The CPT Editorial Panel Workgroup on Psychological and Psychiatric Services (PPS), chaired by Patrick Cafferty, PA-C, and Boyd Buser, DO, met over the course of several months to develop a series of CPT codes that would more accurately describe the work performed. During that time, the workgroup determined that the description of work for Psychoanalysis (CPT code 90845) did not require changes and could move forward to the RUC. Recommendations based on the survey data from 2010 were submitted to

*15 codes with 2012 survey data and 1 code, 90845, Psychoanalysis for reaffirmation

the RUC for review at its September 2011 meeting. The RUC accepted the societies' recommended values for 90845, (5 pre-service, 50 intra-service, 5 post-service time; 2.10 RVW) and forwarded that recommendation to CMS. In the 2012 Final Rule, published November XX, 2011, CMS elected not to finalize the RUC's recommended values until the remaining codes in the family were reviewed by the RUC. We are asking that the RUC reaffirm the previously approved values for 90845 at this meeting.

In February 2012, the CPT Editorial Panel approved a revised version of the workgroup's proposal that included 15 new or revised codes. We have submitted RUC recommendations on the following codes:

- 9080D1, Psychiatric diagnostic interview examination
- 9080D2, Psychiatric diagnostic evaluation with medical services
- 908P10 – 908P30 (30, 45, 60 minutes respectively) (XXX code), Psychotherapy with the patient and/or family member
- 908P10X-908P30X (30, 45, 60 minutes respectively) (ZZZ code), Psychotherapy with the patient and/or family member when performed with an evaluation and management service
- 90846, Family Therapy without the patient present
- 90847, Family Therapy with the patient present
- 90853, Group Therapy (other than multiple family group therapy)

As mentioned earlier we are requesting the RUC reaffirm the 2011 recommendation for the following code:

- 90845, Psychoanalysis – Reaffirmation of the RUC's 2011 recommendation

In addition to the recommendations for the codes listed above, we are requesting that the following codes be carrier priced. This will allow for education and experience with a significantly different coding structure than that in place for 2012. This will afford the RUC time to assess options for a survey and it will give providers experience with the codes prior to moving to an AMA RUC survey:

- 9080XE (ZZZ code), Interactive Complexity
- 908CP1, Psychotherapy for Crisis, first 60 minutes
- 908CP2 (ZZZ code), Psychotherapy for crisis, each additional 30 minutes
- 90862X (ZZZ code), Pharmacologic management, including prescription and review of medication, when performed with psychotherapy services

Current RUC Recommendations

The societies sought the approval of the RUC's Research Subcommittee prior to fielding their surveys. The subcommittee granted approval for the following items;

- Modification of the survey tools, including:
    - Adding the term "healthcare professional" to reflect varying educational backgrounds.
    - Adding a link to a PDF of the revised introductory language to the Psychiatry section
    - Modifying the XXX tool (XXX Group) used to survey the group psychotherapy code, 90853, for clarity
        - Adding a question asking for survey participants to indicate the typical number of patients they see in a group session.
        - Asking survey participants to base the time estimates and RVU estimates on the entire session rather than calculating them on a per patient basis.
    - Eliminating the moderate sedation section on the ZZZ tool (ZZZ) used to survey the add-on codes.
- Use of a common Reference Service list for all survey respondents, and approval to include a select number of reference service codes where the RVU calculation was done for the participant per the recommendation made by HCPAC at their September 2011 meeting.

- Approval of a revised vignette for group psychotherapy (the current vignette in the RUC database was found to be typical by only 39% of survey respondents in the last survey process.)
- Modifications to the RUC educational tool, consistent with our requests regarding the healthcare professional and survey changes.
- Approval of a request by the American Psychological Association to conduct both a random survey and a proctored convenience sample of participants attending their March leadership conference.

As a result of the change noted above, the SOR for the group psychotherapy code, 90853, reflects a calculated RVW and times based on responses to the additional questions The survey participants were asked to calculate the RVW and times based on the full length of the session rather than on a per patient basis. Those RVWs were then divided by the typical number of patients in a group therapy session as determined by respondents' answers to that additional survey question and those values were used in completing the SOR.

As we did in the 2011 presentation, we have included a breakdown of the survey results by physicians and non-physicians in those surveys where both groups jointly surveyed to facilitate RUC review of the data.

Thank you for your assistance throughout this process. We look forward to presenting our recommendations at the April RUC meeting in Chicago. We are available before then should you have any questions.

Sincerely,

Jeremy Musher, MD
American Psychiatric Association, RUC Advisor

Sherry Barron Seabrook, MD

I. AMA/Specialty RVS Update Committee Meeting Minutes September 29 – October 3, 2010

II. Welcome and Call to Order

Doctor Barbara Levy called the meeting to order on Thursday, September 30, 2010, at 8:00 am. The following RUC Members were in attendance:

Barbara Levy, MD (Chair)
Michael D. Bishop, MD
James Blankenship, MD
R. Dale Blasier, MD
Joel Bradley, MD
Ronald Burd, MD
John Gage, MD
William Gee, MD
David Hitzeman, DO
Peter Hollmann, MD
Charles F. Koopmann, Jr., MD
Robert Kossmann, MD
Walt Larimore, MD
Brenda Lewis, DO
J. Leonard Lichtenfeld, MD
Scott Manaker, MD, PhD
Geraldine McGinty, MD
Bill Moran, Jr., MD
Guy Orangio, MD
Gregory Przybylski, MD
Marc Raphaelson, MD
Sandra Reed, MD
Daniel Mark Siegel, MD
Lloyd Smith, DPM
Peter Smith, MD
Susan Spires, MD
Arthur Traugott, MD
James Waldorf, MD
George Williams, MD
Allan Anderson, MD*
Gregory Barkley, MD*
Dennis M. Beck., MD*
Bruce Deitchman, MD*
Gregory DeMeo, DO*
Jane Dillon, MD*
Verdi DiSesa, MD*
Jeffrey Paul Edelstein, MD*
Emily Hill, PA-C*
Robert Jansen, MD*
M. Douglas Leahy, MD*
William J. Mangold, Jr., MD*
Daniel McQuillen, MD*
Terry Mills, MD*
Scott D. Oates, MD*
Julia Pillsbury, DO*
Chad Rubin, MD*
Steven Schlossberg, MD*
Stanley Stead, MD*
J. Allan Tucker, MD*
Robert Stomel, DO*

*Alternate

III. Chair's Report

- Doctor Levy welcomed the CMS staff and representatives attending the meeting, including:
  - Edith Hambrick, MD, CMS Medical Officer
  - Ken Simon, MD, CMS Medical Officer
  - Ryan Howe
  - Ferhat Kassamali
- Doctor Levy welcomed Jeffrey Cozzens, MD of the CPT Editorial Panel who is observing this meeting.

Gastric Emptying Study (Tab 51)
Kevin Donohoe, MD, SNM; Kenneth McKusick, MD, SNM; Zeke Silva, MD, ACR

In the 4th Five-Year Review of the RBRVS, CMS identified CPT code 78264 *Gastric emptying study* as potentially misvalued through the Harvard-Valued – Utilization Over 30,000 screen.

78264 ***Gastric emptying study***
The specialty society provided compelling evidence there has been a change in technology as the protocol to perform CPT code 78264 has been standardized, the procedure is different than it was 20 years ago and the Harvard methodology was flawed as it used extrapolation to determine physician time and the work RVU. The performance and interpretation of radionuclide solid phase gastric emptying was standardized in 2009. The new guideline standardized the radiolabled meal, the preparation of the patient, the acquisition and processing of the imaging data and the interpretation criteria. The preparation of the patient requires a standard patient questionnaire, assessment of the patient's glucose level, assessment of patient's current medications to avoid an adverse reaction and determining womens' menstrual cycle. The standardized procedure now requires that the interpreting physician be certain that there was or was not >90% gastric emptying of the radiolabeled meal by four hours. Additionally, the interpretation is more complex requiring both greater knowledge of the clinical conditions leading to the procedures as well as the limitations and causes of errors in the results. The RUC determined that there is compelling evidence that the physician work and time required to perform this service has changed.

The RUC review the survey results from 168 radiologists and nuclear medicine physicians for code 78264 and determined that the median work RVU of 0.95 appropriately maintains the relativity among similar services. The RUC compared 78264 to key reference service CPT code 78707 *Kidney imaging morphology; with vascular flow and function, single study without pharmacological intervention* (work RVU = 0.96 and total time = 22 minutes) and determined that this service is a code comparison because the total physician time is the same, 22 minutes. For further support, the RUC compared this service to CPT code 78453 *Myocardial perfusion imaging, planar (including qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); single study, at rest or stress (exercise or pharmacologic)* (work RVU = 1.00 and total time = 20 minutes) and determined that the total physician time is similar to the surveyed service,.22 and 20 minutes, respectively, and that the survey median work RVU of 0.95 is appropriate in relation to this service. **The RUC recommends a work RVU of 0.95 for CPT code 78264.**

Psychotherapy (Tab 52)
Naakesh Dewan, MD, APA; Chester Schmidt, MD, APA; Sherry Barron-Seabrook, MD, AACAP; Mary Moller, DNP, ARNP, ANA; Eileen Carlson, RN, JD, ANA; James Georgoulakis, PhD, APA; Doris Tomer, LCSW, NASW
Facilitation Committee #1

In the 4th Five-Year Review of the RBRVS, CMS received comment letters from the providers of psychotherapy, CPT codes 90801-90880 as potentially misvalued. CMS forwarded these services to the RUC to be included in the fourth Five-Year Review process. CPT code 90849 was withdrawn by the original commenter as the specialties

indicated that very few of their members provide this service. This specialty recommendation was supported by the Medicare utilization data for this service which was very low in 2008, 343 claims. In April 2010 and May 2010, the Research Subcommittee met to review vignettes and reference service lists. The Subcommittee recommended that 90801 and 90802 be removed from the list of codes to be reviewed and be referred to the CPT Editorial Panel so that modifications could be made to the descriptors to reflect the different work performed by the physician and non-physician providers. In June 2010, the Pre-Facilitation Committee met with the sponsoring specialty societies. The Pre-Facilitation Committee agreed with the Research Subcommittee's recommendations to refer 90801 and 90802 to the CPT Editorial Panel. The Pre-Facilitation Committee recommended that all of the psychotherapy codes with Evaluation and Management components (90805, 90807, 90809, 90811, 90813, 90815, 90817, 90819, 90822, 90824, 90827, 90829, and 90862) be referred to the CPT Editorial Panel to potentially create a new coding structure based on the varying levels of evaluation and management within each code. The remainder of the CPT codes identified were surveyed for the October 2010 RUC Meeting.

At the October 2010 RUC Meeting, the specialties presented compelling evidence arguments to change the current value of the remaining psychotherapy services. The specialties indicated that the patient population receiving these services has dramatically changed since the codes were previously reviewed. Currently, according to a National Comorbidity Survey, 56% of patients receiving psychotherapy have comorbid conditions, meaning having more than one mental or physical disorder, including substance abuse. Due to the prevalence of co-morbid patients, the work of the provider has changed as most research treatment protocols were originally designed for patients with single disorders. Further, the specialties indicated that the site of service for patients receiving many of these services has changed. Patients, who were once treated n the hospital setting, are now more frequently being treated in the office setting at the number of psychiatric beds has dropped by more than 60% between 1970 and 2000. The RUC accepted these compelling evidence arguments to change the current value of these services.

The specialties requested that the remaining psychotherapy codes be referred to the CPT Editorial Panel along with the other psychotherapy codes for revision to address the differences in work performed by the physician and the non-physician providers. The RUC understands that a CPT Workgroup has been created to address all of these concerns with the psychotherapy codes and that a coding proposal will be issued from this Workgroup upon completion of their work to the CPT Editorial Panel for review. **The RUC recommends the psychotherapy codes be referred to the CPT Editorial Panel for revision.**

Nasopharyngoscopy (Tab 53)
Wayne Koch, MD, AAO-HNS

In the 4th Five-Year Review of the RBRVS, CMS identified CPT code 92511 as potentially misvalued through the Harvard-Valued – Utilization over 30,000 screen.

92511 ***Nasopharyngoscopy with endoscope (separate procedure)***
The RUC reviewed the survey results 30 otolaryngologists for CPT code 92511. The RUC noted that there is typically an Evaluation and Management services provided on the same day as this service. The specialties' explained that pre-service time of 11

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:90791 Tracking Number LL2 Original Specialty Recommended RVU: **3.00**
Presented Recommended RVU: **3.00**
Global Period: XXX RUC Recommended RVU: **3.00**

CPT Descriptor: Psychiatric diagnostic evaluation code
(Do not report 90791 or 90792 in conjunction with 99201-99337, 99341-99350, 99366-99368, 99401-99444)
(Use 90785 in conjunction with 90791, 90792 when the diagnostic evaluation includes interactive complexity services)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Diagnostic evaluation of an adult with co-morbid medical conditions who reports increasing anxiety, irritability, and trouble sleeping. Although on antidepressant medication, the patient has been feeling increasingly depressed and helpless and is unable to go to work. The patient was referred by the primary care provider for psychotherapy services.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review reason for referral, usually involves discussion with person who initiated referral, e.g, physician, family, law enforcement, employer, or an initial phone conversation when self-referred. When possible, involves review of records from referral source and lab or consultation reports.

Description of Intra-Service Work: Explain and obtain informed consent, obtain a psychiatric history, including present illness, past history, family history, complete mental status examination; referrals for other tests and evaluations as needed; review and ordering of diagnostic studies; establishing a definitive diagnosis or at least a narrow enough differential to warrant a treatment plan; decision making concerning need for degree of supervision (e.g. hospitalization); counseling with patient concerning diagnosis and options for treatment and proposed options, including explaining the need for and process of psychotherapy. May also include communication with family or other informants in addition to or in lieu of the patient.

Description of Post-Service Work: Arrange for further studies and further care; report to or discussion with referral source; arrange getting additional information; write or dictate results of examination; and frequently involves additional communication with patient and/or family after results of studies are known or additional health care records reviewed. May include report and consultation with third party utilization manager to arrange for payment and funding for proposed treatment.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.17	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.61	**RUC Time**	7,451,227

CPT Descriptor 1 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99223	XXX	3.86	**RUC Time**	11,496,707

CPT Descriptor 2 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99244	XXX	3.02	**RUC Time**

CPT Descriptor Office consultation for a new or established patient, which required these 3 key components: A comprehensive history; a comprehensive examination, and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 86 **% of respondents:** 42.5 **%**

TIME ESTIMATES (Median)

Time Segments (Mean)		
Pre-Service intensity/complexity	2.21	2.21
Intra-Service intensity/complexity	4.24	4.19

Post-Service intensity/complexity	3.24	3.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

90791, Psychiatric diagnostic evaluation, is a new code for a service that was previously reported using 90801, Psychiatric diagnostic interview examination. Psychologists and clinical social workers will typically use this code, while physicians and other medical professionals are expected to use 90792, although they may also use 90791 if medical services are not provided. These procedures can be reported in all settings (i.e., outpatient, inpatient, residential care, nursing facility) so the RVW recommended reflects the range of work necessary in order to appropriately provide the service in all settings.

As noted in our cover letter, the RUC accepted the compelling evidence arguments presented by the societies at the RUC's October 2010 meeting.

Survey process
The survey was sent randomly to members of Psychiatry, Child Psychiatry, Psychology, and Social Work. In addition to the random sample, Psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. This in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC. The reference service list was the same list used in all of the other XXX surveys for this family of codes that was reviewed and approved by the RUC Research Subcommittee. The societies worked jointly to develop a typical vignette.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The review of the survey data by the expert panel showed that 82 percent of the survey respondents indicated that the vignette described the typical patient. The expert panel concluded the service performance rate was reasonable.

The expert panel supported the median survey time of 15 minutes pre-, 60 minutes intra-, and 20 minutes post-service work. The pre-service work includes locating and reviewing information from multiple sources, including notes from other professionals, correspondence from the patient or family members, symptom check lists, etc.

As noted earlier in the SOR, the intra-service work includes a variety clinical tasks and decision making functions. Given the nature and complexity of the patients and the need to generate comprehensive diagnostic reports, integrate information from multiple sources, follow up with referral sources when necessary, develop formal written treatment plans (typically required by insurers), and arrange appropriate disposition for the patient, and in light of the fact that the provider has no clinical staff to assist with these tasks, the expert panel agrees that 20 minutes accurately reflects the post-service time. **Therefore the expert panel recommends 15 minutes of pre-, 60 minutes intra-, and 20 minutes post-service for a total time of 95 minutes.**

The expert panel reviewed the survey median and 25th percentile data. The panel concluded that the median survey RVW of 3.00 was supported by the key reference service code, 99205, *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family* (7, 45, 15; RVW 3.17), which was chosen by 42% of the survey respondents. An analysis of the data on intensity and complexity measures shows that in most instances the survey respondents found the work of the surveyed code was slightly less intense/complex than that of the higher valued reference code. This held true for most of the measures, with the key exceptions being the measure addressing the outcome (dependent on the skill and judgment of the physician) and the intensity and complexity of the intra-service period. Overall, the panel concluded this provided support for the median value.

The expert panel also compared the work of the surveyed code to 99222, *Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit* (15, 40, 20; RVW 2.61), with a total time of 75 minutes, which has a lower RVW and lower intra and total time, and to 99223, *Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit* (15, 55, 20; RVW 3.86) with a total time of 90 minutes. The surveyed code fell between the two MPC codes, which both have intra times and total times less than the surveyed code.

In addition, the expert panel compared the work of the surveyed code to 99244, *Office consultation for a new or established patient, which required these 3 key components: A comprehensive history; a comprehensive examination, and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family* (10, 40, 15; RVW 3.02), with a total time of 65 minutes and medical decision making of moderate complexity.

Based on the review and comparisons above, the expert panel believes the median RVW of 3.00 correctly reflects the appropriate rank order of this procedure. They also compared it to the current value of 2.80, and believe that the survey median reflects the appropriate value based on the increased complexity of the patients and the increased intensity of the work as compared to when the current values were established.

Recommendation

In summary, based on comparisons of the reference code, and MPCs, **we recommend a median RVW of 3.00 and median times of 10 minutes pre-, 60 minutes intra-, 20 minutes post-time for a total time of 95 minutes for code 90791.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90801

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry	How often? Rarely
Specialty Psychology	How often? Commonly
Specialty Social Work	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 2532026
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on the fact that Medicare accounts for approximately 25% of all physician and clinician payments in the US; and that psychiatrists will only provide this service 1% of the time

Specialty Psychiatry	Frequency 27470	Percentage 1.08 %
Specialty Psychology	Frequency 1796554	Percentage 70.95 %
Specialty Social Work	Frequency 708002	Percentage 27.96 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 753,593 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on the most recent RUC database and the assumption that psychiatrists will only provide this service approximately 1% of the time

Specialty Psychiatry	Frequency 7530	Percentage 0.99 %
Specialty Psychology	Frequency 527515	Percentage 69.99 %
Specialty Social Work	Frequency 211006	Percentage 27.99 %

Do many physicians perform this service across the United States? Yes

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 90846

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:90792 Tracking Number LL3 Original Specialty Recommended RVU: **3.25**
Presented Recommended RVU: **3.25**
Global Period: XXX RUC Recommended RVU: **3.25**

CPT Descriptor: Psychiatric diagnostic evaluation with medical services
(Do not report 90791 or 90792 in conjunction with 99201-99337, 99341-99350, 99366-99368, 99401-99444)
(Use 90785 in conjunction with 90791, 90792 when the diagnostic evaluation includes interactive complexity services)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Diagnostic evaluation of an adult with co-morbid medical conditions who reports worsening depression and agitation. The patient has been feeling hopeless and sleeping poorly, and reports deteriorating work performance and marital problems. The patient was referred by the primary care provider after a six-week trial of an antidepressant medication with little improvement.

Percentage of Survey Respondents who found Vignette to be Typical: 71%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review available information including records, reason for referral, outside information and other gathered information such as rating scales and intake data forms including medical review of systems.

Description of Intra-Service Work: Introduce self to patient and obtain informed consent, including discussion of mandatory reporting. The purposes of the evaluation may include assessing competence, assessing safety, establishing a presumptive diagnosis(es) and formulating a treatment plan, including consideration of additional medical evaluation, medication, psychotherapy, or both and the appropriate site of service based on acuity and level of risk for potentially harmful behaviors, among other criteria (in-patient, day treatment or outpatient).

In order to accomplish the above, an extensive history is obtained, including present illness, past psychiatric history, chemical dependency history, family history, social history, and treatments, as well as a medical history, review of systems, and focused questions related to safety, lethality, aggression, and/or competence, as indicated. A specialty specific examination is completed as well. A working therapeutic relationship is established.

The findings are integrated into a diagnostic formulation, including specific medical psychiatric diagnoses, personality considerations, contributing general medical factors, psychosocial stressors and current level of functioning.

Based on these multi-faceted diagnoses, a treatment plan is formulated including consideration of medications, psychotherapy, general medical laboratory or other tests as well as level of care (inpatient, day hospital, intensive outpatient

or outpatient). This plan is discussed with the patient (and other parties as indicated/appropriate), treatment options are reviewed and informed consent is obtained to begin treatment. Prescriptions are provided for medication and additional medical diagnostic tests, when indicated.

Description of Post-Service Work: Arrangements are made for further studies and care including psychotherapy and other scheduled follow-up appointments. Requests may be made for other outside records. Documentation of the visit is completed. Referral sources may be contacted, and records forwarded to them. Follow-up as needed to address questions regarding medications, titration of dosage, and side-effects and results of additional testing. Questions or issues related to the psychiatric reasons for the visit are addressed, including addressing general psychiatric status as well as dealing with subsequent crises.

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.17	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99223	XXX	3.86	**RUC Time**	11,496,707

CPT Descriptor 1 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.61	**RUC Time**	7,451,227

CPT Descriptor 2 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99244	XXX	3.02	**RUC Time**

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 35 **% of respondents:** 42.6 **%**

TIME ESTIMATES (Median)	CPT Code: 90792	Key Reference CPT Code: 99205	Source of Time RUC Time

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry).

90792, *Psychiatric diagnostic evaluation with medical services*, is a new code for a physician service that was previously reported by medical and nonmedical professionals using 90801. This new code, *Psychiatric diagnostic interview examination with medical services*, will be used by physicians and other qualified medical professionals. This procedure can be reported in all settings (i.e., outpatient, inpatient, residential care, nursing facility) so the RVW recommended reflects the range of work necessary in order to appropriately provide the service in all settings.

As noted in our cover letter, the RUC accepted the compelling evidence arguments presented by the societies at the RUC's October 2010 meeting.

Survey process
The survey was sent randomly to members of the American Psychiatric Association (APA) and the American Academy of Child and Adolescent Psychiatry (AACAP).

The reference service list was the same list used in all of the other XXX surveys for this family of codes that was reviewed and approved by the RUC Research Subcommittee. This new code 90792 will be used in all settings (i.e., outpatient, inpatient, residential care, nursing facility).

A typical vignette was developed with assistance of experts from APA and AACAP. It was agreed that while there are a considerable number of children and adolescents evaluated, the typical patient is an adult.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The expert panel concluded that 82 survey responses and the service performance rate of 100 per year are reasonable. They noted that while only 71 percent of those responding found the vignette to be typical, the majority of those who indicated the vignette was not typical stated that they worked with children and adolescents so their typical patient was simply not an adult.

The expert panel supported the median survey times of 10 minutes pre, 60 minutes intra, and 20 minutes post. As noted in the work descriptor, the 10 minutes of pre-service time is spent arranging for the appointment and collecting and reviewing medical records and other data, including correspondence from other professionals, the

patient and patient's family , symptom check lists, etc. prior to the first face-to-face visit. The 20 minutes of post-service time is spent scheduling the next appointment, developing a written treatment plan and documenting the visit, following up with others (providers/agencies/family members) to get collateral information and confirm any necessary information, providing verbal or written findings to referring providers, and seeking treatment authorizations. The pre- and post-service times are slightly higher than a higher level E/M office visit for a new patient, but equal to or slightly lower than the higher level initial hospital care code. Based on this comparison, **we recommend 10 minutes pre-, 60 minutes intra-, and 20 minutes post-service time for a total time of 90 minutes.**

We believe the median RVW result of 3.25 appropriately represents the current physician work for this code. This value is supported by an analysis of the intensity and complexity measures comparing the 90792 with the key reference service, 99205, *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family,* with an RVW of 3.17 and a total time of 67 minutes (7, 45, 15 pre, intra, and post respectively), which was chosen by 42% of the survey respondents. In reviewing those figures, the survey respondents indicated that the intensity and complexity of the work of the 90792 was greater than the 99205 in every measure with the exception of physical effort and the pre-service time segment, where the differences between the two were 0.02 and 0.05 respectively.

An additional comparison can be made to 99223, *Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit.* (15, 55, 20; RVW of 3.86) for a total time of 90 minutes. In comparing the two services, the expert panel noted that the total time was the same and the variation of the RVW could be accounted for by the increased intensity for inpatient care. They noted that the survey median RVW of 3.25 falls between the codes for the initial day inpatient service and a new patient outpatient visit.

The expert panel also compared the typical work to the inpatient and outpatient consultation codes: 99254, *Inpatient consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 80 minutes at the bedside and on the patient's hospital floor or unit* (15, 45, 20; RVW 3.29), with a total time of 80 minutes and medical decision making of moderate complexity; and 99244, *Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family*, (10, 40, 15; RVW 3.02) with a total time of 65 minutes and medical decision making of moderate complexity.

The 99254 and the 99244 codes are similar in work and level of medical decision making to the surveyed code and represent work performed in inpatient and outpatient settings. The survey median of 3.25 is greater than the shorter timed service of the 99244 and closer to the 80 minute service of the 99254. For 90792, in addition to completing an evaluation, the physician is also constructing a detailed treatment plan and discussing ongoing treatment options with the patient rather than writing a report back to the referring provider. We believe this comparison supports the median value.

Recommendation

In summary, based on comparisons to the reference code, MPCs, and other codes, **we recommend the median RVW of 3.25, and median times of 10 minutes pre-, 60 minutes intra-, and 20 minutes post-time for a total time of 90 minutes for code 90792.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90801, 90802

SUMMARY OF RECOMMENDATION

CPT Code:90832 Tracking Number LL4 Original Specialty Recommended RVU: **1.50**
Presented Recommended RVU: **1.50**
Global Period: XXX RUC Recommended RVU: **1.50**

CPT Descriptor: Psychotherapy, 30 minutes with patient and/or family member
(Use the 90785 in conjunction with (90832, 90833, 90834, 90836, 90837, 90838 when psychotherapy includes interactive complexity services)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Psychotherapy for a young adult with the diagnoses of depression, anxiety, and attention deficit disorder who has relationship problems and recently moved away from family. Patient is taking stimulant and antidepressant medications.

Percentage of Survey Respondents who found Vignette to be Typical: 69%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Prepare to see patient and/or family member. Review record. Communicate with other professionals and significant others such as guardians, caretakers, and family members.

Description of Intra-Service Work: Face-to-face therapeutic communication with patient and/or family member. Obtain objective information and interval history. Examine mental state. Evaluate and explore intensity and complexity of symptoms, feelings, thoughts, and behaviors in the context of psychosocial and health stressors and coping styles. Use a range of psychotherapy approaches to reduce distress, morbidity, and address ongoing behavioral and mental status changes in the patient.

Description of Post-Service Work: Arrange for further services. Coordinate care in writing or by telephone with patient, family, and other professionals such as a primary care provider. Document intra-service and post-service work activities. Provide written or telephone reports to third-party payers.

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
96152	XXX	0.46	**RUC Time**

CPT Descriptor Health and behavior intervention, each 15 minutes, face-to-face; individual

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99214	XXX	1.50	**RUC Time**	78,471,610

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99232	XXX	1.39	**RUC Time**	50,265,346

CPT Descriptor 2 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 25 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99382	XXX	1.60	**RUC Time**

CPT Descriptor Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; early childhood (age 1 through 4 years)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 58 **% of respondents:** 31.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 90832**	**Key Reference CPT Code:** 96152	**Source of Time RUC Time**

Intra-Service intensity/complexity	3.44	3.30
Post-Service intensity/complexity	2.42	2.32

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

The 90832, Psychotherapy, 30 minutes with patient and/or family member had previously been reported as 90804 (Psychotherapy 20-30 minutes, outpatient) and 90816 (Psychotherapy, 20-30 minutes, facility). The 90832 will be used in all settings (i.e., outpatient, inpatient, residential care, nursing facility).

Survey process
The survey was sent randomly to members of Psychiatry, Child Psychiatry, Psychology, and Social Work. In addition to a random sample, Psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. The in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC. The reference service list was the same list used in all of the other XXX surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee. The societies worked jointly to develop a typical vignette. The typical patient for this service is an adult patient.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations involved in this survey convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The review of the survey by the expert panel determined there were 185 survey responses. Sixty-nine percent of the survey respondents found the vignette typical. The panel noted that a variety of reasons were listed by those who did not find the vignette typical. The most frequent response was that they simply did not treat adult patients, some others noted they did not typically see patients for 30 minutes but rather for 45 minutes or that the vignette described a more complex patient than they would see for 30 minutes.

The median survey results regarding time are 10 minutes pre-service, 30 minutes intra-service, and 10 minutes post- service. The expert panel supports the survey results for the median time of 30 minutes for the intra-service. The panel also agreed that the survey result of 10 minutes of pre-service time is representative of what would typically occur with 90832. The panel noted that the post-service times from the survey varied across the three timed psychotherapy codes (90832, 90834, 90837). They believe the post-service time is typically consistent across the three services. They believe that the survey respondents likely underestimated the post-service time for the 90832. The panel believes 12 minutes is typical due to the range of services provided during the post-service period which include arranging for further service, coordinating care with the patient, family, and other professionals such as primary care providers, documenting intra-service and post-service work activities, and providing reports to third-party payers. These activities are typically performed directly by the psychotherapist without assistance of clinical staff. There is also increased documentation time because providers of psychotherapy services typically maintain a separate record from the medical record for psychotherapy process notes as allowed under HIPAA to protect patient privacy. **Therefore, the panel**

recommends 10 minutes pre-service, 30 minutes intra-service, and 12 minutes post-service times for a total of 52 minutes.

An analysis of the intensity and complexity measures of the surveyed code as compared to the key reference service, 96152, *Health and behavior intervention, each 15 minutes, face-to-face; individual* (4, 15, 5; RVW 0.46) shows that the surveyed code is greater in intensity and complexity in nine of the identified areas and the same for the tenth of the eleven measures. The panel agreed that 90832 and 96152 are different services. The skills and expertise required to provide a psychotherapy service exceed those for a health and behavior service. This increased intensity/complexity accounts for a higher RVW of 1.50 for the surveyed code.

Additional support for this is provided by the comparison of the surveyed code to 99214, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family* (5, 25, 10; RVW 1.50), which is similar in work with less total time.

The panel also compared the surveyed code with 99382, *Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; early childhood (age 1 through 4 years)* (5, 25, 5; RVW 1.60), with a total time of 35 minutes, which they believe supports the median RVW of 1.50 on the basis of increased time, and increased intensity of work of the surveyed code when compared with a preventive medicine visit with a higher RVW.

The panel further compared the 90833 to 99232, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 25 minutes at the bedside and on the patient's hospital floor or unit* (10, 20, 10; RVW 1.39), with a total time of 40 minutes. The panel believes the median survey value is supported by the increased time of the 90832 and the range of settings in which the service is delivered.

Finally, the expert panel reviewed the median RVW in the context of survey values for the range of timed psychotherapy codes and found that the relativity of the values of the codes across the family of codes was consistent.

Recommendation

In summary, based on the comparisons to the MPCs and other codes, **the expert panel recommends an RVW of 1.50 and median values of 10 minutes pre-, 30 minutes intra-, 12 minutes post-time for a total time of 52 minutes for 90832.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90804, 90816

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry	How often? Sometimes
Specialty Psychology	How often? Commonly
Specialty Social Work	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 8,822,536
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry	Frequency 711249	Percentage 8.06 %
Specialty Psychology	Frequency 5071281	Percentage 57.48 %
Specialty Social Work	Frequency 2759059	Percentage 31.27 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,214,469 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most recent RUC database

Specialty Psychiatry	Frequency 177157	Percentage 7.99 %
Specialty Psychology	Frequency 1273319	Percentage 57.49 %
Specialty Social Work	Frequency 686485	Percentage 30.99 %

Do many physicians perform this service across the United States? Yes

Description of Pre-Service Work:

Description of Intra-Service Work: Data from various sources, including past interactions with the patient, current history and mental status findings, information which may have come to light from other historians or outside records, and the patient's behavior, descriptions, and responses to intra-session interventions, are all reviewed or considered and a working therapeutic interpretation, behavioral treatment plan or supportive intervention strategy is formulated and enacted. Examples of the focus of this intervention could include a current acute situation, suicidal thought/ safety plan, or a pattern of dysfunctional behavior. Evidence of behavioral change, demonstration of insight, or reduction in symptoms (anxiety, depression, irritability, etc.) is sought based on the psychotherapeutic interventions.

Description of Post-Service Work: Documentation of the symptoms and behaviors that are the focus of the treatment, as well as the specific psychotherapeutic intervention and work done in the session.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99232	XXX	1.39	**RUC Time**	50,265,346

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication. Physicians typically spend 25 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99243	XXX	1.88	**RUC Time**	1

CPT Descriptor 2 Office consultation for a new or established patient, which requires these 3 key components: A detailed history; A detailed examination; and Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99252	XXX	1.50	**RUC Time**

CPT Descriptor Inpatient consultation for a new or established patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 40 minutes at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 64 **% of respondents:** 56.1 **%**

TIME ESTIMATES (Median)	CPT Code: 90833	Key Reference CPT Code: 99214	Source of Time RUC Time
Median Pre-Service Time	0.00	5.00	
Median Intra-Service Time	30.00	25.00	
Median Immediate Post-service Time	3.00	10.00	
Median Critical Care Time	0.0	0.00

Intra-Service intensity/complexity	3.26	3.24

Post-Service intensity/complexity	2.23	2.25

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry).

The 90833, *psychotherapy, 30 minutes with patient and/or family member (list separately in addition to the code for primary service)* had previously been reported as a bundled service (90805, *Psychotherapy 20-30 minutes, office, with medical evaluation and management services; and 90817, Psychotherapy 20-30 minutes, facility, with medical evaluation and management services*) that captured the work of the psychotherapy and the E/M services in one code. The psychotherapy with medical evaluation and management codes varied only by time with the level of E/M work remaining constant. The newly approved framework describes the work more accurately, allowing for the differentiation of the E/M work based on the actual level of service provided. Psychiatrists will select the appropriate evaluation and management code based on the key elements, adding on the psychotherapy add-on code based only on the time spent providing psychotherapy. There is minimal overlap between the E/M service and the psychotherapy procedure. The information collected during the E/M portion of the service informs the psychotherapy process and the time spent collecting that data during the E/M portion is not counted in the time spent providing psychotherapy.

Survey process
The survey for the 90833 was sent to a random sample of psychiatrist members of the American Psychiatric Association (APA) and the American Academy of Child and Adolescent Psychiatry (AACAP). This code can be used in all settings (i.e., outpatient, inpatient, residential care, nursing facility).

The reference service list was the same list used in all of the other ZZZ surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee. A typical vignette was developed with assistance of experts from APA and AACAP.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The expert panel reviewed the number of responses and the service performance rate. Although there were a number of respondents who indicated they had never performed the service, the expert panel believes these individuals were unfamiliar with the survey process and did not recognize a current service being described in a different way. Of the 114 survey respondents, 70 percent found the vignette to be typical. As with the 9080D2, a significant number of those who said the patient described was not typical indicated that they specialized in child and adolescent or geriatric psychiatry, noting simply that their typical patient was not an adult.

The expert panel supports the median survey times of 30 minutes of intra service time. This code is an add-on code and as such typically has no pre or post time. The expert panel believes that additional documentation requirements for psychotherapy services adds additional time that is not captured in the evaluation and management codes billed with these services. It is typical for payers to require separate documentation of the psychotherapy session including a description of the modality used, the psychotherapeutic intervention, the focus of the session and the patient's response to treatment. The expert panel supports adding an additional 3 minutes post service time to account for that work, particularly in light of the fact that there is no clinical staff to assist in this work. Based on the above, **we recommend 0 minutes pre, 30 minutes intra, and 3 minutes post service time.**

We believe that the median survey RVW of 1.50 appropriately represents the typical work of this service. This is supported by a comparison of the intensity and complexity measures of the surveyed code with the key reference service. 56% of the survey respondents chose 99214, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family, (5, 25, 10; RVW 1.50)* with a total time of 40 minutes, as the key reference service. A comparison of the measures shows that the respondents found the surveyed code to be greater in intensity/complexity to the reference code a majority of the time including during the intra-service period.

In looking at other services, the expert panel compared the 90833 with 99242, *Office consultation for a new or established patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.* (5, 25, 10; RVW 1.34). In addition to a slightly longer intra-service time, the expert panel believes that the typical presenting problems addressed in the 90833 are of greater severity than those typically addressed by the low level consultation code, thus supporting a higher RVW.

Additional comparisons were made between the surveyed code and CPT codes 99232, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: An expanded problem focused interval history; An expanded problem focused examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is responding inadequately to therapy or has developed a minor complication.* (10, 20, 10; RVW 1.39) and 99252, *Inpatient consultation for a new or established patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 40 minutes at the bedside and on the patient's hospital floor or unit.* (5, 25, 10; RVW 1.50). The panel concluded that the intensity of the work of the surveyed code surpassed or equaled the work of these code which have slightly lower intra-service times, thus providing further support for the median RVW.

The expert panel also reviewed the survey data for the entire family of psychotherapy codes and found relativity across the survey results, including the results for 90845, psychoanalysis, which was reviewed by the RUC in September 2011 with reaffirmation requested at this meeting. The panel found that the median RVWs of the 90833, 90836, 90838 codes (psychotherapy when done in conjunction with an E/M service) were equal to or just below that of the 90832, 90834, 90837 codes (psychotherapy only) There is also relativity when compared with other forms of psychotherapy (90845, 90846 and 90847).

Recommendation

In summary, based on comparisons to the reference code, MPC codes, and other codes, **we recommend the median RVW of 1.50, and median times of 0 minutes pre, 30 minutes intra, and 3 minutes post time for a total time of 33 minutes for the 90833.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90805, 90817

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 7636948
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry Frequency 6862470 Percentage 89.85 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,439,350 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is the 2010 Medicare Data from the RUC database. We do not anticipate a change.

Specialty Psychiatry Frequency 1295415 Percentage 90.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 90846

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:90834 Tracking Number LL6 Original Specialty Recommended RVU: **2.00**
Presented Recommended RVU: **2.00**
Global Period: XXX RUC Recommended RVU: **2.00**

CPT Descriptor: Psychotherapy, 45 minutes with patient and/or family member
(Use the 90785 in conjunction with (90832, 90833, 90834, 90836, 90837, 90838 when psychotherapy includes interactive complexity services)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Psychotherapy for an adult suffering from co-morbid medical conditions, depression, and agitation of two months duration which resulted in loss of job after several emotional outbursts at work. Patient is anxious about loss of income and inability to find another job.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Prepare to see patient and/or family member. Review record. Communicate with other professionals and significant others such as guardians, caretakers, and family members.

Description of Intra-Service Work: Face-to-face therapeutic communication with patient and/or family member. Obtain objective information and interval history. Examine mental state. Evaluate and explore intensity and complexity of symptoms, feelings, thoughts, and behaviors in the context of psychosocial and health stressors and coping styles. Use a range of psychotherapy approaches to reduce distress, morbidity, and address ongoing behavioral and mental status changes in the patient.

Description of Post-Service Work: Arrange for further services. Coordinate care in writing or by telephone with patient, family, and other professionals such as a primary care provider. Document intra-service and post-service work activities. Provide written or telephone reports to third-party payers.

CPT Descriptor Health and behavior intervention, each 15 minutes, face-to-face; individual

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,650,554

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99215	XXX	2.11	**RUC Time**	9,976,351

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 52 **% of respondents:** 28.4 **%**

Urgency of medical decision making	3.21	3.04
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.04	3.75
Physical effort required	1.77	1.80
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.08	3.02
Outcome depends on the skill and judgment of physician	3.98	3.76
Estimated risk of malpractice suit with poor outcome	2.82	2.73

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.24	2.25
Intra-Service intensity/complexity	3.90	3.71
Post-Service intensity/complexity	2.84	2.79

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

The 90834, Psychotherapy, 45 minutes with patient and/or family member had previously been reported as 90806 (Psychotherapy 45-50 minutes, outpatient) and 90816 (Psychotherapy, 45-50 minutes, facility). The 90834 will be used in all settings (i.e., outpatient, inpatient, residential, nursing facility).

Survey process

The survey was sent randomly to members of Psychiatry, Child Psychiatry, Psychology, and Social Work. In addition to a random sample, Psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. The in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC.

The reference service list was the same list used in all of the other XXX surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee. The societies worked jointly to develop a typical vignette. The typical patient for this service is an adult patient.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel

The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The expert panel reviewed the survey results citing that 82 percent of the 183 survey respondents found the vignette typical and the median service performance rate was 240, which is a reasonable number for this service.

The survey results regarding time are 10 minutes pre-service, 45 minutes intra-service, and 12 minutes post-service. The panel supported the survey results for the median time of 45 minutes for the intra-service. As with the 90832, there is typically increased documentation time as a result of maintaining a separate record from the medical record for psychotherapy process notes as allowed under HIPAA to protect patient privacy.

Support for the median RVW of 2.00 can be found in the comparison of the surveyed code with the key reference service. Twenty-eight percent of the survey respondents chose 96152, *Health and behavior intervention, each 15 minutes, face-to-face; individual,* as the key reference service. An analysis of the intensity and complexity measures shows that the respondents rated the surveyed code higher in every measure except two (physical effort and the pre-service time segment). The increased intensity and complexity in addition to the total time of the service supports the median value.

In addition, the panel compared the surveyed code to 99215, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family* (5, 35, 15; RVW 2.11) with a total time of 55 minutes. The panel believes that increased time of the 90834 more than accounts for any variation in the intensity of the two services. The value is further supported by the fact that the surveyed code can be used in any setting (outpatient, inpatient, residential care, nursing facility) and the intensity of the patient encounter can vary greatly within each setting.

Additional support comes from the comparison of the surveyed code to 99233, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit* (10, 30, 15; RVW 2.00) which has a similar time and RVW. The panel believes the increased time of 90834 more than accounts for any variation in the RVW of the two services. The value is further supported by the fact that the surveyed code can be used in any setting (inpatient, outpatient, residential care, nursing facility) where the intensity of the patient encounter can vary greatly.

Finally, the expert panel also compared the median survey results of the 90834 to the other median survey results and found that the median value maintains relativity within the family. Psychoanalysis, which has a slightly longer intra-service time, is valued at 2.10 based on the RUC's review of that code at the September 2011 RUC meeting. The expert panel believes the work of the two services is similar and thus supportive of the median RVW. The 90834 also maintains relativity with the other timed-psychotherapy codes.

Recommendations
In summary, based on the comparisons to the key reference service and MPC codes **we recommend the median RVW of 2.00 with 10 minutes pre-, 45 minutes intra-, and 12 minutes post-time for a total time of 67 minutes for 90834.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90806, 90818

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry	How often? Sometimes
Specialty Psychology	How often? Commonly
Specialty Social Work	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 30873016
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry	Frequency 1887479	Percentage 6.11 %
Specialty Psychology	Frequency 15058230	Percentage 48.77 %
Specialty Social Work	Frequency 13143397	Percentage 42.57 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,736,176 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most recent RUC database

Specialty Psychiatry	Frequency 472680	Percentage 6.10 %
Specialty Psychology	Frequency 3790726	Percentage 48.99 %
Specialty Social Work	Frequency 3293290	Percentage 42.56 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 90846

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:90836 Tracking Number LL7 Original Specialty Recommended RVU: **1.90**
Presented Recommended RVU: **1.90**
Global Period: ZZZ RUC Recommended RVU: **1.90**

CPT Descriptor: Psychotherapy, 45 minutes with patient and/or family member when performed with an Evaluation and Management service
(List separately in addition to the code for primary procedure)
(Use 90836 in conjunction with 99201-99255, 99304-99337, 99341-99350)
(Use the 90785 in conjunction with (90832, 90833, 90834, 90836, 90837, 90838 when psychotherapy includes interactive complexity services)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Psychotherapy for an adult suffering from co-morbid medical conditions, depression, and agitation of two months duration which resulted in loss of job after several emotional outbursts at work. Patient is anxious about loss of income and inability to find another job.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Data from various sources, including past interactions with the patient, current history and mental status findings, information which may have come to light from other historians or outside records, and the patient's behavior, descriptions, and responses to intra-session interventions, are all reviewed or considered and a working therapeutic interpretation, behavioral treatment plan or supportive intervention strategy is formulated and enacted. Examples of the focus of this intervention could include a current acute situation, suicidal thought/ safety plan, or a pattern of dysfunctional behavior. Evidence of behavioral change, demonstration of insight, or reduction in symptoms (anxiety, depression, irritability, etc.) is sought based on the psychotherapeutic interventions.

Description of Post-Service Work: Documentation of the symptoms and behaviors that are the focus of the treatment, as well as the specific psychotherapeutic intervention and work done in the session.

Is this new/revised procedure considered to be a new technology or service?

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,650,554

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99243	XXX	1.88	**RUC Time**	1

CPT Descriptor 2 Office consultation for a new or established patient, which requires these 3 key components: A detailed history; A detailed examination; and Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
99221	XXX	1.92	**RUC Time**

CPT Descriptor Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A detailed or comprehensive history; A detailed or comprehensive examination; and Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of low severity. Physicians typically spend 30 minutes at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 35 **% of respondents:** 30.7 **%**

TIME ESTIMATES (Median)	CPT Code: 90836	Key Reference CPT Code: 99214	Source of Time RUC Time

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry).

The 90836, *psychotherapy, 45 minutes with patient and/or family member (list separately in addition to the code for primary service)* had previously been reported as a bundled service (90807, *Psychotherapy 45-50 minutes, office, with medical evaluation and management services; and 90819, Psychotherapy 45-50 minutes, facility, with medical evaluation and management services*) that captured the work of the psychotherapy and the E/M services in one code. The psychotherapy with medical evaluation and management codes varied only by time with the level of E/M work remaining constant. The newly approved framework describes the work more accurately, allowing for the differentiation of the E/M work based on the actual level of service provided. Psychiatrists will select the appropriate evaluation and management code based on the key elements, adding on the psychotherapy add-on code based only on the time spent providing psychotherapy. There is minimal overlap between the E/M service and the psychotherapy procedure. The information collected during the E/M portion of the service informs the psychotherapy process and the time spent collecting that data during the E/M portion is not counted in the time spent providing psychotherapy.

Survey process
The survey for the 90836 was sent to a random sample of psychiatrist members of the American Psychiatric Association (APA) and the American Academy of Child and Adolescent Psychiatry (AACAP). This code can be used in all settings (i.e., outpatient, inpatient, residential care, nursing facility). The reference service list was the same list used in all of the other ZZZ surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee. A typical vignette was developed with assistance of experts from APA and AACAP.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The expert panel reviewed the number of responses and the service performance rate. As with the 90833, there were a number of respondents who indicated they had never performed the service. The expert panel believes these individuals were unfamiliar with the survey process and did not recognize a current service being described in a different way. Of the 114 survey respondents, 75 percent found the vignette to be typical. Those that did not find the vignette typical were primarily individuals who specialized in child and adolescent or geriatric psychiatry.

The expert panel supports the median survey times of 45 minutes of intra-service time. As with the 90833, the expert panel believes that additional post-service documentation requirements for psychotherapy services due to payer requirements adds additional time that is not captured in the evaluation and management codes billed with these services, particularly in light of not employing clinical staff. The expert panel supports adding an additional 3 minutes post-service time to the 90836 to account for that work. Based on the above, **we recommend 0 minutes pre-, 45 minutes intra-, and 3 minutes post- service time.**

The expert panel believes that the median survey RVW of 1.90 appropriately represents the typical work of this service. This is supported by a comparison of the intensity and complexity measures of the surveyed code with the key reference service. Thirty percent of the survey respondents chose 99214, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family, (5, 25, 10; RVW 1.50)* as the reference service. The expert panel reviewed the intensity and complexity measures and found that the respondents rated the surveyed code higher in every category with the exception of the post-service period, which was rated equally. The expert panel concurred that the higher measures of intensity and complexity coupled with the significantly longer intra-service time of the surveyed code supported the median value of 1.90 which is less than the current value for the codes this add-on replaces, 90807 (0,50,0; RVW 2.02) and 90819 (0, 45, 0; RVW 2.05)

In comparing the surveyed code with 99221*, Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A detailed or comprehensive history; A detailed or comprehensive examination; and Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of low severity. Physicians typically spend 30 minutes at the bedside and on the patient's hospital floor or unit.* (10, 30, 10; RVW 1.92), the expert panel reported that the typical work of a 45 minute psychotherapy session is similar to that of the lowest level initial hospital care code.

The expert panel compared the 90836 to 99233, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.*(10, 30, 15; RVW 2.0) and believes that the work in the surveyed code is similar given the increased service time of the surveyed code in comparison with the typical time of the 99233 code.

The expert panel also concluded that the 99243, *Office consultation for a new or established patient, which requires these 3 key components: A detailed history; A detailed examination; and Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family* (5, 28, 7; RVW 1.88) was similar in work and the differences in RVWs could be accounted for due to the longer intra-service time of the surveyed code.

The expert panel also reviewed the survey data for the entire family of psychotherapy codes and found relativity across the survey results, including the results for 90845, psychoanalysis, which was reviewed by the RUC in September 2011 with reaffirmation requested at this meeting. The panel found that the median RVWs of the 90833, 90836, 90838 codes (psychotherapy when done in conjunction with an E/M service) were equal to or just below that of the 90832, 90834, 90837 codes (psychotherapy only) There is also relativity when compared with other forms of psychotherapy (90845, 90846 and 90847).

Recommendation:

In summary, based on comparisons to the reference code, MPC codes, and other codes, **we recommend the**

median RVW of 1.90, and median times of 0 minutes pre, 45 minutes intra, and 3 minutes post time for a total time of 48 minutes for 90836.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90807, 90819

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4231608
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry Frequency 3785326 Percentage 89.45 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 795,328 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on latest RUC database.

Specialty Psychiatry Frequency 715795 Percentage 89.99 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:90837 Tracking Number LL8 Original Specialty Recommended RVU: **2.25**
Presented Recommended RVU: **2.25**
Global Period: XXX RUC Recommended RVU: **3.00**

CPT Descriptor: Psychotherapy, 60 minutes with patient and/or family member
(Use the 90785in conjunction with (90832, 90833, 90834, 90836, 90837, 90838 when psychotherapy includes interactive complexity services)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Psychotherapy for adult with anxiety and depressive symptoms who is on several medications for two co-morbid medical conditions. Patient has returned to work after a recent psychiatric hospitalization for depression. Psychosocial stressors at work and home have increased anxiety and depression since discharge.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Prepare to see patient and/or family member. Review record. Communicate with other professionals and significant others such as guardians, caretakers, and family members.

Description of Intra-Service Work: Face-to-face therapeutic communication with patient and/or family member. Obtain objective information and interval history. Examine mental state. Evaluate and explore intensity and complexity of symptoms, feelings, thoughts, and behaviors in the context of psychosocial and health stressors and coping styles. Use a range of psychotherapy approaches to reduce distress, morbidity, and address ongoing behavioral and mental status changes in the patient.

Description of Post-Service Work: Arrange for further services. Coordinate care in writing or by telephone with patient, family, and other professionals such as a primary care provider. Document intra-service and post-service work activities. Provide written or telephone reports to third-party payers.

