of those present to formulate and include with these materials its own assessment of the appropriate relative value, or

4. the RUC may choose by a two thirds vote of those present to formulate and include with these materials its own assessment of the appropriate range in which the appropriate relative value lies.

Presacral Lumbar Interbody Fusion

Typical Patient (225XX1)

A 40-year old male presents with history of low back pain and radicular leg pain. The patient continues to have limitations to his activities both at home and at work despite adequate physical therapy and other non-operative interventions. Work up shows degenerative disc disease at L5/S1. The patient is a candidate for lumbar fusion and desires to proceed with pre-sacral interbody fusion including discectomy and posterior fixation.

Typical Patient (0195T)

A 40-year-old male presents with a history of low back pain unresponsive to non-operative management for more than 1 year. Work-up and evaluation show a degenerative disc and/or annular tear at L5/S1. The patient continues to have limitations to his activities both at home and at work despite adequate physical therapy and other non-operative interventions. Examination of the patient is consistent with lumbar annular tear with increased pain with forward bending and or lifting. The patient is a candidate for lumbar fusion and desires to proceed with surgery.

Typical Patient (0196T)

A 45-year-old male presents with a history of low back pain unresponsive to non-operative management for more than 1 year. Work-up and evaluation show a degenerative disc and/or annular tear at L4/L5 and L5/S1. The patient continues to have limitations to his activities both at home and at work despite adequate physical therapy and other non-operative interventions. Examination of the patient is consistent with lumbar annular tear with increased pain with forward bending and or lifting. The patient is a candidate for a level 2 lumbar fusion and desires to proceed with surgery. At the completion of the first level, the second level procedure is performed.

Typical Patient (019XXT)

A 45-year-old male presents with a history of low back pain unresponsive to non-operative management for more than 1 year. Work-up and evaluation show a degenerative disc and/or annular tear at L4/L5 and L5/S1. The patient continues to have limitations to his activities both at home and at work despite adequate physical therapy and other non-operative interventions. Examination of the patient is consistent with lumbar annular tear with increased pain with forward bending and or lifting. The patient is a candidate for a level 2 lumbar fusion and desires to proceed with surgery. At the completion of the first level, the second level procedure is performed.

American Medical Association, Current Procedural Terminology (CPT™)

Coding Change Application

Category I CPT Code(s)

Category III CPT Code(s) – Emerging Technology

Criteria for development and evaluation of CPT Category I and Category III Codes

*In developing new and revised **Category I** codes the CPT Advisory Committee and the CPT Editorial Panel require:*

- *that the service/procedure has received approval from the Food and Drug Administration (FDA) for the specific use of devices or drugs;*
- *that the suggested procedure/service is a distinct service performed by many physicians/practitioners across the United States;*
- *that the clinical efficacy of the service/procedure is well established and documented in U.S. peer review literature;*
- *that the suggested service/procedure is neither a fragmentation of an existing procedure/service nor currently reportable by one or more existing codes; and*
- *that the suggested service/procedure is not requested as a means to report extraordinary circumstances related to the performance of a procedure/service already having a specific CPT code.*

*The following is used as formalized criteria by the CPT Advisory Committee and the CPT Editorial Panel for evaluating Category III code applications and includes identification of the following elements as guidelines for establishment of a **Category III** code:*

- *A protocol of the study or procedures being performed;*
- *Support from the specialties who would use this procedure;*
- *Availability of United States peer-reviewed literature for examination by the Editorial Panel;*
- *Descriptions of current United States trials outlining the efficacy of the procedure.*

This form plays a vital role in maintaining and increasing the efficiency of the CPT process. It can be used to submit a coding change application for any one of the three categories of CPT codes. As you fill out the form please consider which category of code change you are requesting. For more information on the three categories please see the attached instructions.

Please complete this entire form (insert additional lines and pages as needed). Refer to the accompanying instructions if necessary Once the application is completed, submit the application electronically via CD or e-mail to ccpsubmit@ama-assn.org

CPT is a registered trademark of the American Medical Association

Formatting Instructions for the Coding Change Application Form.

When entering code information on this application, please use this formatting. You may copy and paste the following symbols:

λ This symbol precedes a new code (example: λ210XX)

σ This symbol precedes a revised code (example: σ43605)

λXXXXX Parent Code (indent 1.0 inch by holding down the "Ctrl" key and pressing "Tab")

λXXXXX Indented Code (indent 1.2 inches by holding down the "Ctrl" key and pressing "Tab" twice)

When entering text on the form, place the content inside the box that follows the question. This field will expand to hold the complete entry.

1. Does the procedure/service involve the use of a drug, vaccine product* or device that requires approval from the Food and Drug Administration (FDA)?

   [X] Yes (go to 2.)

   [ ] No (go to 3.)

   ** Applications requesting establishment of CPT Codes for vaccine products will not be considered until evidence substantiating completion of Phase III Clinical Trials and review of unblinded data is submitted to AMA. However, coding applications may be considered prior to submission of the Biologic License Application (BLA) to the FDA.*

2. If approval is necessary, has FDA approval been received for the device or drugs for the specific use that you are proposing?

   [X] Yes, FDA has approved all necessary aspects of the service.

   [ ] No. Some necessary element of the service has not received FDA approval.

3. Is the procedure/service for which you are applying a code change performed nationally?

   [X] Yes

   [ ] No

4. Is the procedure/service for which you are applying a code change performed by a large number (as a proportion of practitioners within the specialty or subspecialty) of physician or non-physician health professionals?

   [X] Yes

   [ ] No

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

5. Has the clinical efficacy of the procedure/service for which you are requesting a code change been established and well documented?

   [X] Yes

   [ ] No

6. Is the procedure/service for which you are requesting a code change used as a performance or quality measure by any national organization? If yes, please state the organization and name of the measure.

   [ ] Yes*

   [X] No

   [ ] Don't Know

   * Enter the following:
   Organization:

   Name of Measure:

7. Indicate the specific reasons why this code change is necessary (rationale). (Avoid non-rationales. Reasons like "no code currently available" or "need new code" do not describe the clinical reason why you are requesting a coding revision.)

I. Introduction

The pre-sacral approach to lumbar interbody fusion is a minimally invasive technique for achieving an interbody fusion that is an alternative to traditional approaches such as ALIF, TLIF, PLIF or direct lateral. The discectomy and fusion portions of the overall procedure are similar to traditional interbody fusion procedures and hardware. The unique feature of this lumbar interbody fusion procedure is the minimally invasive pre-sacral approach to the lower lumbar region of the spine which spares native anatomy (bone, muscle and ligaments) and reduces soft tissue trauma. This difference in approach will be reflected in the conversion to a new Category I code.

When the pre-sacral interbody fusion application was initially reviewed by the CPT editorial panel in October 2011, there was some confusion regarding the Food and Drug Administration (FDA) clearance for the pre-sacral interbody fusion, as well as, the use of the approach and implant in conjunction with other lumbar spine fusion procedures. The purpose for this application is to address and clarify certain issues that were raised at the October 2011 panel meeting. Furthermore this application contains details regarding how study design justifies Level III status based upon objective study attributes.

II. Proper Coding Methodology for Pre-Sacral Interbody Fusion

The pre-sacral approach to lumbar interbody fusion with its associated implant was cleared by the U.S. FDA in 2004 for use with posterior fixation. In fact, posterior or supplemental fixation is required for most lumbar interbody fusions, such as, anterior lumbar interbody fusion (ALIF) or transforaminal interbody fusion (TLIF) access techniques. The attached FDA clearance letters from the TranS1 AxiaLIF device for pre-sacral interbody fusion and the Medtronic Capstone device for either anterior or transforaminal interbody fusions show that both devices require supplemental fixation instrumentation (Attachments 8, 9 and 10). In most

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

cases supplemental fixation is considered to be posterior fixation. Rather than bundle the fixation administration with the interbody fusion procedures, the CPT Editorial Panel has traditionally allowed surgeons their choice of fixation based on the clinical requirements of each case. As a result, the spine instrumentation codes are add-on codes, intended to be used with different arthrodesis CPT codes. This coding structure provides flexibility to the physician in selecting the most appropriate instrumentation, while avoiding multiple CPT spine arthrodesis codes that are differentiated only by type of instrumentation. It also allows for the occasional clinical scenario in which the patient has already been treated with posterior fixation.

Based on existing CPT coding methodologies and the existence of other ALIF and TLIF procedures in the CPT code set that make use of the add-on spine instrumentation codes, the pre-sacral interbody fusion should be adopted as a Category I CPT code with the same coding conventions as these other procedures. Presacral interbody fusion is an analog to the aforementioned interbody fusion procedures and therefore, bundling pre-sacral interbody fusion with posterior instrumentation is not consistent with other procedures in the CPT code set. There are good clinical reasons to maintain flexibility in the selection of posterior instrumentation codes and this should be maintained in establishing Category I CPT codes from the existing Category III codes.

Another area of confusion is whether pre-sacral interbody fusion is generally performed adjacent to more extensive lumbar fusions for disease or deformity. Over the past few years some “long construct” fusions for scoliosis, for example, have been performed adjacent to pre-sacral interbody fusion at L5-S1. While pre-sacral interbody fusions have been performed in this fashion, the vast majority are used strictly for degenerative disease solely requiring single level fusion at L5-S1 or two level fusion at L4-S1, and not adjacent to long constructs for deformities such as scoliosis. In fact, the FDA label states that the procedure and implant is indicated for pseudoarthrosis, spinal stenosis, spondylolisthesis or degenerative disc disease. The Gundanna study of 9,152 pre-sacral interbody fusion patients, discussed later, were for either one level or two level pre-sacral fusions, not pre-sacral fusions in conjunction with other lumbar fusions. While, pre-sacral interbody fusion procedures, like ALIF or TLIF procedures, can technically be performed in conjunction with more extensive lumbar fusions, the typical use is as a stand-alone procedure.

III. The Offered Clinical Literature Support Creation of Category I Codes for 0195T and 0196T

In considering the evidence presented, the Panel disagreed about the level of evidence for these studies. However, we believe that close examination of the characateristics of each study reveals that the requisite level of evidence exists to support a Category I code. Further review shows that for each study presented a research protocol with study questions was created, statistical concerns were accounted for and standardized questionnaires administered. The protocol was then applied to the surgical cases meeting the study criteria. These prospective research considerations serve to eliminate selection bias and result in a more robust study. Also, by focusing on objective quantitative data such as the measured extent of fusion and results from repeated administration of patient derived clinical outcome instruments on pain and disability such as the visual analog scale (VAS) and Oswestry Disability Index (ODI), the studies further reduce bias and allow for statistical tests of significance. This degree of methodological rigor meets the criteria for Level III evidence since the data is obtained from well-designed descriptive studies that allow comparisons to baseline as well as other published literature that exists for alternative procedures.

IV. Clinical Basis for Elevating to Category I

It is appropriate to move the existing CPT Category III codes 0195T (Arthrodesis, pre-sacral interbody technique, including instrumentation, imaging (when performed), and discectomy to prepare interspace, lumbar; single interspace) and 0196T (Arthrodesis, pre-sacral interbody technique, including instrumentation, imaging (when performed), and discectomy to prepare interspace, lumbar;each additional interspace (List separately in addition to code for primary procedure)) to Category I CPT codes. New clinical information has become available since assignment of the Category III code supporting the safety and efficacy of the pre-sacral approach to lumbar interbody fusion. Since the Category III code change proposal was submitted by the North American Spine Society in October 2008, there have been 41 additional peer reviewed publications. Widespread adoption of the procedure has been attained as evidenced by the more than 300

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

surgeons actively performing the procedure in the United States, and more than 12,000 procedures (10,000 in the US) completed worldwide.

8. If this application requests addition of a **new code**, specify the recommended terminology (code descriptor) for the proposed CPT code. Specify the placement of the proposed code in the current text of CPT (list section, subsection (example: MUSCULOSKELETAL, HEAD, INCISION λ210XX)). Also list synonyms, eponyms or other technical names for the procedure (example: λ8661X Borrelia burgdorferi (Lyme disease) confirmatory test (e.g., Western blot or immunoblot)).

MUSCULOSKELETAL, SPINE, ARTHRODESIS

225X1, Arthrodesis, pre-sacral interbody technique, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots, with image guidance, lumbar; single interspace

+225X2, Arthrodesis, pre-sacral interbody technique, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots, with image guidance, lumbar; each additional interspace (List separately in addition to code for primary procedure)

(Use 225X2 in conjunction with 225X1)

(For placement of a posterior instrumentation, see 22840-22865 as appropriate)

(Do not report CT or fluoroscopic guidance separately)

9. If this application requests **revision of a code(s)**, specify the recommended terminology (code descriptor) for the proposed revised code. Use the conventional techniques of strike-outs for deletions and underlining for additions/revisions (example: 33420 Valvotomy, mitral valve (~~commissurotomy~~); closed heart). Also, indicate the revision(s) in context with the current code descriptor (list the complete family of codes related to your request). Please refer to code change application instructions.

N/A

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

10. If you are recommending a code **deletion**, please provide the recommended cross-reference (i.e., how is the deleted service now to be coded? Example (33100 has been deleted. To report, see 33030, 33031)).

0195T has been deleted. To report, see λ225X1

+0196T has been deleted. To report, see +λ225X2

11. Please indicate which CPT or HCPCS Level II code(s) are currently being used to report this procedure/service.

0195T Arthrodesis, pre-sacral interbody technique, including instrumentation, imaging (when performed), and discectomy to prepare the interspace, lumbar; single interspace

+0196T each additional interspace (List separately in addition to code for primary procedure)

12. Why is (are) the present code(s) (in 12. above) inadequate to describe procedure/service?

The CPT Category III code for pre-sacral lumbar interbody fusion was originally created to provide a means to report a new procedure that involved different work from an open or endoscopically assisted anterior interbody fusion.

It is clear that distinct codes are needed and that it is time to move the existing codes into Category I. Category III codes are temporary codes for emerging technology. Since the Category III code was developed, new peer reviewed scientific articles have emerged which show the pre-sacral technique achieves equivalent fusion rates with a significantly lower complication profile compared to open spinal fusion methods. The most common risks associated with anterior approaches are bowel or abdominal injury, vascular injury, and blood loss. The most significant risk associated with the pre-sacral approach to lumbar interbody fusion is perforation of the bowel (perforation of the peritoneal cavity) which has a documented historical rate of 0.6% (as documented in the Gundanna paper referenced below). Also, utilization has greatly increased with over 12,000 procedures performed to date worldwide (more than 10,000 of these are in the U.S.).

The CPT Category III codes achieved their purpose; identifying pre-sacral lumbar fusion as unique procedures and allowing new procedures to be tracked. A new Category I CPT code will reflect the new access to the anterior spine while still adhering to the same surgical principles of decompression and fusion. The anterior fusion device delivered via a pre-sacral approach is not investigational as it received FDA 510(k) clearance in December 2004. Of the more than 12,000 procedures that have been performed worldwide, the documented serious complication rate is approximately 1%. This rate is lower than the traditional ALIF complication rate which is quoted in the literature. This procedure is both safe and its results are reproducible. Literature suggests this procedure has been successful in achieving a high fusion rate (as reported in the Patil, Tobler and Gerszten studies referenced below). Its potential benefits to the patient because of it less invasive approach include short length of hospital stay (1 day or less), low blood loss (< 50cc per procedure), and decreased post-operative pain score (Oswestry Disability Index and Visual Analog Scores).

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

13. Identify the major differences between the proposed code change and other related codes already in CPT (add additional codes as necessary).

Code 1:

22558: Arthrodesis, anterior interbody technique, including minimal discectomy to prepare interspace (other than for decompression); lumbar.

The code for pre-sacral lumbar interbody fusion is similar to this ALIF code in that both represent an anterior retroperitoneal approach to the anterior lumbar spinal column. The major differences in the ALIF code 22558 and the proposed code (225X1) is the access approach and the visualization. The pre-sacral approach for lumbar interbody fusion utilizes instrumentation that creates a pre-sacral access route to the anterior lumbar spine and utilizes fluoroscopic guidance with specific instrumentation to perform a discectomy, insert bone graft and place the spinal fixation device. The pre-sacral approach is also limited to L5-S1 or L4-S1 fusions.

Code 2:

N/A

14. Please provide a list of CPT codes for all procedures/services which are an integral part of the proposed procedure/service. This list should include CPT codes for all procedures/services which, if coded in addition to the code for the procedure/service proposed here, would represent unbundling.

22845: Anterior Instrumentation; 2 to 3 Vertebral Segments
22851: Application of intervertebral biomechanical device(s) to vertebral defect or interspace
63017: Laminectomy with exploration and/or decompression of spinal cord and/or cauda equina, without facetectomy, forminotomy or diskectomy, (e.g. spinal stenosis), more than 2 vertebral segments; lumbar
63030: Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial facetectomy, foraminotomy and/or excision of herniated intervertebral disk; one interspace, lumbar (including open or endoscopically-assisted approach)
63042: Laminotomy (hemilaminectomy), with decompression of nerve root(s), including partial fecetectomy, forminotomy and/or excision of herniated intervertebral disk, reexploration, single interspace; lumbar
63047: Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root(s) (e.g. spinal or recess stenosis), single vertebral segment; lumbar.76000: Fluoroscopy (up to 1 hour physician time)
76380: CT Limited or localized follow-up study
76496: Unlisted fluoroscopic procedure (e.g. diagnostic, interventional)
76497: Unlisted CT procedure, diagnostic or interventional

15. Is the requested service typically reported on the same date as services reported with existing CPT codes? If yes, please explain why multiple codes are typically reported.

[X] No

[ ] Yes (If yes, provide reason here and answer Question #17)

16, Is the requested code expected to be reported with an add-on code?

[X] Yes

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

☐ No

17. Do you request that this service be added to Appendix E (i.e., should this application be presented to the RBRVS Update Committee for valuation as modifier 51 exempt)?

☐ Yes

☒ No

18. For each proposed coding change, please provide (attach) a clinical vignette that describes the typical patient who would receive the procedure(s)/service(s) including diagnosis and relevant conditions. Please refer to the sample format and examples of appropriate clinical vignettes included in the code change application instructions. This same vignette is used during the development of work values by the AMA/Specialty Society RVS Update Committee (RUC). It is important that the description of the typical patient make apparent the degree of complexity required to provide the service.

SEE ATTACHMENT 1

19. For each proposed coding change, please provide (attach) a brief description of the procedure(s)/service(s) performed by the physician or non-physician health care professional. Please refer to the sample format and examples of appropriate descriptions of service included in the code change application instructions. This should be a summary description and should **not** contain the detail or pre, intra and post service breakdowns that are required as part of the AMA/Specialty Society RVS Update Committee (RUC). It is important that the description of the service make apparent the degree of complexity required to provide the service.

If the description includes services that are reported separately, please clearly indicate this separate reporting. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

SEE ATTACHMENT 2

20. What diagnosis or conditions is this service/procedure designed to diagnose/treat?

738.4 Acquired spondylolisthesis

733.82 Nonunion of fracture, V45.4 Arthrodesis status

722.52 Degeneration of lumbar or lumbosacral intervertebral disc

722.73 Intervertebral disc disorder with myelopathy, lumbar region

The pre-sacral approach to lumbar interbody fusion is intended to provide anterior stabilization of the L5-S1 or L4-S1 spinal segment(s) as an adjunct to spinal fusion. This procedure is indicated for patients requiring fusion to treat pseudoarthrosis (unsuccessful previous fusion) spinal stenosis, spondylolisthesis (Grade 1 or 2 for one-level, Grade 1 for two-level), or degenerative disc disease as defined as back pain of discogenic origin with degeneration of the disc confirmed by history and radiographic studies.

The pre-sacral approach to lumbar interbody fusion is intended for minimally invasive access to the anterior portion of the lower lumbar spine for assisting in the treatment of degeneration conditions of the lumbar disc, performing lumbar discectomy, or for assistance in the performance of L5-S1 or L4-S1 interbody fusion.

21. For the proposed coding change, is conscious sedation inherent to this procedure?

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

☐ Yes

☒ No

22. What is the incidence of the disease(s) that this procedure is designed to diagnose/treat? Please quantify when possible (e.g. patients per year; admissions per year).

It is estimated that in 2011 there will be approximately 200,000 patients treated surgically for conditions for which pre-sacral lumbar interbody fusion is indicated.

23. How long (i.e. number of years) has this procedure/service been provided for patients? (Medical literature that indicates utilization of this procedure/service should be cited, and a hard copy of the literature should be provided.)

The subject device was first used clinically in June 2003, in Sao Paulo, Brazil where the initial clinical work was performed. In January 2005, the device was first used clinically in the United States. The device was also first used in the European Union during 2005.
See #34 bibliography for publications illustrating use of the procedure.

24. Do many physicians or non-physician health care professionals perform this service across the United States?

☒ Yes

☐ No

25. How often do physicians or non-physician health care professionals perform this service?

☒ Commonly

☐ Sometimes

☐ Rarely

26. How often is this service provided nationally in a one-year period (i.e. what is the yearly frequency)?

Approximately 2000 cases per year

27. Please identify the specialties or subspecialties that might perform this procedure/service.

Orthopedic spine surgery and Neurosurgery

28. Did you contact any of the national offices for the specialty groups listed in the CPT Advisory Committee listing in the CPT codebook? If yes, which one(s)?

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

Yes

NASS
AAOS
AANS/CNS
ISASS
SMISS

CPT is a registered trademark of the American Medical Association

29. What is the typical site of service that this procedure is performed in? (please check all that apply)

- [ ] Office or other outpatient setting
- [ ] Emergency department
- [ ] Independent laboratory
- [ ] Domiciliary/rest home
- [X] Hospital inpatient
- [ ] Patient's home
- [ ] Psychiatric facility
- [ ] Nursing facility
- [ ] Hospital outpatient
- [ ] Ambulatory surgical center
- [ ] Other (please specify)

30. If you are recommending a new code, please estimate the percentage of services performed using current codes that would now be coded using the proposed new code. Please cite your data sources (example: Current code 12345 will now be reported by λ123X1 30% of the time, λ123X2 70% of the time).

Code 0195T will now be reported by the new code (λ225X1) 100% of the time.
Codes +1096T will now be reported by the new code (+λ225X2) 100% of the time.

31. Are you aware of any practice parameters/guidelines or policy statements about this particular procedure? If yes, please identify and provide below.

- [ ] Yes
- [X] No
- [ ] Don't Know

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

32a Please provide electronic (PDF or Word documents) copy(s) (and internet addresses, if available) of literature to support your application, and cite the author, title, journal, year, volume and page(s) in the "Publication Details and Attributes Grid" (PDA grid) that follows. Each item of submitted literature shall be identified in the PDA grid according to each of the 4 following requirements:

1. Identify the Level of Evidence by selecting a level from the LOE table below;

2. Identify whether this is a U.S. based journal or a non-U.S. based journal, and identify whether the population studied is U.S. or non-U.S. or both;

3. Identify the number of patients studies (total of all group(s) including controls) and indicate whether study is a prospective study;

4. Provide a concise "relevance statement".

General Guidelines for inclusion of the articles are noted in the following:

1. Abstracts are allowed to supplement application but will not be accepted in substitution of full length journal articles.

2. Foreign journals will be permitted if published in the English language.

3. List up to 5 references, of which at least 3 report the procedure/service in a U.S. patient population. Of these, at least 2 articles must report different patient populations or have different authors (no overlapping patient populations or no overlapping authors).

4. At least 1 of the publications meets or exceeds the criteria for evidence level III (i.e. obtained from well-designed, non-experimental descriptive studies such as comparative studies, correlation studies, and case control studies). However, Code Change Applications requesting editorial changes to existing Category I codes and applications for bundled codes to describe unchanged existing Category I services (when provided together) need not meet this requirement.

32b For Category III codes, please reference studies or research performed by national organizations if available.

The following is used as formalized criteria by the CPT Advisory Committee and the CPT Editorial Panel for evaluating Category III code applications, and includes identification of the following elements as guidelines for establishment of a Category III code:

- A protocol of the study or procedures being performed;

- Support from the specialty societies who would use this procedure;

- Availability of U.S. peer-reviewed literature for examination by the CPT Editorial Panel;

- Descriptions of current U.S. trials outlining the efficacy of the procedure.

Level of Evidence Table - LOE

Level	Type of evidence (based on AHCPR 1992)
Ia	Evidence obtained from meta-analysis of randomized controlled trials
Ib	Evidence obtained from at least one randomized controlled trial
IIa	Evidence obtained from at least one well-designed controlled study without randomization
IIb	Evidence obtained from at least one other type of well-designed quasi-experimental study
III	Evidence obtained from well-designed non-experimental descriptive studies, such as comparative studies, correlation studies and case control studies
IV	Evidence obtained from expert committee reports or opinions and/or clinical experience of respected authorities
V	Evidence obtained from case reports or case series

Article #1 *(Author, Title, Journal, Year, Volume and Pages)* Gundanna M, Miller L, Block J: Complications with Axial Presacral Lumbar Interbody Fusion: A Five-Year Postmarket Surveillance Experience. SAS Journal. 2011; Volume 5, pp. 90-94.	*Insert level #* *III*	☒ **U.S.** ☐ **Foreign**	☒ **U.S.** ☐ **Foreign** ☐ **Both**	☐ **Yes** ☒ **No**	*Insert #* *9,152*
Brief description: The Gundanna M, et al study used prospective research techniques to study a database of 9,152 pre-sacral lumbar interbody fusion patients. The pre-defined database was developed to record complaints and complications related to the pre-sacral interbody fusion device or procedure. Complication data were recorded through prospectively established complaint reporting as part of ongoing post-market surveillance. Procedures and training were developed to ensure accurate reporting. Complications were reported in 120 (1.3%) of 9,152 patients, and included bowel injury (n=59, 0.6%), superficial wound and systemic infections (n=9, 0.1%), transient intraoperative hypotension (n=20, 0.2%), migration (n=5, 0.1%), subsidence (n=4, <0.1%), pre-sacral hematoma (n=9, 0.1%), sacral fracture (n=7, 0.1%), vascular injury (n=6, 0.1%), nerve injury (n=3, <0.1%), and ureter injury (n=1, <0.1%). Complications were reported using counts and frequencies with 95% confidence intervals that allowed comparison to historical control groups. χ^2 with Yates' correction for continuity was used to compare complication incidences between single-level and two-level procedures. Patient follow up time points ranged from 3 months to 5 years 3 months. This study represents level III evidence as it is a well characterized prospectively derived study where comparisons to historical controls were performed in terms of complications and adverse events. These elements make this study both descriptive and comparative. **SEE ATTACHMENT 3**					
Article #2 *(Author, Title, Journal, Year, Volume and Pages)* Tobler WD, Ferrara L, The presacral retroperitoneal approach for axial lumbar interbody fusion: A prospective study of clinical outcomes, complications and fusion rates at a follow-up of two years in 26 patients, The Journal of Bone and Joint Surgery, 2011, Vol 93-B, No.7, 955-960.	*Insert level #* *III*	☒ **U.S.** ☐ **Foreign**	☒ **U.S.** ☐ **Foreign** ☐ **Both**	☒ **Yes** ☐ **No**	*Insert #* *26* *Prospective*
Brief description: The Tobler, W.D and Ferrara, L.A. paper was a prospective study of outcomes, complications and fusion rate on 26 patients with symptomatic degenerative disc disease, with follow-up of 2 years. The study used the VAS and ODI questionnaires that were administered pre-operatively, at discharge, and at three weeks and three, six, 12, and 24 months. The evaluation of fusion was by thin-cut CT scans at six and 12 months, and flexion-extension plain radiographs at six, 12 and 24 months. The extent of fusion was determined by an independent radiologist based on FDA established guidance principles allowing comparison with historical control groups. Baseline clinical values were compared with values at two years using a two-sided *t*-test. The resulting p-value of < 0.05 was considered to be statistically significant. "Significant reductions in pain and disability occurred as early as three weeks post-operatively and were maintained. Fusion was achieved in 22 of 24 patients (92%) at 12 months and in 23 patients (96%) at 24 months. One patient (4%) with a pseudoarthrosis underwent successful revision by augmentation of the posterolateral fusion mass through a standard open midline approach." There were no serious adverse events. This study represents level III evidence as the data was collected through a well-defined, prospectively planned trial and allows comparisons to both baseline and historical controls based on the prospectively defined inclusion/exclusion criteria and the ability to view the data across historical controls. **SEE ATTACHMENT 4**					
Article #3 *(Author, Title, Journal, Year, Volume and Pages)* Patil S, Clinical and Radiological Outcomes of Axial Lumbar Interbody Fusion, Orthopedics, 2010, 33(12), 883.	*Insert level #* *III*	☒ **U.S.** ☐ **Foreign**	☒ **U.S.** ☐ **Foreign** ☐ **Both**	☐ **Yes** ☒ **No**	*Insert #* *50*