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
96152	XXX	0.46	**RUC Time**

CPT Descriptor Health and behavior intervention, each 15 minutes, face-to-face; individual

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99215	XXX	2.11	**RUC Time**	9,976,351

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.61	**RUC Time**	7,451,227

CPT Descriptor 2 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99204	XXX	2.43	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 62 **% of respondents:** 33.5 **%**

TIME ESTIMATES (Median)	**CPT Code: 90837**	**Key Reference CPT Code:** 96152	**Source of Time** **RUC Time**
Median Pre-Service Time	5.00	4.00	

Median Intra-Service Time	60.00	15.00
Median Immediate Post-service Time	10.00	5.00
Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**75.00**	**24.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.83	3.59
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.60	3.48
Urgency of medical decision making	3.53	3.28
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.27	4.02
Physical effort required	1.93	1.98
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.52	3.26
Outcome depends on the skill and judgment of physician	4.17	3.91
Estimated risk of malpractice suit with poor outcome	3.09	3.02

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.53	2.40
Intra-Service intensity/complexity	4.28	3.91
Post-Service intensity/complexity	3.10	2.98

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

The 90837, Psychotherapy, 60 minutes with patient and/or family member had previously been reported as 90808 (Psychotherapy 75-80 minutes, outpatient) and 90819 (Psychotherapy, 75-80 minutes, facility). The 90837 will be used in all settings (i.e., outpatient, inpatient, residential care, nursing facility).

Survey process
The survey was sent randomly to members of Psychiatry, Child Psychiatry, Psychology, and Social Work. In addition to a random sample, Psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. The in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC. The reference service list was the same list used in all of the other XXX surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee. The societies worked jointly to develop a typical vignette.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The expert panel reviewed the survey results citing that 81 percent of the 185 survey respondents found the vignette typical and the median service performance rate was 100, which is a reasonable number for this service.

The survey results regarding time are 10 minutes pre-service, 60 minutes intra-service, and 15 minutes post-service. Support for the median RVW of 2.25 can be found in the comparison of the surveyed code with the key reference service. Thirty-three percent of the survey respondents chose 96152, *Health and behavior intervention, each 15 minutes, face-to-face; individual,* as the key reference service. An analysis of the intensity and complexity measures shows that the respondents rated the surveyed code higher in every measure except one - physical effort. The panel believes the increased intensity and complexity in addition to the total time of the service supports the median value.

In addition, the panel compared the surveyed code to 99215, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.*(5, 35, 15; RVW 2.11) with a total time of 55 minutes. The panel believes that substantially increased time of the 90837 more than accounts for any variation in the

intensity of the two services. The value is further supported by the fact that the surveyed code can be used in any setting (outpatient, inpatient, residential care, nursing facility) where the intensity of the patient encounter can vary greatly.

Additional support comes from the comparison of the surveyed code to 99222, *Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit* (15, 40, 20; RVW 2.61) which has a time that is similar to the surveyed code and with the larger RVW of the 99222 accounting for any increased intensity.

Finally, the expert panel also compared the median survey results of the 90837 to the other median survey results and found that the median maintains relativity of values within the family of psychotherapy codes.

Recommendations
In summary, based on the comparisons to the key reference service and MPC codes **we recommend an RVW of 3.00 with 5 pre-, 60 intra-, and 10 post-service minutes for a total time of 82 minutes for 90837.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90808, 90821

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Sometimes

Specialty Psychology How often? Sometimes

Specialty Social Work How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1681744

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry	Frequency 89083	Percentage 5.29 %
Specialty Psychology	Frequency 631443	Percentage 37.54 %
Specialty Social Work	Frequency 886103	Percentage 52.68 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 421,766 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most current RUC database.

Specialty Psychiatry	Frequency 22271	Percentage 5.28 %
Specialty Psychology	Frequency 157861	Percentage 37.42 %
Specialty Social Work	Frequency 221526	Percentage 52.52 %

Do many physicians perform this service across the United States? Yes

---

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: Data from various sources, including past interactions with the patient, current history and mental status findings, information which may have come to light from other historians or outside records, and the patient's behavior, descriptions, and responses to intra-session interventions, are all reviewed or considered and a working therapeutic interpretation, behavioral treatment plan or supportive intervention strategy is formulated and enacted. Examples of the focus of this intervention could include a current acute situation, suicidal thought/ safety plan, or a pattern of dysfunctional behavior. Evidence of behavioral change, demonstration of insight, or reduction in symptoms (anxiety, depression, irritability, etc.) is sought based on the psychotherapeutic interventions.

Description of Post-Service Work: Documentation of the symptoms and behaviors that are the focus of the treatment, as well as the specific psychotherapeutic intervention and work done in the session.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99354	ZZZ	1.77	**RUC Time**

CPT Descriptor Prolonged service in the office or other outpatient setting requiring direct patient contact beyond the usual service; first hour (List separately in addition to code for office or other outpatient Evaluation and Management service)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99387	XXX	2.50	**RUC Time**	0

CPT Descriptor 1 Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; 65 years and older

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,650,554

CPT Descriptor 2 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

Other Reference CPT Code	Global	Work RVU	Time Source
99221	XXX	1.92	**RUC Time**

CPT Descriptor Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A detailed or comprehensive history; A detailed or comprehensive examination; and Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of low severity. Physicians typically spend 30 minutes at the bedside and on the patient's hospital floor or unit.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 35 **% of respondents:** 30.7 **%**

TIME ESTIMATES (Median)	**CPT Code: 90838**	**Key Reference CPT Code:** 99354	**Source of Time RUC Time**

Post-Service intensity/complexity	3.42	3.42

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The 90838, *psychotherapy, 60 minutes with patient and/or family member (list separately in addition to the code for primary service)* had previously been reported as a bundled service (90809, *Psychotherapy 75-80 minutes, office, with medical evaluation and management services;* and 90822, *Psychotherapy 75-80 minutes, facility, with medical evaluation and management services*) that captured the work of the psychotherapy and the E/M services in one code. The psychotherapy with medical evaluation and management codes varied only by time with the level of E/M work remaining constant. The newly approved framework describes the work more accurately, allowing for the differentiation of the E/M work based on the actual level of service provided. Psychiatrists will select the appropriate evaluation and management code based on the key elements, adding on the psychotherapy add-on code based only on the time spent providing psychotherapy. There is minimal overlap between the E/M service and the psychotherapy procedure. The information collected during the E/M portion of the service informs the psychotherapy process and the time spent collecting that data during the E/M portion is not counted in the time spent providing psychotherapy.

Survey process

The survey for the 90838 was sent to a random sample of psychiatrist members of the American Psychiatric Association (APA) and the American Academy of Child and Adolescent Psychiatry (AACAP). This code can be used in all settings (i.e., outpatient, inpatient, residential care, nursing facility). The reference service list was the same list used in all of the other ZZZ surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee. A typical vignette was developed with assistance of experts from APA and AACAP.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel

The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

The expert panel reviewed the number of responses and the service performance rate. It was the opinion of the expert panel that this has not generally been a high volume service. As with the 90833 and the 90836, there were a number of respondents who indicated they had never performed the service however the expert panel believes these individuals were unfamiliar with the survey process and did not recognize a current service being described in a different way. Of the 114 survey respondents, 74 percent found the vignette to be typical. Many of those that did not find the patient typical were primarily individuals who specialized in child and adolescent or geriatric psychiatry who simply said their typical patient was not an adult.

The expert panel supports the median survey time of 60 minutes of intra service time. As with the 90833 and 90836, the expert panel believes that additional post-service documentation requirements for psychotherapy services due to payer requirements adds additional time that is not captured in the evaluation and management codes billed with these services, particularly in light of not employing clinical staff. The expert panel supports adding an additional 3 minutes post-service time to the 90838 to account for that work. Based on the above, **we recommend 0 minutes pre, 60 minutes intra, and 3 minutes post service time.**

Thirty percent of the survey respondents chose 99354, *Prolonged service in the office or other outpatient setting requiring direct patient contact beyond the usual service; first hour (List separately in addition to code for office or*

other outpatient Evaluation and Management service) (0, 60, 0; RVW 1.77), as the key reference service. A review of the intensity and complexity measures shows that the respondents rated the surveyed code the same or higher in a majority of the areas. The expert panel believes that this increased work substantiates the higher median RVW of 2.10 proposed by the survey respondents.

The expert panel compared 90838 to 99233, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit* (10, 30, 15; RVW 2.0), which was the second highest code chosen for comparison by the survey respondents. The panel believed this code supported the median value of the surveyed code, which is substantially longer in intra-service time than this reference code.

An additional comparison of 90838 to 99387, *Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; 65 years and older* (4, 45, 10; RVW 2.5), supports the median value of 2.10 of the surveyed code which has longer intra-service time and is focused on an existing illness and specific psychotherapeutic interventions.

And the expert panel believed that 99404, *Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 60 minutes* (0, 60, 0; RVW 1.95) provided another strong comparison.

The expert panel also compared 90838 to 90845, psychoanalysis, which has a slightly shorter intra-service time and a RUC recommended RVW of 2.10 based on the RUC's review of that code at its September 2011 meeting. The expert panel believes the work of the two services is similar and thus supportive of the median RVW.

As with the 90836, the median survey RVW of 2.10 is substantially less than the current values of the psychotherapy with E/M service codes this code is replacing, 90809 (0, 80, 0; RVW 2.95) and 90822 (0, 78, 0; RVW 2.99).

The expert panel also reviewed the survey data for the entire family of psychotherapy codes and found relativity across the survey results, including the results for 90845, psychoanalysis, which was reviewed by the RUC in September 2011 with reaffirmation requested at this meeting. The panel found that the median RVWs of the 90833, 90836, 90838 codes (psychotherapy when done in conjunction with an E/M service) were equal to or just below that of the 90832, 90834, 90837 codes (psychotherapy only) There is also relativity when compared with other forms of psychotherapy (90845, 90846 and 90847).

Recommendation
In summary, based on comparisons to the reference code, MPC codes, and other codes, **we recommend an RVW of 2.50 , and median times of 60 intra, and 3 post for a total time of 63 minutes for 90838.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90809, 90822

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 164976
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total payments for physician and clinical services in US

Specialty Psychiatry Frequency 139921 Percentage 84.81 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 31,122 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most recent RUC database.

Specialty Psychiatry Frequency 26453 Percentage 84.99 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 90846

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
2010 FIVE YEAR REVIEW SUMMARY OF RECOMMENDATION

CPT Code:90845 Tracking Number Specialty Society Recommended RVU: **2.10**
Global Period: XXX RUC Recommended RVU: **2.10**

CPT Descriptor: Psychoanalysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 37-year-old man with dysthymia and narcissistic personality disorder manifested by entitlement, inability to be intimate, and extreme variability of self esteem is seen in the second year of psychoanalysis, just prior to going on a business trip. Argumentative and easily offended, he accuses the analyst of being insensitive and detached, and angrily rejects any effort to explore the basis of his mood or behavior.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

---

Description of Pre-Service Work: Preparing to see patient; refreshing memory about recent sessions; assessing and managing one's own psychological reactions to the patient.

Description of Intra-Service Work: In person therapeutic communication with patient; implicitly obtaining information and observing the patient's mental state; evaluating and exploring the intensity of symptoms, feelings, thoughts, conflicts, fantasies, behaviors, and dreams as necessary; exploring the patient's and one's own feelings, fantasies and thoughts about the evolving therapeutic relationship as a model for gaining perspective on significant difficulties in the patient's other relationships (transference and countertransference); introducing the impact of the patient's engagement on the analyst as a data source for grasping the patient's effects on other relationships; providing psychological interpretations regarding defenses, conflicts and tendencies in patient's personality and relationships, including awareness of mental process, self-esteem, self-regulation, and impulse control; addressing impediments to ongoing behavioral change that could reduce distress and promote well-being.

Description of Post-Service Work: Documenting the services provided intra-service including reviewing content and process of session, reflection on the psychoanalyst's reactions to the patient's affects, communications and behavior in the session and identifying issues requiring follow-up at next/future sessions; related consultation with peers and review of literature pertinent to the case.

Urgency of medical decision making	3.61	3.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.56	3.67
Physical effort required	2.28	2.28
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.61	3.44
Outcome depends on the skill and judgment of physician	4.67	3.83
Estimated risk of malpractice suit with poor outcome	3.50	3.39

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.33	3.11
Intra-Service intensity/complexity	4.44	3.89
Post-Service intensity/complexity	3.33	3.11

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

Psychoanalysis, CPT code 90845, was put forward along with a majority of the codes within the psychiatry section of CPT as part of the fourth Five-Year Review process. As noted in the attached letter from the specialty societies, we believe there has been a change in the work required in this service. Our letter to CMS highlights the changes in the patient population with references substantiating the increased complexity of the patients. We have also provided additional information under the section on compelling evidence for changes in technique since this code was last reviewed by the RUC in 1995.

Recommendations regarding this code were originally submitted for the September 2010 RUC meeting along with 16 additional codes that were identified as being misvalued. During that presentation the specialties requested that entire tab be referred to the CPT Editorial Panel to more accurately describe the service. The RUC supported the referral to CPT and a CPT Workgroup was established to address these issues.

During the review process, a recommendation was made to remove psychoanalysis from the CPT Workgroup process and forward it on to the RUC for review. It was the opinion of all of the provider groups that the work inherent in providing psychoanalysis was the same regardless of who was performing the procedure and there was no need to further refine the descriptor for that service. A request was made and granted by the AMA RUC staff to add this to code to the RUC's September agenda using the data from our original survey.

Survey Process and Data

The following three groups surveyed 90845: the American Psychiatric Association (Psychiatry), the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work). The survey included two separate reference service lists (RSL), one used by the psychiatry, and one used by the psychology and social work. The separate RSL's were reviewed and approved by the RUC Research Subcommittee. Together the societies convened a joint society expert panel ("expert panel") to review the survey data and make recommendations.

Analysis and recommendations from the expert panel

Time: The survey median results regarding time are 10 minutes pre, 50 minutes intra, and 10 minutes post service. The expert panel supported the median time of 50 minutes for the intra-service time however thought that the median values for the pre and post service times were an overestimation. According to the experts, the patient is typically seen face to face for 50 minutes and the total encounter lasts approximately 60 minutes. The panel reviewed the 25th percentile of 5 minutes of pre and 5 minutes for post service work and agreed these times were more representative of what typically occurs. The 5 minutes of pre and post time combined with the intra-service time of 50 minutes results in a total time of 60 minutes. **Therefore we recommend 5 minutes pre, 50 minutes intra and 5 minutes post service time for a total time of 60 minutes.**

RVW: As noted above, two separate reference service lists were used for this survey effort resulting in two different codes being selected as the key reference service. Responses by psychologists and social workers who were using a common reference service list outnumbered the responses by psychiatrists which impacted the selection of the key reference service. The expert panel reviewed the number of times each specialty billed this code using the RUC database and compared it to the response rate by specialty to the RUC survey. They found that psychiatry was under-represented and psychology and social work over-represented in the results.

Specialty	2010 Medicare Claims (Frequency)		Percentage of Responses by Specialty	RVW Median	Median Time			
	%	# Claims			Pre	Intra	Post	Total Time
Psychiatry	50%	2709	36%	2.50	5	50	10	65
Psychology	36%	1950	43%	2.10	10	55	10	75
Social Work	0.12%	7	21%	1.95	15	50	15	80

The key reference service for the combined survey results was 99404, *Preventive medicine counseling and/or risk factor reduction intervention(s) provided to an individual (separate procedure); approximately 60 minutes* (RVW of 1.95 with time of 0, 60, 0, pre, intra and post respectively and a total time of 60 minutes) which was selected by 17 of the 34 psychologists and social workers completing the survey.

An analysis of the intensity and complexity measures shows that respondents thought the intensity and complexity of the work of psychoanalysis was greater in every measure – in particular technical skill (4.53 for 90845 and 3.65 for 99404) and

outcome (4.65 for 90845 and 3.76 for 99404) -- than the key reference service except one, physical effort, validating the median value of 2.10.

Six of the 19 psychiatrists responding to the survey chose CPT code 99215, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family* (RVW of 2.11, with times of 5, 35, 15 pre, intra and post respectively and a total time of 55 minutes) as the key reference service.

Again, an analysis of the intensity and complexity measures show that respondents indicated that the work was more intense and/or complex in a majority of the categories, again with the greatest difference in the area of technical skill required (4.83 for 90845 and 3.83 for 99215) and outcome dependent on the skill and judgment of the physician (4.50 for 90845 and 3.50 for 99215), further substantiating the median RVW of 2.10.

The expert panel concurred with the survey median RVW of 2.10, agreeing that psychoanalysis was more intense, required greater technical effort and relied more heavily on the skill and judgment of the clinician than the key reference services cited.

The current RVW for 90845 is 1.79, we guide you to the compelling evidence section for details regarding two compelling evidence criteria which the expert panel believed were met - changes in physician work due to patient population and technique. In addition to the reference service codes identified above, the following service is provided for comparison to support our recommended RVW and times:

CPT 99233, *Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit*, with a work RVW of 2.00 and 55 minutes of total time (10 pre, 30 intra, 15 post service).

This comparison code, coupled with the median survey results, supports our recommendation of the median value of 2.10 for 90845, Psychoanalysis. **Therefore we recommend the median RVW of 2.10 with times of 5 pre, 50 intra and 5 post service for a total time of 60 minutes.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? (ie. similar work RVU, and specialty) No

If no, please select another crosswalk and provide a brief rationale. 90845

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

---

Compelling Evidence

The RUC operates with the initial presumption that the current values assigned to the codes under review are correct. The argument for a change must be substantial and meet the RUC's compelling evidence standards listed in the Instructions Document. Please list your compelling evidence below (if appropriate).

As noted in the letter to CMS, psychoanalysis and the other codes within the psychiatry section were identified by the specialty societies as being misvalued predominately because of changes in the patient population and in the case of psychoanalysis, due to changes to the technique since the code was originally valued in 1995 as described below. The following outlines those changes in addition to the original arguments in the letter to CMS as part of the five-year review process.

(1) Change in the patient population: Psychoanalysts traditionally treated a wide variety of conditions which included a considerable number of high functioning patients who came to treatment for what might be regarded today as relatively minor psychological problems. Patients with such conditions are now often treated in a variety of newer treatment modalities (such as short term cognitive-behavioral and psychodynamic psychotherapies, CPT 90806 or 90807) rather than psychoanalysis. As a result there has been a change in the overall severity of the clinical population engaged in full psychoanalytic treatment (CPT 90845) with an increased number of patients suffering from narcissistic and borderline conditions, as well as patients with dual diagnoses, including bipolar disorder and some forms of substance abuse. Such patients tend to be more unstable both within and outside the treatment setting, and may require a much more active approach on the part of the psychoanalyst. This change in the overall composition of the patient population has resulted in a greater degree of work effort on the part of psychoanalysts, as well as increased stress borne out of concern for possible transitory negative effects (including transitory increases in suicidal ideation) which may occur as an effect of such intensive treatment and which must be carefully managed.

(2) Change in the technique employed in psychoanalytic practice: Traditionally, psychoanalytic treatment (CPT 90845) had been based in a model originated in theoretical writings of Freud and carried into actual practice by psychoanalysts during the mid-20th century. In this model the analyst tended to be silent a great deal of the time, listening closely to the patient's associations and intervening sparsely with interpretations with the aim of augmenting the patient's self-understanding. As a result of growing understanding of the actual role of the psychoanalyst's presence in the session the focus has shifted to a greater emphasis on the interaction between the psychoanalyst and the patient as the data for gaining understanding of the patient's internal dynamics. Technically, this focus on the interpersonal process between them is a further development of the fundamental concepts of transference, counter-transference, and therapeutic change. This technical change had already started to become evident in the 1990's but is now a widely regarded important feature of psychoanalytic treatment. As a result of this technical change the psychoanalyst is required to be much more intently focused on the minute to minute interaction during the session, considerably more active during the session, and much more focused on his or her internal feeling states both within and between the analytic sessions. This substantially increases the psychoanalyst's intensity and complexity effort during the session, when compared with the earlier model.

Five-Year Review Specific Questions

Please indicate the number of survey respondent percentages responding to each of the following questions (for example 0.05 = 5%).

Has the work of performing this service changed in the past 5 years? Yes 40% No 60%

A. This service represents new technology? Yes 32% No 68%

Of survey respondents, who said yes, the new technology affected the work:

Less Work: 0% Same Work: 14% More Work: 86%

B. This service reflects new technology that has become more familiar: Yes 14% No 86%

C. Patients requiring this service are now:
More complex (more work) 91% Less complex (less work) 0% No change in complexity 9%
D. The typical site-of-service has changed:
From outpatient to inpatient 9% From inpatient to outpatient 9% No change 82%

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

Presented Recommended RVU: **2.40**
Global Period: XXX RUC Recommended RVU: **2.40**

CPT Descriptor: Family psychotherapy (without the patient present)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Parents of a 16 year old girl who is defiant, unruly, failing in school, and recently caught smoking marijuana seek help in managing the child. The child refuses to come in for treatment. The parents disagree on how to manage the child.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Prepare office for family; review patient's records, including information from outside sources; communicate with other professionals.

Description of Intra-Service Work: Face to face interaction with the patient's family; obtain interval history of the patient; provide psychoeducation regarding the patient's problems and the role family members have in perpetuating or diminishing them; formulation of treatment goals; and, development of systemic strategies to achieve desired goals.

Description of Post-Service Work: Arrange for further services; provide electronic, written or telephone communication with other family and other professionals (e.g., physicians, teachers, psychotherapists); document the services provided; provide written, electronic or telephone reports to Medicare or other third party payers.

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99215	XXX	2.11	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99386	XXX	2.33	**RUC Time**	

CPT Descriptor 1 Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; 40-64 years

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.43	**RUC Time**	8,436,133

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family

Other Reference CPT Code	Global	Work RVU	Time Source
99310	XXX	2.35	**RUC Time**

CPT Descriptor Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A comprehensive interval history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. The patient may be unstable or may have developed a significant new problem requiring immediate physician attention.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 22 **% of respondents:** 17.8 **%**

TIME ESTIMATES (Median)	**CPT Code: 90846**	**Key Reference CPT Code: 99215**	**Source of Time RUC Time**
Median Pre-Service Time	5.00	5.00	
Median Intra-Service Time	50.00	35.00

Time Segments (Mean)		
Pre-Service intensity/complexity	2.76	2.62
Intra-Service intensity/complexity	4.19	4.19

Post-Service intensity/complexity	3.19	3.10

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

This code, 90846, Family Psychotherapy (without the patient present) is an existing code and was not revised during the CPT process.

Survey Process
The survey was sent randomly to members of Psychiatry, Child Psychiatry, Psychology, and Social Work. In addition to a random sample, psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. The in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC.

The reference service list was the same list used in all of the other XXX surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers, and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

82 percent of the 123 survey respondents indicated that the vignette described the typical patient.

As noted in the work descriptor, the pre-service time is spent collecting and reviewing medical records and other data prior to the family visit. The post time is spent scheduling the next appointment, developing a written treatment plan, following up with other providers/agencies regarding findings, writing referrals for other services, and any other activities that result from the treatment decisions made during the session, again, without benefit of clinical staff to assist. **Therefore we recommend 5 minutes pre-, 50 minutes intra-, and 10 minutes post-service time for a total time of 65 minutes.**

The key reference service for the survey results was 99215, *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's*

needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family (5, 35, 15; RVW 2.11), which was selected by 18% of the survey respondents.

An analysis of the intensity and complexity measures shows that respondents thought the intensity and complexity of the work of family therapy (without the patient present) was equal to or higher than the majority of the measures. In particular, the respondents indicated that the technical skill required and the risk of complications was greater in the surveyed code than in the reference code. They rated the intra-service intensity/complexity the same as the reference code with the pre- and post-service periods rated higher for the surveyed code. The expert panel reviewed this data, comparing the reference service code RVW and time to the surveyed code. They agreed that the difference in RVW could be accounted for by the increased time required, as well as by the increased intensity and complexity in specific measures and support the survey median RVW of 2.40.

An additional comparison can be made to 99386, *Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; 40-64 years,* (5, 40, 10; RVW 2.33) with a total time of 55 minutes. The increased RVW of the surveyed code accounts for the increased time of the service.

The expert panel also identified 99204, *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family*, with a work RVW of 2.43 and 45 minutes of total time (5 pre, 30 intra, 10 post service). In comparing the work of the surveyed code to 99204, the expert panel noted that the difference in time between the two codes supports the median RVW and makes up for any difference in intensity between work for the benefit of an established patient versus work associated with a new patient.

One last comparison was made with 99310, *Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A comprehensive interval history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. The patient may be unstable or may have developed a significant new problem requiring immediate physician attention* (15, 35, 20; RVW 2.35), with a total time of 70 minutes. The times and RVW values are similar, again, with the increased intra-service time accounting for the slightly higher RVW of the surveyed code.

Finally, the expert panel compared the results from this survey process with the results from the 2010 survey of this code. The panel thinks that the differences in the median RVWs between the 2012 survey and the 2010 survey (2.40 RVWs vs. 2.00 RVWs) can be accounted for by the increased number of responses (123 responses in the 2012 survey as compared to 76 responses in the 2010 survey) and an increase in the median service performance rate. The expert panel thinks the current survey results are more reliable than the previous survey effort and there is appropriate relativity between the 2012 median value of 2.40 and the values for other psychotherapy services being presented at this meeting.

Recommendation:
The comparisons above support our recommendation of the median value of 2.40 for 90846, Family psychotherapy (without the patient present). **Therefore we recommend the median RVW of 2.40 with times of 10 pre-, 50 intra-, and 15 post-service for a total time of 65 minutes for code 90846.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90846

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry How often? Sometimes

Specialty Psychology How often? Sometimes

Specialty Social Work How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 104808
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry Frequency 30195 Percentage 28.80 %

Specialty Psychology Frequency 26621 Percentage 25.39 %

Specialty Social Work Frequency 42856 Percentage 40.89 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 26,202 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most recent RUC database

Specialty Psychiatry Frequency 7549 Percentage 28.81 %

Specialty Psychology Frequency 6655 Percentage 25.39 %

Specialty Social Work Frequency 10714 Percentage 40.89 %

Do many physicians perform this service across the United States? Yes

---

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99205	XXX	3.17	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99222	XXX	2.61	**RUC Time**	7,451,227

CPT Descriptor 1 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.43	**RUC Time**	8,436,133

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordinatio

Other Reference CPT Code	Global	Work RVU	Time Source
99336	XXX	2.46	**RUC Time**

CPT Descriptor Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes with the patient and/or family or caregiver.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 28 **% of respondents:** 22.7 **%**

TIME ESTIMATES (Median)	**CPT Code: 90847**	**Key Reference CPT Code:** 99205	**Source of Time RUC Time**
Median Pre-Service Time	5.00	7.00

Pre-Service intensity/complexity	2.44	2.19
Intra-Service intensity/complexity	4.44	4.19

Post-Service intensity/complexity	3.15	2.96

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

This code, 90847, *Family psychotherapy (conjoint psychotherapy) (with patient present)* is an existing code and was not revised during the CPT process. This code can be used in all settings.

Survey process
The survey was sent randomly to members of Psychiatry, Child Psychiatry, Psychology, and Social Work. In addition to a random sample, Psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. The in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC.

The reference service list was the same list used in all of the other XXX surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers, and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations involved in this survey convened a joint society expert panel expert panel with broad representation from each group to review the survey data and make recommendations.

84 percent of the survey respondents indicated that the vignette described the typical patient.

As noted in the work descriptor, the pre-service time is spent collecting and reviewing medical records and other data prior to the family visit. The post-service time is spent scheduling the next appointment, developing a written treatment plan, following up with other providers/agencies regarding findings, writing referrals for other services, and any other activities as a result of the treatment decisions from the session, again, without benefit of clinical staff to assist. **Therefore we recommend 5 minutes pre-, 55 minutes intra-, and 10 minutes post service time for a total time of 70 minutes.**

The key reference service chosen for this code was 99205, *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the*

patient and/or family (7, 45, 15 ; RVW 3.17) with a total time of 67 minutes, which was selected by 23% of the survey respondents.

An analysis of the intensity and complexity measures shows that respondents thought the intensity and complexity of the work of *Family psychotherapy (conjoint psychotherapy) (with patient present)* was greater than the reference code in many of the measures. In particular, the respondents indicated that the intensity/complexity was greater in each of the time segments than for 99205. The panel believes this data supports the median RVW of 2.50.

An additional comparison can be made to 99222, *Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of moderate severity. Physicians typically spend 50 minutes at the bedside and on the patient's hospital floor or unit* (15, 40, 20; RVW 2.61). In comparing the two services, the expert panel noted that the times were similar and the variation of the RVW was accounted for by the increased intensity of a new patient in an inpatient setting.

The expert panel also believes the 99336, *Domiciliary or rest home visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes with the patient and/or family or caregiver* (10, 40, 15; RVW 2.46), supports the median RVW of the surveyed code based on the similarities in time.

Finally, the expert panel compared the results of the 2012 survey with those of the 2010 survey. The median RVW increased from 1.94 in the 2010 survey to 2.50 in 2012. As with the 90846, there was an increase in the number of survey respondents from 2010 to 2012 (94 to 123). The panel noted that in 2010 there was variation in the median survey responses between the MD and Non-MD groups, which negatively affected the median RVW when the data was combined. The panel thinks that the use of the common reference service list in 2012 led to more reliable survey data with the difference in the median RVW between MDs and Non-MDs at 0.08. The panel also thinks the median value of 2.50 RVWs is in line with the median value for 90846, *Family psychotherapy (without the patient present)*, noting that the work involved is more difficult when the patient is present.

Recommendation
These comparison codes and the median survey results support our recommendation of the median value of 2.50 for 90847, *Family psychotherapy (conjoint psychotherapy) (with patient present)*. **Therefore we recommend the median RVW of 2.50 with times of 5 pre-, 55 intra-, and 10 post- service minutes, for a total time of 70 minutes for 90847.**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90847

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry	How often? Sometimes
Specialty Psychology	How often? Sometimes
Specialty Social Work	How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 890852
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry	Frequency 171400	Percentage 19.24 %
Specialty Psychology	Frequency 340395	Percentage 38.21 %
Specialty Social Work	Frequency 338257	Percentage 37.97 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 222,713 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most recent RUC database

Specialty Psychiatry	Frequency 42850	Percentage 19.24 %
Specialty Psychology	Frequency 85099	Percentage 38.21 %
Specialty Social Work	Frequency 84564	Percentage 37.96 %

Do many physicians perform this service across the United States? Yes

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
96153	XXX	0.10	**RUC Time**

CPT Descriptor Health and behavior intervention, each 15 minutes, face-to-face; group (2 or more patients)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99223	XXX	3.86	**RUC Time**	11,496,707

CPT Descriptor 1 Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
		0.00		

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
97804	XXX	0.25	**RUC Time**

CPT Descriptor Medical nutrition therapy; group (2 or more individual(s)), each 30 minutes

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 34 **% of respondents:** 41.4 **%**

TIME ESTIMATES (Median)	**CPT Code: 90853**	**Key Reference CPT Code:** 96153	**Source of Time**
Median Pre-Service Time	3.00	1.00	
Median Intra-Service Time	10.00	3.00	
Median Immediate Post-service Time	3.00	1.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	

Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**16.00**	**5.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.55	3.23
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.23	3.13
Urgency of medical decision making	2.90	2.77
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.13	3.90
Physical effort required	2.45	2.29
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.77	2.57
Outcome depends on the skill and judgment of physician	4.00	3.70
Estimated risk of malpractice suit with poor outcome	2.52	2.47

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.61	2.38
Intra-Service intensity/complexity	4.45	4.19
Post-Service intensity/complexity	2.91	2.69

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
We have provided a detailed cover letter regarding the background of this RUC submission which includes this code and the 10 others from the Psychiatry section that were surveyed in March 2012.

The physician specialty societies (the *MDs)* include the American Psychiatric Association (Psychiatry) and the American Academy of Child and Adolescent Psychiatry (Child Psychiatry). The psychologist and clinical social worker specialty societies (the *Non-MDs)* include the American Psychological Association (Psychology) and the National Association of Social Workers (Social Work).

This code, 90853, *Group psychotherapy (other than of a multifamily group)* is an existing code and was not revised during the CPT process. This code can be used in all settings.

Survey Process
The survey was sent to all psychiatrist members of the American Group Psychotherapy Association, and randomly to members of Child Psychiatry, Psychology, and Social Work. In addition to a random sample, Psychology conducted a convenience sample of 100 psychologists attending a conference in Washington, DC. This in-person survey was monitored by AMA RUC staff and the chair of the RUC HCPAC. The reference service list was the same list used in all of the other XXX surveys for this family of codes and was reviewed and approved by the RUC Research Subcommittee.

The RUC Research Subcommittee also approved adding to additional questions to the RUC survey regarding group psychotherapy. The societies asked to include a question as to the typical number of patients seen in a typical group session and they asked to include an instruction for the survey respondents to calculate the time and the RVW of the procedure as a whole rather than on a per patient basis. The societies were concerned that survey respondents many respond in an in consistent way if those questions were not included. The RUC Research Subcommittee approved the request.

As noted in our submission to the Practice Expense Subcommittee, there has been a shift in practice over the years, and while approximately half of the practicing psychiatrists employ administrative staff, a lesser number employ clinical staff. These numbers are even lower for psychologists, clinical social workers, and other qualified healthcare providers. As a result, our PE submission did not include any clinical staff time. This is another argument for the RVW recommendation since this increased work is done entirely by the treating provider.

Analysis and recommendations from the expert panel
The associations convened a joint society expert panel with broad representation from each group to review the survey data and make recommendations.

78 percent of the 82 survey respondents indicated that the vignette described the typical patient and the expert panel concluded that the service performance rate seemed reasonable

The expert panel noted that the median intra-service time of 60 minutes appeared less than what is typical. A review of the data from the 2010 RUC survey of this code shows that the intra-service time was 90 minutes at the median and 75th percentile. Further discussions with experts in group psychotherapy confirmed that the standard length of a typical group psychotherapy visit was 76 to 90 minutes which was reported in the results of a 2010 survey by the American Group Psychotherapy Association. The pre and post service times appeared to be in the appropriate range and in line with the current.

The expert panel does not believe the survey results accurately represent the work of these procedures. We believe that survey respondents were confused by this new way of considering time and work, by using the total work and time of the entire group, rather than considering it by individual patient work and time. This led to an under reporting of values. Despite the increased complexity of patients since the last survey, we don't have credible survey evidence to increase the values, and therefore recommend that the current values should be maintained. We also believe the research Subcommittee should investigate options for future surveys that address procedure codes that describe services provided to groups of patients. The panel requests that the current values be maintained on the basis of the following comparisons.

In comparing 97804, Medical nutrition therapy; group (2 or more individual(s)), each 30 minutes (2,6,2; RVW 0.25), and 99411, Preventive medicine counseling and/or risk factor reduction intervention(s) provided to individuals in a group setting (separate procedure); approximately 30 minutes 10, 30, 5; RVW 0.15) to *90853, Group Psychotherapy,* the expert panel noted that the complexity of the intra-service work is greater with the surveyed code due to the interpersonal dynamic between participants in the psychotherapeutic process.

The panel also believed that the work of the 90853 was similar to that of the 99223, Initial hospital care, per day, for the evaluation and management of a patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of high severity. Physicians typically spend 70 minutes at the bedside and on the patient's hospital floor or unit. (15, 55, 20; RVW 3.86) which has a similar total time and the higher RVW of the 99223 accounts for the increased intensity of the inpatient service.

Recommendation
We recommend maintaining the current RVW of 0.59 with times of 3 pre-, 10 intra-, and 3 post-service minutes for a total time of 16 minutes (per patient) for 90853.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 90853

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Psychiatry	How often? Commonly
Specialty Psychology	How often? Commonly
Specialty Social Work	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 5061420

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare payments are approximately 25% of total phsyician and clinical services expenses in US.

Specialty Psychiatry	Frequency 1464775	Percentage 28.94 %
Specialty Psychology	Frequency 907513	Percentage 17.93 %
Specialty Social Work	Frequency 1912711	Percentage 37.79 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,265,355 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on most recent RUC database.

Specialty Psychiatry	Frequency 366194	Percentage 28.94 %
Specialty Psychology	Frequency 226878	Percentage 17.92 %
Specialty Social Work	Frequency 478178	Percentage 37.79 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 90853

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
Psychiatric diagnostic evaluation code

Global Period: XXX Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Specialty Society Practice Expense Committee for the psychiatric codes consisted of representatives from the American Psychiatric Association, the Academy of Child and Adolescent Psychiatry, the American Psychological Association, and the National Association of Social Workers. An expert panel that included psychiatrists, psychologists, and clinical social workers, was developed to review practice expense across the spectrum of care for the psychiatric codes. It was agreed that there is no clinical service labor for any of the psychiatric codes. The groups will be requesting expenses related to medical supplies and equipment only.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: N/A

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: N/A

Service Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities: N/A

Global Period: XXX Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Specialty Society Practice Expense Committee for the psychiatric codes consisted of representatives from the American Psychiatric Association, the Academy of Child and Adolescent Psychiatry, the American Psychological Association, and the National Association of Social Workers. An expert panel that included psychiatrists, psychologists, and clinical social workers, was developed to review practice expense across the spectrum of care for the psychiatric codes. It was agreed that there is no clinical service labor for any of the psychiatric codes. The groups will be requesting expenses related to medical supplies and equipment only.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: N/A

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: N/A

Service Clinical Labor Activities: N/A

Post-Service Clinical Labor Activities: N/A

CPT Code: 90853
Specialty Society('s)_APA-RUC, AACAP, APA-HCPAC, NASW

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:
Group psychotherapy (other than of a multiple-family group)

(Use 9080XE in conjunction with 90853 for the specified patient when group psychotherapy includes interactive complexity)

Global Period: XXX Meeting Date: April 2012

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Wireless Motility Capsule

In February 2012, the CPT Editorial Panel deleted Category III code (0242T) and created a Category I code to describe gastrointestinal tract transit and pressure measurement from the stomach to the colon via wireless capsule.

The RUC reviewed the survey results from 41 gastroenterologists for CPT code 91112 *Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report* and determined that a work RVU of 2.10, the survey's 25th percentile, appropriately accounts for the physician work required to perform this service. The RUC agreed with the survey time of 5 minutes pre-service, 40 minutes intra-service and 15 minutes post-service. The RUC compared 91112 to key reference service CPT code 91110 *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* (work RVU=3.64) and determined that while code 91112 is a XXX code, 5 minutes of pre service time to capture the face-to-face patient encounter work including informed consent is appropriate for this code and is consistent with other XXX gastrointestinal diagnostic services. The reference service requires twice as much time to perform than 91112, 80 and 40 minutes intra-service time, respectively. The RUC noted that while the quantity of data to be reviewed for 91112 is less than that for 91110, the complexity of the data is greater. For further support the RUC compared 91112 to CPT code 88189 *Flow cytometry, interpretation; 16 or more markers* (work RVU=2.23) and noted that the codes had identical intra-service time. **The RUC recommends a work RVU of 2.10 for CPT code 91112.**

New Technology
This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:91112 Tracking Number Y1 Original Specialty Recommended RVU: **2.10**
Presented Recommended RVU: **2.10**
Global Period: XXX RUC Recommended RVU: **2.10**

CPT Descriptor: Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report.

(Do not report 91112 in conjunction with 83986, 91020, 91022, 91117)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 35-year-old female is referred for evaluation of nausea, bloating, abdominal discomfort and constipation. Previous diagnostic studies were negative and confirm absence of a luminal obstructing lesion. The patient has failed to respond to pharmacological therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: Assess for possible contraindications, such as presence of pacemaker, active bowel obstruction or swallowing disorder. Provide education to patient on the nature of the procedure, why it is being performed and possible complications. Provide instructions to patient on preparation for capsule ingestion. Obtain informed consent.

Description of Intra-Service Work: Physician observes patient while ingesting capsule. Patient wears data receiver for 3-7 days while recording transit and pressure measurements. After receiver has been returned to the physician office, the data is downloaded to the computer. The physician proceeds to review the data collected by the reviever.

Description of Post-Service Work: Upon completion of the review and interpretation of the data , a report is prepared and dictated. The findings are communicated to the patient and a copy of the report is sent to the referring physician. The referring physician may also be contacted to discuss the findings.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
91110	XXX	3.64	**RUC Time**

CPT Descriptor Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,650,554

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99204	XXX	2.43	**RUC Time**	8,436,133

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 24 **% of respondents:** 58.5 **%**

TIME ESTIMATES (Median)	**CPT Code: 91112**	**Key Reference CPT Code:** 91110	**Source of Time** RUC Time
Median Pre-Service Time	5.00	5.00	
Median Intra-Service Time	40.00	80.00	
Median Immediate Post-service Time	15.00	15.00	

Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**60.00**	**100.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.46	3.96
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.63	4.17
Urgency of medical decision making	3.50	3.79
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.25	4.08
Physical effort required	3.38	3.46
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.13	3.17
Outcome depends on the skill and judgment of physician	4.38	4.33
Estimated risk of malpractice suit with poor outcome	3.42	3.58

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.75	3.58
Intra-Service intensity/complexity	4.00	3.96
Post-Service intensity/complexity	4.04	3.83

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) conducted a survey of 184 gastroenterologists who perform the service described by CPT code 91112; *Gastrointestinal transit and pressure measurement, stomach through colon, wireless capsule, with interpretation and report*. We received 41 responses (22.2%) from physicians familiar with the physician work involved in performing this service. The societies received approval from the Research Subcommittee to conduct a Panel survey consisting of a mix of physicians from a device manufacturer's user list and a random sample of members. The societies convened an Expert Panel to review the survey results and develop society recommendations.

The Panel determined that 41 surveys represented a robust response for this infrequently-performed service, noting that the survey data exhibited good clustering about the medians that accurately captured the data elements for this service. The key reference code identified in the survey was code 91110; *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report.* The Panel felt that code 91110 is an appropriate reference code that describes a service with similarities in physician work to the surveyed code, specifically in that code 91110 also describes a service in which extensive recorded data is analyzed subsequent to the face-to-face patient encounter to develop a procedure report.

While code 91112 is a XXX code, the expert Panel recommended 5 minutes of pre service time to capture the face-to-face patient encounter work including informed consent, which compares appropriately with other XXX gastrointestinal diagnostic services reviewed by the RUC, such as codes 91110 and 91111, with 5 minutes of pre service time.

The survey median intraservice time was 40 minutes. In comparison, the key reference code, 91110, has a work RVU of 3.64 and an intra-service time of 80 minutes. The expert Panel reviewed the physician work and noted that while the quantity of data to be reviewed for 91112 is less than that for 91110, the complexity of the data is greater. The Panel compared this service to other diagnostic procedures describing analysis of gastrointestinal physiologic recordings:

Code	Brief descriptor	Intraservice time	wRVU	RUC reviewed
91010	Esophageal manometry	20	1.28	April 2010
91022	Duodenal manometry	30	1.44	Feb 2005
91035	Esophageal reflux test with attached telemetry electrode	20	1.59	Feb 2004
91110	Gastrointestinal tract imaging, esophagus through ileum	80	3.64	April 2003

The Panel evaluated the procedure for interpretation of the wireless motility capsule tracings. The test is typically 5 days in duration, includes measurement of 3 distinct physiologic parameters, and requires both an overview evaluation of the full tracing as well as a detailed analysis of approximately 40-60 discrete (<5 minute) event episodes during the test period. In comparing the quantity and intensity of analysis required for 91112 with the physiologic studies listed in the table, the Panel concluded that the survey median intraservice time of 40 minutes is correct and represents an intermediate value between the 20-30 minutes of intraservice time for the other GI physiology tests listed (Codes 91010, 91022, 91035) and code 91110, the Key Reference Service (80 minutes).

The survey reported a median RVW of 3.38 and a 25th percentile value of 2.10. In comparing these values with the wRVU of the Key Reference Service, 91110 at 3.64 the Panel noted that there are less data (but of greater intensity) for 91112 than for 91110, and more than for the three physiology codes listed in the table (91010, 91022, and 91035). The Panel concluded that the 25th percentile wRVU of 2.10 more appropriately reflected the work associated with 91112.

The survey indicated a median post service time of 20 minutes. The Panel noted that this is greater than the 15 minutes of post-service time for the key reference code 91110 and code 91010 which was recently reviewed and recommends 15 minutes of post service time for 91112.

Our societies recommend a work RVU at the survey's 25th percentile at an RVU of 2.10 with 5 minutes of preservice time, a median intra service time of 40 minutes and post-service time of 15 minutes. This would result in an IWPUT of 0.041 for 91112. The IWPUT of the key reference code 91110 is 0.04. In addition, the IWPUT of MPC reference codes 99233 and 99204 are 0.048 and 0.0697, respectively. Our societies note that the recommended value for this code fits with both the key reference code and with the additional MPC reference codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was previously reported with Category III CPT code 0242T. This new Category I CPT code replaces that code. There is no utilization data available for 0242T as it became effective on January 1, 2011.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Gastroenterology Frequency 2700 Percentage 90.00 %

Specialty Internal Medicine Frequency 300 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 900
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The service is provided across a varied patient population. It is estimated that approximately 70% of patients are below the Medicare-elegible patient age range and 30% fall within this range.

Specialty Gastroenterology Frequency 810 Percentage 90.00 %

Specialty Internal Medicine Frequency 90 Percentage 10.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 91110

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

As the key reference code in the physician work survey, we decided to compare practice expenses to CPT code 91110.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff (RN/LPN/MTA) calibrates and activates the various pieces of equipment including the data recorder, software, wireless capsule and docking station in preparation for the patient to ingest the capsule and wear the recorder home.

Service Clinical Labor Activities:

The staff greets the patient and ensures the appropriate records are available. They educate the patient on how to ingest the standardized meal and capsule, how to operate the equipment and how and when to wear and remove the recording device. The staff prepares the meal and capsule for ingestion and monitors the patient. The staff coordinates the patient’s next office visits and how to return the data recorder.

When the recorder is returned, the staff will sit with the patient to discuss the “events” that took place and were recorded by the patient using the recorder button. This includes reviewing the patient diary of events and marking them on the software depending on what the event was (i.e., bowel movement, meal, exercise, abdominal pain, etc.) for the physician to review during the interpretation of data.

Post-Service Clinical Labor Activities:

Staff collects the recorder and equipment from patient, downloads the data to the computer software system and prepares the data for the physician to review. Staff conducts follow up phone call with patient regarding test results.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued - Utilization over 30,000 screen

April 2012

Anterior Segment Imaging

In April 2011, the RUC identified CPT code 92286 *Anterior segment imaging with interpretation and report; with specular microscopy and cell analysis* through the Harvard-Valued utilization over 30,000 screen. The utilization for this service was just below 100,000 for the initial Harvard-Valued – Utilization over 100,000 screen based on 2007 Medicare claims data. The specialty society submitted a coding proposal to revise the existing code descriptor to better describe the service. CPT code 92287 *segment imaging with interpretation and report; with fluorescein angiography* is to be reviewed as part of this family of services.

92286
The RUC reviewed the survey data from 51 ophthalmologists and optometrists for CPT code 92286 and determined that the survey median work RVU of 0.40, which is below the current work RVU, and survey pre-time of 5 minutes and intra-service time of 10 minutes appropriately account for the physician work and time required to perform this service. The specialty society indicated and the RUC agreed that the interpretation and report are included as part of the intra-service work. The RUC compared 92286 to 92025 *Computerized corneal topography, unilateral or bilateral, with interpretation and report* (work RVU = 0.35) and determined that although 92286 is inherently bilateral and requires 2 minutes less intra-service time to perform than 92025, the survey respondents indicated that it is more intense and complex. **The RUC recommends a work RVU of 0.40 for CPT code 92286.**

92287
The American Academy of Ophthalmology (AAO) indicated that apart from utilizing an image, codes 92286 and 92287 are completely different clinical indications and conditions. These services are also provided by different specialties within ophthalmology. CPT code 92286 is used primarily to follow patients with corneal endothelial dystrophy for progression of their disease, pre-cataract surgery to assess the need for possible corneal transplant at the same time and for follow-up care of post corneal transplant patients. CPT code 92287 is rarely performed (less than 3000 in 2010) and obtaining valid survey responses would be difficult. AAO indicated that CPT code 92287 may be inadvertently being reported in lieu of CPT code 92235 *Fluorescein angiography (includes multiframe imaging) with interpretation and report* since it is designates that an image was made at the same time as the angiogram. Currently, there is no increased work when that is occurring as both have the same work value. The Academy believes that coding education and publication of a CPT Assistant article may help clarify the difference between codes 92287 and 92235. **The RUC recommends that the specialty society develop a CPT Assistant article to clarify the difference between CPT codes 92287 and 92235.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
92132		Scanning computerized ophthalmic diagnostic imaging, anterior segment, with interpretation and report, unilateral or bilateral (For specular microscopy and endothelial cell analysis, use 92286)		
▲92286	M1	~~Special a~~Anterior segment ~~photography~~ imaging with interpretation and report; with specular ~~endothelial~~ microscopy and endothelial cell ~~count~~ analysis	XXX	0.40
▲92287	M2	with fluorescein angiography	XXX	Refer to CPT Assistant

Subject: Tab 28 Anterior Segment Imaging—CPT Codes 92286/92287

Dear Dr. Levy,

The American Academy of Ophthalmology at the request of CMS was asked to review CPT *Code 92286 Special anterior segment photography with interpretation and report; with specular endothelial microscopy and cell count*. This service was identified by Harvard Valued – Utilization-Over 30,000 screen. In April 2011, the RUC recommended that this service be surveyed and that the specialty societies identify and survey any related codes in the family during this LOI process *to avoid rank order anomalies*.

The Academy believes that the service represented by 92286 is a singular service that is not related to any of the other codes represented in this category of *Other Specialized Service* within the CPT book. This is a section of miscellaneous services that do not fit with other services within CPT. When we reviewed 92286 we found that the language and equipment used to perform the endothelial microscopy and cell count has changed and the language needed updated. We also suggested tightening up the photography language and eliminating the word special since it is not well defined. Since another photography code that follows 92286 numerically had the same introductory descriptor language the panel agreed the opening descriptors should be similar and accepted our editorial change for 92287 *Special anterior segment photography with interpretation and report; with fluorescein angiography*. As outlined in our application, we believed this change was editorial and the panel accepted that interpretation.

Apart from utilizing an image, the two services are done for completely different clinical indications and conditions. These services are also provided by different specialties within ophthalmology. CPT 92286 is used primarily to follow patients with corneal endothelial dystrophy for progression of their disease, pre-cataract surgery to assess the need for possible corneal transplant at the same time and for follow up care of post corneal transplant patients. CPT 92287 is done rarely (less than 3000 in 2010). The code may

inadvertently being reported in lieu of 92235 Fluorescein Angiography since it is designates that an image was made at the same time as the angiogram. Currently there is no increased work when that is occurring as both have the same work value. The Academy believes that coding education and publication of a CPT Assistant article may help clarify the difference between 92287 and 92235.

We appreciate your consideration of this issue and are happy to discuss and answer any further questions at the upcoming RUC meeting.

Sincerely,

Steve Kamenetzky

Stephen A. Kamenetzky, M.D.
AAO RUC Advisor

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92286 Tracking Number M1 Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: Anterior segment imaging with interpretation and report; specular microscopy with endothelial cell analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72 year old female with visually significant cataracts is noted to have slit-lamp evidence of endothelial dystrophy prior to planned cataract surgery.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient history is reviewed. The correct eye is identified and a time out is prformed. Previous exams are evaluated. A topical anesthetic is placed in both eyes (for those cases in which a contact specular microscope is used). The patient is positioned in front of the instrument.

Description of Intra-Service Work: Images are acquired and reviewed for adequate quality before analysis. Cells to be counted are outlined and marked. Software is used to calculate endothelial cell density. Images and cell density measurements are evaluated. A report is prepared and sent to the referring physician.