Code Change Application
Last updated August 6, 2010
CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

The Patil, et al study, which included 50 patients, enrolled subjects with degenerative conditions of the spine including spondylolisthesis and degenerative disc disease. The study used standing neutral lateral radiographs of the lumbosacral spine obtained preoperatively, six weeks postoperatively, and at the last postoperative visit (six-24 months postoperatively) to analyze the extent of fusion. Two radiographic characteristics were measured: disk space height and Cobb angle. Disk space height was measured as the distance between the anterior superior endplate and inferior endplate. Lumbar lordosis angle, or Cobb angle, was measured as the angle derived from the slope between the upper and lower vertebral endplates. Fusion was also assessed on plain lateral radiographs and computed tomography (CT). Fusion was evaluated using Brantigan and Steffee's criteria, which is defined as a bony continuity between the upper and lower endplates and a lack of radiolucent lines around the screws. All measurements were performed by a single observer. Data were statistically analyzed with paired two-tailed *t* tests allowing scientific comparison to baseline. Patient clinical outcomes were derived from well accepted VAS and ODI questionnaires that were administered to patients during the preoperative evaluation and at three, six, 12 and 24 months post-surgical follow-up visits. ODI scores were reduced from 46 to 22, and VAS scores were lowered from 8.1 to 3.6. Of the 49 patients with postoperative radiographs, 47 (96%) went on to solid fusion. Several patients experienced complications (11/50), including 1 high rectal injury attributed to altered intra-abdominal anatomy , with the most common being superficial infection and pseudoarthrosis. This study represents level III evidence because it is a study with descriptive well characterized data that allows comparisons to the baseline condition of the patients as well as cross comparisons to published historical controls.

Article #4 Gerszten PC, Tobler W, Raley TJ, Miller LE, Block JE, Nasca RJ. Axial Presacral Lumbar Interbody Fusion and Percutaneous Posterior Fixation for Stabilization of Lumbosacral Isthmic Spondylolisthesis. Journal of Spinal Disorders & Techniques. Accepted, not yet published. Epub ahead of print September 29, 2011.	*Insert level #* *III*	☒ **U.S.** ☐ **Foreign**	☒ **U.S.** ☐ **Foreign** ☐ **Both**	☐ **Yes** ☒ **No**	*Insert #* *26*

Brief description:

The Gerszten et al paper is a descriptive, comparative, prospectively designed, multi-center study of 26 consecutive patients diagnosed with isthmic spondylolisthesis treated with pre-sacral interbody fusion and posterior fixation. Outcomes for fusion were CT scans and flexion/extension films at 2 years which were compared to historical controls. Data was analyzed using Predictive Analytics Software. Spondylolisthesis slip grade was determined using the Wilcoxson signed-ranked test. Change in pain scores before and after surgery was assessed with paired t-tests allowing comparison to baseline. The Mann-Whitney U test was used to determine the relationship of spondylolisthesis reduction magnitude with baseline patient characteristics and patient outcomes. Patients treated had a 66% reduction in baseline pain scores with a 95% confidence interval (54-78%), and all showed solid fusion at 2-year follow-up. This study represents a singularly defined clinical indication with highly descriptive data that allows comparisons to both baseline patient conditions and historical controls that are also defined as treatments for isthmic spondylolisthesis. These elements make this a level III comparative study.

SEE ATTCHMENT 6

Article #5 *(Author, Title, Journal, Year, Volume and Pages)* Tobler W, Gerszten P, Bradley W, Raley T, Nasca R, Block J: Minimally-invasive Axial Pre-sacral L5-S1 Interbody Fusion: Two Year Clinical and Radiographic Outcomes. Spine. 2011 Sept; Volume 36, Number 20, pp. E1296-E1301.	*Insert level #* *IV*	☒ **U.S.** ☐ **Foreign**	☒ **U.S.** ☐ **Foreign** ☐ **Both**	☐ **Yes** ☒ **No**	*Insert #* *156*

Brief description:

The Tobler WD, et al study retrospectively examined 156 patients from four clinical sites. Inclusion criteria required patients to have received L5-S1 presacral fusion and to have both presurgical and 2 year radiographic or patient-reported clinical follow-up. Subjects meeting inclusion criteria had refractory axial low back pain and degenerative spine conditions with at least 6 months of failed nonoperative management. Evaluation of back pain severity and condition-specific functional impairment was performed pre-operativeley as well as at 2 years follow-up using ODI questionnaires. Developing fusion mass was evaluated using standard anteroposterior and lateral radiographs as well as dynamic flexion-extension films (n=89) and thin cut multiplanar computed tomography scans (n=66). The degree of clinical improvement in pain and functional outcomes over baseline was determined by comparing baseline values for all outcomes with values at 2 years using a two-sided *t* test for statistical significance, and clinical success was defined as change relative to baseline values of at least 30%. Subgroup evaluations of potential predictors of fusion success were analyzed using Fisher's exact test (two tailed). In this study, patients realized 86% and 74% clinically significant improvements in pain and function, respectively, at 2 years post-op. There was a reported 94% fusion rate and no radiographic evidence of device subsidence or joint space narrowing. This study represents level IV evidence.

CPT Code Change Application Conflict of Interest Policy

Every code change applicant shall disclose his or her financial and other potential interest as described below in the course of submitting the code change application.

Interests required to be disclosed:

Applicant may benefit financially from the code change application; and/or

Applicant is a consultant, agent or employee, and applicant should reasonably be aware that applicant's client or employer may benefit financially from the code change proposal.

This does not include any interest that is limited to providing clinical services to patients (including the service(s) for which a code change application is being submitted).

This disclosure does not restrict or limit the ability of the code change applicant to submit the proposal or to advocate for the CPT changes before the Panel or in writing.

Please complete and sign the following Statement of Compliance. The Statement of Compliance will be disclosed to all individuals reviewing/considering the code change application.

Statement on Lobbying

Applicants and other interested parties must not engage in "lobbying" for or against code change applications. "Lobbying" means **unsolicited** communications of any kind made at any time (including during Editorial Panel meetings) for the purpose of attempting to influence either (1) the CPT Advisors' evaluation of or comments upon a code change application or (2) voting by members of the Editorial Panel on a code change application. **Lobbying is strictly prohibited. Violation of the prohibition on lobbying may result in sanctions, such as being barred from further participation in the CPT process.** Information that accompanies a code change application, presentations or commentary to the full Editorial Panel during an open meeting and responses to inquiries from a Panel member or a CPT staff member do not constitute "lobbying."

In order for the CPT Editorial Panel to effectively review and act on proposed changes to the CPT code set, code change applications must be reviewed by the CPT Advisors and the Editorial Panel based on the information contained in the application and available clinical literature. CPT staff is responsible for organizing and submitting information to the CPT Advisors and the Editorial Panel for consideration. Information relating to a code change application must be submitted to CPT staff no later than thirty days prior to the start of the Editorial Panel meeting at which the code change application will be considered. In some cases, the Chair of the Editorial Panel may establish rules which allow for supplemental submissions of information to workgroups or facilitation sessions established by the Chair or for postponed or appealed agenda items. (A facilitation session is an informal meeting requested by the Chair during a CPT Editorial Panel meeting to allow interested parties to confer and attempt to reach a consensus recommendation for presentation at the meeting.)

During development of a code change application, an applicant may seek input or assistance from staff or advisors of medical specialty societies but may not engage in "lobbying" as defined above. Medical specialty societies may have their own policies governing interactions with applicants or other interested parties regarding code change applications. The AMA encourages medical societies to work with applicants, from both industry and other medical specialty societies, to assure that code change applications are complete, coherent and consistent with current medical practice. Contacts with consulting medical societies should be limited to that which is necessary to construct and submit the code change application. After the date a code change application is posted for review and comment by the CPT Advisors and the Editorial Panel, contact between an applicant and medical society representatives should be confined to communications pertaining to feedback from the CPT staff or Advisors' comments regarding the application. If an applicant or other interested party wishes

CPT is a registered trademark of the American Medical Association
Copyright 2010 American Medical Association All rights reserved.

the CPT Advisors or the Editorial Panel to consider additional information, that information must be submitted to AMA's CPT staff and not directly to the CPT Advisors or the Editorial Panel.

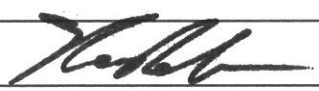
Applicants and other interested parties are invited to participate in open CPT Editorial Panel meetings and present their views on code change applications when recognized by the Chair during the course of the meeting. The views of applicants and other interested parties may be sought during work group or facilitation sessions established by the Chair and participation in a workgroup or a facilitation session is not considered lobbying.

Statement of Compliance with the CPT Code Change Proposal Conflict of Interest Policy

I understand that I am expected to comply with the CPT Code Change Proposal Conflict of Interest Policy. I will disclose any financial interests or other interest as described in the Conflict of Interest Policy in the above CPT Code Change Proposal. I understand that, should I choose to present the above CPT Code Change Proposal to the CPT Editorial Panel, I have a continuing responsibility to comply with the Conflict of Interest Policy, and I will promptly disclose my interests required to be disclosed under the Policy.

Please check as appropriate:

☐ I have no conflicts as described in the CPT Code Change Proposal Conflict of Interest Policy.



☒ I may benefit financially from the code change proposal; and/or

If checked, please describe:

There is potential that a Category I code change could result in increased company revenue. As President and CEO of the company, there is a potential indirect financial benefit due to the compensation package which is linked to company revenue.

☐ I am a consultant, agent or employee, and my client or employer may benefit financially from the code change proposal.

If checked, please describe:

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Shoulder Arthroplasty and Implant Removal

In October 2011, the CPT Editorial Panel created two new CPT codes for total shoulder revision, CPT code 23473*Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component* and CPT code 23474 *Revision of total shoulder arthroplasty, including allograft when performed; humeral AND glenoid component.* The new codes were created because of a CCI edit stating that providers can no longer report an implant removal with a total shoulder revision, as it was previously reported. The specialty society surveyed for the January 2012 RUC meeting, but was not able to collect a sufficient number of surveys for an accurate review and valuation. In January 2012 the RUC approved the specialty society's request to continue collecting survey responses. CMS requested surveys for all base and family codes. CPT code 23331 *Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal)* (work RVU=7.63), CPT code 23332 *Removal of foreign body, shoulder; complicated (eg, total shoulder)* (work RVU=12.37) and CPT code 23472 *Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)* (work RVU=22.65) were added and surveys were conducted for the April 2012 RUC meeting. These codes are low volume and as a result have low survey response, however the RUC agreed that enough additional surveys have been collected for the specialty society to provide accurate work RVU recommendations.

23331

The RUC reviewed the code and determined that the CPT descriptor does not accurately depict the "removal of previously-placed implant" and requested that the removal portion of the service be returned to CPT for development of new "implant removal" codes to correlate with the revision shoulder arthroplasty codes. Specifically the codes should distinguish between removal of a prosthesis and a foreign body. **The RUC recommends that CPT code 23331 be referred to CPT for further clarification and that the current work RVU of 7.63 be maintained until the code is revised and resurveyed.**

23332

The RUC reviewed the code and determined that the CPT descriptor does not accurately depict the "removal of previously-placed implant" and requested that the removal portion of the service be returned to CPT for development of new "implant removal" codes to correlate with the revision shoulder arthroplasty codes. Specifically the codes should distinguish between removal of a prosthesis and a foreign body. **The RUC recommends that CPT code 23332 be referred to CPT for further clarification and that the current work RVU of 12.37 be maintained until the code is revised and resurveyed.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

23472
The RUC reviewed the survey and recommends a work RVU of 22.13, the survey's 25th percentile, a decrease from the current work RVU of 22.65. The specialty society pointed out that the intra-service time in the RUC database is listed as 165, however when the code was surveyed in 2000 the survey indicated that the intra-service time was 155. The current survey indicates that there is now 140 minutes of intra-service time to perform this service. In addition, the RUC agreed that 12 minutes of additional pre-service positioning time is warranted in order to position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. The RUC compared 23472 to the key reference service 23616 *Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; with proximal humeral prosthetic replacement* (work RVU=18.37) and determined that the service requires more physician time and justifies a higher value. The RUC also compared 23472 to 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* (work RVU=22.65) a comparable procedure in the elbow that was approved at this meeting at a work RVU of 22.00. This service has slightly more positioning work than the elbow which justifies the slightly higher value. **The RUC recommends a work RVU of 22.13 for CPT code 23472.**

23473
The RUC reviewed the survey and recommends a work RVU of 25.00, the survey's 25th percentile. In addition, the RUC agreed that 12 minutes of additional pre-service positioning time is warranted in order to position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. The RUC compared 23473to the key reference service 23210 *Radical resection of tumor; scapula* (work RVU=27.21, intra-service time=210) and determined that this service requires less physician time at 180 minutes intra-service time. Due to less time and in order to maintain rank order the RUC recommends a lower value than the key reference service. The RUC also agreed that the recommended work RVU maintains relativity within the family, specifically compared to 23472 which has less intra-service time. **The RUC recommends a work RVU of 25.00 for CPT code 23473.**

23474
The RUC reviewed the survey and recommends a work RVU of 27.21, below the survey's 25th percentile. The RUC agreed that a value any higher would cause a rank order anomaly in the code family and render intensity that is too high for this procedure. The work RVU recommendation for 23474 was determined based on a direct crosswalk to CPT code 23210 *Radical resection of tumor; scapula* (work RVU=27.21). These codes have intra-service times of 210 and 205 minutes, respectively and the remainder of the post-operative work is the same. The RUC also compared 23474 to 27487 *Revision of total knee arthroplasty, with or without allograft; femoral and entire tibial component* (work RVU=27.11) and determined that the codes are consistent with a total time of 513 and 520, respectively. **The RUC recommends a work RVU of 27.21 for CPT code 23474, a direct crosswalk to CPT code 23210.**

Work Neutrality: The RUC's recommendations for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense: The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
23331	E1	Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal)	090	7.63 (No Change) Refer to CPT Editorial Panel
23332	E2	complicated (eg, total shoulder) (Do not report 23331, 23332 in conjunction with 23473, 23474 if a prosthesis [ie, humeral and/or glenoid component(s)] is being removed and replaced in the same shoulder)	090	12.37 (No Change) Refer to CPT Editorial Panel
23472	E3	Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)) (For removal of total shoulder implants, see 23331, 23332) (For osteotomy, proximal humerus, use 24400)	090	22.13
●23473	E4	Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component	090	25.00
●23474	E5	humeral and glenoid component (Do not report 23473, 23474 in conjunction with 23331, 23332 if a prosthesis [ie, humeral and/or glenoid component(s)] is being removed and replaced in the same shoulder)	090	27.21

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:23472 Tracking Number E3 Original Specialty Recommended RVU: **22.13**
Presented Recommended RVU: **22.13**
Global Period: 090 RUC Recommended RVU: **22.13**

CPT Descriptor: Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder))

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old with incapacitating arthritis undergoes a total shoulder replacement involving both humeral and glenoid components

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning - position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a deltopectoral incision is made from the mid clavicle to the junction to the mid-third of the humerus. The deltopectoral interval is opened allowing identification of the conjoined tendon. Careful protection around neurovascular structures during the case including the axillary and musculocutaneous nerve is imperative. The subscapularis tendon is divided , tagged and mobilized. The anterior capsule is excised. A wide capsular release is performed for exposure and mobilization of the proximal humerus. Dislocation of the shoulder is performed with intraoperative inspection and assessment of the humeral head and glenoid fossa. Precise resection of the proximal humeral head is done utilizing an alignment jig. The humeral canal is reamed and broached to accept the prosthesis. The glenoid fossa is carefully prepared to accept the properly aligned glenoid component in the correct version. This component is fixed in place with cement or screws. Scrupulous preparation and cleansing of the humeral canal is necessary prior to placement of the prosthetic humeral component. Cementing or press-fit of the humeral component within the humeral shaft is performed. Carefully align the humeral component in the proper degree of retroversion to prevent postoperative subluxation or dislocation. The rotator cuff and anterior capsule are repaired. Frequently a subacromial decompression and

acromioplasty with resection of the coracoacromial ligament is done. Reattachment of the subscapularis tendon is accomplished followed by re-approximation of the deltopectoral interval and closure of the subcutaneous tissue and skin.

Description of Post-Service Work: Hospital - through discharge from recovery room: Apply sterile dressings. The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity to ensure that no brachial plexus injury has occurred during surgery. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise, indicating avoidance of passive stretching of the shoulder. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic shoulder. Write orders for progression to active exercise depending on the quality of the rotator cuff tissues and the adequacy of the rotator cuff repair. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.08	2.89
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.17	2.89
Urgency of medical decision making	2.58	3.56
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.08	3.78
Physical effort required	3.75	3.56
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.42	3.33
Outcome depends on the skill and judgment of physician	4.42	4.22
Estimated risk of malpractice suit with poor outcome	3.42	3.56

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.25	3.22
Intra-Service intensity/complexity	3.92	3.67
Post-Service intensity/complexity	3.08	3.22

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT code **23472** was included for survey as a family member of new CPT codes **23473**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component*, and **23474**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral AND glenoid component*

23473 and 23474, along with CPT codes 24370, *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component* and 24371, *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component* were presented to, and approved by, the CPT Editorial Panel at their October 2011 meeting. The rationale for developing the new codes for total shoulder arthroplasty revision and for total elbow arthroplasty revision was to replace the current coding for these procedures which consisted of billing the total joint implant (23472 and 24363 respectively) with the foreign body removal or implant removal (23331, 23332, and 24160 respectively) with codes for revision of one or both components. This had been requested of the societies by the Centers for Medicare and Medicaid Services (CMS) through written correspondence.

Subsequent to the October 2011 CPT Editorial Panel meeting the new revision codes were forwarded for survey and CMS also asked the societies to survey codes within the respective families. The societies undertook survey efforts for presentation and review at the January 2012 RUC meeting but had collected an insufficient number of surveys for an accurate valuation and at the January 2012 RUC meeting we requested additional time to continue to collect survey responses which was granted and we were able to collect enough additional surveys to provide accurate work RVU recommendations.

CPT code 23472 is a RUC-valued code last surveyed in 1995. The current wRVU is 22.65. Times are 55 minutes pre-service, not broken out, 155 minutes intra-service time, 30 minutes immediate post-service time, 2 inpatient facility visits (1-99232, 1-99231), a full 99238 discharge, and four total post-operative office visits (3-99213, 1-99212) and a total time of 458. The current IWPUT is 0.079.

The AAOS and ASSH conducted a RUC survey and received 28 responses from surgeons without a financial conflict. The median preservice survey times were 45 minutes for pre-service evaluation time, 18 minutes for pre-service positioning time, and 15 minutes scrub, dress and wait. The survey intra-service time was 140 minutes, and immediate post-service time was 30 minutes. The survey respondents overwhelmingly indicated the procedure is performed in inpatient hospital settings and indicated the typical patient stays four days in the facility with one 99232, two 99231 and one 99238 discharge visit assigned. The survey results indicated there are typically four post-operative office visits, three 99213 and one 99212. The survey 25th percentile wRVU was 22.13 and the survey median wRVU was 25.00.

Survey Sample Description
The survey sample for the surveys was derived randomly. The AAOS pulled a random set of 200 orthopaedic surgeons from their member database and then sent all three surveys to this set of 200. The ASSH sent an email to their entire membership asking for members familiar with the procedures and then forwarded the three surveys to any members who indicated experience with the procedures. The ASES sent all three surveys to a random subset of 200 members.

Recommended wRVU and Physician Times

We are recommending a wRVU of 22.13 which is the survey 25th percentile wRVU and less than the current wRVU. We are recommending the pre-service package 4, difficult patient/diffuclt procedure with 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time (12 minutes more than the package and crosswalked from recently valued shoulder codes with the patient positioned beach chair) and 15 minutes pre-service scrub, dress and wait time. We are recommending the survey median intra-service time of 140 minutes and immediate post-service time of 30 minutes. We are recommending the survey post-operative facility visits of 1-99232, 2-99231, and 1-99238 and the survey post-operative office visits of 3-99213 and 1-99212. Total recommended time is 448 minutes with an IWPUT of 0.089.

We believe this is an appropriate value because it is the 25th percentile wRVU; because it fits well in rank order with its key reference service (23616), and because it fits in rank order with other codes in the family, most specifically 23331 and 23332 for which we are recommending slightly lower wRVUs to reflect the intra-service times.

Comparison to Key Reference Service

	CPT	RVW	TOT MIN	Pre-Eval	Pre-Position-ing	Pre-SDW	Intra-Service	Immd Post	# and Level Post Fac	# and Level Fac Discharge	# and Level Post Office
Survey Code	23472	**22.13**	**448**	40	15	20	140	30	1-99232 2-99231	1-99238	3-99213 1-99212
Key Ref Code	23616	**18.37**	**413**	50	15	15	120	30	1-99232 1-	1-99238	3-99213 1-99212

									99231		

23616, Open treatment of proximal humeral (surgical or anatomical neck) fracture, includes internal fixation, when performed, includes repair of tuberosity(s), when performed; with proximal humeral prosthetic replacement is a good comparison code for 23332 with similar, but slightly lower times and a wRVU that is lower to reflect the lower intra-service time for 23616. The total recommended time for 23472 is 448 minutes, which is 35 minutes more than the total time for 23616 with 20 more intra-service minutes and an additional post-operative inpatient facility visit.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23472

Presented Recommended RVU: **25.00**
Global Period: 090 RUC Recommended RVU: **25.00**

CPT Descriptor: Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old female is 17 years following a total shoulder arthroplasty and has pain and limited motion with radiographic evidence of component loosening. She undergoes revision of the humeral component.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning - position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a deltopectoral incision is made from the mid clavicle to the junction to the mid-third of the humerus. The deltopectoral interval is opened allowing identification of the conjoined tendon. Careful protection around neurovascular structures during the case including the axillary and musculocutaneous nerve is imperative. The subscapularis tendon is divided , tagged and mobilized. A wide capsular release is performed for exposure and mobilization of the proximal humerus. Dislocation of the shoulder components is performed with intraoperative inspection and assessment of the humeral component. Extensive scar tissue is excised. Extraction instruments are used to remove the loose humeral component and loose glenoid component. Meticulous preparation and cleaning of the humeral canal, including removal of the fibrous membrane and all of the cement is performed. The wound is irrigated with liters of antibiotic fluid. Cementing or press-fit with or without bone graft of the humeral component within the humeral shaft is done. Judgment and technical skill are necessary to carefully align the humeral component in the proper height and degree of retroversion to prevent postoperative subluxation or dislocation. Reattachment of the subscapularis tendon is next done followed by re-approximation of the deltopectoral interval and closure of the subcutaneous tissue and skin.

Description of Post-Service Work:
Hospital - through discharge from recovery room: Apply sterile dressings. The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity to ensure that no brachial plexus injury has occurred during surgery. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise, indicating avoidance of passive stretching of the shoulder. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic shoulder. Write orders for progression to active exercise depending on the quality of the rotator cuff tissues and the adequacy of the rotator cuff repair. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Pre-Service intensity/complexity	4.50	4.75
Intra-Service intensity/complexity	5.00	5.00
Post-Service intensity/complexity	4.13	4.75

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT codes **23473**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component*, and **23474**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral AND*

glenoid component, along with CPT codes 24370, *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component* and 24371, *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component* were presented to, and approved by, the CPT Editorial Panel at their October 2011 meeting. The rationale for developing the new codes for total shoulder arthroplasty revision and for total elbow arthroplasty revision was to replace the current coding for these procedures which consisted of billing the total joint implant (23472 and 24363 respectively) with the foreign body removal or implant removal (23331, 23332, and 24160 respectively) with codes for revision of one or both components. This had been requested of the societies by the Centers for Medicare and Medicaid Services (CMS) through written correspondence.

Subsequent to the October 2011 CPT Editorial Panel meeting the new revision codes were forwarded for survey and CMS also asked the societies to survey codes within the respective families. The societies undertook survey efforts for presentation and review at the January 2012 RUC meeting but had collected an insufficient number of surveys for an accurate valuation and at the January 2012 RUC meeting we requested additional time to continue to collect survey responses which was granted and we were able to collect enough additional surveys to provide accurate work RVU recommendations.

The AAOS and ASSH conducted a RUC survey and received 28 responses from surgeons without a financial conflict. The median preservice survey times were 58 minutes for pre-service evaluation time, 18 minutes for pre-service positioning time, and 15 minutes scrub, dress and wait. The survey intra-service time was 180 minutes, and immediate post-service time was 30 minutes. The survey respondents overwhelmingly indicated the procedure is performed in inpatient hospital settings and indicated the typical patient stays four days in the facility with one 99232, two 99231 and one 99238 discharge visit assigned. The survey results indicated there are typically four post-operative office visits, three 99213 and one 99212. The survey 25th percentile wRVU was 25.00 and the survey median wRVU was 30.00.

Survey Sample Description
The survey sample for the surveys was derived randomly. The AAOS pulled a random set of 200 orthopaedic surgeons from their member database and then sent all three surveys to this set of 200. The ASSH sent an email to their entire membership asking for members familiar with the procedures and then forwarded the three surveys to any members who indicated experience with the procedures. The ASES sent all three surveys to a random subset of 200 members.

Recommended wRVU and Physician Times

We are recommending a wRVU of 25.00 which is the survey 25th percentile wRVU. We are recommending the pre-service package 4, difficult patient/diffuclt procedure with 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time (12 minutes more than the package and crosswalked from recently valued shoulder codes with the patient positioned beach chair) and 15 minutes pre-service scrub, dress and wait time. We are recommending the survey median intra-service time of 180 minutes and immediate post-service time of 30 minutes. We are recommending the survey post-operative facility visits of 1-99232, 2-99231, and 1-99238 and the survey post-operative office visits of 3-99213 and 1-99212. Total recommended time is 488 minutes with an IWPUT of 0.085.

We believe this is an appropriate value because it is the 25th percentile wRVU and it fits well in rank order with its key reference service (23310), this also aligns with other codes in the family, most specifically 23472 for which we are recommending a lower wRVU than 23473 to reflect the lower intra-service time and 23474 for which we are recommending a wRVU higher than 23473 to reflect the higher intra-service time.

A wRVU of 25.00 is also less than what the current wRVUs. The procedure is currently coded 23472 (22.65 wRVU) + 23331-51 modifier (7.63/2=3.82wRVU) which is a total of 26.47 wRVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23472 and 23331

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 650
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We arrived at the estimate by looking first at the 2010 Medicare utilization for CPT code 23472, Total Shoulder Arthroplasty which was 24,415. The third most common ICD-9 diagnosis code was ICD-9 code 996 which is for complication of a specific procedure and it was listed for 4.3% of the 23472's in 2010. 4.3% of 24,415 equals approximately 1,050. Next, we assumed that of those 1,050 revisions approximately half were for one component (23473) and half were for both components (23474) which would mean 525 for each. We then added another 125 procedures to account for the potential other 23472s that may have actually been revisions but had a different ICD-9 code attached to them.