Description of Post-Service Work:

Post-Service intensity/complexity	3.29	3.29

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Previously, CPT 92286 *Special anterior segment photography with interpretation and report; with specular endothelial microscopy and cell count* was chosen for review by CMS because it is Harvard valued with

utilization >30,000**.** The test is used to quantify the number of corneal endothelial cells present and to assess their morphology and health. The test is used primarily to follow patients with corneal endothelial dystrophy for progression of their disease, pre-cataract surgery to assess the need for possible corneal transplant at the same time and for follow up care of post corneal transplant patients. The technology has improved over the years shortening the time needed to perform the test and analyze the results. Because of the change in technology a descriptor change was requested at CPT and the revised descriptor now reads: *Anterior segment imaging with interpretation and report; specular microscopy and endothelial cell analysis.* The current WRVU is 0.66 with Harvard time of 18 minutes, designated entirely (as was the custom then) intra-service time. It has an XXX global period.

There were 51 respondents (11% response rate) to the joint AAO-AOA survey and over 90% felt that the vignette was typical. The 25th percentile WRVU was 0.35 and the median WRVU 0.40. The median times were 5/10/5 minutes. The predominant reference code chosen was CPT 92025 *Computerized corneal topography, unilateral or bilateral, with interpretation and report*. The code was RUC reviewed in Feb 2006, is XXX global and has **a WRVU of 0.35** (the survey median in 2006) with times of **5/12/0**. The surveyed code is typically done with an EM service.

An expert consensus panel composed ophthalmologists and optometrists familiar with the RUC process and visual field testing reviewed the survey results. The panel felt that the pre-service time of 5 minutes was appropriate and that the values for intra-service and post-service time should conform to the RUC guideline established for other ophthalmology diagnostic codes. That guideline was that there was no post-service time and all of that physician work, including interpretation and report, should be captured in the intra-service time. After consideration of these factors, the consensus panel adjusted the survey times slightly and is recommending **5/10/0 minutes.** The panel is also recommending the **median survey value of 0.40 WRVU**, which is 0.26 WRVU lower than the current value (40% reduction).

The consensus panel considered the fact that the survey participants assessed the surveyed code as being more intense and complex than the reference code for all but one metric. The surveyed code requires not only review of a large amount of data, but also assessment of a photograph of the corneal endothelium to assess functional viability. That increases the time required to review the test as well as the intensity and complexity of the effort.

There are other codes with similar times and WRVU across all specialties. CPT 93923 *Complete bilateral noninvasive physiologic studies of upper or lower extremity arteries, 3 or more levels (eg, for lower extremity: ankle/brachial indices at distal posterior tibial and anterior tibial/dorsalis pedis arteries plus segmental blood pressure measurements with bidirectional Doppler waveform recording and analysis, at 3 or more levels, or ankle/brachial indices at distal posterior tibial and anterior tibial/dorsalis pedis arteries plus segmental volume plethysmography at 3 or more levels, or ankle/brachial indices at distal posterior tibial and anterior tibial/dorsalis pedis arteries plus segmental transcutaneous oxygen tension measurements at 3 or more level(s), or single level study with provocative functional maneuvers (eg, measurements with postural provocative tests, or measurements with reactive hyperemia) (*RUC 2010, XXX) has a WRVU of 0.45 and times 3/10/3. CPT *93291 Interrogation device evaluation (in person) with physician analysis, review and report, includes connection, recording and disconnection per patient encounter; implantable loop recorder system, including heart rhythm derived data analysis* (RUC 2008,XXX) has a WRVU of 0.43 and times of 5/12/5. CPT 27882, *Ultrasound, extremity, nonvascular, real-time with image documentation; limited, anatomic specific* (RUC 2010, XXX) has a WRVU of 0.41 with times of 5/11/5.

Using these codes for reference, the consensus panel felt that the median survey value of 0.40 WRVU correctly valued the surveyed service. As noted earlier, this is a 40% reduction from the current value.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
☐ Multiple codes are used to maintain consistency with similar codes.
☐ Historical precedents.
☒ Other reason (please explain) This is a diagnostic service that typically accompanies an office visit

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Code	Pre	Intra	Post-	Total Time	Work RVU	Global Period
92002	5	15	5	25	.88	XXX
92004	5	25	10	40	1.82	XXX
92012	5	15	5	25	.92	XXX
92014	5	24	8	37	1.42	XXX
99213	3	15	5	23	.97	XXX

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92286

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

Anterior segment imaging with interpretation and report; specular microscopy with endothelial cell analysis

Global Period: **XXX** Meeting Date: **April 2012**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The societies convened a panel of experts to review and develop inputs by phone and email.**

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: **This is an existing code so the current inputs for 92286 should be compared.**

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The ophthalmic tech assures that the appropriate referral forms are complete and that the medical record is available for the physician.

Service Clinical Labor Activities:

The ophthalmic tech ensures that all supplies and equipment are available for the test and imaging. The tech confirms the test and correct side for testing. The tech assists the physician in positioning the patient and ensuring that the patient remains still during the imaging. Once the procedure is completed and the patient has been escorted to the administrative area, the clinical staff does final review of the photos and prepares them for archiving to the record.

Post-Service Clinical Labor Activities:

Not applicable.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
MPC List Screen

January 2012

Percutaneous Coronary Intervention

In October 2010, CPT code 92980 *Transcatheter placement of an intracoronary stent(s), percutaneous, with or without other therapeutic intervention, any method; single vessel* was identified by the MPC List screen. Since it had not been reviewed in over six years, the Relativity Assessment Workgroup (RAW) requested that the specialty societies survey this code for RUC review. Subsequently, the specialty society referred the code to the CPT Editorial Panel to revise the family of procedures to more accurately describe the current physician work involved in percutaneous coronary interventions. At the October 2011 CPT meeting, the Panel approved 13 new codes to describe these services.

The RUC had significant discussion regarding the proper reporting of a diagnostic coronary angiogram with a percutaneous coronary intervention (PCI). The specialty explained that while a diagnostic angiogram is required for an intervention procedure, these services are typically performed by different physicians. Typically, a complete diagnostic angiogram would be performed on a day prior to the PCI and would be separately reportable. However, in the event that a patient needs the intervention procedure immediately, a diagnostic exam is performed to determine the anatomy and then the intervention service is performed shortly thereafter. If these services are reported on the same day, by the same physician the standard multiple procedure reduction is applied. This policy mirrors the lower extremity revascularization codes approved by the CPT Editorial Panel and RUC in the 2011 cycle.

92920 *Percutaneous transluminal coronary angioplasty; single major coronary artery or branch*
The RUC reviewed the survey results from 79 cardiologists and recommends the following physician time components: 39 minutes pre-service time, 60 minutes intra-service time and 30 minutes post-service time. The RUC reviewed the survey data and agreed that the 25th percentile of 9.25 work RVUs slightly overestimated the physician work value appropriate for this service. To find a more appropriate value, the RUC compared the surveyed code to CPT code 37224 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty* (work RVU= 9.00). The Committee noted that while the reference code has more intra-service time compared to 92920, 80 minutes compared to 60 minutes, the intensity and complexity is much greater for a physician working on the heart rather than the leg. Given this, the RUC recommends a work RVU of 9.00, a direct crosswalk to 37224, for CPT code 92920. To ensure this value is relative, the RUC compared the surveyed code to CPT code 37220 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU= 8.15) and noted that while the intra-service times are identical, 60 minutes, the surveyed code is again a more intense procedure and should be valued higher than the reference code. **The RUC recommends a work RVU of 9.00 for CPT code 92920.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92921 ***Percutaneous transluminal coronary angioplasty; each additional branch of a major coronary artery***
The RUC reviewed the survey results from 80 cardiologists and recommends 30 minutes of intra-service time for this add-on code. The RUC reviewed the survey data and agreed with the specialty that the survey's 25th percentile of 4.00 work RVUs accurately values the physician work involved in the service. To justify this value the RUC compared the surveyed code to the key reference code 37232 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal angioplasty* (work RVU= 4.00) and noted that while the reference code has more intra-service time compared to 92921, 40 minutes and 30 minutes, respectively, the survyed code is a more intense procedure given the service is performed on the heart as opposed to the leg. Additionally, the Committee reviewed CPT code 34826 *Placement of proximal or distal extension prosthesis for endovascular repair of infrarenal abdominal aortic or iliac aneurysm, false aneurysm, or dissection; each additional vessel* (work RVU= 4.12) and agreed that since these two services have identical intra-service time, 30 minutes, they should be valued similarly. **The RUC recommends a work RVU of 4.00 for CPT code 92921.**

92924 ***Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed; single major coronary artery or branch***
The RUC reviewed the survey results from 73 cardiologists and recommends the following physician time components: 39 minutes pre-service time, 75 minutes intra-service time and post-service time of 30 minutes. The RUC reviewed the survey results and agreed that the survey respondents overestimated the physician work value appropriate for this service. To determine an appropriate value, the RUC compared the surveyed code to CPT code 37228 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU=11.00) and noted that while the reference code has 15 minutes more intra-service time, 92924 is a more intense procedure and should be valued the same. Given this comparison, the RUC agreed that a work RVU of 11.00, a direct crosswalk to 37228, is an accurate value for the surveyed code. To ensure this value is relative to the family of services, the RUC took the intra-service time of 92920, 60 minutes, and added half of the intra time of 92921, 15 minutes, to arrive at an intra-service time of 75 minutes, identical to 92924. Adding these times would create the same work RVU, 11.00, as is recommended for 92924. **The RUC recommends a work RVU of 11.00 for CPT code 92924.**

92925 ***Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed; each additional branch of a major coronary artery***
The RUC reviewed the survey results from 71 cardiologists and recommends 45 minutes of intra-service time for this add-on code. The RUC reviewed the survey data and agreed with the specialty that the survey's 25th percentile of 5.00 work RVUs accurately values the physician work involved in the service. To justify this value the RUC compared the surveyed code to CPT code 35600 *Harvest of upper extremity artery, 1 segment, for coronary artery bypass procedure* (work RVU= 4.94) and noted that the surveyed code has slightly more intra-service time, 45 minutes compared to 40 minutes, and should be valued slightly higher than the reference code. Additionally, the RUC compared 92925 to 92921 and agreed that since 92925 code has 15 minutes more of intra-service time compared to 92921, the recommended work value for 92925 is appropriately valued higher. **The RUC recommends a work RVU of 5.00 for CPT code 92925.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92928 ***Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed; single major coronary artery or branch***

The RUC reviewed the survey results from 79 cardiologists and recommends 39 minutes pre-service time, 71 minutes intra-service time and 30 minutes post-service time. The RUC noted that survey respondents clearly underestimated the intra time to perform this service with a median of 60 minutes. This service includes the entire physician work of 92920 plus the additional placement of intracoronary stent(s). Given the necessary additional physician work, the RUC recommends the 75th percentile intra-service time of 71 minutes. The RUC reviewed the survey data and agreed with the specialty that the survey's 25th percentile of 10.49 work RVUs accurately values the physician work involved in the service. To justify this value the RUC compared the surveyed code to CPT code 37226 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 10.49) and noted that while the reference code have more intra-service time compared to 92928, 90 minutes and 71 minutes, respectively, the intensity of performing stent placement in the heart is much greater than a placement in the leg. Thus the recommended value is appropriately valued relative to other similar services. **The RUC recommends a work RVU of 10.49 for CPT code 92928.**

92929 ***Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed; each additional branch of a major coronary artery***

The RUC reviewed the survey results from 80 cardiologists and recommends 30 minutes of intra-service time for this add-on code. The RUC reviewed the survey results and agreed that the survey respondents overestimated the physician work value appropriate for this service. To determine an appropriate value, the RUC compared the surveyed code to CPT code 33572 *Coronary endarterectomy, open, any method, of left anterior descending, circumflex, or right coronary artery performed in conjunction with coronary artery bypass graft procedure, each vessel* (work RVU= 4.44) and noted that the two service have identical intra time, 30 minutes, and should be valued identically. Thus, the RUC recommends a work RVU of 4.44, a direct crosswalk to 33572, for CPT code 92929. To ensure this value is relative within the family of services, the Committee compared this service to the other two add-on codes just reviewed, 92921 and 92925. It was agreed that the work value for 92929 should be higher than 92921 (recommended work RVU= 4.00) due to greater intensity and lower than 92925 (recommended work RVU= 5.00) due to less intra time. **The RUC recommends a work RVU of 4.44 for CPT code 92929.**

92933 ***Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed; single major coronary artery or branch***

The RUC reviewed the survey results from 73 cardiologists and recommends 39 minutes pre-service time, 85 minutes intra-service time and 30 minutes post-service time. The RUC reviewed the survey results and agreed that the survey respondents overestimated the physician work value appropriate for this service. To determine an appropriate value, the RUC compared the surveyed code to CPT code 61640 *Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel* (work RVU= 12.32) and noted that the physician work is similar, with almost identical intra-service times, 90 minutes compared to 85 minutes. Thus, the Committee agreed that the work RVUs for code 92933 should be directly

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

crosswalked to CPT code 61640. To ensure a work RVU of 12.32 is relative within the family, the RUC noted that this service requires the second highest physician time in the family, 154 minutes, and is a very intense and complex procedure to perform relative to the other services. Thus, the RUC agreed that the work RVU for this service should set the upper threshold for work values within the percutaneous coronary intervention family. **The RUC recommends a work RVU of 12.32 for CPT code 92933.**

92934 ***Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed; each additional branch of a major coronary artery***
The RUC reviewed the survey results from 73 cardiologists and recommends 45 minutes of intra-service time for this add-on code. The RUC reviewed the survey data and agreed with the specialty that the survey's 25th percentile of 5.50 work RVUs accurately values the physician work involved in the service. To justify this value the RUC compared the surveyed code to the key reference service 37234 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 5.50) and noted that while the reference code has greater total time than 92934, 62 minutes compared to 45 minutes, the codes should be valued the same because the surveyed code is a much more intense procedure than 37234, as indicated by the survey respondents. Additionally, the Committee compared 92934 to the other similar add-on service in this family, 92925, and noted that while both services have identical times, 45 minutes, 92934 is a more intense procedure and should be valued slightly higher. **The RUC recommends a work RVU of 5.50 for CPT code 92934.**

92937 ***Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed; single vessel***
The RUC reviewed the survey results from 66 cardiologists and recommends 39 minutes pre-service time, 60 minutes intra-service time and 30 minutes post-service time. The RUC reviewed the survey results and agreed that the survey respondents overestimated the physician work value appropriate for this service. To determine an appropriate value, the RUC compared the surveyed code to 92928 (recommended work RVU= 10.49) and noted that while 92928 has slightly more total time compared to 92937, 140 minutes and 129 minutes, respectively, 92937 is a more intense procedure and should be valued the same. To ensure a work RVU of 10.49 is relative to other similar services, the Committee reviewed CPT code 37224 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty* (work RVU= 9.00) and agreed that while the reference code has more total time, 158 minutes compared to 129 minutes, 92937 is a more intense procedure than 37224 and should be valued higher. **The RUC recommends a work RVU of 10.49 for CPT code 92937.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

92938 ***Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed; each additional branch subtended by the bypass graft***
The RUC reviewed the survey results from 67 cardiologists and recommends 60 minutes of intra-service time for this add-on code. The RUC reviewed the survey results and noted that the survey's median work RVU of 6.00 is a more appropriate value given intensity involved in the service and to maintain appropriate rank order within the family. The RUC compared 92938 to the similar add-on service 92934 (recommended work RVU= 5.50) and agreed that with 15 minutes more intra-service time, 60 minutes compared to 45 minutes, 92938 must be valued higher than 92934. In addition, the Committee compared the surveyed code to key reference service 37234 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 5.50) and noted that while the two service have identical intra-service time, 60 minutes, 92938 is a more intense procedure compared to the reference code and should be valued slightly higher. **The RUC recommends a work RVU of 6.00 for CPT code 92938.**

92941 ***Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel***
The RUC reviewed the survey results from 67 cardiologists and recommends 39 minutes pre-service time, 70 minutes intra-service time and 40 minutes post-service time. The RUC reviewed the survey results and agreed that the survey respondents overestimated the physician work value appropriate for this service. To determine an appropriate value, the RUC compared the surveyed code to 92933 (recommended work RVU= 12.32) and noted that the total physician times for these two services are almost identical, 149 minutes compared to 154 minutes, and should have identical work RVUs of 12.32. The Committee also confirmed that 92933 sets the upper threshold for physician work and intensity in this family of services. To ensure this value aligns itself to similar services, the RUC reviewed key reference service 37231 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed* (work RVU= 15.00). While 92941 is a more intense procedure, the reference code has significantly more total time, 213 minutes compared to 149 minutes, and should be valued higher than the surveyed code**. The RUC recommends a work RVU of 12.32 for CPT code 92941.**

92943 ***Percutaneous transluminal revascularization of chronic total occlusion, coronary artery, coronary artery branch, or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty; single vessel***
The RUC reviewed the survey results from 65 cardiologists and recommends 39 minutes pre-service time, 90 minutes intra-service time and 30 minutes post-service time. The RUC reviewed the survey results and agreed that the survey respondents overestimated the physician work value appropriate for this service. To determine an appropriate value, the RUC compared the surveyed code to 92933 (recommended work RVU=12.32) and determined since both services have almost identical total times, 154 minutes and 159 minutes, respectively, the work value should be identical. . The Committee also confirmed that 92933 sets the upper threshold for physician work and intensity in this family of services. To

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

ensure a work value of 12.32 is appropriate for 92943, the RUC reviewed the key reference service 37231 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed* (work RVU= 15.00). While 92943 is a more intense procedure, the reference code has significantly more total time, 213 minutes compared to 159 minutes, and should be valued higher than the surveyed code**. The RUC recommends a work RVU of 12.32 for CPT code 92943.**

92944

The RUC reviewed the survey results from 64 cardiologists and recommends 60 minutes of intra-service time for this add-on code. The RUC reviewed the survey data and agreed with the specialty that the survey's 25th percentile of 6.00 work RVUs accurately values the physician work involved in the service. To justify this value the RUC compared the surveyed code to the key reference service 37234 *Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed* (work RVU= 5.50) and noted that while the two service have identical intra-service time, 60 minutes, 92944 is a more intense procedure compared to the reference code and should be valued slightly higher. To ensure relativity within the family of service, the Committee compared 92944 to analogous add-on code 92938 (recommended work RVU= 6.00) and agreed that given the identical times and similar intensity and complexity, these two service should valued the same. **The RUC recommends a work RVU of 6.00 for CPT code 92944.**

CPT Discussion:

In order to clarify the correct reporting of a complete diagnostic angiography and these percutaneous coronary intervention procedures, the RUC requests that the CPT Editorial Panel, working with the specialty society, add clarifying introductory language further explaining the specific criteria for separately reporting the two services or that the services may be reported on the same day. The CPT Editorial Panel in February 2012, reviewed this request and made necessary additions to the introductory language.

Work Neutrality:

The RUC noted that under the old coding system placing a stent in a major coronary artery and one stent in one branch resulted in billing one CPT code (92980). In the new coding system, this scenario will result in billing two CPT code (92928 and 92929). While additional CPT codes will be reported under this system, the subsequent reductions in work values results in a budget neutrality savings of 17% to be redistributed back into Medicare payment.

Practice Expense:

These services are primarily performed in the facility setting and no direct practice expense inputs are recommended.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
37205		Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; initial vessel (For radiological supervision and interpretation, use 75960) (For transcatheter placement of intravascular cervical carotid artery stent(s), see 37215, 37216) (For transcatheter placement of intracranial stents, use 61635) (For transcatheter coronary stent placement, see 92928-9294~~92980, 92981~~) (For transcatheter stent placement of Extracranial vertebral or intrathoracic carotid artery stent(s), see Category III codes 0075T, 0076T) (For stent placement in iliac, femoral, popliteal, and tibial/peroneal arteries, see 37221, 37223, 37226, 37227, 37230, 37231, 37234, 37235)	000	8.27 (No Change)
37207		Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; initial vessel	000	8.27 (No Change)

Codes 92920-92944 describe percutaneous revascularization services performed for occlusive disease of the coronary vessels (major coronary arteries, coronary artery branches, or coronary artery bypass grafts). These percutaneous coronary intervention (PCI) codes are built on progressive hierarchies with more intensive services inclusive of lesser intensive services. These PCI codes all include the work of accessing and selectively catheterizing the vessel, traversing the lesion, radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy when performed through the access sheath, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. These codes include angioplasty (eg, balloon, cutting balloon, wired balloons, cryoplasty), atherectomy (eg, directional, rotational, laser), and stenting (eg, balloon expandable, self-expanding, bare metal, drug eluting, covered). Each code in this family includes balloon angioplasty, when performed. Diagnostic coronary angiography is reported separately.

Major coronary arteries: The major coronary arteries are the left main, left anterior descending, left circumflex, right, and ramus intermedius arteries. All PCI procedures performed in all segments (proximal, mid, distal) of a single major coronary artery through the native coronary circulation are reported with one code. When one segment of a major coronary artery is treated through the native circulation and treatment of another segment of the same artery requires access through a coronary artery bypass graft, the intervention through the bypass graft is reported separately.

Coronary artery branches: Up to two coronary artery branches of the left anterior descending (diagonals), left circumflex (marginals), and right (posterior descending, posterolaterals) coronary arteries are recognized. The left main and ramus intermedius coronary arteries do not have recognized branches for coding purposes. All PCI(s) performed in any segment (proximal, mid, distal) of a coronary artery branch is reported with one code. PCI is reported for up to two branches of a major coronary artery. Additional PCI in a third branch of the same major coronary artery is not separately reportable.

Coronary artery bypass grafts: Each coronary artery bypass graft represents a coronary vessel. A sequential bypass graft with more than one distal anastomosis represents only one graft. A branching bypass graft (eg, Y graft) represents a coronary vessel for the main graft, and each branch off the main graft constitutes an additional coronary vessel. PCI performed on major cor-onary arteries or coronary artery branches by access through a bypass graft is reported using the bypass graft PCI codes. All bypass graft PCI codes include the use of coronary artery embolic protection devices when performed.

Only one base code from this family may be reported for revascularization of a major coronary artery and its recognized branches. Only one base code should be reported for revascularization of a coronary artery bypass graft, its subtended coronary artery, and recognized branches of the subtended coronary artery. If one segment of a major coronary artery and its recognized branches is treated through the native circulation, and treatment of another segment of the same vessel requires access through a coronary artery bypass graft, an additional base code is reported to describe the intervention performed through the bypass graft. The PCI base codes are 92920, 92924, 92928, 92933, 92937, 92941, and 92943. The PCI base code inclusive of the most intensive service provided for the target vessel should be reported.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

PCI performed during the same session in additional recognized branches of the target vessel should be reported using the applicable add-on code(s). The add-on codes are 92921, 92925, 92929, 92934, 92938, and 92944 and follow the same principle in regard to reporting the most intensive service provided.

PCI performed during the same session in additional major coronary or in additional coronary artery bypass grafts should be reported using the applicable additional base code(s). PCI performed during the same session in additional coronary artery branches should be reported using the applicable additional add-on code(s).

If a single lesion extends from one target vessel (major coronary artery, coronary artery bypass graft, or coronary artery branch) into another target vessel, but can be revascularized with a single intervention bridging the two vessels, this PCI should be reported with a single code despite treating more than one vessel. For example, if a left main coronary lesion extends into the proximal left circumflex coronary artery and a single stent is placed to treat the entire lesion, this PCI should be reported as a single vessel stent (92928). In this example, a code for additional vessel treatment (92929) would not be additionally reported.

When bifurcation lesions are treated, PCI is reported for both vessels treated. For example, when a bifurcation lesion involving the left anterior descending artery and the first diagonal artery is treated by stenting both vessels, 92928 and 92929 are both reported.

Target vessel PCI for acute myocardial infarction is inclusive of all balloon angioplasty, atherectomy, stenting, manual aspiration thrombectomy, distal protection, and intracoronary rheolytic agent administration performed. Mechanical thrombectomy is reported separately.

Chronic total occlusion of a coronary vessel is present when there is no antegrade flow through the true lumen, accompanied by suggestive angiographic and clinical criteria (eg, antegrade "bridging" collaterals present, calcification at the occlusion site, no current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion). Current presentation with ST elevation or Q wave acute myocardial infarction attributable to the occluded target lesion, subtotal occlusion, and occlusion with dye staining at the site consistent with fresh thrombus are not considered chronic total occlusion.

Codes 92973 (percutaneous transluminal coronary thrombectomy, mechanical), 92974 (coronary brachytherapy), 92978 and 92979 (intravascular ultrasound), and 93571 and 93572 (intravascular Doppler velocity and/or pressure [fractional flow reserve (FFR) or coronary flow reserve (CFR)]) are add-on codes for reporting procedures performed in addition to coronary and bypass graft diagnostic and interventional services, unless included in the base code. Non-mechanical, aspiration thrombectomy is not reported with 92973, and is included in the PCI code for acute myocardial infarction (92941), when performed.

(To report transcatheter placement of radiation delivery device for coronary intravascular brachytherapy, use 92974)

(For intravascular radioelement application, see 77785-77787)

(For nonsurgical septal reduction therapy [eg, alcohol ablation], use 93799

Presented Recommended RVU: **9.25**
Global Period: 000 RUC Recommended RVU: **9.00**

CPT Descriptor: Percutaneous transluminal coronary angioplasty; single major coronary artery or branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female presents with progressive unstable angina. Stress testing shows anterior ischemia. Coronary arteriography demonstrates diffusely diseased diabetic-appearing coronary arteries with a 90% calcified lesion in the distal part of a tortuous left anterior descending coronary artery. The size of the vessel is less than the size of the smallest available stent. The patient is transferred to a PCI center for percutaneous coronary balloon angioplasty on the following day. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the

pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow. The coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Intra-Service intensity/complexity	4.11	3.94
Post-Service intensity/complexity	3.56	3.39

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

ACC and SCAI convened a panel of physicians familiar with the services to review the survey data. The survey was robust and was completed by physicians who have experience with the service. Code 92920 will be used to report percutaneous transluminal coronary angioplasty of a single major coronary artery or branch. The panel reviewed the

preservice time and selected package 2b for a straightforward procedure on a difficult patient with moderate sedation in a facility.

The key reference service is 37225, femoral/popliteal revascularization with atherectomy. While procedurally similar, this is a longer, less intense service. Key reference respondents felt surveyed code 92920 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 8-23% higher for the new code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92982

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 53812
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 26,848 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty.

Please explain the rationale for this estimate. We predict 9298X1 will be used to report 100% of the procedures previously reported with 92982. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:92921 Tracking Number N2 Original Specialty Recommended RVU: **4.00**
Presented Recommended RVU: **4.00**
Global Period: ZZZ RUC Recommended RVU: **4.00**

CPT Descriptor: Percutaneous transluminal coronary angioplasty; each additional branch of a major coronary artery (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female presents with progressive unstable angina. Stress testing shows anterior ischemia. Coronary arteriography demonstrates diffusely diseased diabetic-appearing coronary arteries with a 90% calcified lesion in the distal part of a tortuous left anterior descending coronary artery. An additional 80% calcific lesion is noted in the first diagonal artery. The size of the vessels is less than the size of the smallest available stent. The patient is transferred to a PCI center for percutaneous coronary balloon angioplasty on the following day. The first lesion has been treated. Now an additional lesion is to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The indwelling guide catheter from the first coronary intervention is removed over a guide wire. A new guide is selected to engage the second vessel. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous

panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device ("indeflator") is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow. The coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92921 is an add-on code to 92920 that will be used to report additional branch(es) of a major coronary artery. The survey was robust and was completed by physicians who have experience with the service.

They key reference code is 37232, additional tibial/peroneal revascularization with angioplasty. This is a longer, less intense service. Key reference respondents felt surveyed code 92921 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 7-23% higher for the new code.

The panel notes that it is difficult to make a time comparison of the survey to the current code, which has 83 minutes of CMS/Other time. That time is 3 minutes longer than the intraservice time of the current base code for angioplasty (92982). Our research did not produce any further information for how that 83 minutes was derived.

Due to these considerations and the broader issues of rank order and new coding conventions discussed in the attached overview, the panel recommends the 25th percentile work value of 4.00 for this service. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92984

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 14064
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,368
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X2 will be used to report 103% of the procedures previously reported with 92984. This rate was then applied to 2010 utilization data.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with coronary angioplasty when performed; single major coronary artery or branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old male with diffuse peripheral vascular disease presents with chronic stable angina refractory to medical therapy. Stress testing shows inferior ischemia at a low level of cardiac stress. Coronary arteriography demonstrates heavily calcified coronary arteries. The left anterior descending and circumflex coronary arteries are relatively free of occlusive disease but the right coronary artery has a long heavily calcified lesion which is 50% stenotic throughout and 80% stenotic at the worst point. The patient is transferred to a PCI center for percutaneous coronary rotational atherectomy on the following day. The result after rotational atherectomy and angioplasty is "stent-like", and passage of a stent would be difficult due to proximal calcification and tortuosity, so stenting is not performed. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the

dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. The coronary guide wire is then removed through the balloon lumen and replaced with a wire specifically designed for rotational atherectomy. The balloon is removed over the wire. Balloon position is confirmed by angiography.

An appropriate sized rotational atherectomy burr is selected and the rotational atherectomy system is assembled and attached to a Rotablator Console. A Rotablator Foot Pedal is positioned under the table. The burr delivery unit is loaded with extreme care over the rotablator wire as the latter is very susceptible to kinking. If kinked the wire must be removed from the coronary and the entire process to this point is redone. Rotaflush is administered as a continuous infusion to prevent no-reflow. The burr is activated outside the body to test the rotational speed and the console is used to adjust the speed to a proper level.
The burr is advanced over the rotablator wire to the coronary artery proximal to the lesion. This typically requires carefully coordinated pulling of the wire during burr advancement to overcome resistance. The burr is adjusted to remove tension from the system. The device is activated to test the rotational speed in the body and adjusted as needed. Careful monitoring of the rhythm and blood pressure is performed as bradycardia and hypotension frequently occur. Once the test is complete, the burr is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Typically the patient develops chest pain and/or electrocardiographic changes during these “runs”, which are kept short to avoid severe hypotension, bradycardia and even heart block. Angiography is performed in between runs to assess coronary flow and to ensure no dissection or perforation. The operator must wait up to several minutes between runs to allow resolution of ischemia. Multiple runs are performed with the burr until it is able to progress through the resistant lesion. Polishing runs are then performed. The burr is exchanged out over the wire. A larger burr is then selected to enlarge the lumen more optimally. The same procedure is then performed with the larger burr. After several progressively larger burrs and successful enlargement of the lumen, balloon angioplasty is typically performed to smooth out irregularities and seal any atheromatous flaps up against the vessel wall to try to prevent abrupt vessel closure.

An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide.

Intracoronary vasodilators are again administered. Angiography is performed in multiple views. Once an adequate expansion is achieved, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow. The coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92924 will be used to report coronary atherectomy in a major coronary artery or branch. It includes angioplasty when performed. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed the preservice time and selected package 2b for a straightforward procedure on a difficult patient with moderate sedation in a facility.

The key reference service is 37229, tibial/peroneal revascularization with atherectomy and angioplasty when performed. While procedurally similar, this is a longer, less intense service. Key reference respondents felt surveyed code 92924 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 7-21% higher for the new code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92995

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2356
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,167
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X3 will be used to report 100% of the procedures previously reported with 92995. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

Description of Pre-Service Work:

Description of Intra-Service Work: The indwelling guide catheter from the first coronary intervention is removed over a guide wire. A new guide is selected to engage the second vessel. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional

guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. The coronary guide wire is then removed through the balloon lumen and replaced with a wire specifically designed for rotational atherectomy. The balloon is removed over the wire. Balloon position is confirmed by angiography.
An appropriate sized rotational atherectomy burr is selected and the rotational atherectomy system is assembled and attached to a Rotablator Console. A Rotablator Foot Pedal is positioned under the table. The burr delivery unit is loaded with extreme care over the rotablator wire as the latter is very susceptible to kinking. If kinked the wire must be removed from the coronary and the entire process to this point is redone. Rotaflush is administered as a continuous infusion to prevent no-reflow. The burr is activated outside the body to test the rotational speed and the console is used to adjust the speed to a proper level.
The burr is advanced over the rotablator wire to the coronary artery proximal to the lesion. This typically requires carefully coordinated pulling of the wire during burr advancement to overcome resistance. The burr is adjusted to remove tension from the system. The device is activated to test the rotational speed in the body and adjusted as needed. Careful monitoring of the rhythm and blood pressure is performed as bradycardia and hypotension frequently occur. Once the test is complete, the burr is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Typically the patient develops chest pain and/or electrocardiographic changes during these “runs”, which are kept short to avoid severe hypotension, bradycardia and even heart block. Angiography is performed in between runs to assess coronary flow and to ensure no dissection or perforation. The operator must wait up to several minutes between runs to allow resolution of ischemia. Multiple runs are performed with the burr until it is able to progress through the resistant lesion. Polishing runs are then performed. The burr is exchanged out over the wire. A larger burr is then selected to enlarge the lumen more optimally. The same procedure is then performed with the larger burr. After several progressively larger burrs and successful enlargement of the lumen, balloon angioplasty is typically performed to smooth out irregularities and seal any atheromatous flaps up against the vessel wall to try to prevent abrupt vessel closure.

An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. Once an adequate expansion is achieved, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow. The coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Intra-Service intensity/complexity	4.84	4.33
Post-Service intensity/complexity	4.07	3.77

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92925 is an add-on code to 92924 that will be used to report additional branch(es) of a major coronary artery. The survey was robust and was completed by physicians who have experience the service.

They key reference code is 37234, additional tibial/peroneal revascularization with stent(s) and angioplasty when performed. This is a longer, less intense service. Key reference respondents felt surveyed code 92925 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 9-21% higher for the new code.

The panel notes that it is difficult to make a time comparison of the survey to the current code, which has 88 minutes of CMS/Other time. Our research did not produce any further information for how that 88 minutes was derived.

Due to these considerations and the broader issues of rank order and new coding conventions discussed in the attached overview, the panel recommends the 25th percentile work value of 5.00 for this service. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92996

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 436
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 231
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X4 will be used to report 100% of the procedures previously reported with 92996. This rate was then applied to 2010 utilization data.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

CPT Descriptor: Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed; single major coronary artery or branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old obese male presents with unstable angina consistent with acute coronary syndrome. Coronary arteriography demonstrates a 22 mm long hazy 80% lesion in the circumflex coronary artery. The patient is transferred to a PCI center for percutaneous coronary intervention on the following day. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the

pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved to allow stent deployment, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow.

The patient’s ability to tolerate long term dual antiplatelet therapy and to comply with this therapy is again confirmed. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92928 will be used to report percutaneous transcatheter placement of intracoronary stent(s) in a major coronary artery or branch. It includes angioplasty when performed. The survey was robust and was completed by physicians who have experience the service. The panel reviewed the preservice time and selected package 2b for a straightforward procedure on a difficult patient with moderate sedation in a facility.

The key reference service is 37231, tibial/peroneal revascularization with stent and atherectomy. While procedurally similar, this is a longer, less intense service. Key reference respondents felt surveyed code 92928 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 8-24% higher for the new code.

Due to a reduction in intraservice time and a reduction in preservice time with selection of package 2b, the panel agreed compelling evidence did not exist for the median survey RVU of 13.50 which is slightly below the current RVU. The panel recommends the 25th percentile survey RVU of 10.49 for this service. This value maintains rank order in the family. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92980

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 458962
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 225,877 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 9298X5 will be used to report 70% of the procedures previously reported with 92980. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92980

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92929 Tracking Number N6 Original Specialty Recommended RVU: **5.00**
Presented Recommended RVU: **5.00**
Global Period: ZZZ RUC Recommended RVU: **4.44**

CPT Descriptor: Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed; each additional branch of a major coronary artery (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 76-year-old obese male presents with unstable angina consistent with acute coronary syndrome. Coronary arteriography demonstrates a 22 mm long hazy 80% lesion in the circumflex coronary artery. An additional 22 mm long hazy 80% lesion is noted in the large first obtuse marginal branch. The patient is transferred to a PCI center for percutaneous coronary intervention on the following day. The first lesion has been treated. Now an additional lesion is to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The indwelling guide catheter from the first coronary intervention is removed over a guide wire. A new guide is selected to engage the second vessel. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wire is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the

lumen is allowed to fill passively with contrast. A balloon inflation device ("indeflator") is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved to allow stent deployment, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow.

A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work:

Intra-Service intensity/complexity	4.67	4.31
Post-Service intensity/complexity	4.11	3.75

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92929 is an add-on code to 92928 that will be used to report additional branch(es) of a major coronary artery. The survey was robust and was completed by physicians who have experience with the service.

They key reference code is 37232, additional tibial/peroneal revascularization angioplasty. This is a longer, less intense service. Key reference respondents felt surveyed code 92929 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 10-21% higher for the new code.

Due to these considerations and the broader issues of rank order and new coding conventions discussed in the attached overview, the panel recommends the 25th percentile work value of 5.00 for this service. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92981

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 73060
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 36,399 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X6 will be used to report 95% of the procedures previously reported with 92981. This rate was then applied to 2010 utilization data.

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed; single major coronary artery or branch

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male presents with progressive angina and pharmacologic stress testing showing lateral ischemia. Coronary arteriography shows 50% lesions in the left and right coronary arteries and an 80% 12 mm long left circumflex coronary artery lesion. The vessels are extremely heavily calcified. After discussion with the patient and family regarding therapeutic options, the patient requests coronary intervention which is scheduled for the next day. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced

retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. The coronary guide wire is then removed through the balloon lumen and replaced with a wire specifically designed for rotational atherectomy. The balloon is removed over the wire. Balloon position is confirmed by angiography.

An appropriate sized rotational atherectomy burr is selected and the rotational atherectomy system is assembled and attached to a Rotablator Console. A Rotablator Foot Pedal is positioned under the table. The burr delivery unit is loaded with extreme care over the rotablator wire as the latter is very susceptible to kinking. If kinked the wire must be removed from the coronary and the entire process to this point is redone. Rotaflush is administered as a continuous infusion to prevent no-reflow. The burr is activated outside the body to test the rotational speed and the console is used to adjust the speed to a proper level.
The burr is advanced over the rotablator wire to the coronary artery proximal to the lesion. This typically requires carefully coordinated pulling of the wire during burr advancement to overcome resistance. The burr is adjusted to remove tension from the system. The device is activated to test the rotational speed in the body and adjusted as needed. Careful monitoring of the rhythm and blood pressure is performed as bradycardia and hypotension frequently occur. Once the test is complete, the burr is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Typically the patient develops chest pain and/or electrocardiographic changes during these “runs”, which are kept short to avoid severe hypotension, bradycardia and even heart block. Angiography is performed in between runs to assess coronary flow and to ensure no dissection or perforation. The operator must wait up to several minutes between runs to allow resolution of ischemia. Multiple runs are performed with the burr until it is able to progress through the resistant lesion. Polishing runs are then performed. The burr is exchanged out over the wire. A larger burr is then selected to enlarge the lumen more optimally. The same procedure is then performed with the larger burr. After several progressively larger burrs and successful enlargement of the lumen, balloon angioplasty is typically performed to smooth out irregularities and seal any atheromatous flaps up against the vessel wall to try to prevent abrupt vessel closure.

The vessel over the course of the atherectomy procedure is irregular, hazy, with slightly impaired flow, and there is concern for dissection. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. Often the stents will not pass through the calcific vessel and additional dilation with balloon angioplasty is required. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres

and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. Once an adequate expansion is achieved, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow.

Now a stent can be passed through the vessel to the target lesion. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Post-Service intensity/complexity	4.19	3.84

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92933 will be used to report percutaneous transcatheter placement of intracoronary stent(s) in a major coronary artery or branch. It includes both angioplasty and atherectomy when performed. The survey was robust and was completed by physicians who have experience with the service. The panel reviewed the preservice time and selected package 2b for a straightforward procedure on a difficult patient with moderate sedation in a facility.

The key reference service is 37231, tibial/peroneal revascularization with stent and atherectomy. While procedurally similar, this is a longer, less intense service. Key reference respondents felt surveyed code 92933 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 10-21% higher for the new code.

Due to a reduction in intraservice time and a reduction in preservice time with selection of package 2b, the panel agreed compelling evidence did not exist for the median survey RVU of 15.50 which is slightly below the current RVU. The panel recommends the 25th percentile survey RVU of 14.00 for this service. This value maintains rank order in the family. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92980

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 19670
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 9,680
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 9298X7 will be used to report 3% of the procedures previously reported with 92980. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92980

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92934 Tracking Number N8 Original Specialty Recommended RVU: **5.50**
Presented Recommended RVU: **5.50**
Global Period: ZZZ RUC Recommended RVU: **5.50**

CPT Descriptor: Percutaneous transluminal coronary atherectomy, with intracoronary stent, with coronary angioplasty when performed; each additional branch of a major coronary artery (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old male presents with progressive angina and pharmacologic stress testing showing lateral ischemia. Coronary arteriography shows 50% lesions in the left and right coronary arteries and an 80% 12 mm long left circumflex coronary artery lesion. An additional 12 mm long 80% lesion is noted in the large first obtuse marginal branch. The vessels are extremely heavily calcified. After discussion with the patient and family regarding therapeutic options, the patient requests coronary intervention which is scheduled for the next day. The first lesion has been treated. Now an additional lesion is to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 97%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: The indwelling guide catheter from the first coronary intervention is removed over a guide wire. A new guide is selected to engage the second vessel. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple

coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. The coronary guide wire is then removed through the balloon lumen and replaced with a wire specifically designed for rotational atherectomy. The balloon is removed over the wire. Balloon position is confirmed by angiography.
An appropriate sized rotational atherectomy burr is selected and the rotational atherectomy system is assembled and attached to a Rotablator Console. A Rotablator Foot Pedal is positioned under the table. The burr delivery unit is loaded with extreme care over the rotablator wire as the latter is very susceptible to kinking. If kinked the wire must be removed from the coronary and the entire process to this point is redone. Rotaflush is administered as a continuous infusion to prevent no-reflow. The burr is activated outside the body to test the rotational speed and the console is used to adjust the speed to a proper level.
The burr is advanced over the rotablator wire to the coronary artery proximal to the lesion. This typically requires carefully coordinated pulling of the wire during burr advancement to overcome resistance. The burr is adjusted to remove tension from the system. The device is activated to test the rotational speed in the body and adjusted as needed. Careful monitoring of the rhythm and blood pressure is performed as bradycardia and hypotension frequently occur. Once the test is complete, the burr is activated and advanced in a gradual back and forth motion to ablate calcific plaque. Typically the patient develops chest pain and/or electrocardiographic changes during these “runs”, which are kept short to avoid severe hypotension, bradycardia and even heart block. Angiography is performed in between runs to assess coronary flow and to ensure no dissection or perforation. The operator must wait up to several minutes between runs to allow resolution of ischemia. Multiple runs are performed with the burr until it is able to progress through the resistant lesion. Polishing runs are then performed. The burr is exchanged out over the wire. A larger burr is then selected to enlarge the lumen more optimally. The same procedure is then performed with the larger burr. After several progressively larger burrs and successful enlargement of the lumen, balloon angioplasty is typically performed to smooth out irregularities and seal any atheromatous flaps up against the vessel wall to try to prevent abrupt vessel closure.

The vessel over the course of the atherectomy procedure is irregular, hazy, with slightly impaired flow, and there is concern for dissection. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. Often the stents will not pass through the calcific vessel and additional dilation with balloon angioplasty is required. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. Once an adequate expansion is achieved, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow.

Now a stent can be passed through the vessel to the target lesion. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no

immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

The number of possible diagnosis and/or the number of management options that must be considered	4.68	4.32
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.70	4.22
Urgency of medical decision making	4.55	3.96
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.91	4.65
Physical effort required	4.65	4.48
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.83	4.22
Outcome depends on the skill and judgment of physician	4.87	4.65
Estimated risk of malpractice suit with poor outcome	4.65	3.96

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.43	4.13
Intra-Service intensity/complexity	4.91	4.57
Post-Service intensity/complexity	4.26	3.91

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92934 is an add-on code to 92933 that will be used to report additional branch(es) of a major coronary artery. The survey was robust and was completed by physicians who have experience with the service.

The key reference code is 37234, additional tibial/peroneal revascularization with stent(s) and angioplasty when performed. This is a longer, less intense service. Key reference respondents felt surveyed code 92934 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 5-17% higher for the new code.

Due to these considerations and the broader issues of rank order and new coding conventions discussed in the attached overview, the panel recommends the 25th percentile work value of 5.50 for this service. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92981

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 770
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 383
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X8 will be used to report 1% of the procedures previously reported with 92981. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92981

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92937 Tracking Number N9 Original Specialty Recommended RVU: **11.00**
Presented Recommended RVU: **11.00**
Global Period: 000 RUC Recommended RVU: **10.49**

CPT Descriptor: Percutaneous transluminal revascularization of or through coronary artery bypass graft (internal mammary, free arterial, venous), any combination of intracoronary stent, atherectomy and angioplasty, including distal protection when performed; single vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 79-year-old female who had bypass surgery 10 years ago presents with unstable angina consistent with an acute coronary syndrome. Coronary arteriography demonstrates that the culprit is a saphenous vein graft to a large left circumflex coronary artery. The vein graft is diffusely diseased and has subtotal occlusion by a 3 mm long thrombus. The patient is transferred to a PCI center for percutaneous coronary intervention on the following day. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire

through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a bypass graft. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the bypass graft and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. A proximal or distal protection device is then advanced down the graft over the coronary guidewire to capture embolic debris and help prevent no-relfow. The device is carefully positioned to avoid vessel disruption and to avoid interference with intervention at the target lesion. Microvascular vasodilators are administered through the graft to help prevent no-relfow. Multiple injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

The patient’s ability to tolerate long term dual antiplatelet therapy and to comply with this therapy is again confirmed. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. As the lesion has generally not been predilated (so as to avoid embolization) positioning of the stent across the lesion often precipitates severe ischemia requiring therapy. If the stent cannot be advanced across the lesion, then the stent is removed, the lesion is predilated with angioplasty, and the stent is repositioned. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. There is no-reflow characterized by severe ischemia, slow flow down the vessel and electrocardiographic changes. Microvascular vasodilators are administered again and if there is no resolution an aspiration catheter is advanced down into the graft and debris is aspirated to restore flow. Once adequate flow is restored, assessment for the need for further balloon expansion is performed. If needed an appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device (“indeflator”) is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. If the result is acceptable, the proximal or distal protection device is then removed. Often the removal catheter must be manipulated by multiple passes to cross through the stents to reach the protection device in the case of a distal protection device. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92937 will be used to report percutaneous coronary revascularization of or through a coronary artery bypass graft. It includes any combination of stent(s), angioplasty, and/or atherectomy. The code also includes use of distal protection when performed. The survey was robust and was completed by physicians who have experience the service. The panel

reviewed the preservice time and selected package 2b for a straightforward procedure on a difficult patient with moderate sedation in a facility.

The key reference service is 37231, tibial/peroneal revascularization with stent and atherectomy. While procedurally similar, this is a longer, less intense service. Key reference respondents felt surveyed code 92937 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 6-35% higher for the new code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Description of Pre-Service Work:

Description of Intra-Service Work: Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenosis.

A coronary guide wire is manipulated from its initial position and across the target lesion. This may require entirely removing the wire and re-shaping the tip, or starting with a new wire and passing it through the graft. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. If appropriate, a proximal or distal protection device is then advanced down the graft over the coronary guidewire to capture embolic debris and help prevent no-reflow. The device is carefully positioned to avoid vessel disruption and to avoid interference with intervention at the target lesion. Microvascular vasodilators are administered through the graft to help prevent no-relfow. Multiple injections

are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. As the lesion has generally not been predilated (so as to avoid embolization) positioning of the stent across the lesion often precipitates severe ischemia requiring therapy. If the stent cannot be advanced across the lesion, then the stent is removed, the lesion is predilated with angioplasty, and the stent is repositioned. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. There is no-reflow characterized by severe ischemia, slow flow down the vessel and electrocardiographic changes. Microvascular vasodilators are administered again and if there is no resolution an aspiration catheter is advanced down into the graft and debris is aspirated to restore flow. Once adequate flow is restored, assessment for the need for further balloon expansion is performed. If needed an appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device ("indeflator") is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. If the result is acceptable, the proximal or distal protection device is then removed. Often the removal catheter must be manipulated by multiple passes to cross through the stents to reach the protection device in the case of a distal protection device. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work:

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92938 is an add-on code to 92937 that will be used to report additional branch(es) that was subtended by the bypass graft. The survey was robust and was completed by physicians who have experience with the service.

The key reference code is 37234, additional tibial/peroneal revascularization with stent(s) and angioplasty when performed. This code has identical intraservice time of 60 minutes. Key reference respondents felt surveyed code 92938 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 11-32% higher for the new code.

The panel recommends the 25th percentile survey RVU of 5.00 for this newly defined service. This value aligns closely with the key reference code of 37234 which has a work RVU of 5.50. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92981

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3846
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,916
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X10 will be used to report 5% of the procedures previously reported with 92981. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92981

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92941 Tracking Number N11 Original Specialty Recommended RVU: **14.50**
Presented Recommended RVU: **12.32**
Global Period: 000 RUC Recommended RVU: **12.32**

CPT Descriptor: Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old male calls 911 for sudden onset of crushing substernal chest pain. Pre-hospital 12 lead electrocardiography in the ambulance demonstrates acute anterior myocardial infarction with ST elevation in leads V2-V5. The heart attack alert system is activated. The emergency medical personnel bypass the emergency department and take the patient directly to the cardiac catheterization laboratory, arriving within 50 minutes of symptom onset. After rapid assessment, immediate coronary angiography is performed (reported separately), demonstrating 100% occlusion by a large thrombus in the middle segment of the left anterior descending artery. The patient demonstrates runs of non-sustained ventricular tachycardia. Percutaneous coronary intervention is planned immediately with the goal of achieving first medical contact-to-balloon time of under 90 minutes. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 99%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are rapidly reviewed. Physical examination is rapidly conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is quickly reviewed with the patient. The risks and benefits of the procedure are rapidly presented, as well as the alternatives. Informed consent is obtained. In an emergent fashion, hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is rushed to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" is rapidly performed which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is rapidly obtained, typically through the femoral artery or radial artery. Often the pulse is rapid and thread in the setting of hypotension and

access is frequently difficult as a result. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access.

After diagnostic coronary angiography to identify the culprit lesion (reported separately) an appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views and often requires additional guidewires if the first wires is not successful. Wire position across the lesion is confirmed angiographically. The wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Brief angiography confirms intraluminal position of the guidewire. There is no flow down the vessel and the patient is typically in severe pain. An appropriate aspiration catheter is selected and rapidly advanced to the occluded vessel and thrombus is aspirated. Multiple rounds of intracoronary microvascular vasodilators are administered. Frequently reperfusion arrhythmias occur requiring additional pharmacologic management. Hypotension frequently requires titration of pressor agents. Antegrade coronary flow is restored, but there is globular thrombus superimposed on a critical residual lesion. Intracoronary antiplatelet agents are infused to help resolve the thrombus.

An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device ("indeflator") is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. Typically the patient develops chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved to allow stent deployment, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow.

The patient's ability to tolerate long term dual antiplatelet therapy and to comply with this therapy is again confirmed. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. This may require placing additional coronary guide wires down the vessel to allow the stent to pass. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. Frequently there is some degree of no-reflow requiring additional microvascular vasodilators to resolve. Frequently there is evidence of thrombotic embolization to distal vessels beyond the original lesion. This requires additional balloon dilation and aspiration thrombectomy at the site of the thrombus to resolve. Frequently there is ongoing hemodynamic instability and electrical instability requiring additional pharmacologic therapy. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators.

Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Intra-Service intensity/complexity	4.95	4.24
Post-Service intensity/complexity	4.62	3.57

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92941 will be used to report percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft. It includes any combination of stent(s), angioplasty, and/or atherectomy. The code also includes aspiration thrombectomy when performed. The survey was

robust and was completed by physicians who have experience with the service. The panel reviewed the preservice time and selected package 2b for a straightforward procedure on a difficult patient with moderate sedation in a facility.

The key reference service is 37231, tibial/peroneal revascularization with stent and atherectomy. While procedurally similar, this is a longer, less intense service. Key reference respondents felt surveyed code 92941 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 9-44% higher for the new code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92980

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 163916
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 80,671 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty.

Please explain the rationale for this estimate. We estimate 9298X11 will be used to report 25% of the procedures previously reported with 92980. This rate was then applied to 2010 utilization data.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:92943 Tracking Number N12 Original Specialty Recommended RVU: **14.00**
Presented Recommended RVU: **12.32**
Global Period: 000 RUC Recommended RVU: **12.32**

CPT Descriptor: Percutaneous transluminal revascularization of chronic total occlusion, coronary artery, coronary artery branch, or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty; single vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old female presents with 6 months of exertional angina. Coronary angiography shows 100% left circumflex coronary stenosis. The lesion is on a bend in the circumflex coronary artery with focal calcification at the site and has antegrade bridging collaterals to the distal vessel, consistent with a chronic total occlusion. After a 2-week trial of 2 anti-anginal agents, the patient is not satisfied with her quality of life and requests coronary intervention. This is the first lesion in this coronary territory to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 100%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. Physical examination is conducted. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Hair is removed from the potential access sites. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The patient's information is loaded in the hemodynamic monitoring equipment in order to retain the data from the upcoming study.

Description of Intra-Service Work: A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced

retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to attempt to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views. Typically, crossing of the total occlusion with generic guide wires is unsuccessful. Typically, the operator uses additional guidewires progressing to increasingly stiff, guidewires in order to puncture through the chronic total occlusion, or more lubricious or tapered tip wires are used to engage and cross a microchannel. Wire position across the lesion is confirmed angiographically. Frequently, the wire is extraluminal and left in position while additional wires are used to reattempt crossing of the total occlusion. If crossing of the total occlusion is eventually achieved successfully, and the wire is intraluminal distally, the wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device ("indeflator") is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Often no balloon will cross the rigid total occlusion. Specialty devices may be employed to screw or "Dotter" through the rigid total occlusion. Rotational atherectomy may be attempted to ablate the rigid material at the total occlusion site. If crossing is eventually achieved, an angioplasty balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. The patient may develop chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved to allow stent deployment, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow. Frequently, there is evidence of dissection from the recanalization of the total occlusion and frequently additional lesions are now evident in the vessel. In the event of a vessel perforation, emergent echocardiogram may be requested and pericardiocentesis, volume resuscitation, and vasopressors may be required to stabilize the patients.

The patient's ability to tolerate long term dual antiplatelet therapy and to comply with this therapy is again confirmed. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. Frequently, the stent will not cross due to rigidity of the lesion. This may require placing additional coronary guide wires down the vessel, placement of a more aggressive guiding catheter, or more balloon dilation to allow the stent to pass. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased/dissected segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work: Films and hemodynamics are reviewed and a formal report is generated. The patient, family and the referring physician are notified of the results. A plan of management is developed and discussed with the patient and family. Additional antiplatelet and antithrombin therapy is administered as necessary. The patient is admitted to ensure no bleeding, to monitor for abrupt vessel closure, and for continued therapy of ischemic heart disease.

Global Period: ZZZ RUC Recommended RVU: **6.00**

CPT Descriptor: Percutaneous transluminal revascularization of chronic total occlusion, coronary artery, coronary artery branch, or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty; each additional coronary artery, coronary artery branch, or bypass graft (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male presents with a 3 year history of stable angina. Stress testing shows inferior ischemia but no myocardial infarction. Coronary arteriography demonstrates 100% mid-right coronary occlusion with left-to-right collaterals to the distal vessel. The occluded segment is about 20 mm long and appears straight with focal calcification at the lesion site consistent with a chronic total occlusion. In the posterior descending, there is an additional occluded segment that is about 20 mm long and appears straight with focal calcification at the lesion site consistent with a chronic total occlusion. After a 2-week trial of 2 anti-anginal agents, the patient is not satisfied with his quality of life and requests coronary intervention. The first lesion has been treated. Now an additional lesion is to be treated.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Description of Pre-Service Work:

Description of Intra-Service Work: A “Time Out” occurs during which confirmation of critical information is ensured, such as the patient’s identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered and adequate conscious sedation monitoring is verified. Percutaneous arterial access is obtained, typically through the femoral artery or radial artery. A thin-walled needle is inserted percutaneously into the peripheral artery, through which a flexible guide wire is inserted. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. Intra-arterial vasodilators are administered to prevent arterial spasm for radial artery access. An appropriate guiding catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance throughout the procedure. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. The guide is aspirated to remove any air, atheroma, or thrombus. Pressure is measured in the aortic root. The catheter is then manipulated using fluoroscopic guidance into the ostium of a coronary artery. Typically the guide must be manipulated to avoid aortic atheroma and adjusted substantially to engage the artery based on the anatomy of the

aorta. The arterial pressure and waveform are then checked to be sure there is no evidence of catheter malposition or impairment of coronary flow due to an ostial stenosis. Frequently, several guide catheters are required to achieve a safe catheter engagement of the artery. Test contrast injections under fluoroscopy are performed to check catheter position.

Appropriate antiplatelet therapy pretreatment is confirmed, and additional antiplatelet therapy is administered as needed. Direct thrombin inhibitors or heparin is administered for anticoagulation. Therapeutic anticoagulation is confirmed by drawing blood from the guide and testing an Activated Clotting Time (ACT). Additional anticoagulation is administered as needed to achieve a therapeutic ACT. Intracoronary vasodilators are administered. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses.

A coronary guide wire is then manipulated through the guide and down the coronary artery and carefully used to attempt to cross the target lesion. Typically, this requires manipulation of the wire in several angiographic views. Typically, crossing of the total occlusion with generic guide wires is unsuccessful. Typically, the operator uses additional guidewires progressing to increasingly stiff, guidewires in order to puncture through the chronic total occlusion, or more lubricious or tapered tip wires are used to engage and cross a microchannel. Wire position across the lesion is confirmed angiographically. Frequently, the wire is extraluminal and left in position while additional wires are used to reattempt crossing of the total occlusion. If crossing of the total occlusion is eventually achieved successfully, and the wire is intraluminal distally, the wire is adjusted as needed to ensure it is not lodged in a small distal vessel that might result in perforation or dissection. Multiple coronary injections are performed, each with the imaging system aligned in a different orientation, with simultaneous panning (moving the table) to assess the stenoses. An appropriate sized balloon is selected. The balloon is deaired and the lumen is allowed to fill passively with contrast. A balloon inflation device ("indeflator") is prepared and filled with dilute contrast. The balloon is advanced over the coronary guidewire to the lesion. Often no balloon will cross the rigid total occlusion. Specialty devices may be employed to screw or "Dotter" through the rigid total occlusion. Rotational atherectomy may be attempted to ablate the rigid material at the total occlusion site. If crossing is eventually achieved, an angioplasty balloon position is confirmed by angiography. The balloon is inflated gradually, observing for clinical and angiographic signs of ischemia, and watching for balloon deformation and appropriate balloon expansion. The patient may develop chest pain and/or electrocardiographic changes that limit the duration of balloon inflation and the balloon is quickly deflated. The balloon is reinflated several times to progressively higher atmospheres and for longer periods of time up to several minutes. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. The lesion is not fully expanded and the angioplasty procedure is repeated multiple times with progressively larger balloons. Once an adequate expansion is achieved to allow stent deployment, the balloon is again exchanged out of the coronary artery into the guide. Completion angiography is performed after repeat administration of intracoronary vasodilators. Inspection of the images is performed for signs of vessel dissection, perforation or impaired coronary flow. Frequently, there is evidence of dissection from the recanalization of the total occlusion and frequently additional lesions are now evident in the vessel. In the event of a vessel perforation, emergent echocardiogram may be requested and pericardiocentesis, volume resuscitation, and vasopressors may be required to stabilize the patients.

The patient's ability to tolerate long term dual antiplatelet therapy and to comply with this therapy is again confirmed. A stent of appropriate diameter and length is selected. The stent is advanced over the wire to the target lesion and carefully positioned. Frequently, the stent will not cross due to rigidity of the lesion. This may require placing additional coronary guide wires down the vessel, placement of a more aggressive guiding catheter, or more balloon dilation to allow the stent to pass. The stent is deployed at high pressure. The original stent frequently does not cover the entire diseased/dissected segment and additional stents are then placed as needed using the same techniques. Next a high pressure non-compliant balloon is advanced over the coronary guidewire into the stented segment and this is inflated at high pressure to ensure stent expansion. Frequently more than one balloon of different sizes is required. The balloon is then exchanged back over the guidewire into the guide. Intracoronary vasodilators are again administered. Angiography is performed in multiple views. If the result is acceptable, the coronary wire is then withdrawn back into the guide. Completion angiography is again performed after repeat administration of intracoronary vasodilators. Inspection of the images is again performed for signs of vessel dissection, perforation or impaired coronary flow. The guide catheter is disengaged from the coronary ostium and then removed over a guide wire from the body. Anticoagulation infusions are stopped.

Angiography of the access site is often performed through the access sheath to assess for any complications and suitability for a percutaneous closure device. The catheter and sheath are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision. Observation of the site is performed to ensure no immediate bleeding if a vascular closure device is deployed. Manual pressure is required for a short time to achieve

complete hemostasis. If manual pressure is used, typically the sheath is sewn in for subsequent removal once the ACT level falls to a safe level.

Description of Post-Service Work:

SURVEY DATA

RUC Meeting Date (mm/yyyy)	01/2012		
Presenter(s):	Richard Wright, MD; Cliff Kavinsky, MD		
Specialty(s):	ACC, SCAI

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
37234	ZZZ	5.50	**RUC Time**

CPT Descriptor Revascularization, endovascular, open or percutaneous, tibial/peroneal artery, unilateral, each additional vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
22534	ZZZ	5.99	**RUC Time**	917

CPT Descriptor 1 Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); thoracic or lumbar, each additional vertebral segment (List separately in addition to code for primary procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
	ZZZ	0.00	**RUC Time**	

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 28 **% of respondents:** 43.7 **%**

TIME ESTIMATES (Median)	**CPT Code: 92944**	**Key Reference CPT Code:** 37234	**Source of Time** **RUC Time**
Median Pre-Service Time	0.00	1.00	
Median Intra-Service Time	60.00	60.00	
Median Immediate Post-service Time	0.00	1.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**60.00**	**62.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.57	3.85
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.39	4.00
Urgency of medical decision making	3.86	3.52
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.86	4.26
Physical effort required	4.75	4.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.75	4.00
Outcome depends on the skill and judgment of physician	4.89	4.37
Estimated risk of malpractice suit with poor outcome	4.54	3.78

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	4.14	3.67
Intra-Service intensity/complexity	4.96	4.19
Post-Service intensity/complexity	3.93	3.52

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 92944 is an add-on code to 92943 that will be used to report ach additional coronary artery, coronary artery branch, or bypass graft. The survey was robust and was completed by physicians who have experience with the service.

The key reference code is 37234, additional tibial/peroneal revascularization with stent(s) and angioplasty when performed. This code has identical intraservice time of 60 minutes. Key reference respondents felt surveyed code 92944 entails significantly more mental effort, technical skill, and psychological stress than the reference code. These comparisons were 10-20% higher for the new code.

The panel recommends the 25th percentile survey RVU of 6.00 for this newly defined service. This value maintains rank order with other add-on codes in the family and reflects the increased intraservice time indicated by respondents in comparison to other add-on codes in the family that had code precursors. It reflects the increased intensity of this code over 92938. It also aligns closely with the less intense key reference code, 37234, which has a work RVU of 5.50. Please see the attached summary for a more comprehensive analysis of the PCI family.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 92981

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1538
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This national estimate is predicated on the Medicare popuation estimate below. We estimate one half of the total utilization will be in the Medicare population.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 766
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We predict 9298X13 will be used to report 2% of the procedures previously reported with 92981. This rate was then applied to 2010 utilization data.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 92981

PCI Family Rationale Summary

In the 2011 Medicare physician fee schedule final rule, CMS indicated that it desired services on the MPC list that had not been valued over the past five years be reexamined by the RUC. One of the services on this list was code 92980, used to report the placement of a coronary stent. After reviewing the code during the RUC process, the ACC and SCAI felt that the entire family of percutaneous coronary intervention (PCI) codes should be revised to reflect current practice and to reflect coding conventions established as part of the revision of lower extremity revision (LER) codes in 2010. The CPT Editorial Panel approved the creation of a set of 13 new codes in October. Codes were revised to capture the three techniques used for PCI (angioplasty, atherectomy, and stent) which can be used in various combinations depending on the patient presentation. In addition, three very different populations representing those who have had coronary artery bypass graft(s) (CABG), those having active ST-elevated myocardial infarction (STEMI) heart attacks, and those with chronic total coronary artery occlusion were separated because of the significant difference in the work and the typical patient. We feel the best way to evaluate these codes is in four separate groups: traditional base codes, traditional add-on codes, new patient population base codes, and new patient population add-on codes.

Traditional Base Codes (92920, 92924, 92928, 92933)

For the first four base codes, rank order proceeded as expected with angioplasty (92920) requiring the lowest amount of work. Stent with angioplasty (92928) is more work; atherectomy with angioplasty (92924) is yet more work; finally, stent with both angioplasty and atherectomy (92933) is the most work. Due to the reduction in intraservice time we have recommended the 25th percentile for these four codes. We note that this still produces values with relatively high intensity. However, we feel this increased intensity can validly be attributed to the broader diversity of patients in whom PCI is currently utilized, particularly those with acute coronary syndromes and in the very elderly. This trend has been documented in literature that concluded PCIs "in the last 2 decades, have evolved to include more urgent, comorbid cases, despite achieving high success rates with significantly reduced need for repeat revascularization."[1] Additionally, the variety of drugs, devices, instruments, and patient management is more complex than in the past. Finally, we feel the robust survey response further validates the recommendations we have made.

Traditional Add-on Codes (92921, 92925, 92929, 92934)

The first four add-on codes that correspond to the traditional base codes are entirely new services because of the way the codes were rewritten. PCI add-ons are currently reported per vessel so that only a single code would be reported regardless of the number of branches treated in a single vessel. These new codes could be reported for a second additional branch of a major coronary artery, as defined in the new CPT introductory language. We recommend he 25th percentile for these four codes.

New Patient Population Base Codes (92937, 92941, 92943)

These base codes describe PCI performed on newly described patient populations. In this case, they do not differentiate based on the PCI technique. These codes were created to describe a level of work that is significantly higher than the traditional PCI population and are among the most complex patients encountered by an interventional cardiologist. The rank order again proceeded as expected with PCI of CABG (92937) requiring the lowest amount of work. PCI of chronic occlusion (92943) is more work; finally, PCI of acute occlusion (STEMI) (92941) is the most work. To maintain rank order for both work RVU and IWPUT, we recommend the 25th percentile for these three codes. Additionally, we note that

[1] Venkitachalam, et al. *Circulation: Cardiovascular Interventions. 2009; 2: 6-13*

the value for PCI of a chronic occlusion is the same as that for stent with both angioplasty and atherectomy. We feel this is a good benchmark between the two groups.

New Patient Population Add-on Codes (92938, 92944)
These two add-on codes correspond to the base codes for PCI of/through CABG and chronic total occlusion, respectively. To maintain rank order for both work RVU and IWPUT, we recommend the 25th percentile for these three codes.

Utilization
The new CPT introductory language accompanying these codes defines, for coding purposes, which coronary vasculature constitutes major coronary arteries and which constitutes coronary artery branches. Based on these parameters and coding instructions, we predict utilization of the 13 new codes will result in a **12.5% RVU reduction** for the family.

The ACC, in collaboration with SCAI, maintains a registry for PCI that covers more than 75% of hospitals that provide PCI in the United States. This Cath-PCI registry has captured the number of cases in which multiple vessels are treated or multiple branches of the same vessel are treated. We used this registry data to estimate the distribution of work from the current coding system to the new coding system. Cath-PCI registry data indicate that 28% of stent PCIs involve more than one lesion. 14 stents are used per 10 stent patients, and by this reckoning, under the old coding system, 6 patients would get 1 stent (one code), 2 would get 2 stents in a major coronary artery (1 code), 1 would get a stent in major coronary artery and a in a coronary artery branch (1 code), and 1 would get a stent in 2 major coronary arteries (2 codes). Under the new system, the patient with the stent in the major coronary artery and the stent in the coronary artery branch would get 2 codes. So, out of these 10 patients, the old system would produce 11 codes (10 base codes and 1 each additional) and the new system would produce 12 codes (10 base codes and 2 add-ons). (see table below) This estimate is confirmed by the RUC database Medicare utilization data that shows for 2010, 92980 (stent) was reported 328,000 times and 92981 (each additional stent) was reported 38,000 times. We are estimating an additional 31,000 units in our budget neutrality crosswalk (attached). Despite this 8% increase in the number of units, our recommendations will result in a 12.5% overall RVU reduction due to recommendations for several services being substantially lower than current values.

10 Typical patients	Old 92980-1		New 92928-92929
Patients 1-6: 1 stent in 1 major coronary artery	92980		92928
	92980		92928
	92980		92928
	92980		92928
	92980		92928
	92980		92928
Patients 7-8: 2 stents in 1 major coronary artery	92980		92928
	92980		92928
Patient 9: 1 stent in 1 major coronary artery, 1 stent in 1 branch	92980		9598X5, 92929
Patient 10: 2 stents in 2 major coronary arteries	92980, 92981		92928 x 2

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% of More Screen

January 2012

Bundling EPS with Transcatheter Ablation

In February 2010, the Relativity Assessment Workgroup (RAW) identified CPT codes 93651 *Intracardiac catheter ablation of arrhythmogenic focus; for treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathways, accessory atrioventricular connections or other atrial foci, singly or in combination* and 93652 *Intracardiac catheter ablation of arrhythmogenic focus; for treatment of ventricular tachycardia* as billed together more than 75% of the time with CPT code 93620 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of arrhythmia; with right atrial pacing and recording, right ventricular pacing and recording, His bundle recording.* The specialty societies referred this issue to the CPT Editorial Panel at the October 2011 meeting and it was surveyed for the January 2012 RUC meeting.

93653 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording, His recording with intracardiac catheter ablation of arrhythmogenic focus; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry*

The RUC reviewed the survey results from 182 cardiologists who perform the service and recommend the following physician work time components: 39 minutes pre-service time, 180 minutes intra-service time and 30 minutes post-service time. The RUC discussed two issues related to the physician time for this service. First, the RUC discussed the time variation between the bundled 93653 code and the previously reported codes. It was noted that the current survey has almost 150 more survey respondents than the previous surveys. Thus, the RUC determined that these current survey data in both physician work and time are the best measure for the valuation of this service. Second, the RUC discussed the typical number of patients a practicing physician would see in a typical day. Given the large amount of time involved in these codes, the specialty society explained that two patients are typically seen by the physician per day for this service.

The RUC reviewed the robust survey data for 93653 and agreed that the survey 25th percentile of 15.00 work RVUs accurately accounts for the physician work involved in the service. To justify this value, the RUC compared the surveyed code to reference CPT code 33889 *Open subclavian to carotid artery transposition performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision, unilateral* (work RVU= 15.92) and agreed that since the reference code has greater total time, 298 minutes, compared to the surveyed code, 265 minutes, 33889 should be valued slightly higher than 93653. Finally, the RUC reviewed CPT code 50575 *Renal endoscopy through nephrotomy or pyelotomy, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service; with endopyelotomy (includes cystoscopy,*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

ureteroscopy, dilation of ureter and ureteral pelvic junction, incision of ureteral pelvic junction and insertion of endopyelotomy stent) (work RVU= 13.96) and noted that while the two services have identical intra-service time of 180 minutes, 93653 is a more intense procedure and should be valued higher than 50575. **The RUC recommends a work RVU of 15.00 for CPT code 93653.**

93654 *Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording, His recording with intracardiac catheter ablation of arrhythmogenic focus; with treatment of ventricular tachycardia or focus of ventricular ectopy including intracardiac electrophysiologic 3-dimensional mapping, when performed and left ventricular pacing and recording, when performed*

The RUC reviewed the survey results from 179 cardiologists who perform the service and recommend the following physician work time components: 70 minutes pre-service time, 240 minutes intra-service time and 40 minutes post-service time. The RUC discussed two issues related to the physician time for this service. First, the RUC discussed the time variation between the bundled 93654 code and the previously reported codes. It was noted that the current survey has almost 150 more survey respondents than the previous surveys. Thus, the RUC determined that these current survey data in both physician work and time are the best measure for the valuation of this service. Second, the RUC discussed the typical number of patients a practicing physician would see in a typical day. Given the large amount of time involved in these codes, the specialty society explained that two patients are typically seen by the physician per day for this service.

The RUC reviewed the robust survey data for 93654 and agreed that the survey 25th percentile of 20.00 work RVUs accurately accounts for the physician work involved in the service. To justify this value, the RUC compared the surveyed code to CPT code 33891 *Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision* (work RVU= 20.00) and agreed that the two services should be valued the same given the similar physician work and total service times, 319 minutes and 323 minutes, respectively. In addition, the RUC compared 93654 to the base code 93653 and agreed that given the additional work involved in 93654, including the additional 3-D mapping and left ventricular pacing and recording, a work RVU of 20.00 appropriately ranks 93654 in relation to the base code. **The RUC recommends a work RVU of 20.00 for CPT code 93654.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93655 *Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia*

The RUC reviewed the survey results from 181 cardiologists who perform this service and recommend 90 minutes intra-service time for this add-on code. The RUC reviewed the robust survey data for 93655 and agreed that the survey 25th percentile of 9.00 work RVUs accurately accounts for the physician work involved in the service. The RUC compared the surveyed code to CPT code 35306 *Thromboendarterectomy, including patch graft, if performed; each additional tibial or peroneal artery* (work RVU= 9.25) and agreed that with identical intra-service time of 90 minutes, the two codes should be valued similarly. Given this strong comparison and the strong data presented by the specialty society, the RUC agreed that a work RVU of 9.00 places 93655 in appropriate relativity in comparison to the family of services and across the RBRVS. **The RUC recommends a work RVU of 9.00 for CPT Code 93655.**

93656 *Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with atrial recording and pacing, when possible, right ventricular pacing and recording, His bundle recording with intracardiac catheter ablation of arrhythmogenic focus; with treatment of atrial fibrillation by ablation by pulmonary vein isolation*

The RUC reviewed the survey results from 181 cardiologists who perform the service and recommend the following physician work time components: 39 minutes pre-service time, 240 minutes intra-service time and 40 minutes post-service time. The RUC discussed two issues related to the physician time for this service. First, the RUC discussed the time variation between the bundled 93656 code and the previously reported codes. It was noted that the current survey has almost 150 more survey respondents than the previous surveys. Thus, the RUC determined that these current survey data in both physician work and time are the best measure for the valuation of this service. Second, the RUC discussed the typical number of patients a practicing physician would see in a typical day. Given the large amount of time involved in these codes, the specialty society explained that two patients are typically seen by the physician per day for this service.

The RUC reviewed the robust survey data for 93656 and agreed that the survey 25th percentile of 20.02 work RVUs accurately accounts for the physician work involved in the service. To justify this value, the RUC compared the surveyed code to CPT code 33891 *Bypass graft, with other than vein, transcervical retropharyngeal carotid-carotid, performed in conjunction with endovascular repair of descending thoracic aorta, by neck incision* (work RVU= 20.00) and agreed that the two services should be valued the same given the similar physician work and total service times, 319 minutes and 323 minutes, respectively. Finally, the RUC compared 93656 to the family of services and agreed that this code should be valued almost identically to 93654 given the analogous physician time and work. **The RUC recommends a work RVU of 20.02 for CPT code 93656.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93657 *Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation*

The RUC reviewed the survey results from 181 cardiologists who perform this service and recommend 90 minutes intra-service time for this add-on code. The RUC reviewed the robust survey data for 93657 and agreed that the survey 25th percentile of 10.00 work RVUs accurately accounts for the physician work involved in the service. The RUC compared the surveyed code to CPT code 35306 *Thromboendarterectomy, including patch graft, if performed; each additional tibial or peroneal artery* (work RVU= 9.25) and agreed that with identical intra-service time of 90 minutes, the two codes should be valued similarly. In addition, the RUC compared 93657 to the other add-on service in the family 93655 and noted that while the times are identical, 93657 is a more intense service. This increased intensity is validated through the survey results which show that 93657 was rated as a more intense service compared to 93655 in every intensity/complexity measure. **The RUC recommends a work RVU of 10.00 for CPT Code 93657.**

CPT Discussion:
During the deliberations, the RUC questioned whether the reprogramming of the implantable cardioverter-defibrillator was inherent in these services. The specialty societies indicated that should reprogramming be required at the time of the comprehensive electrophysiologic evaluation, that work would be considered inclusive of the service. Therefore, the CPT Editorial Panel at the February 2012 meeting, included in the parenthetical notes that CPT code 93642 is a code not to be reported in conjunction with 93653, 93654 and 93656.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense:
These services are primarily performed in the facility setting and no direct practice expense inputs are recommended.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Category I **Medicine, Cardiovascular** **Therapeutic Services and Procedures**				
⊙92960		Cardioversion, elective, electrical conversion of arrhythmia; external	000	2.25 (No Change)
⊙92961		internal (separate procedure) (Do not report 92961 in conjunction with 93282-93284, 93287, 93289, 93295, 93296, 93618-93624, 93631, 93640-93642, 93650~~-93654~~, 93653-93657~~93652~~, 93662)	000	4.59 (No Change)

Cardiac Catheterization

Right heart catheterization includes catheter placement in one or more right-sided cardiac chamber(s) or structures (ie, the right atrium, right ventricle, pulmonary artery, pulmonary wedge), obtaining blood samples for measurement of blood gases, and cardiac output measurements (Fick or other method), when performed. Left heart catheterization involves catheter placement in a left-sided (systemic) cardiac chamber(s) (left ventricle or left atrium) and includes left ventricular injection(s) when performed. Do not report ~~code~~ 93503 in conjunction with other diagnostic cardiac catheterization codes. When right heart catheterization is performed in conjunction with other cardiac catheterization services, report 93453, 93456, 93457, 93460, or 93461. For placement of a flow directed catheter (eg, Swan-Ganz) performed for hemodynamic monitoring purposes not in conjunction with other catheterization services, use 93503. Right heart catheterization does not include right ventricular or right atrial angiography (93566). When left heart catheterization is performed using either transapical puncture of the left ventricle or transseptal puncture of an intact septum, report 93462 in conjunction with 93452, 93453, 93458-93461, 9365~~93651~~93654~~,~~ ~~and~~ 9365~~393652~~. Catheter placement(s) in coronary artery(ies) involves selective engagement of the origins of the native coronary artery(ies) for the purpose of coronary angiography. Catheter placement(s) in bypass graft(s) (venous, internal mammary, free arterial graft[s]) involve selective engagement of the origins of the graft(s) for the purpose of bypass angiography. It is typically performed only in conjunction with coronary angiography of native vessels.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

⊙+93462		Left heart catheterization by transseptal puncture through intact septum or by transapical puncture (List separately in addition to code for primary procedure) (Use 93462 in conjunction with 93452, 93453, 93458-93461, 93653, 9365493651, 93652) (Do not report 93462 in conjunction with 93656)	ZZZ	3.73 (No Change)

Intracardiac Electrophysiological Procedures/Studies

Intracardiac electrophysiologic studies (EPS) are ~~an~~ invasive diagnostic medical procedures which include the insertion and repositioning of electrode catheters, recording of electrograms before and during pacing, ~~or~~ programmed stimulation of multiple locations in the heart, analysis of recorded information, and report of the procedure. ~~Electrophysiologic studies are most often performed with two or more electrode catheters.~~ In many circumstances, patients with arrhythmias are evaluated and treated at the same encounter. In this situation, a diagnostic *electrophysiologic study* is performed, induced tachycardia(s) are *mapped*, and on the basis of the diagnostic and mapping information, the tissue is *ablated*. ~~Electrophysiologic study(ies), mapping, and ablation represent distinctly different procedures, requiring individual reporting whether performed on the same or subsequent dates.~~

Definitions

Arrhythmia Induction: In most electrophysiologic studies, an attempt is made to induce arrhythmia(s) from single or multiple sites within the heart. Arrhythmia induction may be ~~is~~ achieved by multiple techniques, eg, by performing pacing at different rate~~s~~ or programmed stimulation (introduction of critically timed electrical impulses)~~, and other techniques~~. Because arrhythmia induction occurs via the same catheter(s) inserted for the electrophysiologic study(ies), catheter insertion and temporary pacemaker codes are not additionally reported. Codes 93600-93603, 93610~~-~~, 93612 and 93618 are used to describe unusual situations where there may be recording, pacing or an attempt at arrhythmia induction from only one site in the heart. Code 93619 describes only evaluation of the sinus node, atrioventricular node and His-Purkinje conduction system, without arrhythmia induction. Codes 93620-93624, ~~and~~ 93640-93642, 93653, 93654, and 93656 all include recording, pacing and attempted arrhythmia induction from one or more site(s) in the heart.

Mapping: ~~Mapping is a distinct procedure performed in addition to a diagnostic electrophysiologic procedure and should be separately reported using 93609 or 93613. Do not report standard mapping (93609) in addition to 3D mapping (93613).~~ When a tachycardia is induced, the site of tachycardia origination or its electrical path through the heart is often defined by mapping. Mapping creates a multidimensional depiction of a tachycardia by recording multiple electrograms obtained sequentially or simultaneously from multiple catheter sites in the heart. Depending upon the technique, certain types of mapping catheters may be repositioned from point-to-point within the heart, allowing sequential recording from the various sites to construct maps. Other types of mapping catheters allow mapping without a point-to-point technique by allowing simultaneous recording from many electrodes on the same catheter and computer-assisted three dimensional reconstruction of the tachycardia activation sequence.

Mapping is a distinct procedure performed in addition to a diagnostic electrophysiologic study or ablation procedure and may be separately reported using 93609 or 93613. Do not report standard mapping (93609) in addition to 3D mapping (93613).

Ablation: Once the part of the heart involved in the tachycardia is localized, the tachycardia may be treated by ablation (the delivery of a radiofrequency or cryo-energy to the area to selectively destroy cardiac tissue). Ablation procedures (~~93651-93652~~ 93653-9365~~7~~6)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

~~may be performed: independently on a date subsequent to a diagnostic electrophysiologic study and mapping; or, at the time a diagnostic electrophysiologic study, tachycardia(s) induction and mapping is performed. When an electrophysiologic study, mapping, and ablation are performed on the same date, each procedure should be separately reported. In reporting catheter ablation, 93651 and/or 93652 should be reported once to describe ablation of cardiac arrhythmias, regardless of the number of arrhythmias ablated~~ are ~~commonly~~ performed at the same session as electrophysiology studies and therefore represent a combined code description. When reporting ablation therapy codes (93653-9365~~6~~7), the single site electrophysiology studies (93600-93603, 93610, 93612, 93618) and the comprehensive electrophysiology studies (93619, 93620) may not be reported separately. Codes 93622 and 93623 may be reported separately with 93656 for treatment of atrial fibrillation. However, 93621 for left atrial pacing and recording from coronary sinus or left atrium should not be reported in conjunction with 93656 as this is a ~~standard~~ component of 93656~~ the procedure~~.

The differences in the techniques involved for ablation of supraventricular arrhythmias, ventricular arrhythmias, and atrial fibrillation are reflected within the descriptions for 93653-9365~~6~~7. Code 93653 is a primary code for catheter ablation for treatment of supraventricular tachycardia caused by dual atrioventricular nodal pathways, accessory atrioventricular connections, or other atrial foci. Code 93654 describes catheter ablation for treatment of ventricular tachycardia or focus of ventricular ectopy. Code 93656 is a primary code for reporting treatment of atrial fibrillation by ablation to achieve complete pulmonary vein electrical isolation. Codes 93653, 93654, and 93656 are distinct primary procedure codes and may not be reported together.

Codes 93655 and 93657 are add-on codes listed in addition to the primary ablation code to report ablation of sites distinct from the primary ablation site. After ablation of the primary target site, post-ablation electrophysiologic evaluation is performed as part of those ablation services (93653, 93654, 93656) and additional mechanisms of tachycardia may be identified. For example, if the primary tachycardia ablated was atrioventricular nodal reentrant tachycardia and during post-ablation testing an atrial tachycardia, atrial flutter or accessory pathway with orthodromic reentry tachycardia was identified, this would be considered a separate mechanism of tachycardia. Pacing maneuvers are performed to define the mechanism(s) of the new tachycardia(s). Catheter ablation of this distinct mechanism of tachycardia is then performed at the newly discovered atrial or ventricular origin. Appropriate post-ablation attempts at re-induction and observation are again performed. Code 93655 is listed in conjunction with 93653 when repeat ablation is for treatment of an additional supraventricular tachycardia mechanism and with 93654 when the repeat ablation is for treatment of an additional ventricular tachycardia mechanism. Code 93655 may be reported with 93656 when an additional non-atrial fibrillation tachycardia is separately diagnosed after pulmonary vein isolation. Code 93657 is reported in conjunction with 93656 when successful pulmonary vein isolation is achieved, attempts at re-induction of atrial fibrillation identify an additional left or right atrial focus for atrial fibrillation, and further ablation of this new focus is performed.

In certain circumstances, depending on the chamber of origin, a catheter or catheters may be maneuvered into the left ventricle to facilitate arrhythmia diagnosis. This may be accomplished via a retrograde aortic approach by means of the arterial access or through a transseptal puncture. For ablation treatment of supraventricular tachycardia (93653) and ventricular tachycardia (93654), the left heart catheterization by transseptal puncture through intact septum (93462) may be reported separately as an add-on code. However, for ablation treatment of atrial

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

fibrillation (93656), the transseptal puncture (93462) is a standard component of the procedure and may not be reported separately. Do not report 93462 in conjunction with 93656. ~~In certain circumstances, percutaneous catheter access is required in the pericardial space to facilitate mapping and ablation as well as pacing maneuvers along the epicardial surface of the heart to facilitate eradication of ventricular tachycardia. Once the tachycardia circuit or focus is localized a catheter is moved via venous, arterial or percutaneous epicardial access to the appropriate location to deliver ablative energy.~~ *Modifier 51 should not be appended to 93600-93603, 93610, 93612, 93615-93618, 93631.*

SUMMARY OF RECOMMENDATION

CPT Code:93653 Tracking Number O1 Original Specialty Recommended RVU: **18.00**
Presented Recommended RVU: **18.00**
Global Period: 000 RUC Recommended RVU: **15.00**

CPT Descriptor: Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording, His recording with intracardiac catheter ablation of arrhythmogenic focus; with treatment of supraventricular tachycardia by ablation of fast or slow atrioventricular pathway, accessory atrioventricular connection, cavo-tricuspid isthmus or other single atrial focus or source of atrial re-entry
(Do not report 93653 in conjunction with 93600-93603, 93610, 93612, 93618-93620, 93654)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old woman has recurrent palpitations. An event monitor has documented supraventricular tachycardia.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 76%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The procedure and the risks, benefits and alternatives associated with electrophysiology testing and supraventricular tachycardia ablation are explained to the patient and patient's family. Arrangements are made for the x-ray technician, electrophysiology laboratory technician and nurse. Informed consent is obtained. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory testing is reviewed as well as current medications and changes in health status. Informed consent is obtained.

Description of Intra-Service Work: The patient is brought to the electrophysiology lab. Direct-current cardioversion/defibrillation and EP testing/ablation equipment is confirmed present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Local analgesia is administered along with anesthesia appropriate to the patient including moderate sedation. Venous access is obtained. In addition, arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle is obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. Pacing and sensing is performed in the right atrium and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at arrhythmia induction are performed. via maneuvers that include burst pacing and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple atrial and ventricular sites. Once the SVT is induced, pacing maneuvers are performed to elucidate the mechanism of the tachycardia. Once the combination of both diagnostic maneuvers and mapping is complete, catheter ablation may be performed. An ablation catheter is maneuvered from the sites of vascular access to the appropriate cardiac location to

facilitate delivery of ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue. Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, brady- or tachyarrhythmias, embolic phenomena or damage to cardiac or vascular structures. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst and premature pacing maneuvers. These are repeated following a 30-minute period following the conclusion of the final ablation lesion. Sheaths are removed, appropriate hemostasis is achieved and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family and post-procedure assessments are performed.

Intra-Service intensity/complexity	4.49	4.28
Post-Service intensity/complexity	2.88	2.85

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was created after electrophysiology studies (93620) and ablation procedures (93651 and 93652) were identified in the RAW's screen for services that are reported together 75% of the time. Specifically, the screen found

that 93620 and 93651 were reported together 83% of the time, and that 93620 and 93652 were reported together 89% of the time.

Identifying comparison codes on the MPC list was extremely difficult due to: the high number of work values for the procedure; that many codes on the MPC list with similar times and/or values had 90-day global periods; and that similar codes such as percutaneous cardiac interventions (stents), are also being reviewed for this RUC meeting.

Prior to conducting the survey, we convened a conference call with the Research Subcommittee to review our reference service list since the majority of electrophysiology services were included in the new code descriptors, plus many other cardiac services were also being surveyed for this RUC meeting. That left surveyees with limited choices of services that they perform while still affording a list of services encompassing a broad spectrum of work values. The Subcommittee recommended minor changes and we incorporated all of them.

Our survey returned nearly a 30% response rate with over 179 completed surveys for each code. Given the limits in finding comparison codes due to the high number of work relative values per new code we compared the survey's median and 25th percentile of times and values to the existing codes in order to validate our work value recommendation.

To compare the existing and new codes we applied the multiple payment procedure reduction (MPPR) to the times and values. We also computed the IWPUT for the existing and new codes as an additional point of comparison in an effort to identify any anomalies that our survey responses could have created. Both sources of comparison indicate that our survey data is valid.

We considered the decrease in time between the existing and new, bundled code(s) and found that some of the former inputs used to value the electrophysiology study and ablation services we're based on technologies that are not typically used anymore, and that the patients eligible to receive these services have changed. For example, while technology is more advanced, the knowledge and accuracy required to perform the procedures has increased. In addition, ablation services used to be available primarily for patients who had no other co-morbidities and who were younger. Within the past two-to-five years, Medicare-age patients have become more likely to be eligible to undergo ablations for atrial fibrillation and tachycardial disorders because of technological advances. Plus, due to their advanced age, it is more likely that they will have an intracardiac defibrillator in place and that the patient will have received multiple shocks before being ablated. Medicare-eligible patients are becoming a much larger percentage of the population receiving this care.

For 93653, we recommend a work value of 18.00, which is equal to the survey median. While the RVW is less than the existing work value for the unbundled services, our survey data could not justify maintaining the current work values. In comparing the code with key reference service, 93580 (repair of atrial septal defect) we noted longer reported intra-service times for 93653 and slightly higher intra-service intensity, technical skill, and mental effort ratings justifying the median value of 18.00. As an additional point of comparison, we calculated that the IWPUT for the newly bundled codes, using the 18.00 RVWs, and found that it falls nearly equal to the intensity to the other two similar codes that we surveyed.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.

☐ Historical precedents.
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was previously reported using 93620 (electrophysiology study) and 93651 (intracardiac catheter ablation).

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 30600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The majority of these services will be provided by electrophysiologists. Access to electrophysiology services would be the most typical reason for the procedure to be conducted by cardiologists. Information to this effect will become more evident once CMS has collected utilization data incorporating the new specialty designation (effective 7/1/2011) for electrophysiology.

Specialty Electrophysiology Frequency 21420 Percentage 70.00 %

Specialty Cardiology Frequency 9180 Percentage 30.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15,598 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 42% of 93651 will be reported in this code

Specialty Electrophysiology Frequency 12000 Percentage 76.93 %

Specialty Cardiology Frequency 5000 Percentage 32.05 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93620

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93654 Tracking Number O2 Original Specialty Recommended RVU: **23.40**
Presented Recommended RVU: **25.00**
Global Period: 000 RUC Recommended RVU: **20.00**

CPT Descriptor: Comprehensive electrophysiologic evaluation including insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with right atrial pacing and recording, right ventricular pacing and recording, His recording with intracardiac catheter ablation of arrhythmogenic focus; with treatment of ventricular tachycardia or focus of ventricular ectopy including intracardiac electrophysiologic 3-dimensional mapping, when performed and left ventricular pacing and recording, when performed
(Do not report 93654 in conjunction with 93600-93603, 93610, 93612, 93613, 93618-93620, 93622, 93653)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 73-year-old man with a history of New York Heart Association Class III heart failure due to ischemic dilated cardiomyopathy (EF 25%) and prior myocardial infarction presents with recurrent ICD therapies for drug-refractory ventricular tachycardia.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 77%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Description of Pre-Service Work: Transthoracic echocardiography and, if necessary, transesophageal echocardiography are obtained prior to the procedure to rule-out left ventricular thrombus and to assess the aortic arch for presence of atherometous plaques. The procedure and the risks, benefits and alternatives associated with electrophysiology testing and ventricular tachycardia ablation are explained to the patient and patient's family. Arrangements are made for the x-ray technician, electrophysiology laboratory technician and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory testing, medications and changes in heath are reviewed. Informed consent is obtained.

Description of Intra-Service Work: The patient is brought to the electrophysiology laboratory. Direct-current cardioversion/defibrillation, EP and ablation equipment is confirmed present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Three-dimensional mapping equipment is tested and confirmed to be functioning normallyLocal analgesia is administered. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed and/or transiently deactivated at the start of the case so as to minimize adverse consequences resulting from electromagnetic interference from radiofrequency current application.
Venous access is obtained In addition, arterial access to monitor blood pressure and to facilitate retrograde aortic access to the left ventricle is obtained. Multi-electrode catheters are advanced from the access sheaths and into the respective cardiac chambers where they will be used to pace and record. An intracardiac echo probe is placed via a femoral venous access

approach. The intracardiac echo is used in conjunction with the 3-D mapping system to create a 3-dimensional shell of the right or left ventricle, including the aortic root, aortic valve leaflets, coronary ostia and mitral valve annulus. Papillary muscles are also recorded in the 3-dimensional anatomical ultrasound map. Pacing and sensing is performed in the right atrium and right ventricle. His bundle recording is obtained. Refractory periods are measured. Attempts at ventricular tachycardia induction are performed via burst pacing, decremental pacing and premature pacing using programmed electrical stimulation at multiple drive cycle lengths from multiple ventricular sites.

Once an arrhythmia is induced, pacing maneuvers are performed to elucidate the mechanism of the ventricular tachycardia. The electrical activation sequence is mapped with the 3-dimensional electroanatomical mapping system and activation timing is superimposed upon the 3-dimensional echo image previously obtained. Anticoagulation is administered once catheters have been placed on the left side of the heart. Once the ventricular tachycardia circuit is localized, a catheter is moved to the appropriate location or region of abnormal myocardium to deliver ablative energy. Multiple lesions are delivered to ensure eradication of the arrhythmia focus and to provide consolidation lesions in the surrounding tissue. Throughout the ablation the patient is monitored for hemodynamic compromise due to cardiac perforation, brady- or tachyarrhythmias, embolic phenomena or damage to cardiac or vascular structures.

Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation using decremental, burst and premature pacing maneuvers. These are repeated following a 30-minute period following the conclusion of the final ablation lesion. Anticoagulation is reversed. Sheaths are removed, appropriate hemostasis is achieved and follow-up assessment of the patient for any complications is performed. Patients with implantable cardioverter-defibrillators will have their devices reprogrammed to an active configuration with rates reprogrammed as necessary to treat any remaining arrhythmias.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient’s family and post-procedure assessments are performed.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was created after electrophysiology studies and ablation procedures were identified in the RAW's screen for services that are reported together 75% of the time. Specifically, the screen found that 93620 and 93651 were reported together 83% of the time, and that 93620 and 93652 were reported together 89% of the time.

Identifying comparison codes on the MPC list was extremely difficult due to the high number of work values for the procedure, that many codes on the MPC list with similar values had 90-day global periods, and that codes with equal global periods, such as per cutaneous cardiac interventions (PCI) stents were also being reviewed for this RUC meeting.

Prior to conducting the survey, we convened a conference call with the Research Subcommittee to review our reference service list since the majority of electrophysiology services were included in the new code descriptors, plus many other cardiac services were also being surveyed for this RUC meeting. That left surveyees with limited choices of services that they perform while still affording a list of services encompassing a broad spectrum of work values. The Subcommittee recommended minor changes and we incorporated all of them.

Our surveys returned nearly a 30% response rate with over 179 completed surveys for each code. Given the limits in finding comparison codes due to the high number of work relative values per new code we compared the surveys' median and 25th percentile of times and values to the existing codes in order to validate our work value recommendations.

To compare the existing and new codes we applied the multiple payment procedure reduction (MPPR) to the times and values. We also computed the IWPUT for the existing and new codes as an additional point of comparison in an effort to identify any anomalies that our survey responses could have created.

Both sources of comparison indicate that our survey data is valid.

The intra-service time is slightly less than what is captured under the MPPR calculations. In reviewing the changes in times, we found that some of the former inputs used to value the electrophysiology study and ablation services we're based on technologies that are not typically used anymore, and that the patients eligible to receive these services have changed. For example, while technology is more advanced, the knowledge and accuracy required to perform the procedures has increased. In addition, ablation services used to be available primarily for patients who had no other co-morbidities and who were younger. Today, Medicare-age patients are more likely to be eligible to undergo ablations for atrial fibrillation and tachycardial disorders because of technological advances.

For 93654, we recommend the 23.40 work units. This value is between the 25th and 50th percentiles of the survey data and matches the existing work value for the unbundled services (93652 and 93620). In comparing the new code with key reference service 93581 (Percutaneous transcatheter closure of a congenital ventricular septal defect with implant) we determined that even though the intra-service time to perform the surveyed code is longer, the intensity of the reference service is greater. Patients undergoing the surveyed code and the reference service are fragile, either due to age (infants or the elderly) or co-morbidities. We found the work similar yet not close to enough for the new code to warrant a value greater than the currently existing one for the unbundled services (CPT 93652 and 93620). The recommended value recognizes the added complexity of the patient's status, physician's work and the IWPUT reference point is nearly equal to that of the existing one for the combined unbundled codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93652 in addition to 93620

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 6500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. With Medicare patients equaling half of the patient population receiving this service, we doubled the annual Medicare utilization of 2,961 and added roughly 500 aptients to account for increasing numbers of patients eligible to undergo the procedure.

Specialty Electrophysiology Frequency 4250 Percentage 70.83 %

Specialty Cardiology Frequency 1750 Percentage 29.16 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,012
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. With patients becoming increasingly more eligible to receive these services, we anticipate a slight increase in the currently reported utilization rate of 2961

Specialty Electrophysiology Frequency 2500 Percentage 83.00 %

Specialty Cardiology Frequency 800 Percentage 26.56 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States?

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93620

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

59 New Molecular Pathology Services

Global Period:_XXX Meeting Date: _September 2011

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

TAB 5 – All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011), except for the HLA code set where CAP surveyed several large and small labs throughout the United States. Survey responses were compiled; questions and clarifications were followed up with lab managers and directors. CAP's expert panel reviewed compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment for all codes.

TAB 9 – All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011).

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Molecular DNA analyses based on specific code.

Intra-Service Clinical Labor Activities:

NONE

Post-Service Clinical Labor Activities:
Clean up, document filing, and other activities, see spreadsheet

SUMMARY OF RECOMMENDATION

CPT Code:93656 Tracking Number O4 Original Specialty Recommended RVU: **23.40**
Presented Recommended RVU: **23.40**
Global Period: 000 RUC Recommended RVU: **20.02**

CPT Descriptor: Comprehensive electrophysiologic evaluation including transseptal catheterizations, insertion and repositioning of multiple electrode catheters with induction or attempted induction of an arrhythmia with atrial recording and pacing, when possible, right ventricular pacing and recording, His bundle recording with intracardiac catheter ablation of arrhythmogenic focus; with treatment of atrial fibrillation by ablation by pulmonary vein isolation
(Do not report 93656 in conjunction with 93600, 93602, 93603, 93610, 93612, 93618, 93619, 93620, 93621, 93462, 93653, 93654)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 62-year-old man with a history of hypertension has recurrent atrial fibrillation. Despite rate or rhythm control with antiarrhythmic drugs, he remains symptomatic.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 81%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting?

Description of Pre-Service Work: A 3-D imaging study such as cardiac MRI, or CT scanning is be obtained prior to the procedure to assess atrial size and for pulmonary vein anatomic variants. The procedure and the risks, benefits and alternatives associated with electrophysiology testing and ventricular tachycardia ablation are explained to the patient and patient's family. Arrangements are made for the x-ray technician, electrophysiology laboratory technician and nurse. The patient is evaluated on the day of the procedure with a history and physical examination and pre-procedure laboratory, medications and change in health status are reviewed with careful attention to the degree of anticoagulation. Informed consent is obtained.

Description of Intra-Service Work: The patient is brought to the electrophysiology laboratory. Direct-current cardioversion/defibrillation, EP and ablative equipment is confirmed present and in proper working order. Fluoroscopic equipment that will be used to visualize catheter movements and location is tested. Local analgesia is administered. Venous access is obtained. In addition, arterial access to monitor blood pressure and to retrograde aortic access to the left ventricle is be obtained. By means of the venous access sites, multi-electrode catheters are positioned in specific cardiac chambers. Two transseptal catheterizations are performed to achieve access and facilitate placement of both a circular mapping catheter and an ablation catheter in the left atrium. Additional anticoagulation is administered. Conduction intervals and refractory periods are measured and arrhythmia induction attempted. His bundle recording and ventricular pacing and sensing are performed. A circular mapping catheter is passed into the left atrium and pulmonary vein conduction is assessed and recorded. Selective venography of the pulmonary veins is performed to define anatomy.

Catheter ablation is then performed to achieve pulmonary vein isolation. Point lesions encircling the pulmonary vein region are created that guided by anatomical mapping and electrical signals provided by a circular mapping catheter. Pulmonary vein isolation, as measured by the circular mapping catheter as well as loss of tissue voltage and tissue pacing capture are the measured endpoints. Throughout the ablation the patient is monitored hemodynamic compromise due to cardiac perforation, brady- or tachyarrhythmias, embolic phenomena, thrombus formation or damage to cardiac or vascular structures, including meticulous monitoring for lesion delivery within the pulmonary vein or close to the esophagus. Following the ablation portion of the procedure, further electrophysiologic testing is performed to assess the outcome of ablation over a 30-minute period following the last ablation lesion. Once electrophysiology testing and ablation are completed, anticoagulation is reversed. Post procedure, sheaths are removed, appropriate hemostasis is achieved and follow-up assessment of the patient for any complications is performed.

Description of Post-Service Work: The patient is monitored in the recovery unit and then overnight in a telemetry unit for delayed complications. Results of the procedure are discussed with the patient and the patient's family and a post-procedure assessment is performed.

Post-Service intensity/complexity	4.24	3.98

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was created after electrophysiology studies and ablation procedures were identified in the RAW's screen for services that are reported together 75% of the time. Due to the increasing number of patients undergoing ablations for atrial fibrillation, this code's development was warranted.

Identifying comparison codes on the MPC list was extremely difficult due to the number of work values for the procedure, that many codes on the MPC list with similar values had 90-day global periods, and that codes with equal global periods, such as per cutaneous cardiac interventions (PCI) stents were also being reviewed for this RUC meeting.

To compare the existing and new codes we applied the multiple payment procedure reduction (MPPR) to the times and values. We also computed the IWPUT for the existing and new codes as an additional point of comparison in an effort to identify any anomalies that our survey responses could have created.

Both sources of comparison indicate that our survey data is valid.