Specialty orthopaedic surgery Frequency 620 Percentage 95.38 %

Specialty hand surgery Frequency 30 Percentage 4.61 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning - position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a deltopectoral incision is made from the mid clavicle to the junction to the mid-third of the humerus. The deltopectoral interval is opened allowing identification of the conjoined tendon. Careful protection around neurovascular structures during the case including the axillary and musculocutaneous nerve is imperative. The subscapularis tendon is divided , tagged and mobilized. A wide capsular release is performed for exposure and mobilization of the proximal humerus. Dislocation of the shoulder components is performed with intraoperative inspection and assessment of the humeral and glenoid components. Extensive scar tissue is excised. Extraction instruments are used to remove the loose humeral component and loose glenoid component. Meticulous preparation and cleaning of the humeral canal, including removal of the fibrous membrane and all of the cement is performed. Meticulous preparation and cleaning of the glenoid, including removal of the fibrous membrane and all of the cement is performed. The wound is irrigated with liters of antibiotic fluid. The glenoid fossa is carefully prepared to accept a properly aligned glenoid component, with or without bone graft. This component is fixed in place with cement or screws. Judgment and technical

skill are necessary to carefully align the glenoid component in the proper position and version to prevent postoperative subluxation or dislocation Cementing or press-fit with or without bone graft of the humeral component within the humeral shaft is done. Judgment and technical skill are necessary to carefully align the humeral component in the proper height and degree of retroversion to prevent postoperative subluxation or dislocation. Reattachment of the subscapularis tendon is next done followed by re-approximation of the deltopectoral interval and closure of the subcutaneous tissue and skin.

Description of Post-Service Work:
Hospital - through discharge from recovery room: Apply sterile dressings. The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity to ensure that no brachial plexus injury has occurred during surgery. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise, indicating avoidance of passive stretching of the shoulder. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic shoulder. Write orders for progression to active exercise depending on the quality of the rotator cuff tissues and the adequacy of the rotator cuff repair. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
23220	090	30.21	**RUC Time**

CPT Descriptor Radical resection of tumor, proximal humerus

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
63051	090	25.51	**RUC Time**	781

CPT Descriptor 1 Laminoplasty, cervical, with decompression of the spinal cord, 2 or more vertebral segments; with reconstruction of the posterior bony elements (including the application of bridging bone graft and non-segmental fixation devices (eg, wire, suture, mini-plates), when performed)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
44626	090	27.90	**RUC Time**	4,250

CPT Descriptor 2 Closure of enterostomy, large or small intestine; with resection and colorectal anastomosis (eg, closure of Hartmann type procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
23210	090	27.21	**RUC Time**

CPT Descriptor Radical resection of tumor; scapula

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 32.1 **%**

TIME ESTIMATES (Median)	**CPT Code: 23474**	**Key Reference CPT Code:** 23220	**Source of Time RUC Time**
Median Pre-Service Time	75.00	72.00	
Median Intra-Service Time	205.00	240.00	
Median Immediate Post-service Time	30.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	80.0	120.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	85.0	102.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	

Median Total Time	**513.00**	**602.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.25	4.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.50	4.17
Urgency of medical decision making	2.50	3.67
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.88	5.00
Physical effort required	4.50	4.67
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.63	4.83
Outcome depends on the skill and judgment of physician	4.63	4.67
Estimated risk of malpractice suit with poor outcome	3.88	3.83

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.38	4.33
Intra-Service intensity/complexity	4.75	4.50
Post-Service intensity/complexity	3.63	4.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT codes **23473**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component*, and **23474**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral AND*

glenoid component, along with CPT codes 24370, *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component* and 24371, *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component* were presented to, and approved by, the CPT Editorial Panel at their October 2011 meeting. The rationale for developing the new codes for total shoulder arthroplasty revision and for total elbow arthroplasty revision was to replace the current coding for these procedures which consisted of billing the total joint implant (23472 and 24363 respectively) with the foreign body removal or implant removal (23331, 23332, and 24160 respectively) with codes for revision of one or both components. This had been requested of the societies by the Centers for Medicare and Medicaid Services (CMS) through written correspondence.

Subsequent to the October 2011 CPT Editorial Panel meeting the new revision codes were forwarded for survey and CMS also asked the societies to survey codes within the respective families. The societies undertook survey efforts for presentation and review at the January 2012 RUC meeting but had collected an insufficient number of surveys for an accurate valuation and at the January 2012 RUC meeting we requested additional time to continue to collect survey responses which was granted and we were able to collect enough additional surveys to provide accurate work RVU recommendations.

The AAOS and ASSH conducted a RUC survey and received 28 responses from surgeons without a financial conflict. The median pre-service survey time was 60 minutes for pre-service evaluation time, 18 minutes for pre-service positioning time, and 15 minutes scrub, dress and wait. The survey intra-service time was 205 minutes, and immediate post-service time was 30 minutes. The survey respondents overwhelmingly indicated the procedure is performed in inpatient hospital settings and indicated the typical patient stays four days in the facility with one 99232, two 99231 and one 99238 discharge visit assigned. The survey results indicated there are typically four post-operative office visits, three 99213 and one 99212. The survey 25th percentile wRVU was 31.50 and the survey median wRVU was 35.00.

Survey Sample Description
The survey sample for the surveys was derived randomly. The AAOS pulled a random set of 200 orthopaedic surgeons from their member database and then sent all three surveys to this set of 200. The ASSH sent an email to their entire membership asking for members familiar with the procedures and then forwarded the three surveys to any members who indicated experience with the procedures. The ASES sent all three surveys to a random subset of 200 members.

Recommended wRVU and Physician Times

We are recommending a wRVU of 27.21 which is a direct crosswalk from the reference code of 23210 with a wRVU of 27.21 minutes. We are recommending the pre-service package 4, difficult patient/diffuclt procedure with 40 minutes pre-service evaluation time, 15 minutes pre-service positioning time (12 minutes more than the package and crosswalked from recently valued shoulder codes with the patient positioned beach chair) and 15 minutes pre-service scrub, dress and wait time. We are recommending the survey median intra-service time of 205 minutes and immediate post-service time of 30 minutes. We are recommending the survey post-operative facility visits of 1-99232, 2-99231, and 1-99238 and the survey post-operative office visits of 3-99213 and 1-99212. Total recommended time is 513 minutes with an IWPUT of 0.086.

We believe this is an appropriate value because of the similarities between the surveyed times for 23474 and reference code 23310 and because our expert consensus panel did not feel the 25th% survey wRVU or the survey median wRVU were appropriate. 23474 has 205 minutes of intra-service time and 23210 has an intra-service time of 210 minutes and the total pre-service times are very similar, and the immediate post-service time is identical. 23210 has more time in the post-operative period but this is from higher levels of post-operative facility and office visits and not because of more post-operative facility and office visits. Thus, a wRVU of 27.21 maintains a correct rank order with reference code 23210 and also fits at the top of the family of should implant removal and total shoulder procedure codes.

A wRVU of 27.21 is also less than the current wRVUs. The procedure is currently coded with 23472 (22.65 wRVU) + 23332-51 modifier (12.37/2=6.19wRVU) which is a total of 28.84 wRVU.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23472 and 23332

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty hand surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 650
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please

explain the rationale for this estimate. We arrived at the estimate by looking first at the 2010 Medicare utilization for CPT code 23472, Total Shoulder Arthroplasty which was 24,415. The third most common ICD-9 diagnosis code was ICD-9 code 996 which is for complication of a specific procedure and it was listed for 4.3% of the 23472's in 2010. 4.3% of 24,415 equals approximately 1,050. Next, we assumed that of those 1,050 revisions approximately half were for one component (23473) and half were for both components (23474) which would mean 525 for each. We then added another 125 procedures to account for the potential other 23472s that may have actually been revisions but had a different ICD-9 code attached to them.

Specialty orthopaedic surgery Frequency 620 Percentage 95.38 %

Specialty hand surgery Frequency 30 Percentage 4.61 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 23210

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:
23331, Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal)
23332, Removal of foreign body, shoulder; complicated (eg, total shoulder)
23472, Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder))
23473, Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component
23474, Revision of total shoulder arthroplasty, including allograft when performed; humeral AND glenoid component

Global Period: 090 Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A consensus expert panel committee was convened and reviewed the procedure under review. The consensus panel compared the current PE details for 23331, 23332 and 23472 and determined no changes beyond changes in post-operative service time where the level and/or number of post-operative office visits were warranted. Otherwise, standard 090 facility inputs were used for the existing codes as well as the new codes.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale: Consensus committee reviewed current PE details as comparison codes for both the existing and the new codes as these are the most relevant to the existing and new code descriptors.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Standard pre-service clinical labor activities for 090-day global facility codes

Intra-Service Clinical Labor Activities:

Standard intra-service clinical labor activities for 090-day global facility codes

Post-Service Clinical Labor Activities:

Standard post-service clinical labor activities for 090-day global facility codes

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Elbow Arthroplasty and Implant Removal

In October 2011, the CPT Editorial Panel created two new CPT codes for revision of a total elbow arthroplasty, CPT code 24370 *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component* and CPT code 24371 *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component.* The new codes were created because of a CCI edit stating that providers could no longer report implant removal and total elbow arthroplasty when a revision arthroplasty was performed. The specialty societies surveyed for the January 2012 RUC meeting, but were not able to collect a sufficient number of surveys for an accurate review and valuation. In January 2012 the RUC approved the specialty society's request to continue collecting survey responses. CMS requested surveys for all base and family codes, including CPT code 24160 *Implant removal; elbow joint* (work RVU=8.00) and CPT code 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow*) (work RVU=22.65). These procedures are low volume and as a result have low survey response, however the RUC agreed that enough additional surveys were collected for the specialty societies to present work RVU recommendations at the April 2012 RUC meeting.

24160 *Implant removal; elbow joint*
The RUC reviewed the survey results and determined the current code descriptor is non-specific to the type of implant removed. **The RUC recommends that the current work RVU of 8.00 be maintained for CPT code 24160 and that the code be referred to CPT for revision of the description.**

24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)*
The RUC reviewed the survey results and recommends a work RVU of 22.00, the survey's 25th percentile, less than the current work RVU of 22.65. The RUC compared 24363 to key reference service 24150 *Radical resection of tumor, shaft or distal humerus* (work RVU=23.46) and determined that the reference code has 40 minutes more intraservice time, justifying the higher work RVU. The RUC also compared 24363 to CPT code 27130 *Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft* (work RVU=21.79), and noted that these services have almost identical intraservice time at 140 and 135, respectively, therefore the recommended work RVU maintains the proper relativity among similar arthroplasty services. **The RUC recommends a work RVU of 22.00 for CPT code 24363.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

24370 *Revision of total elbow arthroplasty, including allograft when performed; humeral or ulnar component*
The RUC reviewed the survey results and recommends a work RVU of 23.55, the survey's 25th percentile. CPT code 24370 is revision of one side of the elbow and is performed less commonly than 24371, which is revision of both sides. The RUC compared 24370 to 24150 *Radical resection of tumor, shaft or distal humerus* (work RVU=23.46) and noted that these services have almost identical intraservice time 175 and 180, respectively, however, the complexity and intensity of work to remove and replace the elbow joint is greater than the work to resect a tumor from a bone. The recommended work RVU maintains the proper relativity among similar arthroplasty services and excision procedures. **The RUC recommends a work RVU of 23.55 for CPT code 24370.**

24371 *Revision of total elbow arthroplasty, including allograft when performed; humeral and ulnar component*
The RUC reviewed the survey and recommends a work RVU of 27.50, the survey's 25th percentile. The RUC discussed changes in the work involved in this service and agreed that there have been significant changes in the removal of the prosthesis with cemented components, which is an integral part of this procedure, consistent with the increase in RVUs. It was also noted that the procedure involves removing the prosthesis as well as preserving what is necessary to complete a replacement arthroplasty, and this is the most intense time in the procedure. The RUC compared 24371 to 23210 *Radical resection of tumor; scapula* (work RVU=27.21) and noted that these services have identical intraservice time and should be valued similarly. **The RUC recommends a work RVU of 27.50 for CPT code 24371.**

Work Neutrality
The RUC's recommendations for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
24160	F1	Implant removal; elbow joint (Do not report 24160 in conjunction with 24370 or 24371 if a prosthesis [ie, humeral and/or ulnar component(s)] is being removed and replaced in the same elbow)	090	8.00 (No Change) (Refer to CPT Editorial Panel)
24363	F2	Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow) (For revision of total elbow implant, see 24370, 24371)	090	22.00
●24370	F3	Revision of total elbow arthroplasty, including allograft when performed; humeral or ulnar component	090	23.55
●24371	F4	humeral and ulnar component (Do not report 24370-24371 in conjunction with 24160 if a prosthesis [ie, humeral and/or ulnar component(s)] is being removed and replaced in the same elbow)	090	27.50

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:24363 Tracking Number F2 Original Specialty Recommended RVU: **22.50**
Presented Recommended RVU: **22.00**
Global Period: 090 RUC Recommended RVU: **22.00**

CPT Descriptor: Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 58-year-old female undergoes total elbow replacement with humeral and ulnar replacement for rheumatoid arthritis..

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning in a lateral decubitus position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a posterior elbow incision is made. The ulnar nerve is identified for protection throughout the dissection. The triceps and extensor mechanism are released from a near insertion on the ulna and then displaced in a radial direction. The elbow joint is exposed and the synovium and capsule are released from the humerus with excision of the excess synovium after exposing the whole elbow joint. A burr and saw along with cutting guides are used to cut the proximal ulna and the distal humerus and a total elbow arthroplasty is performed using the technique as described. After trial components are inserted in a correct position, the final components are inserted using methylmethacrylate in order to complete the procedure. Extra bone is placed about the prosthesis as needed. The tourniquet is released, hemostasis is obtained, and the triceps tendon is re-approximated to the proximal ulna. The remainder of the extensor mechanism is approximated, subcutaneous tissue approximated, and the skin is closed..