In reviewing the changes in times compared to the existing, unbundled services, we found that some of the former inputs used to value the electrophysiology study and ablation services were based on technologies that are not typically used anymore, and that the patients eligible to receive these services have changed. For example, while technology is more advanced, the knowledge and accuracy required to perform the procedures has increased. In addition, ablation services used to be available primarily for patients who had no other co-morbidities and who were below Medicare-age. Today, Medicare-age patients are more likely to be eligible to undergo ablations for atrial fibrillation and tachycardial disorders because of technological advances.

For 93656, we recommend the 23.40 work units. This value is between the 25th percentile and the median of the survey data and matches the existing work value for the unbundled services (93652 and 93620). We are applying the same rationale that we utilized for 93654 since the time, intensity and complexity of the work are identical. In comparing the new code with key reference service 93581 (Percutaneous transcatheter closure of a congenital ventricular septal defect with implant) we determined that even though the intra-service time to perform the surveyed code is longer, the intensity of the reference service is greater. Patients undergoing the surveyed code and the reference service are fragile, either due to age (infants or the elderly) or co-morbidities. We found the work similar yet not close to enough for the new code to warrant a value greater than the currently existing one for the unbundled services (CPT 93652 and 93620). The recommended value recognizes the added complexity of the patient's status, physician's work and the IWPUT reference point is nearly equal to that of the existing one for the combined unbundled codes.

The recommended value recognizes the added complexity of the patient's status, physician's work and the IWPUT reference point as being nearly equal to that of the existing value for the combined unbundled codes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93651 in addition to 93620

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Commonly

Specialty Cardiology How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 30600
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The majority of these services will be provided by electrophysiologists. Access to electrophysiology services would be the most typical reason for the procedure to be conducted by cardiologists. Information to this effect will become more evident once CMS has collected utilization data incorporating the new specialty designation (effective 7/1/2011) for electrophysiology.

Specialty Electrophysiology Frequency 21420 Percentage 70.00 %

Specialty Cardiology Frequency 9180 Percentage 30.00 %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 20,145 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 42% of 93651 and 90% of 93462 will reported in this code.

Specialty Electrophysiology Frequency 14102 Percentage 70.00 %

Specialty Cardiology Frequency 6045 Percentage 30.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Global Period: ZZZ RUC Recommended RVU: **10.00**

CPT Descriptor: Additional linear or focal intracardiac catheter ablation of the left or right atrium for treatment of atrial fibrillation remaining after completion of pulmonary vein isolation (List separately in addition to code for primary procedure)
(Use 93657 in conjunction with 93656)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old man has symptomatic atrial fibrillation refractory to medical therapy. EP study and ablation are performed to achieve pulmonary vein isolation. (Reported separately). Despite demonstration of electrical isolation of the pulmonary veins, atrial fibrillation continues.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 8% , In the ASC 83%, In the office 41%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 83%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work: A full electrophysiologic study and ablation procedure has been performed for atrial fibrillation. Diagnostic and ablation catheters are present in cardiac chambers. Pulmonary vein isolation has been accomplished. Due to the presence of non-pulmonary vein sources of atrial fibrillation, additional non-pulmonary vein ablation lesions are created. Regions of fractionated potentials are mapped and ablated outside the pulmonary vein area. In addition, linear lesions are attempted along the roof, mitral isthmus or septal aspect of the left atrium. Non-pulmonary vein focal sources of atrial fibrillation induction are induced, localized and ablated. These lesion locations are distinct from the pulmonary vein lesions performed in the main EP study/atrial fibrillation ablation procedure. During the delivery of ablation energy, continuous monitoring for hemodynamic instability, arrhythmias, embolic events and injury to the esophagus is performed. Following restoration of sinus rhythm, conduction intervals are measured and arrhythmia induction is re-attempted over a 30-minute period following the last ablation lesion.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 35 **% of respondents:** 19.3 **%**

TIME ESTIMATES (Median)	**CPT Code: 93657**	**Key Reference CPT Code:** 33259	**Source of Time RUC Time**
Median Pre-Service Time	0.00	15.00	
Median Intra-Service Time	90.00	48.00	
Median Immediate Post-service Time	0.00	15.00	
Median Critical Care Time	0.0	35.00	
Median Other Hospital Visit Time	0.0	45.00	
Median Discharge Day Management Time	0.0	19.00	
Median Office Visit Time	0.0	46.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**90.00**	**223.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)	(of those that selected Key Reference code)	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.66	3.97
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.78	4.17
Urgency of medical decision making	4.41	4.10
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.97	4.70
Physical effort required	4.69	4.50
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.88	4.60
Outcome depends on the skill and judgment of physician	4.94	4.73
Estimated risk of malpractice suit with poor outcome	4.63	4.37

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.88	4.66
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was created after electrophysiology studies and ablation procedures were identified in the RAW's screen for services that are reported together 75% of the time. In addition to developing codes that bundle the primary services, this code is an add-on procedure for those cases when additional spontaneous or induced arrhythmias require further ablation.

For 93657, we chose the survey's 25th percentile of 10.00 WRVUs. The intra-service time and the 25th percentile WRVU coincide with the complexity of the additional work that is required. Using magnitude estimation we compared the intra-service work and patient complexity of this code and our key reference service 33259 (Operative tissue ablation and reconstruction of atria, performed at the time of other cardiac procedure(s), extensive (eg, maze procedure), with cardiopulmonary bypass (List separately in addition to code for primary procedure). That code has 14.14 RVUs with 239 total minutes, including pre and post-service work. Despite having a ZZZ global period, the unique nature of the service and the patient complexity warranted including pre and post-service times in the RVW. We also compared it to 22534 (Arthrodesis, lateral extracavitary technique, including minimal discectomy to prepare interspace (other than for decompression); thoracic or lumbar, each additional vertebral segment (List separately in addition to code for primary procedure) which is on the MPC list. Valued at 5.99 RVWs with a total intra-service time of 60 minutes, we agreed that the patient complexity was closer to the surveyed code's typical patient. In addition, using IWPUT as a secondary comparator, the IWPUT for 22534 is .09998 compared to the 25th percentile's IWPUT of .1111.
We also compared the 93657 to our other surveyed code 9365X3 (Intracardiac catheter ablation of a discrete mechanism of arrhythmia which is distinct from the primary ablated mechanism, including repeat diagnostic maneuvers, to treat a spontaneous or induced arrhythmia) for which we recommended 9.00 RVWs. We determined that while the patients receiving each service were similar, the intensity of the work for each service warranted the slight increase RVWs between the two codes.

Based on: Similarities in complexity between 93657 and 22534; the additional time and effort required to perform the code being surveyed compared to 22534; and, the increased work and complexity required of 33259 compared to the surveyed code, we are recommending the 25th percentile RVW of 10.00.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93651 and 93652

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Electrophysiology How often? Sometimes

Specialty Cardiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3500
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We anticiapte this service being provided 5-10% of the time that the primary procedure is conducted.

Specialty Electrophysiology Frequency 2500 Percentage 71.42 %

Specialty Cardiology Frequency 1000 Percentage 28.57 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,381
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 8.5% of 93651 and 5.5% of 93652 will be reported in this code.

Specialty Electrophysiology Frequency 1600 Percentage 71.11 %

Specialty Cardiology Frequency 650 Percentage 27.77 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93620

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Low Value-Billed in Multiple Units screen

April 2012

Percutaneous Allergy Testing

In 2011, CPT code 95010 *Percutaneous tests (scratch, puncture, prick) sequential and incremental, with drugs, biologicals or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests* and 95015 *Intracutaneous (intradermal) tests, sequential and incremental, with drugs, biologicals, or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests* were identified as part of the Low Value-Billed in Multiple Units screen. In April 2011, the RUC reviewed survey data for 95010 and 95015 based on a typical patient that requires venom testing, but determined that both codes were reported on the same day by the same physician more than 80% of time and that a new bundled code was appropriate. As part of the process to develop a bundled code, the specialty society determined there to be little difference in physician work between percutaneous and intracutaneous testing on a "per test" basis, but a significant difference in practice expense inputs and typical number of tests required when comparing venom testing to drugs/biologic testing. Based on this information, the CPT Editorial Panel approved two new bundled codes, one code for percutaneous/intracutaneous venom testing and one code for percutaneous/intracutaneous drug/biologic testing. RUC surveys were conducted for each new code, using the typical patient and typical total number of tests required. The work RVU and times approved by the RUC would then be divided by the typical number of tests to determine the "per test" values.

95017 ***Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests***
At the April 2011 RUC meeting CPT codes 95010 and 95015 (subsequently deleted) were thought to typically be billed with an Evaluation and Management service on the same day and at that time the RUC determined that pre- and post- time should be reduced from the recommended survey times. However, upon further review of claims data, the RUC determined that code 95017 is not typically reported on the same day as an E/M and therefore E/M time and work is bundled into the pre and post-work. The RUC reviewed the survey results from 72 allergists for CPT code 95017 and determined that the median pre-, intra-, and post-times (15, 20, 15, respectively) and the median work RVU of 1.80 are appropriate for the total physician work required for the typical patient who would have 27 venom tests. The RUC compared 95017 to key reference CPT code 99204 *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family* (work RVU=2.43) and 95017 to MPC code 99203 *Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity.*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family (work RVU=1.42) and determined that the survey median work RVU of 1.80 appropriately placed 95017 between these two references. The RUC also compared 95017 to CPT code 95808 *Polysomnography; sleep staging with 1-3 additional parameters of sleep, attended by a technologist* (work RVU=1.74) and noted that this service has identical time with 15 minutes pre-service time, 20 minutes intra-service time and 15 minutes post-service time, and required slightly less intensity to perform, justifying the slightly higher work RVU for 95017. The approved total work RVU of 1.80 for the typical patient was divided by the typical number of tests (27) to arrive at 0.07 work RVUs "per test." The approved total pre-, intra-, and post-times (15, 20, 15, respectively) were divided by the typical number of tests (27) to arrive at the "per test" pre-, intra-, and post-times (0.556, 0.741, 0.556, respectively). This calculation allows for correct work valuation for the typical patient who will undergo 27 venom tests. **The RUC recommends a work RVU of 0.07 per test for CPT code 95017**.

95018 ***Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with drugs or biologicals, immediate type reaction, including test interpretation and report by a physician, specify number of tests***
At the April 2011 RUC meeting CPT codes 95010 and 95015 (subsequently deleted) were thought to typically be billed with an Evaluation and Management service on the same day and at that time the RUC determined that pre- and post- time should be reduced from the recommended survey times. However, upon further review of claims data, the RUC determined that code 95018 is not typically reported on the same day as an E/M and therefore E/M time and work is bundled into the pre and post-work. The RUC reviewed the survey results from 69 allergists for CPT code 95018 and determined that the median pre-, intra-, and post-times (15, 15, 15, respectively) and the 25th percentile work RVU of 1.25 are appropriate for the total physician work required for the typical patient who would have 9 drug tests. The RUC compared 95018 with key reference CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family* (work RVU=1.50) and CPT code 99213 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU=0.97) and determined that the survey 25th percentile work RVU of 1.25 appropriately placed 95018 between these two references. The RUC also compared 95018 to CPT code 93284 *Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with physician analysis, review and report; multiple lead implantable cardioverter-defibrillator system* (work RVU=1.25) and noted that this service requires the same intra-service time of 15 minutes and would require the same total physician work. The approved total work RVU of 1.25 for the typical patient was divided by the typical number of tests (9) to arrive at 0.14 work RVUs "per test." The approved total pre-, intra-, and post-times (15, 15, 15, respectively) were divided by the typical number of tests (9) to arrive at the "per test" pre-, intra-, and post-times (1.667, 1.667, 1.667, respectively). This calculation allows for correct work valuation for the typical patient who will undergo 9 drug tests. **The RUC recommends a work RVU of 0.14 per test for CPT code 95018**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Work Neutrality
The RUC's recommendations for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
D95010		~~Percutaneous tests (scratch, puncture, prick) sequential and incremental, with drugs, biologicals or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests~~	XXX	N/A
D95015		~~Intracutaneous (intradermal) tests, sequential and incremental, with drugs, biologicals, or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests~~ (95010 and 95015 have been deleted. To report, see 95017 and 95018)	XXX	N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95017 Tracking Number EE1 Original Specialty Recommended RVU: **0.07**
Presented Recommended RVU: **0.07**
Global Period: XXX RUC Recommended RVU: **0.07**

CPT Descriptor: Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with venoms, immediate type reaction, including test interpretation and report, specify number of tests

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old male with a history of being stung by an insect followed by generalized urticaria and mild chest discomfort requires venom allergy testing. The allergist performs 27 total tests that include percutaneous and intracutaneous tests of venoms and appropriate positive and negative controls.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: An updated medication history is obtained, along with a review of pertinent medical problems that may have arisen since the previous visit. Explain procedure to patient/family and review risks and complications, including the possibility of anaphylaxis. Obtain consent. Verify that all required supplies and equipment are available, both for testing and for possible intervention if a reaction occurs. Based on evaluation of patient history and risk factors, a safe starting dose is determined and instructions are provided to clinical staff for preparation of testing dilutions.

Description of Intra-Service Work: The first test includes five percutaneous venom tests and two percutaneous control tests (positive histamine and negative diluent). After 15-20 minutes, the physician interprets this initial test by viewing skin reaction at venom test sites compared to control sites and determines if intracutaneous testing can proceed. Sequential and incremental intracutaneous testing is performed in four batches of five venoms. Fifteen to 20 minutes after each test, the physician interprets this test by viewing skin reaction at venom test sites compared to control sites. The physician is available in the office for entire intra-service period and checks the patient periodically and before administration of each test for local and systemic reactions.

Description of Post-Service Work: Discuss testing results with patient/family. Discuss possibility of delayed reaction. Make sure the patient understands how to recognize a reaction and what to do if a reaction occurs, including proper use of EpiPen and/or oral medication. Discuss future management of the condition. Dictate testing results and complete medical record documentation. Discuss results with referring physician and/or PCP (verbal and written)

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99204	XXX	2.43	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 45 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	1.42	**RUC Time**	9,033,717

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

Time Segments (Mean)		
Pre-Service intensity/complexity	3.79	3.53
Intra-Service intensity/complexity	3.58	3.65
Post-Service intensity/complexity	4.00	3.82

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

In the Medicare Physician Payment Schedule Proposed Rule and Final Rule for 2011, CMS indicated that they believe services with low work RVUs that are commonly billed with multiple units in a single encounter are an additional appropriate category for identifying potentially misvalued codes (ie, low value-billed in multiple units screen). CMS requested that the RUC review specific codes, including codes **95010** *Percutaneous tests (scratch, puncture, prick) sequential and incremental, with drugs, biologicals or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests* and **95015** *Intracutaneous (intradermal) tests, sequential and incremental, with drugs, biologicals, or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests.* "

JCAAI conducted RUC surveys for codes 95010 and 95015 and presented work RVU recommendations at the April 2011 RUC meeting. At that meeting, it was determined that 95010 and 95015 were reported on the same day by the same physician more than 80% of time. Based on this information, the RUC asked the specialty to pursue a new bundled code.

During development of the coding change proposal, JCAAI determined that although there was little difference in "per test" physician work between percutaneous and intracutaneous testing, there was a difference in direct practice expense inputs when comparing venoms to drugs/biologics. There also was a difference in the typical number of tests required for venom testing when compared with drug/biologic testing. This information resulted in a request for two new bundled codes: one code for percutaneous/intracutaneous venom testing; and one code for percutaneous/intracutaneous drug/biologic testing.

Survey Sample

A RUC survey was sent to a random sample of JCAAI members. An email query was sent to all JCAAI members asking for volunteers who perform either venom or drug/biologic testing allergy testing and who would be willing and available to participate in a review of physician work during the February/March survey time frame. In addition, JCAAI conducted a Webinar for any participant interested in learning more about the RUC survey process. A power point presentation (approved by RUC staff) was used in the Webinar and the Webinar was attended by RUC staff. The power point presentation was the standard RUC process power point presentation, modified to accommodate codes with an XXX global period instead of a 90-day global period.

Survey Vignette

The vignette for new code 95017 bundles the vignettes of to-be-deleted codes 95010 (7 percutaneous venom tests) plus 95015 (20 intracutaneous venom tests). These numbers of tests were previously determined to be typical for each code.

Recommendation for Pre-, Intra- and Post-time

During the previous review of codes 95010 and 95015 at the April 2011 meeting, a table was provided that indicated an EM was typically billed with these codes on the same day. April 2011 Information:

CPT	Est 2010 Util	2009 Util	5% file of 2009 Util Used	% Billed with Office E/M
95010	108,095	118,160	5,352	**84%**
95015	57,772	46,551	2,388	**54%**

Based on this table, the RUC determined that pre- and post-time should be reduced from the recommended survey times. *"The specialty society indicated and the RUC agreed that this service is typically reported with an Evaluation and Management service on the same date by the same provider as part of counseling the patient on the use of the epinephrine auto injector following the tests. Therefore, the RUC reduced the pre-service time to 7 minutes and reduced the immediate post-service time to 2 minutes."*

At this April 2012 meeting, a new table that reviewed the same 5% file indicates that the previous table had an error. April 2012 Information:

CPT	2010 Util	2009 Util	5% file of 2009 Util Used	% Billed with Office E/M
95010	80,259	118,160	233	**4%**
95015	56,202	46,551	123	**5%**

This corrected data is not surprising considering that only a *significant* and *separately identifiable* E/M service can be reported (mod-25 appended) in conjunction with these codes. **We recommend the survey median times for pre, intra, and post work divided by 27 for "per test" minutes as shown below.**

CPT	DESC	Total Time	pre	intra	post
95017	Total for 27 Tests	50	15	20	15
95017	**Total divided by 27 = PER TEST**	**1.852**	**0.556**	**0.741**	**0.556**

Work RVU Recommendation

As shown in the table below, the 2012 current work RVUs for codes 95010 and 95015 result in a blended work RVU of 0.07 per test [Row 7: (95010 * 7 * 0.11) + (95015 * 20 * 0.06) divided by 27 = 0.07].

The survey median work RVU of 1.80 corresponds to physician work for 27 venom tests. Dividing this work RVU of 1.80 by 27 tests results in a per test work RVU of 0.07.

We recommend a work RVU of 0.07 per test for 95017. This value is over 50% less than the 2011 work RVU of 0.15 for 95010 and 95015. This value is the same as the per test value based on the RUC's previous determination for venom allergy testing (April 2011).

		CPT	DESC	IWPUT	RVW	Total Time	pre	intra	post
1	**REF**	**99204**	OV, new patient - LEVEL 4	**0.070**	**2.43**	**45**	5	30	10
3		95010	RUC approved for 7 VENOM tests (after time deleted for EM)	0.057	0.77	19	7	10	2
4	***per test =***	**95010**	**Percutaneous tests**	**0.057**	**0.11**	**2.72**	**1.00**	**1.43**	**0.29**
5		95015	RUC approved for 20 VENOM tests (after time deleted for EM)	0.065	1.20	25	7	15	3
6	***per test =***	**95015**	**Intracutaneous**	**0.065**	**0.06**	**1.25**	**0.35**	**0.75**	**0.15**
7	**CURRENT**	**(95010 * 7) + (95015 * 20) divided by 27**		**0.062**	**0.07**	**1.631**	**0.519**	**0.926**	**0.186**
8	**SVY**	**95017**	Allergy testing, any combination…	**0.056**	**1.80**	**50**	**15**	**20**	**15**
9	**REC**		**Totals for 27 Tests**	**0.056**	**1.80**	**50**	**15**	**20**	**15**
10	**REC**		**Total divided by 27 = PER TEST**	**0.056**	**0.07**	**1.852**	**0.556**	**0.741**	**0.556**

The recommended work RVU of 0.07 per test (1.80 for 27 typical tests) is supported by comparison with the key reference code, MPC codes, and several other RUC reviewed XXX-global codes requiring similar total physician work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95010 plus 95015

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty allergy/immunology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency not available

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 102,346 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2010 data: 75% of 95010 plus 95015 (to be deleted)

Specialty allergy/immunology Frequency 54510 Percentage 53.26 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:95018 Tracking Number EE2 Original Specialty Recommended RVU: **0.17**
Presented Recommended RVU: **0.17**
Global Period: XXX RUC Recommended RVU: **0.14**

CPT Descriptor: Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with drugs or biologicals, immediate type reaction, including test interpretation and report, specify number of tests

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 48-year-old woman with chronic sinusitis and a history of adverse reactions to multiple antibiotics requires drug allergy testing. The allergist performs 9 total tests that include percutaneous and intracutaneous tests of penicillin and appropriate positive and negative controls.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: An updated medication history is obtained, along with a review of pertinent medical problems that may have arisen since the previous visit. Explain procedure to patient and review risks and complications, including the possibility of anaphylaxis. Obtain consent. Verify that all required supplies and equipment are available, both for testing and for possible intervention if a reaction occurs. Based on evaluation of patient history and risk factors, a safe starting dose is determined and instructions are provided to clinical staff for preparation of testing dilutions.

Description of Intra-Service Work: The first test includes four percutaneous tests, including benzylpenicilloyl polylysine, penicillin G potassium, and two control tests (positive histamine and negative diluent). After 15-20 minutes, the physician interprets this initial test by viewing skin reaction at drug test sites compared to control test sites and determines intracutaneous testing should proceed. Next, intracutaneous testing is performed that includes five tests; benzylpenicilloyl polylysine in duplicate, penicillin G potassium in duplicate, and one negative control test (diluent). After 15-20 minutes, the physician interprets the test by viewing skin reaction at drug test sites compared to control test sites. The physician is available in the office for entire intra-service period and checks the patient periodically and before administration of each test for local and systemic reactions.

Description of Post-Service Work: Discuss testing results with patient/family. Discuss possibility of delayed reaction. Make sure the patient understands how to recognize a reaction and what to do if a reaction occurs, including proper use of EpiPen and/or oral medication. Discuss future management of the condition. Dictate testing results and complete medical record documentation. Discuss results with referring physician and/or PCP (verbal and written).

Modifier -51 Exempt Status

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99203	XXX	0.00	**RUC Time**	9,033,717

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of a new patient, which requires these 3 key components: A detailed history; A detailed examination; Medical decision making of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

Post-Service intensity/complexity	3.75	3.41

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

In the Medicare Physician Payment Schedule Proposed Rule and Final Rule for 2011, CMS indicated that they believe services with low work RVUs that are commonly billed with multiple units in a single encounter are an additional appropriate category for identifying potentially misvalued codes (ie, low value-billed in multiple units screen). CMS requested that the RUC review specific codes, including codes **95010** *Percutaneous tests (scratch, puncture, prick) sequential and incremental, with drugs, biologicals or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests* and **95015** *Intracutaneous (intradermal) tests, sequential and incremental, with drugs, biologicals, or venoms, immediate type reaction, including test interpretation and report by a physician, specify number of tests.* "

JCAAI conducted RUC surveys for codes 95010 and 95015 and presented work RVU recommendations at the April 2011 RUC meeting. At that meeting, it was determined that 95010 and 95015 were reported on the same day by the same physician more than 80% of time. Based on this information, the RUC asked the specialty to pursue a new bundled code.

During development of the coding change proposal, JCAAI determined that although there was little difference in "per test" physician work between percutaneous and intracutaneous testing, there was a difference in direct practice expense inputs when comparing venoms to drugs/biologics. There also was a difference in the typical number of tests required for venom testing when compared with drug/biologic testing. This information resulted in a request for two new bundled codes: one code for percutaneous/intracutaneous venom testing; and one code for percutaneous/intracutaneous drug/biologic testing.

Survey Sample

A RUC survey was sent to a random sample of JCAAI members. An email query was sent to all JCAAI members asking for volunteers who perform either venom or drug/biologic testing allergy testing and who would be willing and available to participate in a review of physician work during the February/March survey time frame. In addition, JCAAI conducted a Webinar for any participant interested in learning more about the RUC survey process. A power point presentation (approved by RUC staff) was used in the Webinar and the Webinar was attended by RUC staff. The power point presentation was the standard RUC process power point presentation, modified to accommodate codes with an XXX global period instead of a 90-day global period.

Survey Vignette

The vignette for new bundled code 95018 describes the typical number of tests (9) involved in penicillin allergy testing, the most common drug tested.

Compelling Evidence

The work RVUs for codes 95010 and 95015 were based on venom testing which represents 75-80 percent of patients. However, patients undergoing drug allergy testing require more physician time and work on a per test basis than venom testing because there are duplicate tests in each batch that add a degree to the complexity and additional time for assessment.

Consideration for the increased work of drug testing *may* have been incorporated in the original work RVUs for codes 95010 and 95015 (1993-2011 work RVU was 0.15 per test for both codes). However, the additional work for drug allergy testing was not considered in the April 2011 RUC review where the typical patient description for both 95010 and 95015 was venom allergy testing. Additionally, incorrect information regarding same day billing of an E/M service resulted in reduction of time.

At the April 2011 meeting, it was determined that 95010 and 95015 were reported on the same day by the same physician more than 80% of time and the specialty was asked to pursue a new bundled code. Instead of tabling the review of 95010 and 95015, the RUC forwarded recommendations to CMS for reduced work RVUs – based on venom allergy testing and same day E/M billing.

The current review of 95018 will be the first time that drug allergy testing will be separately reviewed. The work RVU we are requesting for 95018 is greater than 95017. If we could step back one year, the values we are recommending for

new bundled codes 95017 and 95018 would show significant savings to Medicare AND represent correct relativity between per test venom and per test drug allergy testing.

Savings based on 2011 work RVUs compared with 2012 work RVUs:

CPT	2010 Util	2011 RVW	total RVWs
95010	80,259	0.15	12,039
95015	56,202	0.15	8,430
	136,461		**20,469**
CPT	**2010 Util**	**2012 RVW**	**total RVWs**
95010	80,259	0.11	8,828
95015	56,202	0.06	3,372
	136,461		**12,201**
			(8,269)

Savings based on 2011 work RVUs compared with current recommendations:.

CPT		2010 Util	2011 RVW	total RVWs
95010		80,259	0.15	12,039
95015		56,202	0.15	8,430
		136,461		**20,469**
CPT	**Util Split***	**2010 Util**	**Rec RVW**	**total RVWs**
X1 venom	**0.75**	102,346	0.07	7,164
X2 drug	**0.25**	34,115	0.17	5,800
		136,461		**12,964**
				(7,505)

* Estimated national percentage split of new bundled venom vs drug from the total utilization of 95010 and 95015 which were reported per test. The venom percentage is much higher because of the typical number of tests (27 vs 9 or 3:1 or 75:25). This estimated split in confirmed by the expert panel reviewing these data.

The difference in savings between the 2011 RUC review of 95010 and 95015 and current recommendations for new bundled codes 95017 and 95018 equates to approximation $29,000. We believe that if the RUC had requested bundling of codes 95010 and 95015 prior to making a recommendation to CMS, we would not have had to present compelling evidence because the recommendations for the new bundled codes represent significant savings to Medicare (-7,505 work RVUs).

We ask the RUC to consider this discussion regarding the premature review and incorrect E/M assumptions as compelling evidence to consider a different work RVU for 95018.

Pre-, Intra- and Post-time Recommendation

During the previous review of codes 95010 and 95015 at the April 2011 meeting, a table was provided that indicated an EM was typically billed with these codes on the same day. April 2011 Information:

CPT	*Est* 2010 Util	2009 Util	5% file of 2009 Util Used	% Billed with Office E/M
95010	108,095	118,160	5,352	**84%**
95015	57,772	46,551	2,388	**54%**

Based on this table, the RUC determined that pre- and post-time should be reduced from the recommended survey times. *"The specialty society indicated and the RUC agreed that this service is typically reported with an Evaluation and Management service on the same date by the same provider as part of counseling the patient on the use of the epinephrine auto injector following the tests. Therefore, the RUC reduced the pre-service time to 7 minutes and reduced the immediate post-service time to 2 minutes."*

At this April 2012 meeting, a new table that reviewed the same 5% file indicates that the previous table had an error. April 2012 Information:

CPT	2010 Util	2009 Util	5% file of 2009 Util Used	% Billed with Office E/M
95010	80,259	118,160	233	**4%**
95015	56,202	46,551	123	**5%**

This corrected data is not surprising considering that only a *significant* and *separately identifiable* E/M service can be reported (mod-25 appended) in conjunction with these codes. **We recommend the survey median times for pre, intra, and post work divided by 9 for "per test" minutes as shown below.**

CPT	DESC	Total Time	pre	intra	post
95018	Total for 9 Tests	45	15	15	15
95018	Total divided by 9 = PER TEST	5.000	1.667	1.667	1.667

Work RVU Recommendation

We recommend a per test work RVU of 0.14 for 95018. This per test value is greater than the 2011 work RVU of 0.15 for 95010 and 95015, which included both drug and venom allergy testing. Taken together with the per test recommendation of 0.07 work RVUs for new bundled code 95017, this recommendation accounts for the difference in physician work for venom and drug allergy testing that has previously not been considered and represents a significant overall savings due to bundling.

The per test work RVU of 0.17 is supported by comparison with the key reference code, MPC codes, and several other RUC reviewed XXX-global codes requiring similar total physician work.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95010 plus 95015

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty allergy/immunology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency not available

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
95017 Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with **venoms**, immediate type reaction, including test interpretation and report by a physician, specify number of tests

Global Period XXX **Meeting Date**: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
An expert panel of allergists familiar with this new code met by conference call to discuss direct practice expense details.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:
Codes 95010 and 95015 will be deleted for 2013 and replaced by new bundled codes 95017 and 95018. The direct practice expense details of the to-be-deleted codes were considered when the recommendations for new code 95017 were discussed by the expert panel. – No inputs recommended for facility.

Please describe in detail the clinical activities of your staff:
Pre-Service Clinical Labor Activities:
N/A

Service Clinical Labor Activities:

	27 tests	per test	
Greet patient, provide gowning, ensure appropriate medical records are available	**3**	**0.111**	**Std Time** - Test in NOT typically performed with E/M.
Obtain vital signs	**3**	**0.111**	**Std time for 1-3 vitals**: BP, HR, RR
Provide pre-service education/obtain consent	**3**	**0.111**	This will be the first time a patient undergoes testing. An explanation of the testing and consent is necessary.
Prepare room, equipment, supplies			
Prepare testing board and testing syringes	**40**	**1.481**	**Previously approved total time for 95010 and 95015.** There is no overlap in preparation of percutaneous testing board and intradermal syringes. This includes documentation of expiration dates, lot numbers, etc. in the patient's chart.
Performing procedure (percut and intracut)	**33.5**	**1.241**	**Previously approved** 0.5 min per percutaneous plus 1.5 min per intradermal (0.5x7 + 1.5x20 = 33.5 min)
Monitor pt. following service/check tubes, monitors, drains	**21**	**0.778**	**Previously approved total time** for 95010 and 95015 - monitoring time approved for 27 tests.
Clean room/equipment by physician staff	**1**	**0.037**	Although testing supplies will be disposed of while patient is being monitored, additional time to clean room is necessary for final cleaning after patient leaves office (eg, clean exam table and surfaces, dispose of table paper and gown)
Other Clinical Activity - *specify:* Charting	**6.75**	**0.250**	Each test site is measured (wheal and flare) and documented after the monitoring period @ 15 seconds per test.

Post-Service Clinical Labor Activities:
N/A

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
95018 Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with **drugs** or biologicals, immediate type reaction, including test interpretation and report by a physician, specify number of tests

Global Period XXX **Meeting Date**: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
An expert panel of allergists familiar with this new code met by conference call to discuss direct practice expense details.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:
Codes 95010 and 95015 will be deleted for 2013 and replaced by new bundled codes 95017 and 95018. The direct practice expense details of the to-be-deleted codes were considered when the recommendations for new code 95018 were discussed by the expert panel. – No inputs recommended for facility.

Please describe in detail the clinical activities of your staff:
Pre-Service Clinical Labor Activities:
N/A

Service Clinical Labor Activities:

	9 tests	per test	
Greet patient, provide gowning, ensure appropriate medical records are available	**3**	**0.333**	**Std Time** - Test is NOT typically performed with E/M.
Obtain vital signs	**3**	**0.333**	**Std time for 1-3 vitals**: BP, HR, RR
Provide pre-service education/obtain consent	**3**	**0.333**	This will be the first time a patient undergoes testing. An explanation of the testing and consent is necessary.
Prepare testing board and testing syringes	**13.33**	**1.481**	**Previously approved average** time for venom prep (40 min / 27 tests = 1.481 min/test). There is no overlap in preparation of percutaneous testing board and intradermal syringes. This work includes documentation of expiration dates, lot numbers, etc. in the patient's chart.
Assist physician in performing procedure	**9.50**	**1.056**	**Previously approved** 0.5 min per percutaneous plus 1.5 min per intradermal (0.5 x4 + 1.5x5 = 9.5 min)
Monitor pt. following service/check tubes, monitors, drains	**11.67**	**1.297**	Two "batches" of testing is performed. The patient is monitored for 15-20 minutes after each test (30-40 min). Clinical staff will typical monitor 1 to 2 patients. Recommend 1/3 of 35 min = 11.67.
Clean room/equipment by physician staff	**1**	**0.111**	Although testing supplies will be disposed of while patient is being monitored, additional time to clean room is necessary for final cleaning after patient leaves office (eg, clean exam table and surfaces, dispose of table paper and gown)
Other Clinical Activity - *specify:* Charting	**2.25**	**0.250**	Each test site is measured (wheal and flare) and documented after the monitoring period @ 15 seconds per test.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Allergen Ingestion Test

In 1995, the RUC reviewed CPT code 95075 *Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance such as metabisulfite)* and recommended to maintain the 1993 work RVUs, which were not based on a RUC survey. The code has not been reviewed since 1995 and the RUC determined that the dominant specialty at that time (otolaryngology) is no longer the dominant specialty (currently, Allergy/Immunology). In February 2012, the CPT Editorial Panel deleted 95075 and created CPT code 95076 *Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); initial 120 minutes of testing* and CPT code 95079 *Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); each additional 60 minutes of testing (List separately in addition to code for primary procedure),* to establish time based codes to report ingestion challenge tests. The RUC agreed with the specialty society that there is compelling evidence to increase the value of these codes based on a change in the patient population and related physician work. The patient population and severity of food allergies is vastly different than it was in 1995. The 1995 typical patient reacted to wheat with nasal congestion symptoms in comparison to current population. Food allergies (most typically peanuts) now result in anaphylaxis and potentially death (ie, not just nasal congestion). Although not typical in the office setting during testing, anaphylaxis and death is a serious concern, requiring close monitoring by the physician throughout the testing period.

Medicare data indicate an E/M is typically performed on the same day. Although the specialty society experts could not be certain, they believe if a Medicare patient receives this test it would likely be for a speculative antibiotic allergy. These Medicare patients would not undergo incremental dosing and extended monitoring and moving forward would not likely report the new time based code. In addition, Medicare patients comprise a fraction of the national utilization of this code. The RUC agreed with the specialty society and the typical patient is a pediatric patient. A CPT Assistant article will be developed to explain that these codes are to be used to report incremental challenges that require monitoring between dosing and that anything less is to be reported with an Evaluation and Management Service.

95076

The RUC reviewed the survey results from 107 allergists and determined that the work RVU of 1.50, the survey's 25th percentile appropriately accounts for the physicians work required to perform this service. The RUC agreed with the survey times of 7 minutes pre-service, 30 minutes intra-service and 5 minutes post-service. The RUC compared 95076 to key reference CPT code 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU=2.11) which has slightly less intra-service time at 30 and 35 minutes, respectively and less total time at 42 and 55 minutes, respectively. The RUC agreed with the specialty that 95076 requires less time and intensity to perform compared with 99215 and therefore should have a lower work RVU. The RUC also compared 95076 to a second reference code cited by the specialty, CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established* (work RVU=1.50) which

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

has slightly less intra-time and almost identical total time. The RUC agreed that 95076 and 99214 would require similar total physician work and similar intensity, and therefore agreed with the specialty that the 25th percentile work RVU of 1.50 was appropriate. As additional support, the RUC compared 95076 to 99393 *Periodic comprehensive preventive medicine reevaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, established patient; late childhood (age 5 through 11 years)* (work RVU=1.50), with identical physician work. **The RUC recommends a work RVU of 1.50 for CPT code 95076.**

95079

The RUC reviewed the survey results from 104 allergists and determined that the work RVU of 1.38, the survey's 25th percentile, appropriately accounts for the physicians work required to perform this service. The RUC agreed with the survey time of 30 minutes intra-service. The RUC compared 95079 to key reference CPT code 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU=2.11) and determined 99215 required more work than 95079, but was not a good reference because of the difference in global period. The RUC determined 95079 should be compared to other codes which have a ZZZ-global, including 13102 *Repair, complex, trunk; each additional 5 cm or less* (work-RVU=1.24) and 13122 *Repair, complex, scalp, arms, and/or legs; each additional 5 cm or less* (work RVU=1.44). Codes 13102 and 13122 bracket code 95079 in time and support the 25th percentile work RVU of 1.38. The RUC also compared the surveyed service to CPT code 99355 *Prolonged service in the office or other outpatient setting requiring direct patient contact beyond the usual service; each additional 30 minutes (List separately in addition to code for prolonged service)* (work RVU=1.77) with identical intra-service time. **The RUC recommends a work RVU of 1.38 for CPT code 95079.**

Practice Expense

The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Category I **Medicine** **Allergy and Clinical Immunology**				
Definitions ***Immunotherapy (desensitization, hyposensitization)*** *is the parenteral administration of allergenic….* **Other therapy:** for medical conferences on the use of mechanical and electronic devices (precipitators, air conditioners, air filters, humidifiers, dehumidifiers), climatotherapy, physical therapy, occupational and recreational therapy, see **Evaluation and Management** services ~~section~~ Do not report Evaluation and Management (E/M) services for test interpretation and report. If a significant separately identifiable E/M service is performed, the appropriate E/M service code which may include office or other outpatient services (99201-99215), hospital observation services (99217-99220; 99224-99226), initial hospital care (99221-99233), subsequent hospital care and hospital discharge services (99231-99239), consultations (99241-99255), emergency department services (99281-99285), nursing facility services (99304-99316, 99318), domiciliary, rest home services (99324-99337), home services (99341-99350), preventive medicine services (99381-99397) should be reported using modifier 25.				
Ingestion Challenge Testing Codes 95076 and 95079 are used to report ingestion challenge testing. Report code 95076 for initial 120 minutes of *testing* time (ie, not physician face-to-face time). Report code 95079 for each additional 60 minutes of *testing* time (ie, not physician face-to-face time). For total *testing* time less than 61 minutes (eg, positive challenge resulting in cessation of testing), report Evaluation and Management service, if appropriate. Patient assessment/monitoring activities for allergic reaction (eg, blood pressure testing, peak flow meter testing) are not separately reported. Intervention therapy (eg, injection of steroid or epinephrine) may be reported separately as appropriate. For purposes of reporting testing times, if an evaluation and management service is required, then testing time ends.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95076 Tracking Number MM1 Original Specialty Recommended RVU: **2.11**
Presented Recommended RVU: **1.50**
Global Period: XXX RUC Recommended RVU: **1.50**

CPT Descriptor: Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); initial 120 minutes of testing

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 8-year old with a history of an acute allergic reaction to peanut at age 2 years has been monitored by serial allergy skin and serum tests. She had no additional known exposures to peanut. The patient undergoes ingestion challenge testing to determine if her peanut allergy has resolved.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review vital signs obtained by clinical staff including baseline peak flow measurement. Review prior reaction history, skin test and lab results. Update history. Perform brief exam. The procedure, risks, and complications are reviewed and consent obtained.Verify that all required supplies and equipment are available, both for testing and for possible intervention if a reaction occurs. Written instructions are prepared for testing portions and dosing instructions.

Description of Intra-Service Work: Ingestion challenge testing of peanut butter is conducted. This typically involves incremental peanut butter dosing from a minute amount placed on the philtrum, followed by a minute amount placed on the tongue, followed by sequential ingestion of one-eighth, one-quarter, one-half, one, and two teaspoon(s) of peanut butter. Between the doses, there is a period of close patient monitoring for reaction (eg, hives, angioedema, wheezing) and assessing patient status prior to next dose. After the final dose, observation and monitoring are continued until the patient is considered clinically stable and a final physical examination is normal. The physician is available in the office for entire intra-service period [Note: Patient assessment/monitoring activities for allergic reaction (eg, blood pressure testing, peak flow meter testing) are not separately reported. Intervention therapy (eg, injection of steroid or epinephrine) may be reported separately as appropriate. For purposes of reporting testing times, if an evaluation and management service is required, then testing time ends.]

Description of Post-Service Work: Discuss possibility of delayed reaction. Confirm that the patient/family understands how to recognize a reaction and what to do if a reaction occurs. Final exam of patient before discharge from office. Dictate testing results and complete medical record documentation. Discuss results with referring physician and/or PCP (verbal and written).

Time Segments (Mean)		
Pre-Service intensity/complexity	3.52	3.13
Intra-Service intensity/complexity	4.23	3.87
Post-Service intensity/complexity	3.45	3.30

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT code 95075 did not meet the utilization threshold for the CMS/RAW screen for "Different Performing Specialty from Survey." However, JCAAI determined that the work of code 95075 was based on the review by a specialty who is not the current dominant provider. In addition, JCAAI determined that the code approved for CPT 1993 is not consistent with work and variability of physician time in current practice. JCAAI applied to CPT for two new codes to describe ingestion challenge testing: one code for the initial 120 minutes of testing (typical, represents a negative test); and one add-on code to report additional increments of 60 minutes testing time to more accurately report the complete range of time and work involved in performing ingestion challenges.

Compelling Evidence

Change in Patient and Physician Work

Food allergies, the most common of the three types of allergens which are described by the current CPT code for an ingestion challenge (95075), affect more than 10 million Americans, including 3 million children. The prevalence of food allergies among children 18 years and younger increased 18% between 1997 and 2007. The most recent study of food allergy in this age cohort found a higher prevalence rate than had been reported previously. The rate of food allergies among children 18 years and younger was estimated at 8.0% (95% confidence interval [CI]: 7.6–8.3). The same study found that among children with food allergy, 38.7% had a history of severe reactions, and 30.4% had multiple food allergies. We do not have incidence data for allergies to other substances (drugs and metabilsulfite) but ingestion challenge for these items constitutes only about 10% of total ingestion challenges – the rest being for food.

The patient population and severity of food allergies is vastly different than it was in 1995 when code 95075 was reviewed by the RUC. The 1995 typical patient reacted to wheat with nasal congestion symptoms. As discussed above, over the last 15-20 years, there has been a significant increase in the number of individuals affected by food allergies and in the severity of symptoms. In the current population, we now see food allergies (most typically peanuts) that result in anaphylaxis and death (ie, not just nasal congestion). Although not typical in the office setting during testing, anaphylaxis and death is a serious concern, requiring close monitoring by the physician throughout the testing period. From 2003 to 2006, food allergies resulted in approximately 317,000 visits to hospital emergency departments, outpatient clinics and physicians' offices, using data from multiple US national surveys collected by the National Center for Health Statistics. The same study found that food allergy-related hospital admissions increased from 2,600 per year (1998-2000) to 9,500 per year (2004-2006). There are currently more than 125,000 ER visits related to food allergies in the US per year, of which some 12% are accompanied by an anaphylactic reaction. About 20% of these patients with a reaction may need to be hospitalized and, unfortunately, more than 100 may die.

In 2010, the National Institute of Allergy and Infectious Diseases, part of the National Institutes of Health, published "best practices" guidelines for the diagnosis and management of food allergy. In these guidelines, the time course of food-induced anaphylaxis is described as typically characterized by a defined exposure to a food allergen that is followed by a rapid onset and evolution of symptoms over minutes to several hours. Deaths from food-induced anaphylaxis have been reported within 30 minutes to 2 hours of exposure and usually result from cardiorespiratory compromise.

In 1995, the physician work was described by AAOHNS as intermittent assessment for one hour after ingestion of food containing wheat. If there was no reaction after one hour, 1/2 of the original portion was administered as a second does and the same observation occurs for the next hour. If there is no reaction after the second does, the test is considered negative. Intermittent assessment of the patient allergic to nuts is more complex than assessment of a patient allergic to wheat.

In current practice, the typical food ingestion challenge will be peanuts and the dosing will gradually increase (ie, a minute amount placed on the philtrum, followed by a minute amount placed on the tongue, followed by sequential ingestion of one-eighth, one-quarter, one-half, one, and two teaspoon(s) – or the equivalents in grams). These challenges will be administered every 15 to 20 minutes if no reaction is seen. Variation in patient-specific factors may impact testing intervals. For example, some tests require additional time and work because of the patient's ability to ingest a particular food allergen, typically because of fear caused by a prior experience, or age of the patient. This factor may necessitate how a food allergen is introduced and whether or not it needs to be masked and placebo-controlled or, presented in different forms for reasons of palatability or concomitant food allergies. This results in some patients

requiring more than the typical testing time for a negative reaction (95076). For all testing, the physician will need to be readily available nearby throughout the entire testing period as a reaction can occur quickly or be delayed. In practice, typically only one to two patients may be tested simultaneously since the possibility of a life threatening reaction can occur at any time and the physician needs to be available to intervene.

Change in Provider

In 1995, code 95075 was identified as potentially misvalued by the CMDs. Otolaryngology conducted a RUC survey. In 1994, otolaryngology provided this service, but was not the dominant provider. As seen in the table below, in current practice, allergy/immunology now comprises the significant majority of providers. Allergy/immunology did not participate in the 1995 review.

	1994	2010
Medicare utilization	**1,556**	**2,311**
allergy/immunology	41.30%	90.90%
otolaryngology	32.90%	0.65%
general/family practice	17.20%	0.48%
internal medicine	7.50%	3.72%

Flawed methodology for Previous Valuation

In 1995, AAOHNS recommended an increased work RVU for 95075, but the RUC determined that the specialty society only presented compelling evidence to maintain the current value of the code. The code was never surveyed by Harvard and not surveyed in 1992 after approval by CPT as a new code. The value approved in 1992 was based on the AAOHNS relative estimation of work RVUs, not a RUC survey.

Time and Work RVU Recommendations

Pre-time: We have chosen pre-time package 5 (non-facility procedure without sedation). This value is less than the survey median time, but representative of a minimum amount of time necessary to perform an review records and labs, review the procedure and risks with patient/family, obtain consent, confirm supply and equipment availability in the event of a reaction, and write orders for the testing procedure.

Intra-time: We recommend the survey median time of 30 minutes for physician brief exam and assessment of patient after each dose and before next dose (for 6 to 7 doses). This is equivalent to approximately 4 to 5 minutes per assessment and chart note.

Post-time: We recommend 5 minutes of post-service time to discuss the possibility of delayed reaction and confirm that the patient/family understands how to recognize a reaction and what to do if a reaction occurs. Perform a final brief exam of the patient before discharge from the office. Complete medical records and copy PCP (verbal and written).

Comparison of Key Reference Codes

Code 99215 was chosen by 31 respondents and code 99214 was chosen by 30 respondents.

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST
2006	99214	OV, estab patient (40 minutes face-to-face)	1.50	0.047	40	5	25	10
2012	***95076***	*Ingestion challenge, initial 120 min of testing*	***1.50***	***0.041***	***42***	***7***	***30***	***5***
2006	99215	OV, estab patient (40 minutes face-to-face)	2.11	0.047	55	5	35	15

As shown in the table below, 95076 includes more pre-service time and work than 99214, but less post-service work. We believe that total physician work for 95076 where the patient is in the physician's office for over 2 hours (pre+testing+post) is comparable to the total work for 99214. **Therefore, we recommend the survey 25th percentile work RVU of 1.50.**

CPT	DESCRIPTOR	RVW	PRE MIN	PRE WORK	INTRA MIN	POST MIN	POST WORK
95076	Ingestion challenge test; initial 120 minutes of testing	**1.50**	**7**	• Review vital signs obtained by clinical staff including baseline peak flow measurement. • Interval H&P performed including patient's medication history and pertinent medical problems that may have arisen since the previous visit • The procedure, risks, and	**30**	**5**	• Final exam of patient before discharge. • Discuss possibility of delayed reaction. Confirm that the patient/family understands how to recognize a reaction and what to do if a reaction occurs. • Dictate testing results and complete medical record

				complications are reviewed and consent obtained. • Verify that all required supplies and equipment are available, both for testing and for possible intervention if a reaction occurs. • Written instructions are prepared for testing portions.			documentation. Discuss results with referring physician and/or PCP (verbal and written).
99214	Office or other outpatient visit Physicians typically spend 25 minutes face-to-face with the patient and/or family.	**1.50**	**5**	• Review the medical history form completed by the patient and vital signs obtained by clinical staff	**25**	**10**	• Complete the medical record documentation • Handle (with the help of clinical staff) any treatment failures or adverse reactions to medications that may occur after the visit • Provide necessary care coordination, telephonic or electronic communication assistance, and other necessary management related to this office visit • Receive and respond to any interval testing results or correspondence • Revise treatment plan(s) and communicate with patient, as necessary

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95075

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95079 Tracking Number MM2 Original Specialty Recommended RVU: **1.68**
Presented Recommended RVU: **1.38**
Global Period: ZZZ RUC Recommended RVU: **1.38**

CPT Descriptor: Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); each additional 60 minutes of testing (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An 8-year old with a history of an acute allergic reaction to peanut at age 2 years has been monitored by serial allergy skin and serum tests. She had no additional known exposures to peanuts. While undergoing ingestion challenge testing to determine if her peanut allergy has resolved (first 120 minutes reported separately as 9507X1), she has a potential reaction requiring extended testing and additional testing is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The typical patient undergoing more than 120 minutes of ingestion challenge testing (reported separately with 9507X1) will have had one or more "potential" reactions during testing requiring additional/extended monitoring and assessment between doses. These reactions resolve, allowing testing to continue. Between the doses, there is a period of close patient monitoring for reaction (eg, hives, angioedema, wheezing) and assessing patient status prior to next dose. After the final dose, observation and monitoring are continued until the patient is considered clinically stable and a final physical examination is normal. The physician is available in the office for entire intra-service period. [Note: Patient assessment/monitoring activities for allergic reaction (eg, blood pressure testing, peak flow meter testing) are not separately reported. Intervention therapy (eg, injection of steroid or epinephrine) may be reported separately as appropriate. For purposes of reporting testing times, if an evaluation and management service is required, then testing time ends.]

Description of Post-Service Work: N/A

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99215	XXX	2.11	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

CPT code 95075 did not meet the utilization threshold for the CMS/RAW screen for "Different Performing Specialty from Survey." However, JCAAI determined that the work of code 95075 was based on the review by a specialty who is not the current dominant provider. In addition, JCAAI determined that the code approved for CPT 1993 is not consistent with work and variability of physician time in current practice. JCAAI applied to CPT for two new codes to describe ingestion challenge testing: one code for the initial 120 minutes of testing (typical, represents a negative test); and one add-on code to report additional increments of 60 minutes testing time to more accurately report the complete range of time and work involved in performing ingestion challenges.

Compelling Evidence

Change in Patient and Physician Work

Food allergies, the most common of the three types of allergens which are described by the current CPT code for an ingestion challenge (95075), affect more than 10 million Americans, including 3 million children. The prevalence of food allergies among children 18 years and younger increased 18% between 1997 and 2007. The most recent study of food allergy in this age cohort found a higher prevalence rate than had been reported previously. The rate of food allergies among children 18 years and younger was estimated at 8.0% (95% confidence interval [CI]: 7.6–8.3). The same study found that among children with food allergy, 38.7% had a history of severe reactions, and 30.4% had multiple food allergies. We do not have incidence data for allergies to other substances (drugs and metabilsulfite) but ingestion challenge for these items constitutes only about 10% of total ingestion challenges – the rest being for food.