Description of Post-Service Work: Hospital - through discharge from recovery room: Apply sterile dressings and splint. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss

procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic elbow. Write orders for progression to active exercise. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples and sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.57	3.67
Intra-Service intensity/complexity	4.00	3.83
Post-Service intensity/complexity	3.29	3.17

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT code **24363** was included for survey as a family member of new CPT codes **24370**, *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component*, and **24371**, *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component*

24370 and 24371 along with **24373**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component*, and **24374**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral AND glenoid component* were presented to, and approved by, the CPT Editorial Panel at their October 2011 meeting. The rationale for developing the new codes for total shoulder arthroplasty revision and for total elbow arthroplasty revision was to replace the current coding for these procedures which consisted of billing the total joint implant (23472 and 24363 respectively) with the foreign body removal or implant removal (23331, 23332, and 24160 respectively) with codes for revision of one or both components. This had been requested of the societies by the Centers for Medicare and Medicaid Services (CMS) through written correspondence.

Subsequent to the October 2011 CPT Editorial Panel meeting the new revision codes were forwarded for survey and CMS also asked the societies to survey codes within the respective families. The societies undertook survey efforts for presentation and review at the January 2012 RUC meeting but had collected an insufficient number of surveys for an accurate valuation and at the January 2012 RUC meeting we requested additional time to continue to collect survey responses which was granted and we were able to collect enough additional surveys to provide accurate work RVU recommendations.

CPT code 24363 is a RUC valued code that was last surveyed and revalued in 2005 as part of the 3rd 5-Year review. The current work RVU is 22.62 with pre-service evaluation and SDW combined time of 50 minutes, 17.50 minutes of pre-service positioning, 150 minutes of intra-service time, 30 minutes immediate post-service time, 3 total inpatient facility visits (1-99232, 2-99231), one full inpatient facility discharge (99238) and four post-operative office visits (3-99213, 1-99212).

The AAOS and ASSH conducted a RUC survey and received 26 responses from surgeons without a financial conflict. The median preservice survey times were 45 minutes for pre-service evaluation time, 15 minutes for pre-service positioning time, and 15 minutes scrub, dress and wait. The survey intra-service time was 140 minutes, and immediate post-service time was 30 minutes. The survey respondents overwhelmingly indicated the procedure is performed in inpatient hospital settings and indicated the typical patient stays three days in the facility with one 99232, two 99231, plus a full hospital facility discharge (99238). The survey results indicated there are typically four post-operative office visits, three 99213 and one 99212.

Survey Sample Description
The survey sample for the surveys was derived randomly. The AAOS pulled a random set of 200 orthopaedic surgeons from their member database and then sent all three surveys to this set of 200. The ASSH sent an email to their entire membership asking for members familiar with the procedures and then forwarded the three surveys to any members who indicated experience with the procedures. The ASES sent all three surveys to a random subset of 200 members.

Recommended wRVU and Physician Times

We are recommending a wRVU of 22.50 which is the survey median wRVU and less than the current value of 22.65. We are recommending the pre-service package 4, difficult patient/diffuclt procedure with 40 minutes pre-service evaluation time, 12 minutes pre-service positioning time (9 minutes more than the package and crosswalked from recently valued elbow codes with the patient positioned lateral decubitus) and 15 minutes pre-service scrub, dress and wait time. We are recommending the survey median intra-service time of 140 minutes and immediate post-service time of 30 minutes. We are recommending the survey post-operative facility visits of 1-99232, 2-99231, and 1-99238 and the survey post-operative office visits of 3-99213 and 1-99212. Total recommended time is 445 minutes.

We believe this is an appropriate value because it is the survey median wRVU and the recommended value is very similar (but very slightly lower) than the current wRVU. In comparison to the current wRVU and times, our recommended wRVU is very slightly lower (22.50 compared to 22.65) which we believe is appropriate because the total times are essentially identical as well (445 compared to 448). The current IWPUT is 0.091 and the recommended IWPUT is 0.089.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24363

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Sometimes

Specialty hand surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 832
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CMS Website: 2010 Medicare final utilization for CY 2012 PFS for 24363 (979) subtracting the total number of total elbow arthroplasty revision codes we are assuming will be performed which is roughly 147 (24370 and 24371) because those will no longer will be billed under 24363 leaving approximately 832 total elbow arthroplasty codes done a year

Specialty orthopaedic surgery Frequency 652 Percentage 78.36 %

Specialty hand surgery Frequency 163 Percentage 19.59 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 24363

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Descriptor: Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female is 15 years following a total elbow arthroplasty and has pain and limited motion with radiographic evidence of component loosening. She undergoes revision of the humeral component.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning in a lateral decubitus position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a posterior elbow incision is made. The ulnar nerve is identified for protection throughout the dissection. The triceps and extensor mechanism are released from their insertion on the ulna and then displaced in a radial direction. The elbow joint is exposed and scar tissue is excised and contractures released from the humerus for exposure and soft tissue balancing. Extraction instruments are used to remove the loose humeral component. Meticulous preparation and cleansing of the humeral canal, including fibrous membrane and cement removal, is necessary prior to placement of the prosthetic humeral component. A burr and saw along with cutting guides are used to cut the proximal ulna or the distal humerus as necessary. After a trial component is inserted in a correct position, the final component is inserted using cement in order to complete the procedure. Judgment and technical skill are necessary to carefully align the component with the proper degree of rotation. The tourniquet is released, hemostasis obtained, the collateral ligaments repaired and the triceps tendon/extensor mechanism is re-approximated to the proximal ulna. The subcutaneous tissue is approximated and the skin is closed.

Description of Post-Service Work: Hospital - through discharge from recovery room: Apply sterile dressings and splint. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery

room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic elbow. Write orders for progression to active exercise. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples and sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT codes **24370**, *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component*, and **24371**, *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component* along with **24370**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component*, and **24371**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral*

AND glenoid component were presented to, and approved by, the CPT Editorial Panel at their October 2011 meeting. The rationale for developing the new codes for total shoulder arthroplasty revision and for total elbow arthroplasty revision was to replace the current coding for these procedures which consisted of billing the total joint implant (23472 and 24363 respectively) with implant removal (23331, 23332, and 24160 respectively) with codes for revision of one or both components. This had been requested of the societies by the Centers for Medicare and Medicaid Services (CMS) through written correspondence.

Subsequent to the October 2011 CPT Editorial Panel meeting the new revision codes were forwarded for survey and CMS also asked the societies to survey codes within the respective families. The societies undertook survey efforts for presentation and review at the January 2012 RUC meeting but had collected an insufficient number of surveys for an accurate valuation and at the January 2012 RUC meeting we requested additional time to continue to collect survey responses which was granted and we were able to collect enough additional surveys to provide accurate work RVU recommendations.

The AAOS and ASSH conducted a RUC survey and received 26 responses from surgeons without a financial conflict. The median preservice survey times were 58 minutes for pre-service evaluation time, 15 minutes for pre-service positioning time, and 15 minutes scrub, dress and wait. The survey intra-service time was 175 minutes, and immediate post-service time was 20 minutes. The survey respondents overwhelmingly indicated the procedure is performed in inpatient hospital settings and indicated the typical patient stays three days in the facility with one 99232, two 99231, plus a full hospital facility discharge (99238). The survey results indicated there are typically four post-operative office visits, three 99213 and one 99212.

Survey Sample Description
The survey sample for the surveys was derived randomly. The AAOS pulled a random set of 200 orthopaedic surgeons from their member database and then sent all three surveys to this set of 200. The ASSH sent an email to their entire membership asking for members familiar with the procedures and then forwarded the three surveys to any members who indicated experience with the procedures. The ASES sent all three surveys to a random subset of 200 members.

Recommended wRVU and Physician Times

We are recommending a wRVU of 23.55 which is the survey 25th percentile wRVU. We are recommending the pre-service package 4, difficult patient/diffuclt procedure with 40 minutes pre-service evaluation time, 12 minutes pre-service positioning time (9 minutes more than the package and crosswalked from recently valued elbow codes with the patient positioned lateral decubitis) and 15 minutes pre-service scrub, dress and wait time. We are recommending the survey median intra-service time of 175 minutes and immediate post-service time of 20 minutes. We are recommending the survey post-operative facility visits of 1-99232, 2-99231, and 1-99238 and the survey post-operative office visits of 3-99213 and 1-99212. Total recommended time is 470 minutes and an IWPUT of 0.081.

We believe this is an appropriate value because it is the survey 25th% wRVU and a reasonable IWPUT. It also fits in rank order within the family of elbow implant and joint replacement and revision codes with a slightly higher wRVU than CPT code 24363, Total Elbow Arthroplasty, and lower than 24371, revision of Total Elbow Athroplasty, both components.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24363 and 24160

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty hand surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 47 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This procedure was previously billed as 24363 + 24160. We assume the 2010 Medicare total utilization for 24160 includes the majority of elbow implant removals as part of a total elbow arthroplasty revision but that a small number of 24160 would have been for implant removals not as a part of a total elbow arthroplasty.

Specialty orthopaedic surgery Frequency 79 Percentage 168.08 %

Specialty hand surgery Frequency 19 Percentage 40.42 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 24363

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:24371 Tracking Number F4 Original Specialty Recommended RVU: **27.50**
Presented Recommended RVU: **27.50**
Global Period: 090 RUC Recommended RVU: **27.50**

CPT Descriptor: Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old female is 15 years following a total elbow arthroplasty and has pain and limited motion with radiographic evidence of component loosening. She undergoes revision of both the humeral and ulnar components.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning in a lateral decubitus position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a posterior elbow incision is made. The ulnar nerve is identified for protection throughout the dissection. The triceps and extensor mechanism are released from their insertion on the ulna and then displaced in a radial direction. The elbow joint is exposed and scar tissue is excised and contractures released from the humerus and ulna for exposure and soft tissue balancing. Extraction instruments are used to remove the loose humeral and ulnar components, along with all of the fibrous membrane and cement. The proximal ulna is carefully prepared to accept a properly aligned ulnar component, with or without bone graft. Meticulous preparation and cleansing of the humeral canal, including cement removal, is necessary prior to placement of the prosthetic humeral component. A burr and saw along with cutting guides are used to cut the proximal ulna and the distal humerus as necessary. After trial components are inserted in a correct position, the final components are inserted using cement in order to complete the procedure. Judgment and technical skill are necessary to carefully align the components with the proper degree of rotation. The tourniquet is released, hemostasis obtained, the collateral ligaments repaired and the triceps tendon/extensor mechanism is re-approximated to the proximal ulna. The subcutaneous tissue is approximated and the skin is closed.

Description of Post-Service Work: Hospital - through discharge from recovery room: Apply sterile dressings and splint. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic elbow. Write orders for progression to active exercise. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples and sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT codes **24370**, *Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component*, and **24371**, *Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component* along with **24370**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral OR glenoid component*, and **24371**, *Revision of total shoulder arthroplasty, including allograft when performed; humeral AND glenoid component* were presented to, and approved by, the CPT Editorial Panel at their October 2011 meeting along with new . The rationale for developing the new codes for total shoulder arthroplasty revision and for total elbow arthroplasty revision was to replace the current coding for these procedures which consisted of billing the total joint implant (23472 and 24363 respectively) with implant removal (23331, 23332, and 24160 respectively) with codes for revision of one or both components. This had been requested of the societies by the Centers for Medicare and Medicaid Services (CMS) through written correspondence.

Subsequent to the October 2011 CPT Editorial Panel meeting the new revision codes were forwarded for survey and CMS also asked the societies to survey codes within the respective families. The societies undertook survey efforts for presentation and review at the January 2012 RUC meeting but had collected an insufficient number of surveys for an accurate valuation and at the January 2012 RUC meeting we requested additional time to continue to collect survey responses which was granted and we were able to collect enough additional surveys to provide accurate work RVU recommendations.

The AAOS and ASSH conducted a RUC survey and received 26 responses from surgeons without a financial conflict. The median preservice survey times were 60 minutes for pre-service evaluation time, 15 minutes for pre-service positioning time, and 15 minutes scrub, dress and wait. The survey intra-service time was 210 minutes, and immediate post-service time was 20 minutes. The survey respondents overwhelmingly indicated the procedure is performed in inpatient hospital settings and indicated the typical patient stays three days in the facility with one 99232, two 99231, plus a full hospital facility discharge (99238). The survey results indicated there are typically four post-operative office visits, three 99213 and one 99212.

Survey Sample Description
The survey sample for the surveys was derived randomly. The AAOS pulled a random set of 200 orthopaedic surgeons from their member database and then sent all three surveys to this set of 200. The ASSH sent an email to their entire membership asking for members familiar with the procedures and then forwarded the three surveys to any members who indicated experience with the procedures. The ASES sent all three surveys to a random subset of 200 members.

Recommended wRVU and Physician Times

We are recommending a wRVU of 27.50 which is the survey 25th percentile wRVU. We are recommending the pre-service package 4, difficult patient/diffuclt procedure with 40 minutes pre-service evaluation time, 12 minutes pre-service positioning time (9 minutes more than the package and crosswalked from recently valued elbow codes with the patient positioned lateral debbitus) and 15 minutes pre-service scrub, dress and wait time. We are recommending the survey median intra-service time of 210 minutes and immediate post-service time of 20 minutes. We are recommending the survey post-operative facility visits of 1-99232, 2-99231, and 1-99238 and the survey post-operative office visits of 3-99213 and 1-99212. Total recommended time is 505 minutes and an IWPUT of 0.086.

We believe this is an appropriate value because it is the survey 25th% wRVU and a reasonable IWPUT. It also fits in rank order within the family of elbow implant and joint replacement and revision codes with a slightly higher wRVU than CPT code 24370, revision of Total Elbow Athroplasty, one component which correlates with the higher intra-service time for 24371 compared to 24370.