The patient population and severity of food allergies is vastly different than it was in 1995 when code 95075 was reviewed by the RUC. The 1995 typical patient reacted to wheat with nasal congestion symptoms. As discussed above, over the last 15-20 years, there has been a significant increase in the number of individuals affected by food allergies and in the severity of symptoms. In the current population, we now see food allergies (most typically peanuts) that result in anaphylaxis and death (ie, not just nasal congestion). Although not typical in the office setting during testing, anaphylaxis and death is a serious concern, requiring close monitoring by the physician throughout the testing period. From 2003 to 2006, food allergies resulted in approximately 317,000 visits to hospital emergency departments, outpatient clinics and physicians' offices, using data from multiple US national surveys collected by the National Center for Health Statistics. The same study found that food allergy-related hospital admissions increased from 2,600 per year (1998-2000) to 9,500 per year (2004-2006). There are currently more than 125,000 ER visits related to food allergies in the US per year, of which some 12% are accompanied by an anaphylactic reaction. About 20% of these patients with a reaction may need to be hospitalized and, unfortunately, more than 100 may die.

In 2010, the National Institute of Allergy and Infectious Diseases, part of the National Institutes of Health, published "best practices" guidelines for the diagnosis and management of food allergy. In these guidelines, the time course of food-induced anaphylaxis is described as typically characterized by a defined exposure to a food allergen that is followed by a rapid onset and evolution of symptoms over minutes to several hours. Deaths from food-induced anaphylaxis have been reported within 30 minutes to 2 hours of exposure and usually result from cardiorespiratory compromise.

In 1995, the physician work was described by AAOHNS as intermittent assessment for one hour after ingestion of food containing wheat. If there was no reaction after one hour, 1/2 of the original portion was administered as a second does and the same observation occurs for the next hour. If there is no reaction after the second does, the test is considered negative. Intermittent assessment of the patient allergic to nuts is more complex than assessment of a patient allergic to wheat.

In current practice, the typical food ingestion challenge will be peanuts and the dosing will gradually increase (ie, a minute amount placed on the philtrum, followed by a minute amount placed on the tongue, followed by sequential ingestion of one-eighth, one-quarter, one-half, one, and two teaspoon(s) – or the equivalents in grams). These challenges will be administered every 15 to 20 minutes if no reaction is seen. Variation in patient-specific factors may impact testing intervals. For example, some tests require additional time and work because of the patient's ability to ingest a particular food allergen, typically because of fear caused by a prior experience, or age of the patient. This factor may necessitate how a food allergen is introduced and whether or not it needs to be masked and placebo-controlled or, presented in different forms for reasons of palatability or concomitant food allergies. This results in some patients requiring more than the typical testing time for a negative reaction (95076). For all testing, the physician will need to be readily available nearby throughout the entire testing period as a reaction can occur quickly or be delayed. In practice, typically only one to two patients may be tested simultaneously since the possibility of a life threatening reaction can occur at any time and the physician needs to be available to intervene.

Change in Provider

In 1995, code 95075 was identified as potentially misvalued by the CMDs. Otolaryngology conducted a RUC survey. In 1994, otolaryngology provided this service, but was not the dominant provider. As seen in the table below, in current practice, allergy/immunology now comprises the significant majority of providers. Allergy/immunology did not participate in the 1995 review.

	1994	2010
Medicare utilization	**1,556**	**2,311**
allergy/immunology	41.30%	90.90%
otolaryngology	32.90%	0.65%
general/family practice	17.20%	0.48%
internal medicine	7.50%	3.72%

Flawed methodology for Previous Valuation

In 1995, AAOHNS recommended an increased work RVU for 95075, but the RUC determined that the specialty society only presented compelling evidence to maintain the current value of the code. The code was never surveyed by Harvard and not surveyed in 1992 after approval by CPT as a new code. The value approved in 1992 was based on the AAOHNS relative estimation of work RVUs, not a RUC survey.

Work RVU Recommendation

Pre-time: No additional time.

Intra-time: The patient requiring additional monitoring will have had a potential reaction that will extend testing time. Physician work will increase. The intervals between testing will be extended with more frequent assessments during these intervals. The expert panel reviewing this work agrees with the survey median time of 30 minutes which is the same intra time for X1 and accounts for this additional work.

Post-time: No additional time.

Comparison of Key Reference Codes

Allergists do not perform services that have a ZZZ global period. The survey RSL included codes with a global period of XXX. This RSL was approved by the Research Subcommittee. Codes 99215 and 99214 were almost equally chosen by the survey respondents as a reference. We recommend the survey 25th percentile work RVU of 1.38. As the table below shows, this value takes into account the difference in work given the difference in global periods.

CPT	DESC	Glob	RVW	IWPUT	Tot Time	PRE	INTRA	POST
95079	*Ingestion challenge, add'l 60 min of testing*	***ZZZ***	***1.38***	***0.046***	***30***	***0***	***30***	***0***
99214	OV, estab patient (40 minutes face-to-face)	XXX	1.50	0.047	40	5	25	10
99215	OV, estab patient (40 minutes face-to-face)	XXX	2.11	0.047	55	5	35	15

MPC Comparison

The following two MPC codes with ZZZ global bracket the recommendation of X2. These are the lowest ZZZ global MPC.

CPT	DESC	Glob	RVW	IWPUT	Tot Time	PRE	INTRA	POST
13102	Repair, complex, trunk; each additional 5 cm or less	ZZZ	1.24	0.050	25	0	25	0
95079	*Ingestion challenge, add'l 60 min of testing*	***ZZZ***	***1.38***	***0.046***	***30***	***0***	***30***	***0***
13122	Repair, complex, scalp, arms, and/or legs; each additional 5 cm or less	ZZZ	1.44	0.063	23	0	23	0

Other Code Comparison (all have ZZZ global)
The expert panel also looked at several other codes that have a ZZZ global and that support the recommendation of the survey 25th pctl work RVU of 1.38

Code 99359 requires 30 minutes of physician time related to additional review of records before and/or after a patient visit. This code does not include patient face-to-face assessment (which is reported as a separate EM service). Typically, pre and post-service work is valued at a lower intensity than the intra-service work. Therefore, the 30 minutes of 99359 would be at a lower intensity / value than 95079.

Code 99360 does not include patient face-to-face work. Typically, pre and post-service work is valued at a lower intensity than the intra-service work. Therefore, the 30 minutes of 99360 would be at a lower intensity / value than 95079.

Code 99355 is similar to new code 95079 in both code descriptor and description of work, however, the typical patient requiring 99355 is recovering from an office intervention and therefore represents a higher intensity of physician work compared with 95079 and therefore should have a higher value.

As discussed above and shown in the table below, the 25th percentile work RVU of 1.38 appropriately reflects the work of 95079.

RUC Year	CPT	DESC		RVW	IWPUT	Tot Time
2008	**99359**	Prolonged evaluation and management service before and/or after direct patient care; each additional 30 minutes	ZZZ	1.00	0.033	30
1993	**99360**	Physician standby service, requiring prolonged physician attendance, each 30 minutes (eg, operative standby, standby for frozen section, for cesarean/high risk delivery, for monitoring EEG)	ZZZ	1.20	0.040	30
2012	***95079***	*Ingestion challenge, add'l 60 min of testing*	ZZZ	1.38	0.046	30
1993	**99355**	Prolonged service in the office or other outpatient setting requiring direct patient contact beyond the usual service; each additional 30 minutes	ZZZ	1.77	0.059	30

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95075-22, 99354, 99355

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 233
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2010 Medicare data for 95075: 10% 95079 once plus 0.1% 95079 twice

Specialty allergy/immunology Frequency 233 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95180

Time Discussion

Pre-time: We have chosen pre-time package 5 (non-facility procedure without sedation). This value is less than the survey median time, but representative of a minimum amount of time necessary to perform an review records and labs, review the procedure and risks with patient/family, obtain consent, confirm supply and equipment availability in the event of a reaction, and write orders for the testing procedure.

Intra-time: We recommend the survey median time of 30 minutes for physician brief exam and assessment of patient after each dose and before next dose (for 6 to 7 doses). This is equivalent to approximately 4 to 5 minutes per assessment and chart note.

Post-time: We recommend 5 minutes of post-service time to discuss the possibility of delayed reaction and confirm that the patient/family understands how to recognize a reaction and what to do if a reaction occurs. Perform a final brief exam of the patient before discharge from the office. Complete medical records and copy PCP (verbal and written).

REC		25TH PERCENTILE			0.046		1.38				30	0			30			0

Time Discussion

Pre-time: No additional time.

Intra-time: The patient requiring additional monitoring will have had a potential reaction that will extend testing time. Physician work will increase. The intervals between testing will be extended with more frequent assessments during these intervals. The expert panel reviewing this work agrees with the survey median time of 30 minutes which is the same intra time for X1 and accounts for this additional work.

Post-time: No additional time.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

95076	Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); initial 120 minutes of testing
95079	Ingestion challenge test (sequential and incremental ingestion of test items, eg, food, drug or other substance); each additional 60 minutes of testing (List separately in addition to code for primary procedure)

Global Period XXX **Meeting Date**: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:
An expert panel of allergists familiar with these new codes met by conference call to discuss direct practice expense details.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:
Code 95075 will be deleted for 2013 and replaced by new codes 95076 and 95079. The direct practice expense details of the to-be-deleted code was considered when the recommendations for the new codes were discussed by the expert panel. – No inputs recommended for facility.

Please describe in detail the clinical activities of your staff:
Pre-Service Clinical Labor Activities:
N/A

Service Clinical Labor Activities:

	95076	95079	
	XXX	ZZZ	
Greet patient, provide gowning, ensure appropriate medical records are available	3		**Std Time** - Test in NOT typically performed with E/M.
Obtain vital signs	3		**Std time for 1-3 vitals:** HR, RR, and BP.
Provide pre-service education/obtain consent	7		Typical patient is child. Discuss testing process with parent, including reaction signs to look for (clinical staff may not be face-to-face every minute of monitoring). Obtain consent.
Prepare testing doses	15		Weigh/measure prescribed testing doses, label / document.
Assist physician in performing procedure	7		Clinical staff time to administer 7+ oral challenge doses.
Monitor pt. following service/check tubes, monitors, drains	80	40	Clinical staff will monitor patient face-to-face at least 2/3 of the total testing time. (2/3 x 120 = 80) (2/3 x 60 = 40)
Clean room/equipment by physician staff	1		Although supplies will be disposed of while patient is being monitored, additional time to clean room is necessary for final cleaning after patient leaves office.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2012

Pediatric Polysomnography

In February 2012, the CPT Editorial Panel created 95782 *Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, attended by a technologist* and 95783 *Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, with initiation of continuous positive airway pressure therapy or bi-level ventilation, attended by a technologist* to describe the physician work involved in pediatric polysomnography for children 5 years of age or younger. These tests were previously reported using CPT codes 95810 *Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist* and 95811 *Polysomnography; sleep staging with 4 or more additional parameters of sleep, with initiation of continuous positive airway pressure therapy or bilevel ventilation, attended by a technologist.* The RUC noted that although age distribution was not available for the original survey, the specialty society did survey their members and determined that the "under 6" age band indicated the point where physician work and intensity changed. The RUC survey vignettes for CPT codes 95810 and 95811 describe adult patients.

95782

The RUC reviewed the survey results from 89 physicians for 95782 *Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, attended by a technologist* and determined that the physician work is accurately valued at the survey median work RVU of 3.00. The physician work involved is primarily in the interpretation of data which has become more intense due to a shift in patient population. The RUC noted that pediatric patients sleep longer (9 hours versus 8), are more prone to movement which causes leads to fall off and introduces artifacts and more likely to experience hypopnea which is more difficult to identify and review. The RUC compared 95782 to key reference service 95810 *Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist* (work RVU=2.50) and determined that the surveyed code required more time and intensity, as discussed above, and should be valued higher. The RUC also reviewed CPT codes 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)(work RVU=2.78)* and agreed that with 15 minutes more time, 95782 should be valued higher. The RUC also reviewed 95953 *Monitoring for localization of cerebral seizure focus by computerized portable 16 or more channel EEG, electroencephalographic (EEG) recording and interpretation, each 24 hours, unattended* (work RVU=3.08) and determined that the two services have identical intra-service time, 45 minutes, and are comparable in work. **The RUC recommends a work RVU of 3.00 for CPT Code 95782.**

95783

The RUC reviewed the survey results from 86 physicians for 95783 *Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, with initiation of continuous positive airway pressure therapy or bi-level ventilation, attended by a technologist* and determined that physician work is accurately valued at the survey median work RVU of 3.20. The RUC noted that this sleep study is an hour

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

longer than 95782 and includes a capnography and CPAP mask which increases the intensity of the procedure and interpretation of the data. Typically, there are 90-120 additional epochs to review in each pediatric polysomnogram. The RUC compared 95783 to key reference service 95811 *Polysomnography; sleep staging with 4 or more additional parameters of sleep, with initiation of continuous positive airway pressure therapy or bilevel ventilation, attended by a technologist* (work RVU=2.60) and determined that 95783 requires 20 more minutes to perform and is more intense, therefore, necessitating a higher value than the reference code. The RUC also reviewed 94012 *Measurement of spirometric forced expiratory flows, before and after bronchodilator, in an infant or child through 2 years of age (*work RVU=3.10) and agreed that although 94012 requires more time, the physician work of 95783 is more intense. In addition, a work RVU of 3.20 will maintain proper rank order for this family of services. **The RUC recommends a work RVU of 3.20 for CPT Code 95783.**

Practice Expense:
The RUC reviewed and approved practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Medicine **Neurology and Neuromuscular Procedures** **Sleep Medicine Testing**				
Sleep medicine services include procedures that evaluate adult and pediatric patients for a variety of sleep disorders. Sleep medicine testing services are diagnostic procedures using in-laboratory and portable technology to assess physiologic data and therapy. All sleep services (95800-95811) include recording, interpretation and report. (Report with modifier 52 if less than 6 hours of recording for 95800, 95801 and 95806, 95807, 95810, 95811; if less than 7 hours of recording for 95782, 95783 or if less than four nap opportunities are recorded for 95805

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95782 Tracking Number KK1 Original Specialty Recommended RVU: **2.60**
Presented Recommended RVU: **3.00**
Global Period: XXX RUC Recommended RVU: **3.00**

CPT Descriptor: Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, attended by a technologist

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 5-year-old girl has enlarged tonsils and loud snoring. A polysomnogram is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Reviews study request from ordering qualified healthcare professional. Evaluates the clinical scenario for the test ordered. Determines appropriateness and duration of the test requested.

Description of Intra-Service Work: Reviews technologist summary and notes. Reviews the patient's sleep logs and comments on the pre, intra, and post sleep periods. Opens the sleep recording already downloaded to the reading station. Analyzes the raw data at 30 second intervals (epoch by epoch) for adequacy of recording signals and marked sleep stages. Analyzes the technologist's preliminary evaluation of artifacts, sleep stages and physiologic changes noted during the recording. Evaluates the recording for changes in respiration, EKG, oxygen saturation, EMG, periodic limb movements, sleep state and EEG and capnography. Correlates changes of all physiologic signals with the simultaneous video recording of the patient.
Decides if the total sleep time is adequate for interpretation. Determines if the recording addresses clinical question(s).

Description of Post-Service Work: Completes an interpretation of the data, establishes a diagnosis and creates the formal interpretive report. Communicates test results to the patient and the referring qualified healthcare professional.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95810	XXX	2.50	**RUC Time**

CPT Descriptor Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
88189	XXX	2.23	**RUC Time**	164,952

CPT Descriptor 1 Flow cytometry, interpretation; 16 or more markers

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
31622	000	2.78	**RUC Time**	84,807

CPT Descriptor 2 Broncoscopy, rigid or flexible, including fluroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)

Other Reference CPT Code	Global	Work RVU	Time Source
95811	XXX	2.60	**RUC Time**

CPT Descriptor Polysomnography; sleep staging with 4 or more additional parameters of sleep, with initation of continuous positive airway pressure therapy or bilevel ventilation, attended by a technologist

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 54 **% of respondents:** 60.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 95782**	**Key Reference CPT Code:** 95810	**Source of Time** **RUC Time**
Median Pre-Service Time	15.00	15.00	
Median Intra-Service Time	45.00	36.50	
Median Immediate Post-service Time	10.00	15.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**70.00**	**66.50**	

Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.84	3.57
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.09	3.77
Urgency of medical decision making	3.60	3.47
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.43	4.00
Physical effort required	3.32	3.13
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.50	3.25
Outcome depends on the skill and judgment of physician	4.13	3.79
Estimated risk of malpractice suit with poor outcome	3.38	3.17

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.11	2.92
Intra-Service intensity/complexity	4.28	4.02
Post-Service intensity/complexity	3.36	3.26

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was previously reported as code 95810.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pulmonary Disease How often? Sometimes

Specialty Sleep Medicine How often? Sometimes

Specialty Neurology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 3000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This estimate is based on average of freqency data provided by two private insurance companies.

Specialty Pulmonary Disease Frequency 1140 Percentage 38.00 %

Specialty Sleep Medicine Frequency 720 Percentage 24.00 %

Specialty Neurology Frequency 480 Percentage 16.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This service is designed for pediatric patients ages under 6. Therefore it is estimated that this service will not be provided to Medicare patients

Specialty Pulmonary Disease Frequency 0 Percentage 0.00 %

Specialty Sleep Medicine Frequency 0 Percentage 0.00 %

Specialty Neurology Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95810

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95783 Tracking Number KK2 Original Specialty Recommended RVU: **2.83**
Presented Recommended RVU: **3.20**
Global Period: XXX RUC Recommended RVU: **3.20**

CPT Descriptor: Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, with initiation of continuous positive airway pressure therapy or bi-level ventilation, attended by a technologist

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 4-year-old boy with obstructive sleep apnea presents with ongoing witnessed apneas and persistent daytime sleepiness after removal of tonsils and adenoids. A polysomnogram is ordered for continuous positive airway pressure titration.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Reviews sleep study request from ordering qualified healthcare professional. Evaluates the clinical scenario for the test ordered. Determines the appropriateness and duration of the test requested. Reviews pre-test consultation and data. Provides instruction on use of medications, including oxygen, by the patient during the day prior to the test and during the night of the test. Provides instruction to the night technologist hooking up the patient to the equipment, including starting pressures, sequences of pressures tested and the use of positive airway pressure devices.

Description of Intra-Service Work: Reviews technologist summary and notes. Opens the sleep recording already downloaded to the reading station. Analyzes the raw data at 30 second intervals (epoch by epoch) for adequacy of recording signals and marked sleep stages. Analyzes the technologist's preliminary evaluation of artifacts, sleep stages and physiologic changes noted during the recording. Evaluates the recording for changes in respiration, EKG, oxygen saturation, EMG, periodic limb movements, sleep state, EEG and capnography. Correlates changes of all physiologic signals with the simultaneous video recording of the patient. Evaluates the recording for optimal positive airway pressure application (mask). Decides if the total sleep time is adequate for interpretation. Analyzes the recording, including identification and assessment of abnormal events in the recording. Determines if the recording addresses clinical question(s).

Description of Post-Service Work: Completes an interpretation of the data, establishes a diagnosis and creates the formal interpretive report. Communicates test results to the patient and the referring qualfied healthcare professional.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The societies met via teleconference and discussed the survey results. Representatives from the societies agreed that the 25th percentile RVU value was most appropriate for recommendation. They also agreed that the median survey times were accurate given the work involved in the service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

95782

CPT Long Descriptor:
Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, attended by a technologist

Global Period: XXX Meeting Date: April 25-29, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A Multispecialty Sleep Workgroup, including representatives from the American Academy of Pediatrics, American Academy of Sleep Medicine, American College of Chest Physicians and American Thoracic Society met to discuss recommendations for practice expense. Pediatric sleep experts from the societies were included in the workgroup. The workgroup came to consensus on the recommendations over phone and email discussions.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

The reference code used for practice expense inputs was 95810. This code was selected because it describes the same procedure as code 95782 except it is performed on an adult and not a pediatric patient. Equipment and supplies for these codes are very similar and the logic used to calculate time for both procedures is similar.

Please describe in detail the clinical activities of your staff:

Pre-service Clinical Labor Activities:
- Complete pre-service diagnostic and referral forms
- Coordinate pre-service testing

Service Clinical Labor Activities:
- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education/obtain consent, including familiarizing both parent and child with the room and equipment
- Prepare room, equipment supplies
- Set up and calibrate all monitoring and recording equipment
- Measure and mark head and face. Apply and secure electrodes to head and face. Check impedances. (1.5 minutes per electrode)
- Apply recording devices for cardio-respiratory, leg movements, body positioning, snoring and capnography
- Perform procedure (9 hours recording time and 1 night technician for every 1 patient)
- Reapply electrodes as needed (typically at least 2 per night).
- Remove and clean electrodes and recording devices
- Clean room, change the sheets and prepare room for next day

Post-Service Clinical Labor Activities:

- Daytime technician reviews and edits recording, marks artifacts, scores sleep stages, performs evaluation of physiological changes
- Prepare technician report
- Transfer record to reading station and archive data

95783

CPT Long Descriptor:
Polysomnography; younger than 6 years, sleep staging with 4 or more additional parameters of sleep, with initiation of continuous positive airway pressure therapy or bi-level ventilation, attended by a technologist

Global Period: XXX Meeting Date: April 25-29, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A Multispecialty Sleep Workgroup, including representatives from the American Academy of Pediatrics, American Academy of Sleep Medicine, American College of Chest Physicians and American Thoracic Society met to discuss recommendations for practice expense. Pediatric sleep experts from the societies were included in the workgroup. The workgroup came to consensus on the recommendations over phone and email discussions.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

The reference code used for practice expense inputs was 95811. This code was selected because it describes the same procedure as code 95783 except it is performed on an adult and not a pediatric patient. Equipment and supplies for these codes are very similar and the logic used to calculate time for both procedures is similar.

Please describe in detail the clinical activities of your staff:
Pre-service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-service testing

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education/obtain consent, including familiarizing both parent and child with the room and equipment
- Prepare room, equipment supplies
- Set up and calibrate all monitoring and recording equipment
- Measure and mark head and face. Apply and secure electrodes to head and face. Check impedances. (1.5 minutes per electrode)
- Apply recording devices for cardio-respiratory, leg movements, body positioning, snoring and capnography
- Reapply electrodes as needed (typically at least 2 per night)
- CPAP titration including selection and fitting of masks, working with child to accommodate them to mask
- Perform procedure (9 hours recording time and 1 night technician for every 1 patient)

- Remove and clean electrodes and recording devices
- Clean room, change the sheets and prepare room for next day

Post-Service Clinical Labor Activities:

- Daytime technician reviews and edits recording, marks artifacts, scores sleep stages, performs evaluation of physiological changes
- Develop spreadsheet indicating how sleep parameters varied with different levels of positive pressure
- Prepare technician report
- Transfer record to reading station and archive data

Tab 31 Pediatric Polysomnography Practice Expense
Justification for Differences Between Adult (95810 and 95811) and Pediatric Codes (95782 and 95783)

TIME

Difference	Justification
1 minute increase in calibration of monitoring equipment	Calibration of capnograph is not required for adult services. This calibration takes 1 minute.
10 minutes additional time for electrode application	Application of each electrode typically takes 60 seconds for an adult and 90 seconds for a pediatric patient. This difference in time was documented by members of our practice expense workgroup.
5 minutes additional time for applying recording devices	Application of the capnograph is required for pediatric services (not for adult). Additionally, the equipment is typically more difficult to apply on a pediatric patient. This difference in time was documented by members of our practice expense workgroup.
10 minutes additional time for CPAP titration selection of masks, etc	Desensitizing a pediatric patient to CPAP mask is more difficult than with an adult.
300 additional minutes in recording time	Pediatric patients require an additional hour of recording time. Additionally, a technologist to patient ratio of 1:1 is typically required for pediatric patients, as confirmed by a survey of sleep physicians treating pediatric patients under age 6. This ratio is being considered as an accreditation requirement for AASM sleep facilities.
14 additional minutes tech scoring	An additional 12.5% of recording time is required for pediatric studies, which amounts to 11 additional minutes of scoring time. Additionally, the added capnography channel accounts for an additional 3 minutes of scoring time.

SUPPLIES/EQUIPMENT

Difference	Justification
• 2 additional gauze items • 4 additional electrode skin prep tape items • 2 additional alcohol swab-pads	Typically 2 electrodes fall off or are pulled off during the night while a pediatric patient is tested. Additional gauze (1 per electrode) is required for reapplication.
Self-adherent wrap	A wrap is required for pediatric patients to help keep electrodes on.
Pediatric airflow and CO2 cannula	A combination cannula is used to measure CO2 (with the capnograph) and airflow in pediatric patients
60 additional minutes are	The pediatric patient is monitored for an additional 60

required for almost all equipment (except diagnostic system)	minutes.
Capnograph	Capnography is required for pediatric polysomnography.
Crib	Patients in this age range (below age 6) typically sleep in a crib while the parent occupies the bed.
Low light camera with zoom	The camera used to value adult studies in 2010 is no longer an active item on the equipment list. Sleep studies require a low light camera with a zoom feature to record the study.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Harvard Valued - Utilization over 100,000 / Codes Reported Together 75% or More screen

April 2012

EMG in Conjunction with Nerve Testing

In February 2010, CPT codes 95860, 95861, 95863 and 95864 were identified by the Relativity Assessment Workgroup through the Codes Reported Together 75% or More Screen. These codes are billed commonly with 95904. In February 2011, the specialties submitted a code change proposal to the CPT Editorial Panel to bundle the services commonly reported together. The Panel created three new ZZZ global codes to be reviewed at the RUC in April 2011. The CPT Editorial Panel noted, and the RUC agreed, that these three new codes were approved with the intent that the specialties will take additional time and bring forward a more comprehensive coding solution which bundles services commonly performed together during the CPT 2013 cycle. In February 2012, the CPT Editorial Panel created seven new codes that bundle the work of multiple nerve conduction studies into each individual code.

95860 ***Needle electromyography; 1 extremity with or without related paraspinal areas***
The RUC reviewed the survey results from 93 physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 20 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 0.96 work RVUs, for this service. To justify this value, the RUC reviewed the key reference service CPT code 99213 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 0.97) and agreed that while 95860 has greater intra-service time compared to the reference code, 20 minutes and 15 minutes, respectively, the two services have analogous physician work and should be valued similarly. **The RUC recommends a work RVU of 0.96 for CPT code 95860.**

95861 ***Needle electromyography; 2 extremities with or without related paraspinal areas***
The RUC reviewed the survey results from 46 physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 29 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that the current work RVU of 1.54, slightly above the survey 25th percentile, accurately reflects the physician work involved in this service. To justify this value, the RUC reviewed the key reference service CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 1.50) and agreed that 95861 should be valued slightly higher than the reference code due to slightly greater intra-service time, 29 minutes and 25 minutes, respectively. **The RUC recommends a work RVU of 1.54 for CPT code 95861.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95863 ***Needle electromyography; 3 extremities with or without related paraspinal areas***
The RUC reviewed the survey results from 46 physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 40 minutes and post-service time= 11 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 1.87 work RVUs, for this service. To justify this value, the RUC reviewed the key reference service CPT code 99215 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 2.11) and agreed that 95863 has analogous total physician time compared to the reference code, 61 minutes and 55 minutes, respectively, and should be valued slightly less. **The RUC recommends a work RVU of 1.87 for CPT code 95863.**

95864 ***Needle electromyography; 4 extremities with or without related paraspinal areas***
The RUC reviewed the survey results from 46 physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 50 minutes and post-service time= 13.5 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 1.99 work RVUs, for this service. To justify this value, the RUC reviewed the key reference service CPT code 95810 *Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist* (work RVU= 2.50) and agreed that while 95864 should be valued less because it is a less involved, complex service. **The RUC recommends a work RVU of 1.99 for CPT code 95864.**

95865 ***Needle electromyography; larynx***
The RUC reviewed the survey results from practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 15 minutes and post-service time= 6.5 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that the current value of 1.57 work RVUs accurately reflects the physician work involved in the service. To justify this value, the RUC reviewed the key reference service CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 1.50) and agreed that 95865 should be valued slightly higher because that it is a much more intense service compared to the reference code, as shown by the survey respondents' intensity/complexity measures. In addition, the RUC reviewed CPT code 70542 *Magnetic resonance (eg, proton) imaging, orbit, face, and/or neck; with contrast material(s)* (work RVU= 1.62) and agreed that since the two services have identical intra-service times, 15 minutes, and comparable physician work, the work values should be similar. **The RUC recommends a work RVU of 1.57 for CPT code 95865.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95866 ***Needle electromyography; hemidiaphragm***
The RUC reviewed the survey results from practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 15 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 1.25 work RVUs, for this service. To justify this value, the RUC reviewed the key reference service CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 1.50) and agreed that the reference code should be valued slightly higher than 95866 due to greater total time, 40 minutes compared to 35 minutes. **The RUC recommends a work RVU of 1.25 for CPT code 95866.**

95867 ***Needle electromyography; cranial nerve supplied muscle(s), unilateral***
The RUC reviewed the survey results from 39 practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 15 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 0.79 work RVUs, for this service. To justify this value, the RUC reviewed CPT code 76816 *Ultrasound, pregnant uterus, real time with image documentation, follow-up, transabdominal approach, per fetus* (work RVU= 0.85) and agreed that the two services should be valued similarly because they have identical intra-service times of 15 minutes and analogous total time. Additionally, the RUC compared 95867 to 95866 and noted that while both services have the same physician times, the survey respondents rated 95866 as a more intense and complex service compared to 95867. **The RUC recommends a work RVU of 0.79 for CPT code 95867.**

95868 ***Needle electromyography; cranial nerve supplied muscles, bilateral***
The RUC reviewed the survey results from 40 practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 20 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 1.18 work RVUs, for this service. To justify this value, the RUC reviewed key reference service CPT code 99214 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 1.50) and agreed that reference code should be valued higher because of greater intra-service time compared to 95868, 25 minutes and 20 minutes, respectively. **The RUC recommends a work RVU of 1.18 for CPT code 95868.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95869 ***Needle electromyography; thoracic paraspinal muscles (excluding T1 or T12)***
The RUC reviewed the survey results from 43 practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 15 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 0.37 work RVUs, for this service. To justify this value, the RUC reviewed CPT code 94452 *High altitude simulation test (HAST), with physician interpretation and report* (work RVU= 0.31) and agreed that the two services have comparable physician work, but 95869 should be valued higher due to greater total time compared to the reference code, 35 minutes and 30 minutes, respectively. **The RUC recommends a work RVU of 0.37 for CPT code 95869.**

95870 ***Needle electromyography; limited study of muscles in 1 extremity or non-limb (axial) muscles (unilateral or bilateral), other than thoracic paraspinal, cranial nerve supplied muscles, or sphincters***
The RUC reviewed the survey results from 43 practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 15 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that while the survey supports a higher value, there is no compelling evidence to change the current value, 0.37 work RVUs, for this service. To justify this value, the RUC reviewed CPT code 94452 *High altitude simulation test (HAST), with physician interpretation and report* (work RVU= 0.31) and agreed that the two services have comparable physician work, but 95869 should be valued higher due to greater total time compared to the reference code, 35 minutes and 30 minutes, respectively. The RUC also compared 95870 to 95869 and agreed that with identical physician time components the two services should be valued identically. **The RUC recommends a work RVU of 0.37 for CPT code 95870.**

95907 ***1-2 nerve conduction studies***
The RUC reviewed the survey results from 52 practicing physicians and recommends the following median survey times: pre-service time= 10 minutes, intra-service time= 15 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service. The RUC reviewed the respondents' estimated physician work values and agreed with the specialty that the median work RVU of 1.00 accurately reflects the physician work of this bundled code. To justify this value, the RUC compared the surveyed code to CPT code 93890 *Transcranial Doppler study of the intracranial arteries; vasoreactivity study* (work RVU= 1.00) and agreed that the two services have comparable physician work, with identical time components, and should be valued identically. The RUC also reviewed CPT code 94004 *Ventilation assist and management, initiation of pressure or volume preset ventilators for assisted or controlled breathing; nursing facility, per day* (work RVU= 1.00) and agreed that 95907 should have the same work value to ensure relativity to this reference code because they have identical time. **The RUC recommends a work RVU of 1.00 for CPT code 95907.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95908 ***3-4 nerve conduction studies***
The RUC reviewed the survey results from 52 practicing physicians and agreed that the intra-service time for this code did not fit in proper relativity within the family. To determine more accurate intra-service time, the Committee noted that nerve conduction studies are typically done in pairs, thus using the approved physician time from the base code 95907, 15 minutes, the RUC agreed that 7.5 minutes per nerve was a reasonable increment to assess the physician work of 95908. The RUC then conservatively assumed an increase of 1.5 nerves per bundled code, resulting in an additional 10 minutes, from the base code, of intra-service time for 95908. The recommended physician time components are: pre-service time= 10 minutes, intra-service time= 25 minutes and post-service time= 10 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service.

The RUC also noted that the survey's estimated work value was overestimated at the median level, 1.68 work RVUs. To determine an appropriate value, the RUC compared the physician work of 95908 to CPT code 62270 *Spinal puncture, lumbar, diagnostic* (work RVU= 1.37) and agreed that the two services have comparable physician work and physician total time, 40 minutes and 45 minutes, respectively. Given this close comparison, the RUC agreed to directly crosswalk the work RVU of 95908 to CPT code 62270. To justify this value, the RUC noted that the surveyed code has identical intensity to the base code, 95907. Valuing 95908 at the same intensity factor results in a work RVU of 1.37, identical to the reference code. The RUC agreed that this value places 95908 in proper rank order within the family of services and within the RBRVS. **The RUC recommends a work RVU of 1.37 for CPT code 95908.**

95909 5-*6 nerve conduction studies*
The RUC reviewed the survey results from 52 practicing physicians and agreed that the intra-service time for this code did not fit in proper relativity within the family. To determine more accurate intra-service time, the Committee noted that nerve conduction studies are typically done in pairs, thus using the approved physician time from the base code 95907, 15 minutes, the RUC agreed that 7.5 minutes per nerve was a reasonable increment to assess the physician work of 95909. The RUC then conservatively assumed an increase of 1.5 nerves per bundled code, resulting in an additional 10 minutes, from the 3-4 bundled nerve code, of intra-service time for 95909. The recommended physician time components are: pre-service time= 10 minutes, intra-service time= 35 minutes and post-service time= 11 minutes. The RUC agreed that pre-service time of 10 minutes accurately reflects the work to evaluate the patient, given that Evaluation and Management services are not typically billed on the same date of service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC also noted that the survey's estimated work value was overestimated at the median level, 2.28. To determine an appropriate value, the RUC compared the physician work of 95909 to CPT code 95813 *Electroencephalogram (EEG) extended monitoring; greater than 1 hour* (work RVU= 1.73) and agreed that the two services have comparable physician work and physician total time, 60 minutes and 56 minutes, respectively. Given this close comparison, the RUC agreed that the two services should have almost identical work values. To justify this relativity, the RUC noted that the surveyed code has identical intensity to the base code, 95907. Valuing 95909 at the same intensity factor results in a work RVU of 1.77, almost identical to the reference code. The RUC agreed that this value places 95909 in proper rank order within the family of services and within the RBRVS. **The RUC recommends a work RVU of 1.77 for CPT code 95909.**

95910 ***7-8 nerve conduction studies***
The RUC reviewed the survey results from 52 practicing physicians and agreed that the median physician time components accurately reflect the physician work inherent in this procedure. The recommended physician time components are as follows: pre-service time= 13 minutes, intra-service time= 40 minutes and post-service time= 12.50 minutes. The RUC agreed that pre-service time of 13 minutes accurately reflects the work to evaluate the patient, and is an appropriate increase over the lower bundled codes because of the increased complexity in performing more nerve conduction studies, given that Evaluation and Management services are not typically billed on the same date of service.

The RUC reviewed the survey's estimated work value and agreed that the survey median work RVU of 2.80 is an accurate value for CPT code 95910. To justify this value the RUC compared 95910 to CPT code 75635 *Computed tomographic angiography, abdominal aorta and bilateral iliofemoral lower extremity runoff, with contrast material(s), including noncontrast images, if performed, and image postprocessing* (work RVU= 2.40) and agreed that while the reference code has slightly greater total time compared to 95910, 70 minutes and 65.5 minutes, respectively, the surveyed code should be valued higher because it is a more complex and involved procedure. For additional validation, the RUC noted that the physician work involved in performing more than 7 nerve conduction studies in the same setting is a more intense and complex compared to performing less than 7 studies. Therefore, the RUC calculated the time components by the surveyed intensity factor of 95910 and arrived at a work value of 2.80. With a robust survey and validation by a strong reference code and an approved alternative methodology, a work RVU of 2.81 is relative across the RBRVS. **The RUC recommends a work RVU of 2.80 for CPT code 95910.**

95911 ***9-10 nerve conduction studies***
The RUC reviewed the survey results from 52 practicing physicians and agreed that the median physician time components accurately reflect the physician work inherent in this procedure. The recommended physician time components are as follows: pre-service time= 15 minutes, intra-service time= 50 minutes and post-service time= 15 minutes. The RUC agreed that pre-service time of 15 minutes accurately reflects the work to evaluate the patient, and is an appropriate increase over the lower bundled codes because of the increased complexity in performing more nerve conduction studies, given that Evaluation and Management services are not typically billed on the same date of service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey's estimated work value and agreed that the survey median work RVU of 3.34 is an accurate value for CPT code 95911. To justify this value the RUC compared 95911 to CPT code 95953 *Monitoring for localization of cerebral seizure focus by computerized portable 16 or more channel EEG, electroencephalographic (EEG) recording and interpretation, each 24 hours, unattended* (work RVU= 3.08) and agreed that the surveyed code should be valued higher than the reference code because 95911 has five more minutes of intra-service time. For additional validation, the RUC noted that the physician work involved in performing more than 7 nerve conduction studies in the same setting is a more intense and complex compared to performing less than 7 studies. Therefore, the RUC calculated the time components by the surveyed intensity factor of 95911 and arrived at a work value of 3.47. With a robust survey and validation by a strong reference code and an approved alternative methodology, a work RVU of 3.34 is relative across the RBRVS. **The RUC recommends a work RVU of 3.34 for CPT code 95911.**

95912 ***11-12 nerve conduction studies***
The RUC reviewed the survey results from 52 practicing physicians and agreed that the median physician time components accurately reflect the physician work inherent in this procedure. The recommended physician time components are as follows: pre-service time= 15 minutes, intra-service time= 60 minutes and post-service time= 15 minutes. The RUC agreed that pre-service time of 15 minutes accurately reflects the work to evaluate the patient, and is an appropriate increase over the lower bundled codes because of the increased complexity in performing more nerve conduction studies, given that Evaluation and Management services are not typically billed on the same date of service.

The RUC reviewed the survey's estimated work value and agreed that the survey median work RVU of 4.00 is an accurate value for CPT code 95912. To justify this value the RUC compared 95912 to CPT code 95978 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude and duration, battery status, electrode selectability and polarity, impedance and patient compliance measurements), complex deep brain neurostimulator pulse generator/transmitter, with initial or subsequent programming; first hour* (work RVU= 3.50) and agreed that while the two service have identical intra-service time the surveyed code should have a higher value due to greater total time, 90 minutes compared to 70 minutes. For additional validation, the RUC noted that the physician work involved in performing more than 7 nerve conduction studies in the same setting is a more intense and complex compared to performing less than 7 studies. Therefore, the RUC calculated the time components by the surveyed intensity factor of 95912 and arrived at a work value of 4.03. With a robust survey and validation by a strong reference code and an approved alternative methodology, a work RVU of 4.00 is relative across the RBRVS. **The RUC recommends a work RVU of 4.00 for CPT code 95912.**

95913 ***13 or more nerve conduction studies***
The RUC reviewed the survey results from 52 practicing physicians and agreed that the median physician time components accurately reflect the physician work inherent in this procedure. The recommended physician time components are as follows: pre-service time= 15 minutes, intra-service time= 70 minutes and post-service time= 20 minutes. The RUC agreed that pre-service time of 15 minutes accurately reflects the work to evaluate the patient, and is an appropriate increase over the lower bundled codes because of the increased complexity in performing more nerve conduction studies, given that Evaluation and Management services are not typically billed on the same date of service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey's estimated work value and agreed that the survey median work RVU of 4.20 is an accurate value for CPT code 95913. To justify this value the RUC compared 95913 to CPT code 95956 *Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, electroencephalographic (EEG) recording and interpretation, each 24 hours, attended by a technologist or nurse* (work RVU= 3.61) and agreed that the surveyed code should be valued higher due to greater intra-service time, 70 minutes compared to 60 minutes. For additional validation, the RUC noted that the physician work involved in performing more than 7 nerve conduction studies in the same setting is a more intense and complex compared to performing less than 7 studies. Therefore, the RUC calculated the time components by the surveyed intensity factor of 95913 and arrived at a work value of 4.70. With a robust survey and validation by a strong reference code and an approved alternative methodology, a work RVU of 4.20 is relative across the RBRVS. **The RUC recommends a work RVU of 4.20 for CPT code 95913.**

The RUC reviewed the RUC recommendations from April 2011 for the add-on EMG codes 95885 *Needle electromyography each extremity, with related paraspinal areas, when performed, done with nerve conduction, amplitude and latency/velocity study; limited*, 95886 *Needle electromyography each extremity, with related paraspinal areas, when performed, done with nerve conduction, amplitude and latency/velocity study; complete, five or more muscles studied, innervated by three or more nerves or four or more spinal levels* and 95887 *Needle electromyography, non-extremity (cranial nerve supplied or axial) muscle(s) done with nerve conduction, amplitude and latency/velocity study* and agreed to reaffirm the established values, as they are relative to the family of services reviewed at the April 2012 RUC meeting. In addition, the RUC reviewed the recent October 2009 RUC recommendation for CPT code 95905 *Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study, each limb, includes F-wave study when performed, with interpretation and report* and agreed that the physician work is limited for this service, 5 minutes intra-service time, and would not benefit from an additional review only two cycles later. **The RUC reaffirms a work RVU of 0.35 for CPT code 95885, a work RVU of 0.92 for CPT code 95886, a work RVU of 0.73 for CPT code 95887 and a work RVU of 0.05 for CPT code 95905.**

Practice Expense: The RUC reviewed and accepted the direct practice expense inputs as modified by the Practice Expense Subcommittee.

Budget Neutrality: The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Category I **Medicine** **Neurology and Neuromuscular Procedures** **Electromyography**				
Needle electromyographic (EMG) procedures include the interpretation of electrical waveforms measured by equipment that produces both visible and audible components of electrical signals recorded from the muscle(s) studied by the needle electrode. Use 95870 or 95885 when four or fewer muscles are tested in an extremity. Use 95860-95864 or 95886 when five or more muscles are tested in an extremity. Use EMG codes (95860-95864 and 95867-95870) when no nerve conduction studies (~~95900-95904~~ 95907-95913) are performed on that day. Use 95885, 95886 and 95887 for EMG services when nerve conduction studies (~~95900-95904~~ 95907-95913) are performed in conjunction with EMG on the same day. Report either 95885 or 95886 once per extremity. Codes 95885 and 95886 can be reported together up to a combined total of four units of service per patient when all four extremities are tested.				
95860	R1	Needle electromyography; 1 extremity with or without related paraspinal areas	XXX	0.96 (No Change)
95861	R2	2 extremities with or without related paraspinal areas (For dynamic electromyography performed during motion analysis studies, see 96002-96003)	XXX	1.54 (No Change)
95863	R3	3 extremities with or without related paraspinal areas	XXX	1.87 (No Change)
95864	R4	4 extremities with or without related paraspinal areas	XXX	1.99 (No Change)

Nerve Conduction Tests				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The following applies to nerve conduction tests (~~95900-95904~~ 95907-95913): Codes ~~95900-95904~~ 95907-95913 describe nerve conduction tests when performed with individually placed stimulating, recording, and ground electrodes. The stimulating, recording, and ground electrode placement and the test design must be individualized to the patient's unique anatomy. Nerves tested must be limited to the specific nerves and conduction studies needed for the particular clinical question being investigated. The stimulating electrode must be placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, and in some sensory and mixed nerve conduction studies, both proximal and distal stimulation will be used. Motor nerve conduction study recordings must be made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings must be made from electrodes placed directly over the specific nerve to be tested. Waveforms must be reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) must be adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Reports must be prepared on site by the examiner, and consist of the work product of the interpretation of numerous test results, using well-established techniques to assess the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of each nerve tested. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values, summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation. Codes 95907-95913 describe one or more nerve conduction studies. For the purposes of coding, a single conduction study is defined as a sensory conduction test, a motor conduction test with or without an F wave test, or an H-reflex test. Each type of study (sensory, motor with or without F wave, H Reflex) for each nerve includes all orthodromic and antidromic impulses associated with that nerve and constitutes a distinct study when determining the number of studies in each grouping (eg, 1-2 or 3-4 nerve conduction studies). A nerve conduction study is counted only once when multiple sites on the same nerve are stimulated or recorded. The numbers of these separate tests should be added to determine which code to use. For a list of nerves, see Appendix J. Use 95885-95887 in conjunction with 95907-95913 when performing electromyography with nerve conduction studies.

Code 95905 describes nerve conduction tests when performed with preconfigured electrodes customized to a specific anatomic site.

Intraoperative Neurophysiology

Codes 95940, 95941 describe ongoing neurophysiologic monitoring, testing and data interpretation distinct from performance of specific type(s) of baseline neurophysiologic study(s) performed during surgical procedures. When the service is performed by the surgeon or anesthesiologist, the professional services are included in the surgeon's or anesthesiologist's primary service code(s) for the procedure and are not reported separately. Do not report these codes for automated monitoring devices that do not require continuous attendance by a professional qualified to interpret the testing and monitoring.

Recording and testing ~~is~~ are performed either personally or by a technologist who is physically present with the patient during the service. Supervision is performed either in the operating room or by real time connection outside the operating room. The monitoring professional must be solely dedicated to performing the **intraoperative neurophysiologic** monitoring and must be available to intervene at all times during the service as necessary, for the reported time period(s). For any given period of time spent providing these services, the service takes full attention and, therefore, other clinical activities beyond providing and interpreting of monitoring cannot be provided during the same period of time.

Throughout the monitoring, there must be provisions for continuous and immediate communication directly with the operating room team in the surgical suite. One or more simultaneous cases may be reported **(95941).** When monitoring more than one procedure, there must be the immediate ability to transfer patient monitoring to another monitoring professional during the surgical procedure should that individual's

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

exclusive attention be required for another procedure. Report 95941 for all **remote or non-one on one** monitoring time connected to each case regardless of overlap with other cases**.**

Codes 95940, 95941 include only the ongoing neurophysiologic monitoring time distinct from performance of specific type(s) of baseline neurophysiologic study(s) or other services such as intraoperative functional cortical and subcortical mapping.Codes 95940 and 95941 are reported based upon the time spent monitoring only, and not the number of baseline tests performed or parameters monitored. The time spent performing or interpreting the baseline neurophysiologic study(s) should not be counted as intraoperative monitoring, but represents separately reportable procedures. When reporting 95940 and 95941, the same neurophysiologic study(ies) performed at baseline should be reported not more than once per operative session.

Baseline study reporting is based upon the total unique studies performed. For example, if during the course of baseline testing and one-on-one monitoring, two separate nerves have motor testing performed in conjunction with limited single extremity EMG, then 95985 and 959AX would be reported in addition to 95940. For procedures that last beyond midnight, report services using the day on which the monitoring began and using the total time monitored.

Code 95940 is reported per 15 minutes of service. Code 95940 requires reporting only the portion of time the monitoring professional was physically present in the operating room providing one-on-one patient monitoring, and no other cases may be monitored at the same time. Report continuous intraoperative neurophysiologic monitoring in the operating room (95940) in addition to the services related to monitoring from outside the operating room (95941).

Code 95941 should be used once per hour even if multiple methods of neurophysiologic monitoring are used during the time. Code 95941 requires the monitoring of neurophysiological data that is collected from the operating room continuously on-line in real time via a secure data link. When reporting 95941, real-time ability must be available through sufficient data bandwidth transfer rates to view and interrogate the neurophysiologic data contemporaneously.

Report 95941 for all cases in which there was no physical presence by the monitoring professional in the operating room during the monitoring time **or when monitoring more than one case in an operating room.** It is also used to report the time of monitoring physically performed outside of the operating room in those cases where monitoring occurred both within and outside the operating room. Do not report 95941 if the monitoring lasts 30 minutes or less.

Intraoperative neurophysiology monitoring codes 95940 and 95941 are each used to report the total duration of respective time spent providing each service, even if that time is not in a single continuous block.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RE: Tab 32: EMG in Conjunction with Nerve Testing

Dear Dr. Levy:

The American Academy of Neurology (AAN), the American Association of Neuromuscular &Electrodiagnostic Medicine (AANEM), the American Academy of Physical Medicine & Rehabilitation (AAMPR), and the American Physical Therapy Association (APTA) surveyed 17 EMG and nerve testing codes for this meeting.

The following four codes were not surveyed for this meeting because they were recently surveyed and reviewed by the RUC.

- Codes 95885, 95886, 95887 were just reviewed in April 2012. The previous RUC recommendations are included in the attached materials to facilitate the RUC's reaffirmation of these values given the whole family has been reviewed at this meeting.

- Code 95905 was recently reviewed in February 2009. This service has limited physician work and time (work RVU= 0.05 and intra-service time= 5 minutes). The survey in 2009 contained 75 respondents and a new survey three years later would not have gathered better data. Therefore, the previous RUC recommendations are included in the attached materials to facilitate the RUC's reaffirmation of this value given the whole family has been reviewed at this meeting.

The attached spreadsheet shows all the codes in the family and the existing and proposed times and RVUs.

Sincerely,

Marianna Spanaki, MD, PhD
AAN RUC Advisor

SUMMARY OF RECOMMENDATION

CPT Code:95860 Tracking Number R1 Original Specialty Recommended RVU: **0.96**
Presented Recommended RVU: **0.96**
Global Period: XXX RUC Recommended RVU: **0.96**

CPT Descriptor: Needle electromyography; 1 extremity with or without related paraspinal areas

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old man injured his right shoulder and has weakness and restricted range of motion of the proximal right upper extremity. Imaging studies demonstrate a rotator cuff tear, but the orthopedic surgeon believes the weakness on exam is out of proportion to these findings, and orders an EMG to evaluate for the presence of a brachial plexopathy, or mononeuropathy such as an axillary neuropathy that could impact decision making regarding the most appropriate course of treatment. Needle electromyography of five or more muscles in the right upper extremity and related cervical paraspinal muscles is indicated to look for signs of active denervation, fasciculations, chronic denervation/reinnervation, and myopathy.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the medical records, takes a brief history and performs a brief examination to establish the questions to be addressed as part of the EMG. Specifically the physician or other qualified health care professional considers the potential anatomic lesions that could cause the clinical manifestations and considers the questions being posed by the referring physician. The appropriate muscles to be studied are then determined.

Description of Intra-Service Work: Intra-service work includes physician or other qualified health care professional participation in patient preparation, focusing on discussing the test with the patient and answering questions regarding the pain associated with the procedure. The physician or other qualified health care professional places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode into each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the multiple needle insertions. Under minimal voluntary contraction of the muscle 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to insure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle.

Description of Post-Service Work: Post-service work involves summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
78707	XXX	0.96	**RUC Time**	19,721

CPT Descriptor 1 Kidney imaging morphology; with vascular flow and function, single study without pharmacological intervention

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99213	XXX	0.97	**RUC Time**	100,611,197

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 26 **% of respondents:** 27.9 **%**

TIME ESTIMATES (Median)	**CPT Code: 95860**	**Key Reference CPT Code:** 99213	**Source of Time** **RUC Time**
Median Pre-Service Time	10.00	3.00	
Median Intra-Service Time	20.00	15.00	

Median Immediate Post-service Time	10.00	5.00
Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**40.00**	**23.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.08	3.04
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.76	2.92
Urgency of medical decision making	2.69	2.67
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.67	3.17
Physical effort required	2.63	2.57
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.04	1.92
Outcome depends on the skill and judgment of physician	4.04	3.54
Estimated risk of malpractice suit with poor outcome	2.96	2.88

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.24	2.72
Intra-Service intensity/complexity	3.16	2.68
Post-Service intensity/complexity	2.30	2.70

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

These codes describe needle EMG when performed without a nerve study on the same day. This is uncommon and utilization of these codes will be minimal. New add-on codes were created and are effective as of 2012 for EMG when performed on the same day as nerve studies.

For the EMG family, the societies split the 10 EMG codes into two surveys. In order to maintain relativity between the two sets of surveys, code 95860 was in both surveys. The first survey included EMG of 1, 2, 3, and 4 limbs (95860, 95861, 95863, and 95864). The second survey included 95860 as well as EMG codes 95865, 95866, 95867, 95868, 95869, and 95870.

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results.

Code 95860 was included in the survey for the limb EMG codes 95860-95864 as well as the survey for the remaining EMG codes. The data from each survey is included here. The combined data is represented within this summary of recommendation form.

	Pre-time	Intra-time	Post-time	Total Time	Median RVW
95860 in limb survey	7	18	10	35	1.20
95860 in misc. EMG survey	10	20	10	40	1.50
95860 combined data	**10**	**20**	**10**	**40**	**1.25**

The societies recommend that the existing value of 0.96 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/20/10 be accepted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95860

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 21056
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 13265 Percentage 62.99 %

Specialty AAPMR Frequency 6527 Percentage 30.99 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,264
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This utilization was provided by AMA staff and reflects the service provided only when no nerve conduction study is performed on the same day.

Specialty AAN Frequency 3316 Percentage 62.99 %

Specialty AAPMR Frequency 1632 Percentage 31.00 %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:95861 Tracking Number R2 Original Specialty Recommended RVU: **1.54**
Presented Recommended RVU: **1.54**
Global Period: XXX RUC Recommended RVU: **1.54**

CPT Descriptor: Needle electromyography; 2 extremities with or without related paraspinal areas

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old woman with a five-month history of marked pain and proximal left lower limb weakness now presents with 3 weeks of severe pain and weakness in the proximal right lower limb. Physical examination shows a cachectic elderly woman with disproportionate wasting of the left more than right thigh muscles. You suspect lumbar plexopathy but also wish to exclude radiculopathy, polyradiculoneuropathy, mononeuritis multiplex, or a myopathy. Needle electromyography of five or more muscles in the two lower extremities and related lumbar paraspinal muscles is indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the medical records, takes a brief history and performs a brief examination to establish the questions to be addressed as part of the EMG. Specifically the physician or other qualified health care professional considers the potential anatomic lesions that could cause the clinical manifestations and considers the questions being posed by the referring physician. The appropriate muscles to be studied are then determined..

Description of Intra-Service Work: Intra-service work includes physician or other qualified health care professional participation in patient preparation, focusing on discussing the test with the patient and answering questions regarding the pain associated with the procedure. The physician or other qualified health care professional places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode in to each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the needle insertion. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to ensure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle. Five or more muscles are examined individually in each of two limbs using

the steps outlined above. For each of the two limbs examined, the muscles are located in the limb and/or its related cervical or lumbar paraspinal areas, and are innervated by three or more nerves or four or more spinal levels.

Description of Post-Service Work: Post-service work involves summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies recommend that the existing value of 1.54 be maintained, which is near the survey 25th percentile. We recommend times of 10/29/10 be accepted, which are identical to the survey median times, with the exception of a 0.5 minute increase to the pre-service time to make it standard with the other limb EMG code.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95861

CPT Descriptor: Needle electromyography; 3 extremities with or without related paraspinal areas

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old man with a history of IV drug abuse leading to bacterial endocarditis and cervical and lumbar epidural abscess with right arm and bilateral leg weakness is progressing poorly after the cervical and lumbar surgeries to drain the abscesses. It is uncertain if his inability to move his limbs is due to weakness from residual right cervical and bilateral lumbar radiculopathies, polyradiculoneuropathy, mononeuritis multiplex, or is due to pain or psychophysiological factors. Needle EMG of five or more muscles in the right upper extremity and both lower extremities is indicated to look for signs of active denervation, fasciculations, and chronic denervation/reinnervation.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the medical records, takes a brief history and performs a brief examination to establish the questions to be addressed as part of the EMG. Specifically the physician or other qualified health care professional considers the potential anatomic lesions that could cause the clinical manifestations and considers the questions being posed by the referring physician. The appropriate muscles to be studied are then determined.

Description of Intra-Service Work: Intra-service work includes physician or other qualified health care professional participation in patient preparation, focusing on discussing the test with the patient and answering questions regarding the pain associated with the procedure. The physician or other qualified health care professional places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode in to each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the needle insertion. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to ensure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle. Five or more muscles are examined individually in each of two limbs using

the steps outlined above. For each of the three limbs examined, the muscles are located in the limb and/or its related cervical or lumbar paraspinal areas, and are innervated by three or more nerves or four or more spinal levels.

Description of Post-Service Work: Post-service work involves summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99215	XXX	2.11	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Intra-Service intensity/complexity	4.24	3.96
Post-Service intensity/complexity	3.61	3.48

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies recommend that the existing value of 1.87 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/40/11 be accepted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95863

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 572
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 464 Percentage 81.11 %

Specialty AAPMR Frequency 74 Percentage 12.93 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 143
If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate. The utilization was provided by the AMA staff and reflects the service provided only when no nerve conduction study is performed on the same day.

Specialty AAN Frequency 115 Percentage 80.41 %

Specialty AAPMR Frequency 18 Percentage 12.58 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95863

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95864 Tracking Number R4 Original Specialty Recommended RVU: **1.99**
Presented Recommended RVU: **1.99**
Global Period: XXX RUC Recommended RVU: **1.99**

CPT Descriptor: Needle electromyography; 4 extremities with or without related paraspinal areas

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old man with weakness and wasting is referred for a second opinion to rule out motor neuron disease, multifocal motor neuropathy, polyradiculoneuropathy, or myopathy. Earlier nerve conduction studies were normal and needle EMG studies were equivocal. The patient has progressively gotten weaker. Needle EMG of five or more muscles in all four limbs and related paraspinal muscles is indicated to look for signs of active denervation, fasciculations, chronic denervation/reinnervation, and myopathy.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the history and notes in particular if there is any history of reaction to local anesthesia -- if this will be used. The indications, risks, and potential complications are explained in detail, the latter including respiratory mucosal irritation, bleeding, and laryngeal edema necessitating intubation. In addition, the procedures which may need to be performed in event of respiratory insufficiency (including emergency chest x-ray, airway or endotracheal tube placement, and hospitaliztion) are discussed. Informed consent is obtained.

Description of Intra-Service Work: The needle electrode is inserted through the skin, then the cricothyroid membrane until muscle activity is located. Placement can be confirmed by phonation of high-pitched vowels. Activation of neck strap muscles without phonation should produce no EMG activity. The muscles being studied are quite small and swallowing or coughing may displace the needle. Localization is often prolonged, particularly in circumstances of vocal fold paresis or paralysis, as phonation to assist localization may not be possible. When the correct muscles are identified, electrodiagnostic properties of the muscle are reviewed including insertional activity, spontaneous activity, and voluntary motor unit potential activity. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle.After the appropriate muscles have been localized and evaluated, the needle is withdrawn, and direct pressure is applied to prevent bleeding.

Description of Post-Service Work: The patient is observed and queried regarding respiratory symptoms. If stridor or dyspnea is reported, the patient is examined. If necessary the resuscitation team is called for consideration of endotracheal intubation. The patient is instructed what to do should respiratory symptoms develop in the hours or days following the laryngeal EMG. Post-service work includes summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95865 Tracking Number R5 Original Specialty Recommended RVU: **1.57**
Presented Recommended RVU: **1.57**
Global Period: XXX RUC Recommended RVU: **1.57**

CPT Descriptor: Needle electromyography; larynx

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 36 year old man complains of a raspy voice after being intubated for a number of days following a drug induced coma. The condition does not improve two months after the hospitalization. His otolaryngologist is uncertain if the cord has a mechanical problem or has sustained damage to its peripheral innervation. He requests EMG for laryngeal muscle assessment.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the history and notes in particular if there is any history of reaction to local anesthesia -- if this will be used. The indications, risks, and potential complications are explained in detail, the latter including respiratory mucosal irritation, bleeding, and laryngeal edema necessitating intubation. In addition, the procedures which may need to be performed in event of respiratory insufficiency (including emergency chest x-ray, airway or endotracheal tube placement, and hospitaliztion) are discussed. Informed consent is obtained.

Description of Intra-Service Work: The needle electrode is inserted through the skin, then the cricothyroid membrane until muscle activity is located. Placement can be confirmed by phonation of high-pitched vowels. Activation of neck strap muscles without phonation should produce no EMG activity. The muscles being studied are quite small and swallowing or coughing may displace the needle. Localization is often prolonged, particularly in circumstances of vocal fold paresis or paralysis, as phonation to assist localization may not be possible. When the correct muscles are identified, electrodiagnostic properties of the muscle are reviewed including insertional activity, spontaneous activity, and voluntary motor unit potential activity. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle.After the appropriate muscles have been localized and evaluated, the needle is withdrawn, and direct pressure is applied to prevent bleeding.

Description of Post-Service Work: The patient is observed and queried regarding respiratory symptoms. If stridor or dyspnea is reported, the patient is examined. If necessary the resuscitation team is called for consideration of endotracheal intubation. The patient is instructed what to do should respiratory symptoms develop in the hours or days following the laryngeal EMG. Post-service work includes summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99214	XXX	1.50	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A detailed history; A detailed examination; Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 25 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
77290	XXX	1.56	**RUC Time**	334,547

CPT Descriptor 1 Therapeutic radiology simulation-aided field setting; complex

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99382	XXX	1.60	**RUC Time**	0

CPT Descriptor 2 Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; early childhood (age 1 through 4 years)

Time Segments (Mean)		
Pre-Service intensity/complexity	3.52	2.92
Intra-Service intensity/complexity	4.57	3.75
Post-Service intensity/complexity	3.17	3.08

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies noted the survey data is only based on 26 responses because this code is provided by a much smaller subset of providers and had utilization of less than 1200 for Medicare in 2010. The societies recommend that the existing value of 1.57 be maintained, which is near the median RVW of 1.55. The societies also recommend increasing the post-service time to 10 minutes to match that of 95866. We recommend times of 10/15/10 be accepted. This service warrants a higher value than 95866 because it is much more intense and there is more risk working near the larynx.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95865

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

SUMMARY OF RECOMMENDATION

CPT Code:95866 Tracking Number R6 Original Specialty Recommended RVU: **1.25**
Presented Recommended RVU: **1.25**
Global Period: XXX RUC Recommended RVU: **1.25**

CPT Descriptor: Needle electromyography; hemidiaphragm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 59 year old woman who has a 50 pack year history of smoking develops painless weakness of intrinsic hand muscles on both sides, fasciculations of upper and lower limb muscles, and shortness of breath. Her physical examination shows diffuse weakness of upper more than lower limb muscle groups, widespread fasciculations, and hyperreflexia. The clinician suspects ALS but wishes to know whether her dyspnea is due to COPD or to involvement of the diaphragm in her neuromuscular disorder which might improve with positive pressure assisted ventilation (BiPAP). She refers the patient for EMG/NCS which includes needle EMG examination of the diaphragm.

Percentage of Survey Respondents who found Vignette to be Typical: 75%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the history and notes in particular if the chest x-ray shows hyperexpansion and flat hemidiaphragms which makes the procedure relatively contraindicated and much more risky. The indications, risks, and potential complications are explained in detail, the latter including pneumothorax, bleeding, and infection. In addition, the procedures which may need to be performed in event of pneumothorax, including emergency chest x-ray, chest tube placement, respiratory support, and hospitalization, are discussed. Informed consent is obtained.

Description of Intra-Service Work: Ground and reference electrodes are attached. Localization is performed by palpating the lower costal margin and inserting the EMG needle either in a lower intercostal space, between the ribs, through the two layers of intercostal muscles and in to the diaphragm, or inferior to the costal margin, through the abdominal fascia, and abdominal wall muscles into the costal insertion of the diaphragm where muscle electrical activity is encountered. The patient may need to temporarily be taken off of the ventilator if he/she is intubated. Electrical activity of the muscle is evaluated both with breathing and during silent periods. In some instances, particularly when the patient is comatose, an assistant may need to stimulate the phrenic nerve percutaneously to activate motor unit potentials. Once the diaphragm is localized, electrodiagnostic properties of the muscle are identified including insertional activity, spontaneous activity, and voluntary motor unit potential activity. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal.After the

data is collected and analyzed, the needle is withdrawn. In some circumstances, a post-procedure chest x-ray may be desired to exclude pneumothorax, or pneumoperitoneum.

Description of Post-Service Work: The patient is observed and queried regarding respiratory symptoms. If increased dyspnea is reported, the posterior chest is auscultated. If decreased breath sounds are apparent, urgent chest x-ray is arranged. The patient is instructed what to do should worsening respiratory symptoms develop in the hours or days following the diaphragm EMG. Post-service work includes summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

Technical skill required	4.83	3.50
Physical effort required	3.33	2.67
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.67	3.67
Outcome depends on the skill and judgment of physician	4.50	4.00
Estimated risk of malpractice suit with poor outcome	4.00	3.17

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.44	2.96
Intra-Service intensity/complexity	4.44	3.85
Post-Service intensity/complexity	3.04	3.04

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies noted the survey data is only based on 27 responses because this code is provided by a much smaller subset of providers and had utilization of only 233 for Medicare in 2010. The societies recommend that the existing value of 1.25 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/15/10 be accepted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95866

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty ACCP How often? Sometimes

Specialty AAPMR How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 932
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAM Frequency 792 Percentage 84.97 %

Specialty ACCP Frequency 103 Percentage 11.05 %

Specialty AAPMR Frequency 37 Percentage 3.96 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 233
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please

explain the rationale for this estimate. This utilization was provided by AMA staff and reflects the service provided only when no nerve conduction study is performed on the same day.

Specialty AAN Frequency 198 Percentage 84.97 %

Specialty ACCP Frequency 26 Percentage 11.15 %

Specialty AAPME Frequency 9 Percentage 3.86 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95866

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95867 Tracking Number R7 Original Specialty Recommended RVU: **0.79**
Presented Recommended RVU: **0.79**
Global Period: XXX RUC Recommended RVU: **0.79**

CPT Descriptor: Needle electromyography; cranial nerve supplied muscle(s), unilateral

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old woman with right-sided Bell's palsy has had little if any clinical return of motor function for four months. The initial needle EMG showed no recruitable motor units in right-sided facial muscles. Surgical procedures to help her close her right eye to prevent corneal drying and abrasion are being considered. Needle EMG of multiple right facial muscles is indicated to look for the appearance of nascent motor units indicative of the beginning of motor recovery.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the medical records, takes a brief history and performs a brief examination to establish the questions to be addressed as part of the EMG. Specifically the physician or other qualified health care professional considers the potential anatomic lesions that could cause the clinical manifestations and considers the questions being posed by the referring physician. The appropriate muscles to be studied are then determined.

Description of Intra-Service Work: Intraservice work includes physician or other qualified health care professional participation in patient preparation, focusing on discussing the needle EMG test with the patient, and answering questions regarding the pain associated with the procedure. The physician or other qualified health care professional must specifically assess the risk of the procedure (eg, bleeding, infection, damage to vital organs) by reviewing the patient's medical history and medications. The physician or other qualified health care professional places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode into each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the needle insertion. Once the needle is inserted in to the muscle of interest, electrodiagnostic properties of the muscle are identified including insertional activity, spontaneous activity, and voluntary motor unit potential activity. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal.. The patient is examined after the needle is withdrawn from each puncture site to ensure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Cranial nerve

innervated muscles (eg, face or tongue muscles) on one side of the body are examined individually using the steps outlined above. Special care must be taken during the study since many muscles are thin and located adjacent to critical structures (eg, eye, trachea, lung). Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle.

Description of Post-Service Work: Post-service work involves summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies recommend that the existing value of 0.79 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/15/10 be accepted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 8 **% of respondents:** 20.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 95868**	**Key Reference CPT Code:** 99214	**Source of Time** **RUC Time**
Median Pre-Service Time	10.00	5.00	
Median Intra-Service Time	20.00	25.00	
Median Immediate Post-service Time	10.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	

Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**40.00**	**40.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.00	3.63
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.13	3.50
Urgency of medical decision making	3.63	3.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.38	3.71
Physical effort required	3.50	3.75
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.63	3.00
Outcome depends on the skill and judgment of physician	4.50	3.75
Estimated risk of malpractice suit with poor outcome	3.63	3.13

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.17	2.92
Intra-Service intensity/complexity	4.09	3.67
Post-Service intensity/complexity	3.35	3.12

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies recommend that the existing value of 1.18 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/20/10 be accepted. Code 95868 is the bilateral version of 95867 and the times and RVW increase appropriately relative to that service. There is an increase of 5 minutes intra-service time and a 50% increase in RVW.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95868

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAO-HNS How often? Commonly

Specialty AAPMR How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 104
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 74 Percentage 71.15 %

Specialty AAO-HNS Frequency 18 Percentage 17.30 %

Specialty AAPMR Frequency 6 Percentage 5.76 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 26 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please

explain the rationale for this estimate. This utilization was provided by AMA staff and reflects the service provided only when no nerve conduction study is performed on the same day. .

Specialty AAN Frequency 18 Percentage 69.23 %

Specialty AAO-HNS Frequency 4 Percentage 15.38 %

Specialty AAPMR Frequency 1 Percentage 3.84 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95868

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95869 Tracking Number R9 Original Specialty Recommended RVU: **0.37**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: Needle electromyography; thoracic paraspinal muscles (excluding T1 or T12)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old man with four-limb weakness thought originally to have multilevel cervical and lumbar radiculopathies is being evaluated to see if he actually has amyotrophic lateral sclerosis. The thoracic spine is normal on imaging studies. Needle EMG of multiple bilateral thoracic paraspinal muscles is indicated to look for signs of active denervation, fasciculations, and chronic denervation/reinnervation, myopathy, and complex repetitive discharges.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified health care professional reviews the medical records, takes a brief history and performs a brief examination to establish the questions to be addressed as part of the EMG. Specifically the physician or other qualified health care professional considers the potential anatomic lesions that could cause the clinical manifestations and considers the questions being posed by the referring physician. The appropriate muscles to be studied are then determined.

Description of Intra-Service Work: Intra-service work includes physician or other qualified health care professional participation in patient preparation, focusing on discussing the test with the patient and answering questions regarding the pain associated with the procedure. The physician or other qualified health care professional places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode in to each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the multiple needle insertions. Once the needle is inserted in to the muscle of interest, electrodiagnostic properties of the muscle are identified including insertional activity, spontaneous activity, and voluntary motor unit potential activity. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to ensure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Each muscle is graded for insertional/spontaneous activity and voluntary motor unit potential characteristics before proceeding to examine the next muscle.

Description of Post-Service Work: Post-service work involves summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation.

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies recommend that the existing value of 0.37 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/15/10 be accepted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Post-Service intensity/complexity	2.95	2.95

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The societies recommend that the existing value of 0.37 be maintained, which is below the survey 25th percentile. We also recommend the survey times of 10/15/10 be accepted.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95870

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2452
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 1667 Percentage 67.98 %

Specialty AAPMR Frequency 638 Percentage 26.01 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 613
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This utilization was provided by AMA staff and reflects the service provided only when no nerve conduction study is performed on the same day. .

Specialty AAN Frequency 417 Percentage 68.02 %

Specialty AAPMR Frequency 159 Percentage 25.93 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old woman with a history of proximal median nerve injury secondary to I.V. line placement is referred back to your lab 6 months after initial study. Repeat testing is requested to evaluate recovery.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated.

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test design changes during the course of the study in response to the information obtained. 1-2 nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

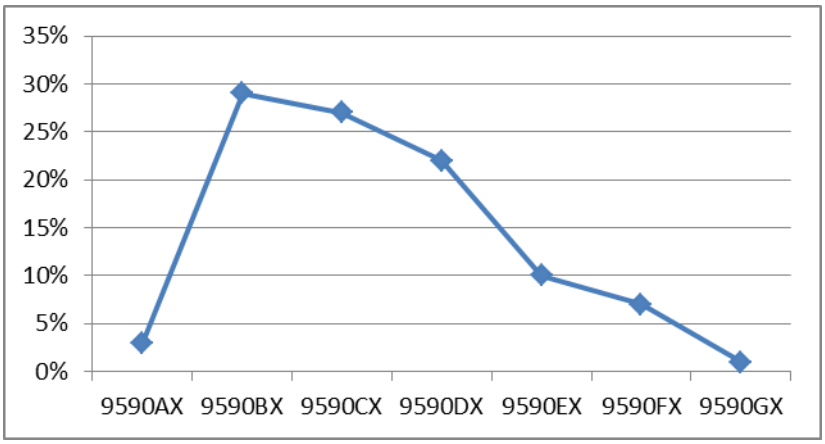
Time Segments (Mean)		
Pre-Service intensity/complexity	1.36	1.29
Intra-Service intensity/complexity	1.86	1.71
Post-Service intensity/complexity	1.57	1.57

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This new family of codes replaces existing nerve conduction codes that described motor and sensory nerve conduction studies (95900, 95903, 95904) and H-reflex studies (95934, 95936). Where previously multiple combinations of codes would have been reported for a single patient, now one new code will be reported to describe any combination of nerve studies provided in one visit.

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. They noted that while the times seemed accurate for the lower level codes (95907-09), once respondents started responding for 7 or 9 and more studies on a day, the intra-service times appear low. This may be because the vast majority of practitioners provide fewer than 9 studies on a patient and estimating times for providing 9-10, 11-12, or 13 or more studies is theoretical rather than based on actual practice.



Furthermore, in patients that require higher numbers of nerve conduction studies, they are sicker and have greater pathology meaning that the nerve conduction studies are technically much more difficult to perform as responses are often low amplitude or absent, or unusual studies that are not performed on a daily basis may be indicated, all of which adds considerable time to each study. When respondents replied, they may have considered how long it takes to do a single nerve conduction study and then tried to estimate doing that multiple times, not reflecting the increased complexity and technical difficulty that comes in to play in the more extensive studies requiring many nerves to be studied.

To establish appropriate times for the higher number of studies, the expert panel calculated how many minutes of intra-service times are currently being provided according to the existing nerve conduction codes as approved by RUC in April 2011. The panel determined a weighted average intra-service time (95900 – 6 minutes, 95903 – 10 minutes, 95904 – 5 minutes), taking into account utilization, is 6.70 minutes.

The panel recommends these calculated times for codes 95910-13:

Code	**Studies**	**Time**
95910	7-8	6.70 min. * 7.5 studies = 50.25 min.
95911	9-10	6.70 min. * 9.5 studies = 63.65 min.
95912	11-12	6.70 min. * 11.5 studies = 77.05 min.
95913	13+	6.70 min. * 13 studies = 87.10 min.

The estimated utilization of the codes in this family will be:

Code – Descriptor	Percentage Utilization
95907 1-2 nerve conduction studies	3%
95908 3-4 nerve conduction studies	29%
95909 5-6 nerve conduction studies	28%
95910 7-8 nerve conduction studies	22%
95911 9-10 nerve conduction studies	10%
95912 11-12 nerve conduction studies	7%
9590FG 13 or more nerve conduction studies	1%

Based on the recommended RVUs, the panel reviewed several typical patient scenarios and compared the total RVUs under the current system to the new system.

Current Scenario	95903 Motor w/ F-wave	95900 Motor w/o F wave	95904 Sensory	RVU		New Scenario	Recommended RVU	Difference
Scenario E (9 studies)	2	3	4	3.82		95911 9-10 studies	3.34	-12.57%
Scenario E (10 studies)	3	3	4	4.42				-24.43%
Scenario F (11 studies)	3	1	6	4.26		95912 11-12 studies	4.00	-6.10%
Scenario F (12 studies)	4	1	6	4.86				-17.70%
Scenario G (13 studies)	3	3	7	5.44		95913 13+ studies	4.20	-22.79%
Scenario G (14 studies)	4	3	7	6.04				-30.46%

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated.

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test design changes during the course of the study in response to the information obtained. 3-4 nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Marianna Spanaki, MD, James Selwa, MD, MBA, PhD, Joe Zuhosky, MD, Andrea Boon, MD, John Palazzo, DSc, PT, ECS

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99213	XXX	0.97	**RUC Time**

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99382	XXX	1.60	**RUC Time**	0

CPT Descriptor 1 Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; early childhood (age 1 through 4 years)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99375	XXX	1.73	**RUC Time**	0

CPT Descriptor 2 Physician supervision of a patient under care of home health agency (patient not present) in home, domiciliary or equivalent environment (eg, Alzheimer's facility) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of related laboratory and other studies, communication (including telephone calls) for purposes of assessment or care decisions with health care professional(s), family member(s), surrogate decision maker(s) (eg, legal guardian) and/or key caregiver(s) involved in patient's care, integration of new information into the medical treatment plan and/or adjustment of medical therapy, within a calendar month; 30 minutes or more

Other Reference CPT Code	Global	Work RVU	Time Source

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 14 **% of respondents:** 26.9 **%**

TIME ESTIMATES (Median)	**CPT Code: 95908**	**Key Reference CPT Code:** 99213	**Source of Time RUC Time**
Median Pre-Service Time	10.00	3.00	

Median Intra-Service Time	25.00	15.00
Median Immediate Post-service Time	10.00	5.00
Median Critical Care Time	0.0	0.00
Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**45.00**	**23.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	2.67	2.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.73	2.53
Urgency of medical decision making	2.47	2.40
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.13	2.73
Physical effort required	2.47	2.27
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	1.87	1.87
Outcome depends on the skill and judgment of physician	3.73	3.13
Estimated risk of malpractice suit with poor outcome	2.93	2.80

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.36	2.20
Intra-Service intensity/complexity	2.71	2.53
Post-Service intensity/complexity	2.50	2.36

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The expert panel observed that only 65% of respondents agreed with the typical patient and noted that many providers may do more than 3-4 studies for carpal tunnel.

The panel estimates this code will constitute 29% of the utilization of the new nerve testing family.

The panel agreed with the survey values and recommends the median RVU of 1.68 and survey times of 10/22/10.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty ACP How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 2491496

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 1295578 Percentage 52.00 %

Specialty AAPMR Frequency 498299 Percentage 19.99 %

Specialty ACP Frequency 199320 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 622,874 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an estimate of how current utilization of 95900, 95903, 95904, 95934, and 95936 will be divided out into the new nerve testing codes.

Specialty AAN Frequency 323894 Percentage 51.99 %

Specialty AAPMR Frequency 12457 Percentage 1.99 %

Specialty ACP Frequency 49830 Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95904

Presented Recommended RVU: **2.28**
Global Period: XXX RUC Recommended RVU: **1.77**

CPT Descriptor: 5-6 nerve conduction studies; (95900-95904 have been deleted. For nerve conduction studies, see 95907-95913)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old diabetic man is referred for further evaluation of progressive numbness, tingling, and pain in the feet, worse at night, and progressive balance difficulties. Evaluation for peripheral neuropathy vs. polyradiculoneuropathy is requested.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated.

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test

design changes during the course of the study in response to the information obtained. 5-6 nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The panel estimates this code will constitute 28% of the utilization of the new nerve testing family. The panel agreed with the survey values and recommends the median RVU of 2.28 and survey times of 10/30/11.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAMPR How often? Commonly

Specialty ACP How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 1530824
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 796028 Percentage 51.99 %

Specialty AAPMR Frequency 306165 Percentage 20.00 %

Specialty ACP Frequency 122466 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 382,706 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an estimate of how current utilization of 95900, 95903, 95904, 95934, and 95936 will be divided out into the new nerve testing codes.

Specialty AAN Frequency 199007 Percentage 51.99 %

Specialty AAPMR Frequency 76541 Percentage 19.99 %

Specialty ACP Frequency 30616 Percentage 7.99 %

Do many physicians perform this service across the United States? Yes

---

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95904

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95910 Tracking Number R17 Original Specialty Recommended RVU: **2.90**
Presented Recommended RVU: **2.90**
Global Period: XXX RUC Recommended RVU: **2.80**

CPT Descriptor: 7-8 nerve conduction studies; (95900-95904 have been deleted. For nerve conduction studies, see 95907-95913)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34-year-old female typist is referred for further evaluation of bilateral upper limb numbness and tingling that occurs during the day at work but can also wake her from sleep at times. The symptoms are described as affecting the entire hand and progressing up to the elbow when severe. Nerve conduction studies are indicated to evaluate for carpal tunnel syndrome versus ulnar neuropathy, brachial plexopathy, or cervical radiculopathy.

Percentage of Survey Respondents who found Vignette to be Typical: 79%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated.

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test

design changes during the course of the study in response to the information obtained. 7-8 nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012

Median Total Time	**65.50**	**55.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.92	3.77
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.85	3.69
Urgency of medical decision making	3.46	3.23
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.23	3.54
Physical effort required	3.62	3.23
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.77	2.69
Outcome depends on the skill and judgment of physician	4.15	3.54
Estimated risk of malpractice suit with poor outcome	3.15	3.15

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.15	2.85
Intra-Service intensity/complexity	3.85	3.38
Post-Service intensity/complexity	3.46	3.38

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The panel estimates this code will constitute 22% of the utilization of the new nerve testing family.

The panel noted the intra-service time appeared too low to perform 7-8 studies and calculated the existing average nerve study intra-service time of 6.70 minutes times 7.5 studies to come up with 50.25 minutes.

The expert panel identified existing code 12007 with 35 intra-service minutes and 2.90 as a crosswalk. The panel recommends an RVU of 2.90 and times of 13/50/12.5.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty ACP How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 882048
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate

Specialty AAN Frequency 458665 Percentage 52.00 %

Specialty AAPMR Frequency 176410 Percentage 20.00 %

Specialty ACP Frequency 70564 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 220,512 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an estimate of how current utilization of 95900, 95903, 95904, 95934, and 95936 will be divided out into the new nerve testing codes

Specialty AAN Frequency 114666 Percentage 51.99 %

Specialty AAPMR Frequency 44102 Percentage 19.99 %

Specialty ACP Frequency 17641 Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

---

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated.

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test design changes during the course of the study in response to the information obtained. 9-10 nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.11	3.67
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.11	3.67
Urgency of medical decision making	3.67	3.44
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.67	4.00
Physical effort required	4.00	3.67
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.89	3.11
Outcome depends on the skill and judgment of physician	4.67	4.00
Estimated risk of malpractice suit with poor outcome	4.00	3.67

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.13	2.78
Intra-Service intensity/complexity	4.00	3.44
Post-Service intensity/complexity	3.25	2.89

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The panel estimates this code will constitute 10% of the utilization of the new nerve testing family. The panel noted the intra-service time appeared too low to perform 9-10 studies and calculated the existing average nerve study intra-service time of 6.70 minutes times 9.5 studies to come up with 63.65 minutes.

The expert panel identified existing code 59012 at 44 intra service and 91 total minutes and 3.44 RVU as a crosswalk. The panel recommends an RVU of 3.44 and times of 15/64/15.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty ACP How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 316524
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 164592 Percentage 51.99 %

Specialty AAPMR Frequency 63305 Percentage 20.00 %

Specialty ACP Frequency 25322 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 79,131 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an estimate of how current utilization of 95900, 95903, 95904, 95934, and 95936 will be divided out into the new nerve testing codes.

Specialty AAN Frequency 41148 Percentage 51.99 %

Specialty AAPMR Frequency 15826 Percentage 19.99 %

Specialty ACP Frequency 6331 Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95904

SUMMARY OF RECOMMENDATION

CPT Code:95912 Tracking Number R19 Original Specialty Recommended RVU: **4.10**
Presented Recommended RVU: **4.10**
Global Period: XXX RUC Recommended RVU: **4.00**

CPT Descriptor: 11-12 nerve conduction studies; (95900-95904 have been deleted. For nerve conduction studies, see 95907-95913)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 75-year-old diabetic woman with a 3-month history of pain, numbness, and weakness progressively involving different peripheral nerve distributions is referred, with the question of mononeuritis multiplex secondary to vasculitis.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test

design changes during the course of the study in response to the information obtained. 11-12 nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99245	XXX	3.77	**RUC Time**

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 80 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99223	XXX	3.86	**RUC Time**	11,496,708

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
11644	010	4.34	**RUC Time**	16,269

CPT Descriptor 2 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 3.1 to 4.0 cm

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 12 **% of respondents:** 23.0 **%**

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The panel estimates this code will constitute 7% of the utilization of the new nerve testing family.

The panel noted the intra-service time appeared too low to perform 11-12 studies and calculated the existing average nerve study intra-service time of 6.70 minutes times 11.5 studies to come up with 77.05 minutes.

The expert panel identified existing code 99345 at 4.09 RVU and 75 minutes intra-service time as a crosswalk. The panel recommends an RVU of 4.10 and times of 15/77/15.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty ACP How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 183032
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 95177 Percentage 52.00 %

Specialty AAPMR Frequency 36606 Percentage 19.99 %

Specialty ACP Frequency 14643 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 45,758 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an estimate of how current utilization of 95900, 95903, 95904, 95934, and 95936 will be divided out into the new nerve testing codes.

Specialty AAN Frequency 23794 Percentage 51.99 %

Specialty AAPMR Frequency 9152 Percentage 20.00 %

Specialty ACP Frequency 3661 Percentage 8.00 %

Do many physicians perform this service across the United States? Yes

Description of Pre-Service Work: The physician or other qualified healthcare professional reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical question. The physician or other qualified healthcare professional considers the clinical presentation, the potential anatomic lesions that could cause the clinical manifestations, any anatomic or other factors that may cause technical limitations (such as body habitus, edema, prior surgery), and/or questions being posed by the referring physician. The stimulating, recording, and ground electrode placement and the test design are individualized to the patient's unique anatomy and the particular clinical question being investigated.

Description of Intra-Service Work: The stimulating electrode is placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, both proximal and distal stimulation are performed. Motor nerve conduction study recordings with or without F-wave testing, when performed, are made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings, when performed, must be made from electrodes placed directly over the specific nerve to be tested. H-reflex study recordings, when performed, must be made from electrodes placed directly over the specific nerve-muscle combination to be tested. Waveforms are reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) is adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Using well-established techniques, the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of the nerve tested are assessed. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values. Test

design changes during the course of the study in response to the information obtained. 13 or more nerve conduction studies are performed.

Description of Post-Service Work: Post-service work involves a review of the raw nerve conduction study data and the documentation of nerve conduction interpretations into a summary report prepared on site by the physician or other qualified healthcare professional.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99255	XXX	4.00	**RUC Time**

CPT Descriptor Inpatient consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 110 minutes at the bedside and on the patient's hospital floor or unit.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
11644	010	4.34	**RUC Time**	16,269

CPT Descriptor 1 Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter 3.1 to 4.0 cm

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
13121	010	4.42	**RUC Time**	97,197

CPT Descriptor 2 Repair, complex, scalp, arms, and/or legs; 2.6 cm to 7.5 cm

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 10 **% of respondents:** 19.2 **%**

TIME ESTIMATES (Median)	**CPT Code: 95913**	**Key Reference CPT Code:** 99255	**Source of Time** **RUC Time**
Median Pre-Service Time	15.00	20.00	
Median Intra-Service Time	70.00	60.00	
Median Immediate Post-service Time	20.00	25.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	

Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**105.00**	**105.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.50	4.30
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.60	4.40
Urgency of medical decision making	3.90	4.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.50	4.20
Physical effort required	4.60	4.40
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.00	4.30
Outcome depends on the skill and judgment of physician	4.40	4.60
Estimated risk of malpractice suit with poor outcome	4.20	4.40

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.80	3.70
Intra-Service intensity/complexity	4.70	4.50
Post-Service intensity/complexity	4.00	4.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel of representatives from the AAN, AANEM, AAPMR, and APTA reviewed the survey results. The panel estimates this code will constitute 1% of the utilization of the new nerve testing family.

The panel noted the intra-service time appeared too low to perform 13 or more studies and calculated the existing average nerve study intra-service time of 6.70 minutes times 13 studies to come up with 87.10 minutes.

The expert panel identified existing code 31636 at 4.30 RVU and 45 minutes intra-service time as a crosswalk. Code 44391 has 59 minutes of intra-service time and a 4.31 RVU.

The panel recommends an RVU of 4.30 and times of 15/87/20.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The service was performed previously using 95900, 95903, 95904, 95934, and 95936

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty AAN How often? Commonly

Specialty AAPMR How often? Commonly

Specialty ACP How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 22272
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national utilization at 4 times the Medicare rate.

Specialty AAN Frequency 11581 Percentage 51.99 %

Specialty AAPMR Frequency 4454 Percentage 19.99 %

Specialty ACP Frequency 1782 Percentage 8.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,568
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an estimate of how current utilization of 95900, 95903, 95904, 95934, and 95936 will be divided out into the new nerve testing codes.

Specialty AAN Frequency 2895 Percentage 51.99 %

Specialty AAPMR Frequency 1114 Percentage 20.00 %

Specialty ACP Frequency 445 Percentage 7.99 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95904

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
Needle electromyography; 1 extremity with or without related paraspinal areas

Global Period: XXX Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The societies convened a consensus panel of physicians and health care providers to develop recommended inputs by phone and email. The members of the panel represent a variety of geographic locations and practice settings. The panel reviewed the existing RUC-approved inputs for the EMG codes and modified based on those.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The reference code is the existing CPT code 95860.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The patient is called prior to the test day to confirm the appointment and answer questions. The patient is greeted by the technician, identity verified by full name and date of birth, and escorted into the room where testing is to be done.

Service Clinical Labor Activities:

The medical record and all documents related to the testing are read, allowing the plan of electrodiagnostic testing unique to the patient to be formulated. The test is explained to the patient, consent is obtained, and the patient is asked if they wish to proceed. The technician prepares the room, changes the exam table paper/linen, and reviews the supplies to be sure that the necessary equipment is available in the room. The patient information is entered into the EMG machine via keyboard including name, medical record number, gender, height, weight, and codified medical history, including indications for testing. The patient is instructed to disrobe, and don a gown. The patient is covered with a blanket and then the limb temperatures are measured using a temperature probe because a threshold temperature is required for an optimal test. The limb is warmed for up to 10 minutes as appropriate to attain the required temperature level. Notes are taken during the test regarding the results and other information (eg, temperature of the limb at the time of the test, presence of peripheral edema, other relevant clinical information)

Post-Service Clinical Labor Activities:

The patient is monitored after the procedure for any adverse effects. Patient questions are answered. When necessary the patient is assisted with re-dressing and is escorted back to the patient waiting area.

The room is cleaned and soiled/disposable linens and other materials are placed in the proper containers.

Forms/data sheets are printed, collected, and brought to the administrative/interpretation area. After the report is finalized, it is uploaded to the electronic medical record and/or mailed/faxed to the outside referring physician

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The societies convened a consensus panel of physicians and health care providers to develop recommended inputs by phone and email. The members of the panel represent a variety of geographic locations and practice settings. The panel reviewed the existing RUC-approved inputs for the EMG codes and modified based on those.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The reference code is the existing code 95870.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The patient is called prior to the test day to confirm the appointment and answer questions. The patient is greeted by the technician, identity verified by full name and date of birth, and escorted into the room where testing is to be done.

Service Clinical Labor Activities:
The medical record and all documents related to the testing are read, allowing the plan of electrodiagnostic testing unique to the patient to be formulated. The test is explained to the patient, consent is obtained, and the patient is asked if they wish to proceed. The technician prepares the room, changes the exam table paper/linen, and reviews the supplies to be sure that the necessary equipment is available in the room. The patient information is entered into the EMG machine via keyboard including name, medical record number, gender, height, weight, and codified medical history, including indications for testing. The patient is instructed to disrobe, and don a gown. The patient is covered with a blanket and then the limb temperatures are measured using a temperature probe because a threshold temperature is required for an optimal test. The limb is warmed for up to 10 minutes as appropriate to attain the required temperature level. Notes are taken during the test regarding the results and other information (eg, temperature of the limb at the time of the test, presence of peripheral edema, other relevant clinical information)

Post-Service Clinical Labor Activities:

The patient is monitored after the procedure for any adverse effects. Patient questions are answered. When necessary the patient is assisted with re-dressing and is escorted back to the patient waiting area.

The room is cleaned and soiled/disposable linens and other materials are placed in the proper containers.

Forms/data sheets are printed, collected, and brought to the administrative/interpretation area. After the report is finalized, it is uploaded to the electronic medical record and/or mailed/faxed to the outside referring physician.

administration), 94726 (Plethysmography for determination of lung volumes and, when performed, airway resistance), 94727 (Gas dilution or washout for determination of lung volumes and, when performed, distribution of ventilation and closing volumes), and 94728 (Airway resistance by impulse oscillometry), involve very similar work and should have the same work RVU. CPT code 94240 (Functional residual capacity or residual volume: helium method, nitrogen open circuit method, or other method) (work RVU=0.26) is being deleted for CY 2012 and the utilization associated with that service is expected to be captured under new CPT codes 94726 and 92727. We believe that a work RVU of 0.26 appropriately reflects the work associated with CPT codes 94060, 94726, 94727, and 94728. We believe this value is further supported by CPT code 97012 (Application of a modality to 1 or more areas; traction, mechanical) (work RVU=0.25) which has similar time and intensity. The AMA RUC recommended a work RVU of 0.31 for CPT codes 94060, 94726, 94727, and 94728, which corresponded to each surveys 25th percentile work RVU. We are assigning a work RVU of 0.26 to CPT codes 94060, 94726, 94727, and 94728 on an interim final basis for CY 2012.

After clinical review of CPT code 94729 (Diffusing capacity (*e.g.,* carbon monoxide, membrane) (List separately in addition to code for primary procedure)), we believe that a work RVU of 0.17 accurately reflects the work associated with this service. Based on comparison to similar services, the AMA RUC recommended a work RVU of 0.19 for CPT code 94729. We believe that CPT code 94010 (Spirometry, including graphic record, total and timed vital capacity, expiratory flow rate measurement(s), with or without maximal voluntary ventilation) (work RVU=0.17) is similar in time and intensity to CPT code 94729, and that the codes should have the same work RVU. Therefore, we are assigning a work RVU of 0.17 to CPT code 94729 on an interim final basis for CY 2012.

For the CY 2012 new, revised, and potentially misvalued CPT codes reviewed in this family of services and not specifically discussed here, we agree with the AMA RUC/HCPAC-recommended work RVUs and are setting as interim final the work RVUs listed in Table 19.

(22) Neurology and Neuromuscular Procedures: Nerve Conduction Tests (CPT Codes 95885–95887)

CPT/ HCPCS Code	Descriptor	CY 2011 Work RVU	AMA RUC/HCPAC Recommended Work RVU	CY 2012 Interim/Interim Final Work RVU	Agree/ Disagree with AMA RUC/HCPAC Recommendation	CMS Refinement to AMA RUC/HCPAC Recommended Time
95885	Musc tst done w/nerv tst lim	New	0.35	0.35	Agree	No
95886	Musc test done w/n test comp	New	0.92	0.92	Agree	No
95887	Musc tst done w/n tst nonext	New	0.73	0.73	Agree	No

CPT codes 95860, 95861, 95863 and 95864 were identified by the AMA RUC Relativity Assessment Workgroup through the Codes Reported Together 75 percent or More screen. These codes are billed commonly with CPT code 95904. The specialty societies submitted a code change proposal to the CPT Editorial Panel to bundle the services commonly reported together. For CY 2012, the CPT Editorial Panel created 3 new add-on procedure codes: CPT codes 95885, 95886, and 95887. The CPT Editorial Panel noted, and the AMA RUC agreed, that these 3 new codes were approved with the intent that the specialties will take additional time and bring forward a more comprehensive coding solution which bundles services commonly performed together for CY 2013.

We reviewed CPT codes 95885 (Needle electromyography, each extremity, with related paraspinal areas, when performed, done with nerve conduction, amplitude and latency/ velocity study; limited), 95886 (Needle electromyography, each extremity with related paraspinal areas when performed, done with nerve conduction, amplitude and latency/velocity study; complete, five or more muscles studied, innervated by three or more nerves or four or more spinal levels), 95887 (Needle electromyography, non-extremity (cranial nerve supplied or axial) muscle(s) done with nerve conduction, amplitude and latency/ velocity study), and are accepting the AMA RUC-recommended work RVUs and times on an interim basis, pending review of the other electromyography services for CY 2012. On an interim basis for CY 2012 we are assigning a work RVU of 0.35 to CPT code 95885, a work RVU of 0.92 to CPT code 95886, and a work RVU of 0.73 to CPT code 95887.

(23) Neurology and Neuromuscular Procedures: Autonomic Function Tests (CPT Codes 95938 and 95939)

95939	C motor evoked upr&lwr limbs	New	2.25	2.25	Agree	No

AMA/Specialty Society RVS Update Committee
Summary of Recommendations
Originated from the RUC Relativity Assessment – Codes Reported Together 75% or More Screen

April 2011

EMG in Conjunction with Nerve Testing

In February 2010, CPT codes 95860, 95861, 95863 and 95864 were identified by the Relativity Assessment Workgroup through the Codes Reported Together 75% or More Screen. These codes are billed commonly with 95904. In February 2011, the specialties submitted a code change proposal to the CPT Editorial Panel to bundle the services commonly reported together. The Panel created three new ZZZ global codes to be reviewed at the RUC in April 2011. The CPT Editorial Panel noted, and the RUC agreed, that these three new codes were approved with the intent that the specialties will take additional time and bring forward a more comprehensive coding solution which bundles services commonly performed together during the CPT 2013 cycle.

95885 *Needle electromyography, each extremity, with related paraspinal areas, when performed, done with nerve conduction, amplitude and latency/velocity study; limited*
The RUC reviewed the survey results from 88 physicians for CPT code 95885. The RUC reviewed the survey work values and agreed with the specialties that the respondents overestimated the work value of this service. The RUC reviewed CPT code 92621 *Evaluation of central auditory function, with report; each additional 15 minutes* (work RVU= 0.35) and agreed that the two services have comparable physician work and intensity with identical intra-service time of 15 minutes. Given this, the RUC recommends the work value for 95885 be directly crosswalked to the reference code's work RVU of 0.35. To further justify this value, the RUC reviewed another reference code 93320 *Doppler echocardiography, pulsed wave and/or continuous wave with spectral display;* complete (work RVU= 0.38) and agreed that these two analogous services have identical intra-service time, 15 minutes, and should be valued similarly. **The RUC recommends a work RVU of 0.35 for CPT code 95885.**

95886 ***Needle electromyography, each extremity with related paraspinal areas when performed, done with nerve conduction, amplitude and latency/velocity study; complete, five or more muscles studied, innervated by three or more nerves or four or more spinal levels***
The RUC reviewed the survey results from 74 physicians for CPT code 95886. The RUC reviewed the survey's estimated work values and agreed with the specialties that the respondents overestimated the work value of this service. The RUC reviewed the reference code 95973 *Electronic analysis of implanted neurostimulator pulse generator system; complex spinal cord, or peripheral (except cranial nerve) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming, each additional 30 minutes after first hour* (work RVU= 0.92) and agreed that the two services have similar physician work and intensity with identical intra-service time of 30 minutes. Given this, the RUC recommends the work value for 95886 be directly crosswalked to the reference code's work RVU of 0.92. To further justify this value, the RUC reviewed the reference code 17315 *Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (work RVU= 0.87) and agreed that while the two services have identical intra-service time of 30 minutes, the surveyed code is a more complex procedure and should be valued slightly higher than the reference code. **The RUC recommends a work RVU of 0.92 for CPT code 95886.**

95887 ***Needle electromyography, non-extremity (cranial nerve supplied or axial) muscle(s) done with nerve conduction, amplitude and latency/velocity study***

The RUC reviewed the survey results from 63 physicians for CPT code 95887. The RUC reviewed the survey work values and agreed with the specialties that the respondents overestimated the work value of this service. The RUC reviewed the reference code 88334 *Pathology consultation during surgery; cytologic examination (eg, touch prep, squash prep), each additional site* (work RVU= 0.73) and agreed that the two services have similar physician work and identical intra-service time of 20 minutes. Given the similarities, the RUC recommends the work value for 95887 be directly crosswalked to the reference code's work RVU of 0.73. To further justify this value, the RUC reviewed reference code 76885 *Ultrasound, infant hips, real time with imaging documentation; dynamic (requiring physician manipulation)* (work RVU= 0.74) and agreed that the two services have comparable physician work and intensity with identical intra-service time of 20 minutes. **The RUC recommends a work RVU of 0.73 for CPT code 95887.**

95900 ***Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study***

The RUC reviewed the survey results from 64 physicians for CPT code 95900. The RUC recommends maintaining the current RUC reviewed pre-service time of 4 minutes, intra-service time of 6 minutes and post-service time of 4 minutes. The RUC reviewed the survey work values and agreed with the specialties that the respondents overestimated the work value of this service. Given that there is no compelling evidence to suggest the physician work has changed for this service, the RUC recommends the current work RVU of 0.42 for this service. To justify this value, the RUC looked at the MPC code 99212 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU= 0.48) and agreed that these service are comparable but given that the reference code has great intra-service time, 10 minutes compared to 6 minutes, the surveyed code should be valued lower. **The RUC recommends a work RVU of 0.42 for CPT code 95900.**

95903 ***Nerve conduction, amplitude and latency/velocity study, each nerve; motor, motor, with F-wave study***

The RUC reviewed the survey results from 64 physicians for CPT code 95903. The RUC recommends pre-service time of 4 minutes, intra-service time of 10 minutes and post-service time of 4 minutes. The pre-service and post-service time components were reduced from the survey median values to match the analogous physician work of 95900. The RUC noted there is no compelling evidence to suggest the physician work has changed for this service and recommends the current work RVU of 0.60 for this code. To justify this value, the RUC looked at the key reference service 95937 *Neuromuscular junction testing (repetitive stimulation, paired stimuli), each nerve, any 1 method* (work RVU= 0.65) and agreed that these services have analogous physician work and intensity. The RUC determined that 95937 has greater intra-service time compared to the surveyed code, 12 minutes and 10 minutes, respectively, therefore the surveyed code should be valued slightly less. Finally, the RUC noted that the current work RVU of 0.60 is supported by the survey's 25th percentile at the same value. **The RUC recommends a work RVU of 0.60 for CPT code 95903.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95904 ***Nerve conduction, amplitude and latency/velocity study, each nerve; motor, motor, sensory***
The RUC reviewed the survey results from 66 physicians for CPT code 95904. The RUC recommends maintaining the current RUC reviewed pre-service time of 4 minutes, intra-service time of 5 minutes and post-service time of 3 minutes. The RUC reviewed the survey work values and agreed with the specialties that the respondents overestimated the work value of this service. Given that there is no compelling evidence to suggest the physician work has changed for this service, the RUC recommends the current work RVU of 0.34 for this service. To justify this value, the RUC reviewed CPT code 92081 *Visual field examination, unilateral or bilateral, with interpretation and report; limited examination* (work RVU= 0.30) and agreed that since the surveyed code has greater total time than the reference code, 12 minutes compared to 10 minutes, 95904 should be valued slightly higher than the reference code. **The RUC recommends a work RVU of 0.34 for CPT code 95904.**

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

Practice Expense
The RUC had an extensive discussion concerning the typical patient service and made revisions to the direct practice expense inputs recommended by the specialties. The direct inputs recommended by the specialty for codes 95900, 95903, and 95904 were not accepted and the existing inputs are to be maintained. In addition, the RUC recommended the codes be sent to CPT for revision. For all other codes the clinical labor was specifically refined to reflect the work of the evaluation and management service typically performed prior to these services. Supplies and equipment were also reviewed carefully and modified where appropriate.

Additional Discussion
The RUC affirmed that the valuation for CPT codes 95900, 95903 and 95904 is appropriate given the current survey data and review. However, if the specialty should obtain compelling evidence through additional data sources they should not be precluded from requesting a review of these services (i.e. Five-Year Review).