Comparison to Key Reference Service

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24363 and 24160

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery How often? Rarely

Specialty hand surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unkown

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This procedure was previously billed as 24363 + 24160. We assume the 2010 Medicare total utilization for 24160 represents the total number of elbow implant removals as part of a total elbow arthroplasty revision.

Specialty orthopaedic surgery Frequency 120 Percentage 120.00 %

Specialty Frequency 28 Percentage 28.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 24363

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:
24160, Implant removal; elbow joint
24363, Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)
24370, Revision of total elbow arthroplasty, including allograft when performed; humeral OR ulnar component
24371, Revision of total elbow arthroplasty, including allograft when performed; humeral AND ulnar component

Global Period: 090 Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A consensus expert panel committee was convened and reviewed the procedure under review. The consensus panel compared the current PE details for 24160, 24363 and and determined no changes beyond changes in post-operative service time where the level and/or number of post-operative office visits were warranted. Otherwise, standard 090 facility inputs were used for the existing codes as well as the new codes.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale: Consensus committee reviewed current PE details as comparison codes for both the existing and the new codes as these are the most relevant to the existing and new code descriptors.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Standard pre-service clinical labor activities for 090-day global facility codes

Intra-Service Clinical Labor Activities:

Standard intra-service clinical labor activities for 090-day global facility codes

Post-Service Clinical Labor Activities:

Standard post-service clinical labor activities for 090-day global facility codes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:74170 Tracking Number Original Specialty Recommended RVU: **1.40**
Presented Recommended RVU: **1.40**
Global Period: XXX RUC Recommended RVU: **1.40**

CPT Descriptor: Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old woman with hepatitis C and hepatocellular carcinoma post liver resection is being followed by her oncologist. The AFP level is newly elevated. A CT scan of the abdomen without and with contrast is ordered to evaluate for recurrence or metastasis.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work:
• Review the reason for the exam and any pertinent clinical history, including history of contrast allergy, renal insufficiency, or other contraindication to IV contrast
• Review any prior imaging studies
• Determine the appropriate CT protocol for the examination and communicate that protocol to the CT technologists, including need for, and type of, oral contrast agent

Description of Intra-Service Work:
• Supervise insertion of IV catheter and set-up of mechanical injector
• Supervise acquisition of scout views, prescribe area to be scanned, and supervise acquisition of unenhanced axial CT image data
• Supervise use of mechanical power injector for administration of a rapid bolus of intravenous contrast during scanning and acquisition of axial source image sections in multiple phases of contrast enhancement
• Supervise monitoring for contrast reaction or contrast extravasation during injection
• Review the early, intermediate, and delayed phases of CT image data to assure adequacy of anatomic coverage and assess need for additional sections, additional delayed images, or reconstruction of thin sections in specific locations
• Supervise reconstruction of coronal and/or sagittal 2-D multiplanar reformatted (MPR) images and assess need for oblique or other 2D images
• Typically, hundreds of images are acquired, and this total can increase to almost double when the source images are reviewed with the various requisite window/level settings

• Axial and multiplanar reformatted images are interpreted in early, intermediate, and delayed phases using "soft-tissue windows" to provide detailed evaluation of each of the following organs: lower mediastinum, liver, spleen, gallbladder, adrenal glands, kidneys, visualized portions of the ureters, retroperitoneal soft-tissues, stomach, duodenum, small bowel, visualized portions of the colon, all lymph node chains, major abdominal arterial and venous vasculature, and supporting musculature
• Axial and 2-D reformatted images are interpreted using "bone windows" to assess the skeletal structures, using "liver windows" to assess the liver, and "lung windows" to assess the visualized portions of the lungs
• Compare current findings to previous studies
• Dictate report for the medical record

Description of Post-Service Work:
• Review and sign final report
• Discuss findings with referring physician

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012				
Presenter(s):	Geraldine McGinty, MD; Zeke Silva, MD; David Rosman, MD				
Specialty(s):	American College of Radiology				
CPT Code:	74170

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
74178	XXX	2.01	**RUC Time**

CPT Descriptor Computed tomography, abdomen and pelvis; without contrast material in one or both body regions, followed by contrast material(s) and further sections in one or both body regions

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99392	XXX	1.50	**RUC Time**	

CPT Descriptor 1 Periodic comprehensive preventive medicine reevaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, established patient; early childhood (age 1 through 4 years)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 38 **% of respondents:** 50.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 74170**	**Key Reference CPT Code:** 74178	**Source of Time** **RUC Time**
Median Pre-Service Time	5.00	5.00	
Median Intra-Service Time	18.00	30.00	
Median Immediate Post-service Time	5.00	5.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	

Median Total Time	**28.00**	**40.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.58	3.53
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.68	3.45
Urgency of medical decision making	3.21	3.13
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.68	3.39
Physical effort required	2.34	2.37
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.00	2.76
Outcome depends on the skill and judgment of physician	4.13	3.71
Estimated risk of malpractice suit with poor outcome	3.45	3.34

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.37	2.32
Intra-Service intensity/complexity	3.76	3.55
Post-Service intensity/complexity	2.39	2.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The ACR convened a panel that included a number of physicians familiar with this service to review the RUC survey data. The recommendation is for the median survey times of 5, 18, and 5 minutes of pre, intra, and post time, respectively. Median survey RVU was 2.0; however, we believe that the median value is too high and are recommending a work value of 1.40, which maintains current value. Our recommended RVU value

falls below 25th percentile survey value.

The existing code, which has not been previously RUC surveyed, has a total time of 27 minutes. Our recommended post service time of 5 minutes is in line with other codes in the family which have been RUC surveyed, including 74176 (*Computed tomography, abdomen and pelvis; without contrast material*) and 74177 (*Computed tomography, abdomen and pelvis; with contrast material(s)*), as well as 72192 (*Computed tomography, pelvis; without contrast material*) and 72193 (*Computed tomography, pelvis; with contrast material(s)*).

The most commonly chosen reference service was 74178, (*Computed tomography, abdomen and pelvis; without contrast material in one or both body regions, followed by contrast material(s and further sections in one or both body regions*). This service is RUC valued with an RVU of 2.01 and pre, intra and post times of 5, 30, and 5 minutes, respectively. Our panel believes this service was chosen based on the similarity in the nature of the service and overlap of the service provided. The identical pre and post service times are expected, and demonstrate the consistency and accuracy of the survey data. The lesser intra-service time reflects the fact that the pelvis is not interpreted in the surveyed code.

The Expert Panel also considered the rank order of this code within the family of CT codes, including 74160, Computed tomography, abdomen; with contrast material(s), with an RVU of 1.27 and 15 minutes of intra service time, and 74150, Computed tomography, abdomen; without contrast material, with an RVU of 1.19 and 12 minutes of intra service time.

Our recommendations also compare favorably to our MPC code, 99392 (*Periodic comprehensive preventive medicine reevaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, established patient; early childhood (age 1 through 4 years*)), with an RVU value of 1.50 and a total time of 28 minutes.

In summary, our Expert Panel is recommending an RVU of 1.40, with pre/intra/post service times of 5/18/5, respectively, for a total time of 28 minutes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 74170

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2577960
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 74170 provided nationally in a one-year period is estimated to be 2,577,960.

Specialty Diagnostic Radiology Frequency 1929345 Percentage 74.83 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 859,320 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that CPT code 74170 was billed approximately 859,320 times for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 643115 Percentage 74.83 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 74170

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
74170 - Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections

Global Period: XXX Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology convened a consensus panel to finalize the practice expense data for CPT code 74170.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Since 74170 is an existing code, we used the PEAC approved data as the basis for the practice expense inputs for code 74170.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Retrieve prior appropriate imaging exams and hang for MD review, verify orders, review the chart to incorporate relevant clinical information and confirm contrast protocol with interpreting MD

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent/ Interview patient for contraindications
- Prepare room, equipment, supplies/ Enter patient demographic information into the scanner
- Prepare and position patient/ monitor patient/ set up IV
- Assist physician in performing procedure/ Acquire Images
- Clean room/equipment by physician staff
- Process films, hang films and review study with interpreting MD prior to patient discharge

Post-Service Clinical Labor Activities:

AMA/S*pecialty Society RVS Update Committee Summary of Recommendations*
Harvard Valued - Utilization over 100,000

April 2012

Denis-Browne Splint Revision

In February 2012, the CPT Editorial Panel accepted a request from the specialty societies to revise CPT code 29590 *Denis-Browne splint strapping* (work RVU=0.76) to more accurately describe the use of the Denis-Browne bar and to differentiate this service from other currently described services. Upon specialty survey, respondents indicated that the revised 29590 descriptor was problematic in that this code now describes manipulation and cast application. According to the specialty presenters, this service is no longer provided, as the prefabricated appliance is applied without manipulation and without casting. **The RUC recommends that the current value of code be maintained pending CPT Editorial Panel action to delete this code as originally proposed.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
#▲29590	FF1	Strapping; to a Denis-Browne bar (splint) with manipulation and casting (eg, for metatarsus adductus, clubfoot) (Do not report 29590 in conjunction with 29450, 29540, 29580, 97760, 97761 and 97762) (Do not report 29590 for fitting or application of shoes to the Denis-Browne orthosis)	000	0.76 (No Change) Refer to CPT Editorial Panel for Deletion

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

April 2, 2012

Barbara Levy, MD
Chair, AMA/Specialty Society RVS Update Committee
American Medical Association
515 North State Street
Chicago, Illinois 60654

Subject: Denis-Browne Splinting Code, 29590

Dear Dr. Levy,

The American Academy of Orthopaedic Surgeons is writing in regards to the surveying of CPT code 29590 which is set for review by the AMA/Multi-Specialty Relative Value Update Committee (RUC) at the April 2012 RUC meeting as agenda tab item number 7. CPT code 29590 was originally identified by the RUC's Relativity Assessment Workgroup as a potentially misvalued code due to a different dominant specialty from the original valuing society. In this, 29590 was a Harvard valued code reviewed by the AAOS but, according to 2010 Medicare utilization data, Podiatry was by far the dominant provider. The American Podiatric Medical Society (APMA) submitted a recommendation the Current Procedural Terminology (CPT) Editorial Panel to delete 29590 but the panel, based on input from advisors and panel members, instead chose to revise the work descriptor.

The revised work descriptor and typical patient vignettes were reviewed and approved at the CPT Editorial Panel's February 2012 meeting and it was determined the revision was not editorial and therefore merited survey and review by the RUC. Thus it was placed on the April 2012 RUC agenda.

The descriptor is as follows-29590, Strapping; to a Denis-Browne bar (splint) with manipulation and casting (eg, for metatarsus adductus, clubfoot). We believe it was incorrect to include manipulation and casting as part of a strapping procedure and that it is impossible to compile a suitable reference service list.

Our consensus expert panel reviewed the revised CPT descriptor and unanimously agreed the approved descriptor is not reflective of the actual work involved in the procedure and also is not amenable to a survey as written and therefore the AAOS did not conduct a survey. We recommend the RUC send the code back to the CPT Editorial Panel for time certain as the October 2012 CPT Editorial Panel meeting to consider further edits to the descriptor and possibly again consider deletion as the volume of the procedure is low and the work can already be described by the use of other CPT codes. If the CPT Editorial Panel wishes to revise the approved descriptor we would recommend the language regarding manipulation and casting be removed.

Given that the February 2012 CPT Editorial Panel meeting was the last meeting to make additions, deletions, or edits to the 2013 CPT code book we recommend that the 2013 CPT code book retain the 2012 descriptor for CPT code 29590 which reads as follows: 29590, Denis-Browne splint strapping. Thank you for your attention to this matter and consideration of our request.

Sincerely,

William Creevy, MD
AAOS RUC Advisor

cc: Sherry Smith

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January/April 2012

Bronchial Valve Procedures

At the October 2011 and February CPT meetings, the CPT Editorial Panel approved four new category I codes to report bronchial valve procedures. These services were previously reported using three category III codes, 0250T, 0251T and 0252T.

31647 ***Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with balloon occlusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s), initial lobe***

The RUC reviewed the survey responses from 30 pulmnologists for CPT code 31647 and determined that a work RVU of 4.40, the survey median, is appropriate. The RUC also recommends the following physician times: 25 minutes of pre-service time, 60 minutes of intra service time and 30 minutes of post service time. The RUC reviewed 31636 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of bronchial stent(s) (includes tracheal/bronchial dilation as required), initial bronchus* (work RVU=4.30) and determined that 31647 requires more physician work since 2-3 valves per lobe are inserted as opposed to one stent. The RUC also reviewed 32601 *Thoracoscopy, diagnostic (separate procedure); lungs, pericardial sac, mediastinal or pleural space, without biopsy* (work RVU=5.50) and calculated a work RVU of 4.11 if 1-99232 *Hospital visit* (5.50 – 1.39 = 4.11) was removed. However, the RUC agreed that the physician work for 31647 was more intense and should be valued higher. **The RUC recommends a work RVU of 4.40 for CPT code 31647.**

31651 ***Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with balloon occlusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s), each additional lobe (List separately in addition to code for primary procedure[s])***

The RUC reviewed the results of 30 pulmnologists and recommends the survey 25th percentile work RVU of 1.58. The RUC reviewed key reference service 31637 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; each additional major bronchus stented* (work RVU=1.58) and determined that these two services require similar physician work and the same amount of time to perform. The RUC also reviewed 13122 *Repair, complex, scalp, arms, and/or legs; each additional 5 cm or less* (work RVU=1.44) and agreed that this procedure requires less physician work and intensity. The RUC also noted that a work RVU of 1.58 would maintain proper rank order within this family of services. **The RUC recommends a work RVU of 1.58 for CPT code 31651.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

31648 ***Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with removal of bronchial valve(s), initial lobe***

The RUC reviewed the results of 35 pulmnologists and recommends a work RVU of 4.20. The RUC compared 31648 to key reference service 31638 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)* (work RVU=4.88) and determined that although the surveyed code requires less time, 45 minutes versus 60 minutes of intra service time, it is more intense to remove a valve as described in 31648. Furthermore, the key reference code describes the revision of a stent in which the physician goes in once whereas with the surveyed code, 31648, the physician is working with multiple valves in each lobe. The RUC also compared the surveyed code to 31636 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of bronchial stent(s) (includes tracheal/bronchial dilation as required), initial bronchus* (work RVU=4.30) and noted that these services both require 45 minutes of intra service time with similar intensity. Given these comparisons, the RUC agreed with the specialty that the median survey work RVU of 4.20 is an accurate measure of the physician work and intensity involved in this service. **The RUC recommends a work RVU of 4.20 for CPT code 31648.**

31649 ***Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with removal of bronchial valve(s), each additional lobe***
The RUC reviewed the results of 35 pulmnologists and recommends a work RVU of 2.00. The RUC compared 31649 to 31637 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; each additional major bronchus stented* (work RVU=1.58) and noted that although the intra-service times are identical, 30 minutes, the intensity of 31649 is greater. CPT Code 31637 refers to one stent per lobe versus the removal of 2-3 valves per lobe. The RUC also compared 31649 to CPT code 15121 *Split-thickness autograft, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof* (work RVU=2.00) and noted that these services both require 30 minutes of intra service time and therefore should be similarly valued. Given these comparisons, the RUC agreed with the specialty that the median survey work RVU of 2.00 is an accurate measure of the physician work and intensity involved in this service. **The RUC recommends a work RVU of 2.00 for CPT code 31649.**

Practice Expense:
The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31647 Tracking Number G1 Original Specialty Recommended RVU: **4.40**
Presented Recommended RVU: **4.40**
Global Period: 000 RUC Recommended RVU: **4.40**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with balloon occusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s), initial lobe

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64 year-old female with a persistent air leak after a surgical resection. Air leak (bronchopleural fistula) has not resolved with chest tube to suction for several days. During the bronchoscopy, the leak is identified in one lobe and bronchial valve(s) is/are inserted.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 70%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Hospital inpatient or ASC admission and preprocedural work-up, review of records, communication with other professionals, patient and family. Obtain informed consent. The physician and staff dress in disposable gown, non-sterile gloves, and protective eyewear before the procedure. Don lead apron for fluoroscopic guidance, if used. Preparing and positioning the patient and equipment. The physician examines the patient to verify that the patient can undergo the procedure. The physician verifies the identity of the patient and the procedure to be performed in accord with JCAHO regulation.

Description of Intra-Service Work: After the air leak is localized, a sizing balloon is inflated in the target airway to measure the size of the airway and used to determine the appropriate bronchial valve size for the selected airway. An appropriately-sized bronchial valve is then loaded into a deployment catheter. The bronchoscope is advanced to the target bronchus and the deployment catheter, introduced via the working channel, is positioned in the target airway orifice under direct vision. The valve is then deployed. The catheter is removed from the bronchoscope and correct positioning of the bronchial valve is confirmed. The sizing, loading and insertion steps are repeated for additional valve(s) inserted in appropriate subsegment(s) of a given lobe.

Description of Post-Service Work: The physician examines the patient post-bronchoscopy and pre-discharge from the facility to ascertain that no complications, such as bleeding, mucus plugging, or shortness of breath have occurred. The findings from the bronchoscope are explained to the patient and/or family/friend. The physician again reinforces previous instructions about post-procedure complications. The physician generates a detailed report of the procedure. The physician communicates results to the referring physician.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Alan Plummer, MD, FCCP, ATS, Burt Lesnick MD, FCCP, ACCP; Kathrin Nicolacakis, MD, FCCP, Alternate, ACCP and ATS and Kevin Kovitz, MD		
Specialty(s):	American College of Chest Physicians and the American Thoracic Society		
CPT Code:	31647		
Sample Size:	85	**Resp N:** 30	**Response:** 35.2 %
Description of Sample:	The specialty socities initially survyed the entire group of physicians performing interventional bronchoscopy, but did not receive a response. In follow-up, the socities used a vendor list to target physicians who have been trained to do the procedure or have the equipment.

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.93	4.00
Intra-Service intensity/complexity	4.73	4.47
Post-Service intensity/complexity	2.87	2.87

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. 3164X1 can be reported with its add-on code 3164X1B for placement of more than the initial lobe during the same session. Values will be determined at the April 2012 RUC meeting.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) +0250T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Rarely

Specialty Thoracic Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 450
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Expect that this will be 90% pulmonary and 10% thoracic surgery.

Specialty Pulmonary Frequency 405 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 45 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 225
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. About 50% Medicare and 50% other insurers

Specialty Pulmonary` Frequency 203 Percentage 90.22 %

Specialty Thoracic Surgery Frequency 22 Percentage 9.77 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31636

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31651 Tracking Number G4 Original Specialty Recommended RVU: **1.58**
Presented Recommended RVU: **1.58**
Global Period: ZZZ RUC Recommended RVU: **1.58**

CPT Descriptor: Bronchoscopy, rigid or flexible, with fluoroscopic guidance, when performed; with balloon occlusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s), each additional lobe (List separately in addition to code for primary procedure[s])

(Use 31651 in conjunction with 31647)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64 year-old female with a persistent air leak after a surgical resection. Air leak (bronchopleural fistula) has not resolved with chest tube to suction for several days. Leak has not resolved with bronchial valve(s) insertion into one lobe and a leak has been identified in an additional lobe, and bronchial valve(s) is/are inserted.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 70%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: Additional lobe(s) determined to also be source of leak. A sizing balloon is inflated in the target airway to measure the size of the airway and used to determine the appropriate bronchial valve size for the selected airway. An appropriately-sized bronchial valve is loaded into a deployment catheter. The bronchoscope is advanced to the target bronchus and the deployment catheter, introduced via the working channel, is positioned in the target airway orifice under direct vision. The valve is then deployed. The catheter is removed from the bronchoscope and correct positioning of the bronchial valve is confirmed. The sizing, loading and insertion steps are repeated for additional valve(s) inserted in appropriate subsegment(s) of a given lobe.

Description of Post-Service Work: N/A

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Alan Plummer, MD, ATS, Burt Lesnick MD, FCCP, ACCP; Kathrin Nicolacakis, MD, FCCP, Alternate ACCP and ATS and Kevin Kovitz, MD

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31648 Tracking Number G2 Original Specialty Recommended RVU: **4.20**
Presented Recommended RVU: **4.20**
Global Period: 000 RUC Recommended RVU: **4.20**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with removal of bronchial valve(s), initial lobe
(Do not report 31648 in conjunction with 31622-31626, 31628-31631, 31634-31636, 31638-31646)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64 year-old female had endobronchial valve(s) placed in a single lobe for control of a persistent air leak. Removal of the valve(s) is indicated from one lobe.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 69%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician reviews the hospital admission and preprocedural work-up, reviews all records, communicates with other professionals, patient and/or family. An informed consent is obtained.The physician dons a lead apron (if fluoroscopy is used). The pateint is prepared and positioned. The equipment is activated. The physician examines the patient to verify that the patient can undergo the procedure. The physician verifies the identity of the patient and procedure with the call to order in accord with Joint Commission regulations.

Description of Intra-Service Work: Bronchoscopy is performed to identify the target valve(s) and conditions affecting removal. Removal is accomplished by clearing any obstruction and using the appropriate forceps or other retrieval device introduced via the working channel of the bronchoscope and directed to the target valve. The removal rod on the bronchial valve is grasped using the forceps and the valve is gently pulled until it dislodges from the airway wall. The valve is pulled as close as possible to the end of the bronchoscope. The bronchoscope and valve are carefully withdrawn from the patient, with care taken to navigate the valve within the endotracheal tube or rigid bronchoscope to prevent dislodgment. Intubation is strongly recommended to avoid potential valve dislodgement at the vocal cords or in the posterior oropharyx. Intraoperative fluoroscopy may also be required to facilitate valve removal in some cases.

Description of Post-Service Work: The physician examines the pateint post-endoscopy and pre-discharge from the facility to ascertain that no complications, such as plugging, and shortness of breath have occurred. The findings from the procedure are explained to the patient and/or family, friend. The physician again reinforces previous instructions about post-procedural complications. The physician communicates results to the referring physician.

Technical skill required	4.47	4.33
Physical effort required	4.00	3.73
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.40	4.20
Outcome depends on the skill and judgment of physician	4.47	4.20
Estimated risk of malpractice suit with poor outcome	4.00	3.87

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.93	3.67
Intra-Service intensity/complexity	3.87	3.60
Post-Service intensity/complexity	3.53	3.27

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. with add-on code 31649

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0251T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Rarely

Specialty Thoracic Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Pulmonary Frequency 450 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 50 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Ratio for Pulmonary frequency to Thoracic Surgery frequency is based on that only ~10% of survey respondents were thoracic surgeons.

Specialty Pulmonary Frequency 90 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 10 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31638

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:31649 Tracking Number G3 Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **2.00**
Global Period: ZZZ RUC Recommended RVU: **2.00**

CPT Descriptor: Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with removal of bronchial valve(s), each additional lobe (List separately in addition to code for primary procedure)
(Use 31649 in conjunction with 31648 initial removal)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59 year-old male had endobronchial valve(s) placed in more than one lobe for control of a persistent air leak. Removal of the valves from both lobes is indicated. The valve from the first lobe has been removed (reported separately) and now the second valve is removed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 69%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Bronchoscopy is performed to identify the target valve(s) and conditions affecting removal. Removal is accomplished by clearing any obstruction and using the appropriate forceps or other retrieval device introduced via the working channel of the bronchoscope and directed to the target valve. The removal rod on the bronchial valve is grasped using the forceps and the valve is gently pulled until it dislodges from the airway wall. The valve is pulled as close as possible to the end of the bronchoscope. The bronchoscope and valve are carefully withdrawn from the patient, with care taken to navigate the valve within the endotracheal tube or rigid bronchoscope to prevent dislodgment. Intubation is strongly recommended to avoid potential valve dislodgement at the vocal cords or in the posterior oropharyx. Intraoperative fluoroscopy may also be required to facilitate valve removal in some cases. The process is repeated until all target valves are removed.

Description of Post-Service Work: n/a

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**30.00**	**30.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.38	3.69
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.38	3.54
Urgency of medical decision making	3.08	3.31
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.38	4.31
Physical effort required	3.62	3.62
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.15	4.00
Outcome depends on the skill and judgment of physician	4.54	4.15
Estimated risk of malpractice suit with poor outcome	3.85	3.69

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	0.00	0.00
Intra-Service intensity/complexity	3.46	3.46
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. With base code 31648

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0252T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary How often? Rarely

Specialty Thoracic Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Ratio for Pulmonary frequency to Thoracic Surgery frequency is based on that only ~10% of survey respondents were thoracic surgeons.

Specialty Pulmonary Frequency 450 Percentage 90.00 %

Specialty Thoracic Surgery Frequency 50 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Ratio for Pulmonary frequency to Thoracic Surgery frequency is based on that only ~10% of survey respondents were thoracic surgeons.

Specialty Pulmonary Frequency 90 Percentage 90.00 %

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

⊙•**31647 Bronchoscopy, rigid or flexible, with fluoroscopic guidance, when performed; with balloon occlusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s), initial lobe**

⊙+•**31651 with balloon occlusion, when performed, assessment of air leak, airway sizing, and insertion of bronchial valve(s). each additional lobe (List separately in addition to code for primary procedure[s]) (Use 31651 in conjunction with 31647**

Global Period: **31647 000 and 31648 ZZZ** Meeting Date: April 26-29, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The American College of Chest Physicians (ACCP) and the American Thoracic Society (ATS) met via conference call to review this code, including all the clinical labor, medical supplies and overhead equipment necessary to perform the procedure. The panel was made up of 2 private practice pulmonary/critical care physicians, 2 academic based pulmonary/critical care physicians, 2 practice administrators for private practice pulmonary/critical care physicians, one RN consultant who works specifically on Pulmonary and Critical Care Coding issues and a CPA who is a consultant to some 20 pulmonary and critical care practices. Please note that the consensus data from the panel was modified to the changes in the rules, policies and procedures of the RUC's Practice Expense Subcommittee.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: Three bronchial valve codes were presented to the AMA RUC's Jan 2012 meeting. RUC referred the placement code back to CPT (which met the next week and approved two placement codes to parallel the 2 removal codes – as ACCP and ATS originally proposed) AND RUC approved the two removal codes. The 31647 stand alone removal code is an excellent comparison for the pre-service times of clinical staff for the bronchial valve stand alone code. There is no pre-service clinical labor time for the 31651 ZZZ add-on bronchial valve code.

Please describe in detail the clinical activities of your staff:

31647 Pre-Service Clinical Labor Activities:

Facility Only

Complete pre-service diagnostic and referral forms

Coordinate pre-surgery services

Schedule space and equipment in the facility

Follow-up phone calls and prescriptions before the procedure

CPT Code: 31648
Specialty Society('s) ACCP and ATS

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

31648 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with removal of bronchial valve(s), initial lobe
(Do not report 31648 in conjunction with 31622-31626, 31628-31631, 31634-31636, 31638-31646)

Global Period: 000 Meeting Date: January 2012

31647 and 31649 codes are ZZZ codes and Facility Only; therefore, no practice expense for office staff.

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ACCP and ATS met via conference call to review this code, including all the clinical labor, medical supplies and overhead equipment necessary to perform the procedure. The panel was made up of 2 private practice pulmonary/critical care physicians, 2 academic based pulmonary/critical care physicians, 2 practice administrators for private practice pulmonary/critical care physicians, one RN consultant who works specifically on Pulmonary and Critical Care Coding issues and a CPA who is a consultant to some 20 pulmonary and critical care practices. Please note that the consensus data from the panel was modified to the changes in the rules, policies and procedures of the RUC's Practice Expense Subcommittee.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Facility Only

Complete pre-service diagnostic and referral forms.

Coordinate pre-surgery services

Provide pre-service education and obtain consent

Follow-up phone calls and prescriptions