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Track-ing Num-ber	CPT Descriptor	Global Period	Work RVU Recommendation
Medicine **Neurology and Neuromuscular Procedures** **Electromyography** Needle electromyographic (EMG) procedures include the interpretation of electrical waveforms measured by equipment that produces both visible and audible components of electrical signals recorded from the muscle(s) studied by the needle electrode. Use 95870 or 95885 when four or fewer muscles are tested in an extremity. Use 95860-95864 or 95886 when five or more muscles are tested in an extremity. Use EMG codes (95860-95864 and 95867-95870) when no nerve conduction studies (95900-95904) are performed on that day. Use 95885, 95886 and 95887 for EMG services when nerve conduction studies (95900-95904) are performed in conjunction with EMG on the same day. Report either 95885 or 95886 once per extremity. Codes 95885 and 95886 can be reported together up to a combined total of four units of service per patient when all four extremities are tested.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95885 Tracking Number GG1 Original Specialty Recommended RVU: **0.34**
Presented Recommended RVU: **0.35**
Global Period: ZZZ RUC Recommended RVU: **0.35**

CPT Descriptor: Needle electromyography, each extremity with related paraspinal areas when performed, done with nerve conduction, amplitude and latency/velocity study; limited (List separately in addition to code for primary procedure)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year old woman has a five month history of frequent awakening at night due to right hand and arm pain. Prolonged typing also causes distal right upper extremity numbness, tingling and pain and she sometimes drops things out of the right hand. Physical examination reveals numbness of the palmar aspects of the right index and middle fingers; and a questionable Tinel's sign over the right median nerve at the carpal tunnel. Three motor and four sensory nerve conduction studies were performed. Right median sensory nerve conduction is slowed across the carpal tunnel. Needle electromyography examination of a thenar muscle innervated by the median nerve of the symptomatic limb is indicated, along with an ulnar and radial-innervated muscle to confirm the diagnosis of median neuropathy at the wrist, evaluate severity, and rule out more widespread pathology.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: Intra-service work includes physician participation in patient preparation, focusing on discussing the needle EMG test with the patient and answering questions regarding the pain associated with the procedure. The physician must specifically assess the risk of the procedure (e.g., bleeding, infection) by reviewing the patient's medical history and medications. The physician places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode into each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the needle insertion. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to insure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Four or fewer muscles are

examined individually using the steps outlined above. The muscles are located in an upper or lower extremity and its related cervical or lumbar paraspinal areas.

Description of Post-Service Work:

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95861	XXX	1.54	**RUC Time**

CPT Descriptor Needle electromyography; 2 extremities with or without related paraspinal areas

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
36405	XXX	0.31	**RUC Time**	1

CPT Descriptor 1 Venipuncture, younger than age 3 years, necessitating physician's skill, not to be used for routine venipuncture; scalp vein

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99212	XXX	0.48	**RUC Time**	19,660,131

CPT Descriptor 2 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

Other Reference CPT Code	Global	Work RVU	Time Source
		0.00	

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 42 **% of respondents:** 47.7 **%**

TIME ESTIMATES (Median)	**CPT Code: 95885**	**Key Reference CPT Code:** 95861	**Source of Time** **RUC Time**
Median Pre-Service Time	0.00	15.00	
Median Intra-Service Time	15.00	25.00	
Median Immediate Post-service Time	0.00	10.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**15.00**	**50.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.64	3.71
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.55	3.52
Urgency of medical decision making	3.14	3.21
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.17	4.19
Physical effort required	3.21	3.29
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.52	2.62
Outcome depends on the skill and judgment of physician	4.19	4.19
Estimated risk of malpractice suit with poor outcome	2.57	2.71

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.81	2.81
Intra-Service intensity/complexity	3.86	3.93
Post-Service intensity/complexity	3.07	3.05

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 5 surveying specialties met via conference call and email to develop recommendations.

While there were a large number of survey respondents, the high times and RVW show there was likely confusion about regarding this service as an add-on EMG only.
The panel considered the existing work value for the corresponding stand-alone limited EMG (95870) which is 0.37 and recommends decreasing the value to 0.34 RVW to reflect the amount of duplication in work of providing the nerve conduction base code and the EMG service. The panel determined 15 minutes was an appropriate intra-service time. When reviewing the needle EMG tests in summary, the panel ensured there were not rank order anomalies with the times or RVW.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached Table 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This is a new add-on code that reflects similar work to the existing stand-alone code 95870.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty PM&R How often? Commonly

Specialty Physical Therapy How often?

Estimate the number of times this service might be provided nationally in a one-year period? 245068
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimated four times the Medicare utilization.

Specialty Neurology Frequency 168386 Percentage 68.70 %

Specialty PM&R Frequency 63423 Percentage 25.87 %

Specialty Physical Therapy Frequency 564 Percentage 0.23 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
60,654 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Please explain the rationale for this estimate. This is based on the 2009 Medicare utilization of CPT code 95870, though a small percentage of 95870 will continue to be reported as stand-alone EMGs.

Specialty Neurology	Frequency 42102	Percentage 68.71 %
Specialty PM&R	Frequency 15862	Percentage 25.88 %
Specialty Physical Therapy	Frequency 141	Percentage 0.23 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95870

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95886 Tracking Number GG2 Original Specialty Recommended RVU: **0.90**
Presented Recommended RVU: **0.92**
Global Period: ZZZ RUC Recommended RVU: **0.92**

CPT Descriptor: Needle electromyography, each extremity with related paraspinal areas when performed, done with nerve conduction, amplitude and latency/velocity study; complete, five or more muscles studied, innervated by three or more nerves or four or more spinal levels
(List separately in addition to code for primary procedure)
(Use 95885, 95886 in conjunction with 95900-95904)
(Do not report 95885, 95886 in conjunction with 95860-95864, 95870, 95905)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55 year old diabetic man has a two month history of pain, numbness, and tingling of the left upper extremity. There was no preceding injury and there are no clear cut provocative or palliative factors. Physical examination reveals no definite motor, sensory or reflex abnormalities. Three motor and four sensory nerve conduction studies were performed. No abnormalities are noted on these studies. Needle electromyography examination of at least 1 muscle innervated by the C5, C6, C7, C8, and T1 spinal roots in the symptomatic limb, and cervical paraspinal muscles at 1 or more levels, is indicated to evaluate for mononeuropathy, peripheral neuropathy, brachial plexopathy, or cervical radiculopathy as a cause for these symptoms.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: Intra-service work includes physician participation in patient preparation, focusing on discussing the needle EMG test with the patient and answering questions regarding the pain associated with the procedure. The physician must specifically assess the risk of the procedure (e.g., bleeding, infection) by reviewing the patient's medical history and medications. The physician places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode into each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the needle insertion. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration,

amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to insure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Five or more muscles are examined individually using the steps outlined above. The muscles are located in an upper or lower extremity and its related cervical or lumbar paraspinal areas, and are innervated by three or more nerves or four or more spinal levels.

Description of Post-Service Work:

Intra-Service intensity/complexity	4.33	4.28
Post-Service intensity/complexity	3.47	3.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 5 surveying specialties met via conference call and email to develop recommendations.

While there were a large number of survey respondents, the high times and RVW show there was likely confusion about the actual work involved in this service as an add-on EMG only.
The panel looked at the existing work value for the stand-alone complete one limb needle EMG (95860) which is 0.96 and recommends decreasing the value to 0.92 RVW to reflect a duplication in work when providing the nerve conduction base code and the EMG add-on code. The panel determined 30 minutes was an appropriate intra-service time. When reviewing the needle EMG tests in summary, the panel ensured there were not rank order anomalies with the times or RVW.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached Table 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This is a new add-on code that reflects similar work to the existing stand-alone code 95860.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty PM&R How often? Commonly

Specialty Physical Therapy How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 1052808
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimated four times the Medicare utilization.

Specialty Neurology Frequency 665796 Percentage 63.24 %

Specialty PM&R Frequency 323423 Percentage 30.72 %

Specialty Physical Therapy Frequency 6528 Percentage 0.62 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 646,904 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on 2009 Medicare utilization of 95860, 61, 63, 64.

Specialty Neurology	Frequency 407552	Percentage 63.00 %
Specialty PM&R	Frequency 194075	Percentage 30.00 %
Specialty Physical Therapy	Frequency 4974	Percentage 0.76 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95860

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95887 Tracking Number GG3 Original Specialty Recommended RVU: **0.48**
Presented Recommended RVU: **0.73**
Global Period: ZZZ RUC Recommended RVU: **0.73**

CPT Descriptor: Needle electromyography, non-extremity (cranial nerve supplied or axial) muscle(s) done with nerve conduction, amplitude and latency/velocity study (List separately in addition to code for primary procedure)
(Use 95887 in conjunction with 95900-95904)
(Do not report 95887 in conjunction with 95867-95870, 95905)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65 year old woman has a two month history of right facial weakness involving the forehead, eyelid and mouth. Initially she was treated with steroids for a presumptive diagnosis of Bell's palsy, but her deficits persisted. Physical examination demonstrates a peripheral distribution right facial palsy. Right facial motor nerve conduction study was abnormal due to prolonged distal motor latency and low compound muscle action potential amplitude. Needle electromyography of right cranial nerve innervated muscles (V, VII, XI, XII) is indicated to confirm the diagnosis, help establish the prognosis and determine the need for facial nerve decompression.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: Intra-service work includes physician participation in patient preparation, focusing on discussing the needle EMG test with the patient and answering questions regarding the pain associated with the procedure. The physician must specifically assess the risk of the procedure (e.g., bleeding, infection) by reviewing the patient's medical history and medications. The physician places the ground surface electrode, cleans the skin overlying anticipated muscle puncture sites, and dons gloves prior to the examination. Prior to inserting the needle electrode into each muscle to be examined, the electromyographer must perform a focused physical examination to determine surface anatomic landmarks, and identify structures to avoid during the needle insertion. Under minimal voluntary contraction of the muscle at least 20 voluntary motor unit potentials are analyzed along multiple passes through the muscle, noting duration, amplitude, configuration and other diagnostic variables both visually and by sound that allow the waveform to be classified as normal or abnormal. The patient is examined after the needle is withdrawn from each puncture site to insure hemostasis and to apply any needed manual pressure or bandage where minor bleeding may be observed. Cranial nerve innervated

muscles (eg, face or tongue muscles) or axial muscles (eg, serratus anterior or thoracic paraspinal muscles) on one side of the body are examined individually using the steps outlined above. Special care must be taken during the study since many muscles are thin and located adjacent to critical structures (eg, eye or lung).

Description of Post-Service Work:

Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**20.00**	**50.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.52	4.31
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.52	4.28
Urgency of medical decision making	4.17	3.93
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.90	4.62
Physical effort required	3.62	3.52
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.79	3.28
Outcome depends on the skill and judgment of physician	4.86	4.66
Estimated risk of malpractice suit with poor outcome	3.59	3.21

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.69	3.52
Intra-Service intensity/complexity	4.48	4.52
Post-Service intensity/complexity	3.79	3.66

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 5 surveying specialties met via conference call and email to develop recommendations.

While there were a large number of survey respondents, the high times and RVW show there was likely confusion about the actual work involved in this service as an add-on EMG only code.
This code represents the work of several current stand-along needle EMG codes, including 95867 (0.79 RVW), 95869 (0.37 RVW) and part of 95870 (0.37 RVW). The panel recommends a value of 0.73 RVW to reflect the amount of duplication in work when providing the nerve conduction base code and the EMG service. The panel determined 20 minutes was an appropriate intra-service time. When reviewing the needle EMG tests in summary, the panel ensured there were not rank order anomalies with the times or RVW. When compared with 95885, 95886 involves increased risk because of the areas involved in the test (e.g., face and paraspinal muscles).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached table 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Either 95867, 95868, 95869, or 95870

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Sometimes

Specialty PM&R How often? Sometimes

Specialty Physical Therapy How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 50292
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimated four times the Medicare utilization.

Specialty Neurology Frequency 39394 Percentage 78.33 %

Specialty PM&R Frequency 7338 Percentage 14.59 %

Specialty Physical Therapy Frequency 110 Percentage 0.21 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 12,573 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on 2009 Medicare utilization of 95867, 95868, and 95869, though a small percentage of those services will continue to be reported as stand-alone EMGs.

Specialty Neurology Frequency 9849 Percentage 78.33 %

Specialty PM&R Frequency 1835 Percentage 14.59 %

Specialty Physical Therapy Frequency 28 Percentage 0.22 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95860

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95900 Tracking Number GG4 Original Specialty Recommended RVU: **0.42**
Presented Recommended RVU: **0.42**
Global Period: XXX RUC Recommended RVU: **0.42**

CPT Descriptor: Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old female presents to the clinic with weakness of the right quadriceps muscle and pain over the right hip. Based on the examination, a traumatic femoral neuropathy is suspected. A motor nerve conduction study without f-wave of the right femoral nerve is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 1%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The physician reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addresses the relevant clinical questions. Specifically the physician considers available recording and stimulating sites for the nerve, and determining the appropriate sites based on the possible sites of nerve injury. The appropriate muscles to be studies are then determined.

Description of Intra-Service Work: Intra-service work includes physician performance or supervision of patient preparation, placement of ground, stimulating and recording surface electrodes, stimulation of nerves and recording of the waveform of the resulting compound muscle action potentials. The waveform is analyzed with respect to latency, amplitude and configuration. Interelectrode distances are measured and recorded. Test design changes during the course of the study in response to the information obtained.

Description of Post-Service Work: Post-service work involves calculation of nerve conduction velocities, comparison to normal values, summarization of clinical and electrodiagnostic data, physician interpretation, generation of a differential diagnosis and sometimes suggestions for further work-up.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 5 surveying specialties met via conference call and email to develop recommendations. While the survey data showed higher times and RVWs, the panel felt there was not evidence

that more time was involved in performing the service and the work had not changed since the code was valued in 2005. The panel supports the existing RUC times and RVW of 0.42.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See Table 1.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95903 Tracking Number GG5 Original Specialty Recommended RVU: **0.60**
Presented Recommended RVU: **0.60**
Global Period: XXX RUC Recommended RVU: **0.60**

CPT Descriptor: Nerve conduction, amplitude and latency/velocity study, each nerve; motor, with F-wave study

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman presents with 3 months of weakness and numbness of her arms and legs. Physical examination shows weakness of distal upper and lower limb muscles, areflexia and sensory loss. Axonal or demyelinating polyneuropathies are suspected. Motor nerve conduction studies with f-waves in the upper and lower limbs are indicated.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 1%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The physician reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addrresses the relevant clinical questions. Specifically the physician considers available recording and stimulating sites for the nerve, and determining the appropriate sites based on the possible sites of nerve injury. The appropriate muscles to be studies are then determined

Description of Intra-Service Work: Intra-service work includes physician performance or supervision of patient preparation, placement of ground, stimulating and recording surface electrodes, stimulation of nerves and recording of the waveform of the resulting compound muscle action potentials. The waveform is analyzed with respect to latency, amplitude and configuration. Interelectrode distances are measured and recorded. F-wave studies involve changing the electromyograph's gain setting, time base and filter settings (sometimes), reorienting the stimulating electrode (sometimes) and stimulating motor nerves enough times to generate more than 10 F-waves, which are recorded and analyzed. Test design changes during the course of the study in response to the information obtained.

Description of Post-Service Work: Post-service work involves calculation of nerve conduction velocities, sometimes calculation of certain F-wave indices that are more sensitive than raw F-wave latencies, comparison to normal values, summarization of clinical and electrodiagnostic data, physician interpretation, generation of a differential diagnosis and sometimes suggestions for further work-up.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? Yes

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95937	XXX	0.65	**RUC Time**

CPT Descriptor Neuromuscular junction testing (repetitive stimulation, paired stimuli), each nerve, any 1 method

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99212	XXX	0.48	**RUC Time**	19,660,131

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99462	XXX	0.62	**RUC Time**	15

CPT Descriptor 2 Subsequent hospital care, per day, for evaluation and management of normal newborn

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 27 **% of respondents:** 41.5 **%**

TIME ESTIMATES (Median)	**CPT Code: 95903**	**Key Reference CPT Code:** 95937	**Source of Time** **RUC Time**
Median Pre-Service Time	4.00	5.00	
Median Intra-Service Time	10.00	12.00	
Median Immediate Post-service Time	4.00	5.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**18.00**	**22.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.41	4.33
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.33	4.30
Urgency of medical decision making	4.04	4.04
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.41	4.56
Physical effort required	3.67	3.81
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.19	3.07
Outcome depends on the skill and judgment of physician	4.63	4.56
Estimated risk of malpractice suit with poor outcome	3.22	3.19

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.59	3.67
Intra-Service intensity/complexity	4.19	4.30
Post-Service intensity/complexity	3.70	3.74

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 5 surveying specialties met via conference call and email to develop recommendations. While the survey data showed higher times and RVWs, the panel felt there was not evidence

that more time was involved in performing the service and the work had not changed since the code was valued at the RUC. The panel supports the existing RUC times and RVW of 0.60.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See table 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95903

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty PM&R How often? Commonly

Specialty Physical Therapy How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 8592492
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national frequency as 4 times the Medicare utilization.

Specialty Neurology Frequency 4458644 Percentage 51.88 %

Specialty PM&R Frequency 1082653 Percentage 12.59 %

Specialty Physical Therapy Frequency 46399 Percentage 0.53 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,148,123 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on 2009 Medicare data.

Specialty Neurology Frequency 1114875 Percentage 51.89 %

Specialty PM&R Frequency 270878 Percentage 12.60 %

Specialty Physical Therapy Frequency 11750 Percentage 0.54 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95903

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95904 Tracking Number GG6 Original Specialty Recommended RVU: **0.34**
Presented Recommended RVU: **0.34**
Global Period: XXX RUC Recommended RVU: **0.34**

CPT Descriptor: Nerve conduction, amplitude and latency/velocity study, each nerve; sensory
(Report 95900, 95903, and/or 95904 only once when multiple sites on the same nerve are stimulated or recorded)
(Use 958XX-958ZZ with 95900-95904 when performing electromyography with nerve conduction studies)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45 year woman with no significant past medical history presents with three months of tingling and numbness in both lower limbs distally and in the left more than right hand. Physical examination shows normal strength, loss of pin prick and vibration over the feet, lower legs, and fingers bilaterally, as well as absent ankle reflexes. A disorder affecting sensorimotor nerves or a neuronopathy is suspected. Motor nerve conduction studies show normal distal lower and upper limb nerve conduction values. Sensory nerve conduction studies are recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 1%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work: The physician reviews the medical records, takes a brief history and performs a brief examination. These steps are necessary to ensure that the test is performed in a way that addrresses the relevant clinical questions. Specifically the physician considers available recording and stimulating sites for the nerve, and determining the appropriate sites based on the possible sites of nerve injury. The appropriate muscles to be studies are then determined.

Description of Intra-Service Work: Intra-service work includes physician participation in patient preparation, focusing on discussing the test with the patient and answering questions regarding the pain associated with the procedure. After identifying anatomic landmarks, the physician (and/or the technologist) cleans the skin overlying anticipated nerve stimulation and recording sites and places the recording electrodes and ground surface electrodes. Electrical stimuli are delivered via the surface stimulating electrode prongs; this includes searching for the optimal site by the obtained response, rotating the prongs to secure the proper shape of waveform on the EMG machine screen, and constantly communicating with the patient in an effort to reduce muscle artifact. Reporting procedures are explained to the patient.

Description of Post-Service Work: Post-service work involves assessing the waveforms from each sensory nerve tested, summarization of clinical and electrodiagnostic data, writing the physician interpretation, generation of a differential diagnosis, and sometimes providing suggestions for further investigations.

Post-Service intensity/complexity	3.83	3.91

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 5 surveying specialties met via conference call and email to develop recommendations. While the survey data showed higher times and RVWs, the panel felt there was not evidence

that more time was involved in performing the service and the work had not changed since the code was valued in 2005. The panel supports the existing RUC times and RVW of 0.34.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See Table 1.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95904

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Commonly

Specialty PM&R How often? Commonly

Specialty Physical Therapy How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 14382148
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national frequency at 4 times Medicare utilization.

Specialty Neurology Frequency 7271614 Percentage 50.55 %

Specialty PM&R Frequency 2863485 Percentage 19.90 %

Specialty Physical Therapy Frequency 86293 Percentage 0.60 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,595,537 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on 2009 Medicare data.

Specialty Neurology Frequency 1818263 Percentage 50.56 %

Specialty PM&R Frequency 716230 Percentage 19.91 %

Specialty Physical Therapy Frequency 21932 Percentage 0.60 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95904

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
95885 Needle electromyography, each extremity with related paraspinal areas when performed, done with nerve conduction, amplitude and latency/velocity study; limited (List separately in addition to code for primary procedure)

Global Period: _ZZZ_

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from each of the 5 surveying specialties met via email and conference call to develop recommendations.

If you have provide any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

The panel looked at existing PE inputs for a similar service (95870) as a basis for the new code, and modified them to reflect current PE Subcommittee conventions.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
No pre-service time as the code is an add-on.

Intra-Service Clinical Labor Activities:
The additional components of the EMG test are explained to the patient, and the patient is asked if they wish to proceed. The patient's medical history is reviewed so that the risks of the procedure (eg, bleeding or pain) can be properly assessed. Notes are taken during the test regarding the results.

Post-Service Clinical Labor Activities:
No pre-service time as the code is an add-on.

AMA/Specialty Society RVS Update Committee
Summary of Recommendations

February 2009

Nerve Conduction Tests

The CPT Editorial Panel created one new Category I CPT code to describe a new nerve conduction test performed with newer technologies that differ from traditional technologies. The Editorial Panel created, 95905, *Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study; each limb, includes F-wave study when performed, with interpretation and report* at its October 2008 Meeting. The Editorial Panel specified that this codes may be reported only once per limb studied.

The specialty societies presented survey data from 75 physicians; however, the median service performance rate of all surveyees was zero. Following RUC policy, the specialties provided additional data from their original survey, including the compilation of responses from physicians with a service performance rate of at least one and the compilation of responses from physicians with a service performance rate of zero, which the RUC compared with the aggregate data in the Summary of Recommendation form. The specialties also provided a complete description of the work that is included in the procedure to support the contention that there is physician work involved since it was noted that 21 of the survey respondents compared the new code to a reference code with no physician work. Based on this description and the overall survey results, the RUC agreed that although the median survey work RVUs and some of the surveyed physician times are inflated, a small amount of physician work is appropriate. The RUC reviewed the times recommended by the specialties and noted that there is no pre-service or post-service physician time and that the physician work is only performed during the intra-service period. Specifically, the RUC decided that the physician work described by the specialties within the pre-service time is included within the evaluation and management service that is typically reported on the same day and that the physician work described by the specialties within the post-service time is inappropriate and is included within the five minutes of intra-service time. The RUC compared 95905 to 76977, *Ultrasound bone density measurement and interpretation, peripheral site(s), any method* (work RVU = 0.05, intra-service = 5 minutes), which is identical in physician time and work. The RUC agreed that 76977 serves as a direct comparison code and the appropriate work RVU for 95905 is 0.05, based on this magnitude estimation. The Committee also noted that 0.05 is the survey 25th percentile work RVU. The RUC also commented that this service is Modifier 51 exempt and assumed it may often be reported more than once, supporting pre- and post-service times of 0 minutes. **Therefore, the RUC recommends a work RVU of 0.05, no pre- or post-service time and five minutes of intra-service time for 95905.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Practice Expense
The RUC reviewed the practice expense inputs and revised the clinical staff time to reflect that multiple units of services are typically reported.

PLI
The RUC recommends a PLI crosswalk to the key reference service, 76977-26 (the professional component only).

New Technology
The RUC recommends that 95905 is placed on the New Technology list.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
The following applies to nerve conduction tests (95900-95904): Codes 95900-95904 describe nerve conduction tests when performed with individually placed stimulating, recording, and ground electrodes. The stimulating, recording, and ground electrode placement and the test design must be individualized to the patient's unique anatomy. Nerves tested must be limited to the specific nerves and conduction studies needed for the particular clinical question being investigated. The stimulating electrode must be placed directly over the nerve to be tested, and stimulation parameters properly adjusted to avoid stimulating other nerves or nerve branches. In most motor nerve conduction studies, and in some sensory and mixed nerve conduction studies, both proximal and distal stimulation will be used. Motor nerve conduction study recordings must be made from electrodes placed directly over the motor point of the specific muscle to be tested. Sensory nerve conduction study recordings must be made from electrodes placed directly over the specific nerve to be tested. Waveforms must be reviewed on site in real time, and the technique (stimulus site, recording site, ground site, filter settings) must be adjusted, as appropriate, as the test proceeds in order to minimize artifact, and to minimize the chances of unintended stimulation of adjacent nerves and the unintended recording from adjacent muscles or nerves. Reports must be prepared on site by the examiner, and consist of the work product of the interpretation of numerous test results, using well-established techniques to assess the amplitude, latency, and configuration of waveforms elicited by stimulation at each site of each nerve tested. This includes the calculation of nerve conduction velocities, sometimes including specialized F-wave indices, along with comparison to normal values, summarization of clinical and electrodiagnostic data, and physician or other qualified health care professional interpretation. Code 95905 describes nerve conduction tests when performed with preconfigured electrodes customized to a specific anatomic site.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

CPT Code:95905 Tracking Number M1 Specialty Society Recommended RVU: **0.15**

Global Period: XXX RUC Recommended RVU: **0.05**

CPT Descriptor: Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study; each limb, includes F-wave study when performed, with interpretation and report
(Report 95905 only once per limb studied)
(Do not report 95905 in conjunction with 95900-95904, 95934-95936)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 42-year-old female data entry clerk reported that, although she had had no injuries and during the day she was okay, she had been awakened in the middle of each night for the past two weeks with a numb, aching, burning feeling in her right hand that was relieved by holding her hand down and shaking it, rubbing it and running cold water over it. Physical examination reveals weakness of right thumb abduction, wasting of the right thenar eminence, numbness of the palmar aspects of the right thumb, index finger and middle finger, and a Tinel's sign over the right median nerve at the carpal tunnel. (History and exam reported separately as E/M). Nerve conduction testing using preconfigured arrays for the right arm is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 73%

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Is moderate sedation inherent in your reference code (Office setting)? No
Is moderate sedation inherent in your reference code (Hospital/ASC setting)? No

Description of Pre-Service Work:

Description of Intra-Service Work: The physician reviews a summary of electrodiagnostic data from each nerve tested and assesses it in the context of comparison to normal values and the patient's history and physical examination.

Description of Post-Service Work:

Time Segments (Mean)

Pre-Service intensity/complexity	1.24	1.48
Intra-Service intensity/complexity	1.19	1.90
Post-Service intensity/complexity	1.43	2.10

Additional Rationale

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The survey received 75 responses from among the 5 surveying societies.

Since the majority of respondents have not performed this service, the group also examined survey data based on only those who had performed the service in the last year. Based on that data, the median RVW was 0.17 and the times were 3 minutes pre-service, 5 minutes intra-service, and 5 minutes post-service. The results were very similar to the complete survey data.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This procedure is typically reported on the same day as an E/M service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Code	Global Period	RVW	Pre-time	Intra-time	Post-time	Total Time
9590X1	XXX	?	3	5	4	12
99213	XXX	0.92	3	15	5	23

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95900, 95903, 95904

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Family Physicians How often? Sometimes

Specialty Endocrinology How often? Sometimes

Specialty Neurology How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 4000000
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We multiplied our estimates for Medicare times 4 to estimate national utilization.

Specialty Family Physicians Frequency 2500000 Percentage 62.50 %

Specialty Endocrinology Frequency 1495000 Percentage 37.37 %

Specialty Neurology Frequency 5000 Percentage 0.12 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000,000 If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate. We examined Medicare utilization data of 95900, 95903, and 95904 by family practice and internal medicine for 2006 and estimated most of the codes would have been reported for automated nerve testing services.

Specialty Family Physicians Frequency 625000 Percentage 62.50 %

Specialty Endocrinology Frequency 373750 Percentage 37.37 %

Specialty Neurology Frequency 1250 Percentage 0.12 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? No

If no, please select another crosswalk and provide a brief rationale. 76977-26

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Non-Surgical

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor:

Motor and/or sensory nerve conduction, using preconfigured electrode array(s), amplitude and latency/velocity study; each limb, includes F-wave study when performed, with interpretation and report
(Report 95905 only once per limb studied)
(Do not report 95905 in conjunction with 95900-95904, 95934-95936)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The RUC advisors from the five specialty societies that surveyed the physician work involved with this code formed a joint RVS panel to formulate the recommendations regarding direct practice expense inputs. The joint RVS panel met twice by conference call and also exchanged information by e-mail. The panel members relied on their own experience and knowledge of the service to formulate the recommendations.

Please describe the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

RN/LPN/MA:

Intra-Service Clinical Labor Activities:

RN/LPN/MA: Reviews test orders and relevant clinical information. Files pre-authorization paperwork if necessary. Ensures adequate supply of electrodes for the ordered testing. Escorts patient from registration area to exam site and instructs patient on appropriate limb exposure, gowning if necessary. Explains testing procedure, purpose, and side effects. Positions patient for study, then cleans and preps indicated limb. Stimulating and recording surface electrode components of the nerve specific pre-configured electrode arrays are placed. Testing involves automated stimulation of nerves and recording of the waveforms of the resulting compound muscle or sensory nerve action potentials. The waveforms are transmitted electronically for computer generated analysis with respect to latency, amplitude, and configuration. Provides discharge instructions. Gathers data report and clinical information for interpretation by physician. Tracks and reorders electrode supplies as needed. Performs internal Q/A activity.

Post-Service Clinical Labor Activities:

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
95886 Needle electromyography, each extremity with related paraspinal areas when performed, done with nerve conduction, amplitude and latency/velocity study; complete, five or more muscles studied, innervated by three or more nerves or four or more spinal levels (List separately in addition to code for primary procedure)

Global Period: _ZZZ_

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from each of the 5 surveying specialties met via email and conference call to develop recommendations.

If you have provide any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

The panel looked at existing PE inputs for a similar service (95860) as a basis for the new code, and modified them to reflect current PE Subcommittee conventions.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
No pre-service time as the code is an add-on.

Intra-Service Clinical Labor Activities:
The additional components of the EMG test are explained to the patient, and the patient is asked if they wish to proceed. The patient's medical history is reviewed so that the risks of the procedure (eg, bleeding or pain) can be properly assessed. Notes are taken during the test regarding the results.

Post-Service Clinical Labor Activities:
No pre-service time as the code is an add-on.

A consensus panel representing members from each of the 5 surveying specialties met via email and conference call to develop recommendations.

If you have provide any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

The panel looked at existing PE inputs for similar services (95867, 95869, and 95870) as a basis for the new code, and modified them to reflect current PE Subcommittee conventions.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
No pre-service time as the code is an add-on.

Intra-Service Clinical Labor Activities:
The additional components of the EMG test are explained to the patient, and the patient is asked if they wish to proceed. The patient's medical history is reviewed so that the risks of the procedure (eg, bleeding or pain) can be properly assessed. Notes are taken during the test regarding the results.

Post-Service Clinical Labor Activities:
No pre-service time as the code is an add-on.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study

Global Period:_XXX_

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from each of the 5 surveying specialties met via email and conference call to develop recommendations.

If you have provide any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

The panel looked at existing PE inputs for the service as approved in 1999 and modified them to reflect current PE Subcommittee conventions and current typical inputs for the service.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
The patient is called prior to the test day to confirm the appointment and answer questions. The patient is greeted by the technician, identity verified by full name and date of birth, and escorted into the room where testing is to be done.

Intra-Service Clinical Labor Activities:
The medical record and all documents related to the testing are read, allowing the plan of electrodiagnostic testing unique to the patient to be formulated.The test is explained to the patient, consent is obtained, and the patient is asked if they wish to proceed.The technician prepares the room, changes the exam table paper/linen, and reviews the supplies to be sure that the necessary equipment is available in the room. Thepatient information is entered into the EMG machine via keyboard including name, medical record number, gender, height, weight, and codified medical history, including indications for testing.The patient is instructed to disrobe,and don a gown. The patient is covered with a blanket and then the limb temperatures are measured using a temperature probe because a threshold temperature is required for an optimal test. The limb is warmed for up to 10 minutes as appropriate to attain the required temperature level. Notes are taken during the test regarding the results and other information (eg, temperature of the limb at the time of the test,presence of peripheral edema, other relevant clinical information).

Post-Service Clinical Labor Activities:
The patient is monitored after the procedure for any adverse effects. Patient questions are answered. When necessary the patient is assisted with re-dressing and is escorted back to the patient waiting area.. The room is cleaned and soiled/disposable linens and other materials are placed in the proper containers. Forms/data sheets are printed, collected, and brought to the administrative/interpretation area. After the report is finalized, it is uploaded to the electronic medical record and/or mailed/faxed to the outside referring physician.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Codes Reported Together 75% or More
Different Performing Specialty from Survey

April 2012

Autonomic Function Testing

CPT codes 95921 and 95922 were identified through the Codes Reported Together 75% or More screen as well as the Different Performing Specialty from the Survey screen. In February 2012, the CPT Editorial Panel created a new code 95924 which combines the procedures currently described in 95921 and 95922 as these are currently reported together more than 75% of the time. Additionally, the dominant specialties now performing these services are Family Medicine and Internal Medicine, specialties that were not part of the 1996 survey. Lastly, the utilization for 95921 and 95922 has dramatically increased and from 2008 to 2009 and continue to rise, which the specialties attribute to incorrect reporting of these services for the use of a device for an automated nervous system test. Therefore, the CPT Editorial Panel created CPT 95943 to describe the automated nervous system test, in which providers do not use a tilt table during autonomic testing.

95921 Testing of autonomic nervous system function; cardiovagal innervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breathing with recorded R-R interval, Valsalva ratio, and 30:15 ratio
The RUC reviewed the survey results from 33 neurologists, neuromuscular and electrodiagnostic medicine physicians and determined that the current work RVU of 0.90 appropriately accounts for the work required to perform this service. The RUC agreed with the median survey results of 8 minutes pre-service time, 15 minutes intra-service time and 10 minute immediate post-service time. The specialties indicated and the RUC agreed that the key reference service 95925 *Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in upper limbs* (work RVU = 0.54) is not an appropriate comparison for this service because the physician is not present during the test, it is much less intense and there is very little risk compared 95921 in which the physician is present and patients are fainting and have arrhythmias. The RUC compared the surveyed code to MPC codes 99202 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU = 0.93 and 15 minutes intra-service time) and determined that these services required similar physician work and the same intra-service time to perform. For additional support, the RUC compared the surveyed code to the secondary key reference service 95819 *Electroencephalogram (EEG); including recording awake and asleep* (work RVU = 1.08 and 15 minutes intra-service time) and determined 95921 requires slightly less physician work to perform and MPC code 20551 *Injection(s); single tendon origin/insertion* (work RVU = 0.75 and 20 minutes total time) and determined that 95921 requires more physician work and time to perform. **The RUC recommends a work RVU of 0.90 for CPT code 95921.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95922 Testing of autonomic nervous system function; vasomotor adrenergic innervation (sympathetic adrenergic function), including beat-to-beat blood pressure and R-R interval changes during Valsalva maneuver and at least 5 minutes of passive tilt
The specialty societies indicated that 20 minutes of tilt is the new standard to perform this service; abnormalities may go undetected in less time. However, depending on the specific conditions of the patient the tilt table time may be less than 20 minutes. The RUC indicated that once physicians are practicing the new standard for this service and 20 minutes of tilt table is typical, at their discretion, the specialties may go to CPT to change the descriptor to "at least 20 minutes".

The RUC reviewed the survey results from neurologists, neuromuscular and electrodiagnostic medicine physicians and determined that the current work RVU of 0.96 appropriately accounts for the work required to perform this service. The RUC agreed with the median survey results of 10 minutes pre-service time, 20 minutes intra-service time and 10 minute immediate post-service time. The RUC compared the surveyed code to MPC codes 95805 *Multiple sleep latency or maintenance of wakefulness testing, recording, analysis and interpretation of physiological measurements of sleep during multiple trials to assess sleepiness* (work RVU = 1.20 and 20 minutes intra-service time) and determined that 95805 services requires slightly more physician work to perform. For additional support, the RUC compared the surveyed code to MPC code 99213 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 0.97 and 23 minutes total time) and determined that 95922 requires similar physician work to perform. **The RUC recommends a work RVU of 0.96 for CPT code 95922.**

95924 Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt
The specialty societies indicated that 20 minutes of tilt is the new standard to perform this service; abnormalities may go undetected in less time. However, depending on the specific conditions of the patient the tilt table time may be less than 20 minutes. The RUC indicated that once physicians are practicing the new standard for this service and 20 minutes of tilt table is typical, at their discretion, the specialties may go to CPT to change the descriptor to "at least 20 minutes".

The specialty societies indicated that 95924 combines the services currently described in 95921 and 95922. The typical patient that will receive the combined tests 95924 is more complex and the testing is more intense than the patient that will just have one test (95921 or 95922). The RUC reviewed the survey results for 95924 and determined that the survey response rate was too low (26 responses). There was also confusion about what is described in 95943 which may have resulted in invalid physician time for this service. As an interim recommendation, the RUC recommends that the physician work and intra-service time for 95921 and 95922 be added together to account for the physician work and time required to perform this service (0.90 + 0.96 = 1.86 and 15 minutes + 20 minutes = 35 minutes intra-service time). The RUC recommends interim pre-service time of 10 minutes, intra-service time of 35 minutes and post-service time of 15 minutes. **The RUC recommends an interim work RVU of 1.86 for CPT code 95924 until this service is resurveyed for the October 2012 RUC meeting.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95923 Testing of autonomic nervous system function; sudomotor, including 1 or more of the following: quantitative sudomotor axon reflex test (QSART), silastic sweat imprint, thermoregulatory sweat test, and changes in sympathetic skin potential
The RUC reviewed the survey results from neurologists, neuromuscular and electrodiagnostic medicine physicians and determined that the current work RVU of 0.90 appropriately accounts for the work required to perform this service. The RUC agreed with the survey 5 minutes pre-service time, 15 minutes intra-service time and 10 minute immediate post-service time, which are the current times. The RUC compared the surveyed code to key reference code 99213 *Office or other outpatient visit for the evaluation and management of an established patient* (work RVU = 0.97 and 23 minutes total time) and determined that 95923 requires similar physician work and intensity and complexity to perform. The RUC also compared 95923 to 95921 and determined that the physician work and intra-service time is the same for these services. **The RUC recommends a work RVU of 0.90 for CPT code 95923.**

95943 Simultaneous, independent, quantitative measures of both parasympathetic function and sympathetic function, based on time-frequency analysis of heart rate variability concurrent with time-frequency analysis of continuous respiratory activity, with mean heart rate and blood pressure measures, during rest, paced (deep) breathing, Valsalva maneuvers, and head-up postural change
The American College of Physicians will survey 95943 once the physicians that use this "small box" technology are identified and matched as members of these societies in order to survey. AMA staff will also provide Medicare claims data by state to the specialty societies to indicate that 40% of the volume for code 95921 is from Florida and Texas. This code is scheduled for the October 2012 RUC meeting.

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

The purpose of autonomic nervous system function testing is to determine the presence of autonomic dysfunction, the site of autonomic dysfunction, and the various autonomic subsystems that may be disordered.

Code 95921 should be reported only when electrocardiographic monitoring of heart rate derived from the time elapsing between two consecutive R waves in the electrocardiogram, or the R-R interval, is displayed on a monitor and stored for subsequent analysis of waveforms. Testing is typically performed in the prone position. A tilt table may be used, but is not required equipment for testing of the parasympathetic function. At least two of the following components need to be included in testing:

1. Heart rate response to deep breathing derived from a visual quantitative analysis of recordings with subject breathing at a rate of 5-6 breaths per minute.
2. Valsalva ratio determined by dividing the maximum heart rate by the lowest heart rate. The initial heart rate responses to sustained oral pressure (blowing into a tube with an open glottis) consist of tachycardia followed by a bradycardia at 15-45 seconds after the Valsalva pressure has been released. A minimum of two Valsalva maneuvers are to be performed.The initial cardioacceleration is an exercise reflex while the subsequent tachycardia and bradycardia are baroreflex-mediated.
3. A 30:15 ratio (R-R interval at beat 30)/(R-R interval at beat 15) used as an index of cardiovascular function

Code 95922 should be reported only when all of the following components are included in testing:

1. Continuous recording of beat-to-beat BP and heart rate.The heart rate needs to be derived from an electrocardiogram (ECG) unit such that an accurate quantitative graphical measurement of the R-R interval is obtained;
2. A period of supine rest of at least 20 minutes prior to testing;
3. The performance and recording of beat-to-beat blood pressure and heart rate during a minimum of two (2) Valsalva maneuvers;
4. The performance of passive head-up tilt with continuous recording of beat-to-beat blood pressure and heart rate for a minimum of five minutes, followed by passive tilt-back to the supine position. This must be performed using a tilt table.

Code 95924 should be reported only when both the parasympathetic function and the adrerenergic function are tested together with the use of a tilt table.

(To report autonomic function testing that does not include beat to beat recording or for testing without use of a tilt table, use 95943)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

RE: RUC Survey of proposed CPT Code 95922X
Simultaneous, independent, quantitative measures of both parasympathetic function and sympathetic function

This letter is to inform you that based on appeals to members, including work with the maker of the product, the AANEM is unable to identify a statistically valid sub-set of our members who perform the above service. Under these circumstances, we do not feel that we can provide meaningful input into a RUC survey for this newly created code.

It is our understanding that our colleagues at the American College of Physicians will continue to work with its members to prepare a summary of recommendations to be presented at the October 2012 RUC meeting.

Please feel free to contact our office if you have any questions.

Sincerely,

Catherine French

Catherine French
AANEM Director of Health Policy

Cc: Debra Lansey, ACP

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95921 Tracking Number BB1 Original Specialty Recommended RVU: **0.90**
Presented Recommended RVU: **0.90**
Global Period: XXX RUC Recommended RVU: **0.90**

CPT Descriptor: Testing of autonomic nervous system function; cardiovagal innervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breathing with recorded R-R interval, Valsalva ratio, and 30:15 ratio

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient who has diabetes and numbness of her feet presents because of frequent lightheadedness which is interfering with her ability to function normally. The general exam is unremarkable. Testing of the autonomic nervous system, specifically the parasympathetic function, is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 76%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work: Pre-service work includes review of the patient's records regarding the indication for the test and the clinical question. A tilt table may be used to perform this test.

Description of Intra-Service Work: Intra-service work involves supervision of patient preparation and performance of the test by the technician. Electrocardiographic monitoring of heart rate is derived from R-R interval displayed on a monitor and stored for analysis. Heart response to deep breathing is derived from an analysis of recordings with subject breathing at a rate of 5-6 breaths per minute. Valsalva ratio is determined by dividing the maximum heart rate by the lowest heart rate. The initial heart rate responses to standing consist of tachycardia at 3 and then 12-15 seconds followed by a bradycardia at 20 seconds. The initial cardioacceleration is an exercise reflex while the subsequent tachycardia and bradycardia are baroreflex-medicated. The 30:15 ratio (R-R interval at beat 30)/(R-R interval at beat 15) is used as an index of cardiovascular function. The results of these measures are reviewed, data is interpreted, and a clinical correlation of the findings is done based on the patient's history.

Description of Post-Service Work: Post-service work includes generating, reviewing, and signing the study report based on the findings of the tests. Findings are discussed with the referring physician as appropriate.

Post-Service intensity/complexity	2.43	2.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The Autonomic Function Testing family includes 5 services. Two new services were created, and three existing services were surveyed as part of the family. The Relativity Assessment Workgroup and the CPT Editorial Panel requested

creation of a combined code for those times when both types of autonomic function are performed together (95921 and 95922 = 9592XX) and to ensure those providers who do not use tilt table during automatic testing report an appropriate code (95922X). Existing service 95923 was also surveyed as part of the family.

Much of the current utilization for 95921 and 95922 will shift to the new codes 9592XX and 95922X. The specialty mix will also change, with Neurology and Cardiology being the dominant providers. Data that shows an E/M billed on the same day reflect the improper usage of these codes. An E/M service typically would not be billed on the same day.

While 76% of respondents found the vignette to be typical, there are many indications for this service, which account for the remaining respondents who did not find it typical.

The key reference service was 95925, which has similar times and a much lower RVW. The societies recommend that the current RVW of 0.90 be maintained.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95923

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95922 Tracking Number BB2 Original Specialty Recommended RVU: **1.10**
Presented Recommended RVU: **1.10**
Global Period: XXX RUC Recommended RVU: **0.96**

CPT Descriptor: Testing of autonomic nervous system function; vasomotor adrenergic innervation (sympathetic adrenergic function), including beat-to-beat blood pressure and R-R interval changes during Valsalva maneuver and at least 5 minutes of passive tilt
(Do not report 95922 in conjunction with 95921)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient has frequent syncopal episodes which have impaired his ability to function normally. Prolonged tilt study confirmed syncope and a diagnosis of neurocardiogenic syncope was made, but treatment for this did not result in meaningful improvement. Because of this, testing of his autonomic nervous system, specifically of the vasomotor adrenergic innervation, is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 82%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Pre-service work includes review of the patient's records regarding the indication for the test and the clinical question.

Description of Intra-Service Work: Intra-service work includes supervision of patient preparation and performance of the test by the technician. Continuous beat-to-beat recording of blood pressure and heart rate in response to the Valsalva maneuver is performed. Patient is positioned on tilt table and after period of rest, undergoes at least five minutes of passive tilt-up and tilt-back. A series of Valsalva maneuvers are performed until reproducible arterial responses are obtained. The results of these measures are reviewed, data is interpreted, and a clinical correlation of the findings is done based on the patient's history.

Description of Post-Service Work: Post-service work includes generating, reviewing, and signing the study report based on the findings of the tests. Findings are discussed with the referring physician as appropriate.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The existing RVW of 0.96 is based on a 1996 RUC survey. The expert panel believes that this code meets the compelling evidence standards for an increased RVW. There have been changes in physician work due to:

- Technique
- Change in patient population
- Physician time

Since the inception of tilt table testing, the patients tested have gradually shifted from a preponderance of orthostatic hypotension (requiring a 5 minute tilt) to postural tachycardia syndrome (requiring a 20 minute tilt) who now dominate the referral reason for tilt by about 3 to 1. In addition indeterminate dizziness is a frequent referral symptom which may require 30 minutes, or until that symptom is reproduced. The physician must be in the room during the upright period of time for patient safety. Finally, even the diagnosis of orthostatic hypotension itself has evolved. The paper by Gibbons and Freeman clearly demonstrates the presence of a clinically significant new diagnosis of delayed orthostatic hypotension that may be associated with syncope and falls. This diagnosis also requires 30 to 40 minutes of tilt (see attachment). Thus, a real change in the population and in our approach to the diagnosis has increased the intensiveness of 95922. This has been a gradual change and all respondents may not have been aware of the new standard of care. There is often a lag between what is published in the literature and when most practices catch up to it. Patients being evaluated for Postural Orthostatic Tachycardia Syndrome will remain in upright tilt for typically 20 minutes. Patients being evaluated for delayed Orthostatic Hypotension will remain in upright tilt for 30 minutes.

CPT	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	IWPUT
95875	Ischemic limb exercise test with serial specimen(s) acquisition for muscle(s) metabolite(s)	XXX	1.10	10	30	10	50	0.0217

Although the RVW would increase 15%, the Medicare utilization for this code is expected to drop dramatically, from about 67,000 to about 1,343.

The key reference service of 95805 has the same total time but less intra time and a higher RVW at 1.20. Respondents rated code 95922 with higher complexity and intensity than the reference service in all measures.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Pre-service work includes review of the patient's records regarding the indication for the test and the clinical question.

Description of Intra-Service Work: Intra-service work includes supervision of patient preparation and performance of the test by the technician. The patient lays on a tilt table in a flat position. The patient is connected to an EKG machine and electrodes are attached to the chest, legs and arms. If needed, an IV line is placed in the arm. A blood pressure (BP) monitor and the heart rate (HR) and BP are constantly monitored during the procedure.
Blood pressure and heart rate are monitored while lying still. Deep breathing and a series of Valsalva maneuvers are performed until reproducible arterial responses are obtained. Electrocardiographic monitoring of heart rate derived from R-R interval is displayed on a monitor and stored for analysis. Heart response to deep breathing is derived from an analysis of recordings with subject breathing at a rate of 5-6 breaths per minute. This is a measure of cardiovagal or parasympathetic testing. Continuous beat-to-beat recording of blood pressure and heart rate in response to the Valsalva maneuver are captured and at least five minutes of passive tilt-up and tilt-back are performed. A series of Valsalva maneuvers are performed until reproducible arterial responses are obtained. These blood pressure responses are analyzed in order to assess cardiac and vascular adrenergic function. Valsalva ratio is determined by dividing the maximum heart rate by the lowest heart rate. This is another measure of cardiovagal or parasympathetic function. The initial heart rate responses to standing consist of tachycardia at 3 and then 12-15 seconds followed by a bradycardia at 20 seconds. The initial cardioacceleration is an exercise reflex while the subsequent tachycardia and bradycardia are baroreflex-medicated. The 30:15 ratio (R-R interval at beat 30)/(R-R interval at beat 15) is used as index of cardiovascular function. The physician reviews and analyzes this data.

After obtaining a baseline HR and BP, safety straps are applied across the chest and legs to hold the patient in place. The patient is raised to the upright and lowered to the supine position several times. The duration of time spent in the supine and upright position can vary from 5 to 30 minutes. Medication may be administered and adjusted during the testing to increase the heart rate and blood pressure. After completing the test, the patient remains flat or supine until the HR and BP return to normal. The patient is observed for 10 to 20 minutes and then disconnected from the equipment.
The results of these measures are reviewed, data is interpreted, and a clinical correlation of the findings is done based on the patient's history.

Description of Post-Service Work: Post-service work includes generating, reviewing, and signing the study report based on the findings of the tests. Findings are discussed with the referring physician as appropriate.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99244	XXX	3.02	**Harvard Time**

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
90806	XXX	1.86	**CMS Time File**	6,270,188

CPT Descriptor 1 Individual psychotherapy, insight oriented, behavior modifying and/or supportive, in an office or outpatient facility, approximately 45 to 50 minutes face-to-face with the patient;

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99385	XXX	1.92	**RUC Time**	

CPT Descriptor 2 Initial comprehensive preventive medicine evaluation and management of an individual including an age and gender appropriate history, examination, counseling/anticipatory guidance/risk factor reduction interventions, and the ordering of laboratory/diagnostic procedures, new patient; 18-39 years

Other Reference CPT Code	Global	Work RVU	Time Source

Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	

Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**60.00**	**65.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.50	4.17
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.67	4.33
Urgency of medical decision making	4.33	4.50
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.83	3.17
Physical effort required	4.17	3.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.17	3.50
Outcome depends on the skill and judgment of physician	4.17	4.17
Estimated risk of malpractice suit with poor outcome	3.83	3.83

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.83	2.83
Intra-Service intensity/complexity	4.67	4.17
Post-Service intensity/complexity	4.00	3.50

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The expert panel reviewed the survey times and determined some respondents must have been confused about what the new code describes. This service involves the work of 95921 and 95922 and the intra-service time should be 45 minutes, the combined intra-service times for 95921 (15 minutes) and 95922 (30 minutes). The intra-service work of providing the two tests does not decrease by providing them on the same day, and it is more complicated to interpret the two tests together than individually. There is an economy of 10 minutes saved in pre-time and 5 minutes saved in post-time.
The expert panel recommends 10/45/15 minutes and the median RVW of 1.89. The key reference service (99244) has similar times (10/40/15) but a higher RVW at 3.02. Respondents ranked 95924 with higher or the same intensity and complexity as the reference service in 10 of 11 measures.
These existing codes serve as crosswalks with comparable times and RVWs:

CPT	Descriptor	Global	Work RVU	Pre Time	Intra Time	Post Time	Total Time	IWPUT
90876	Individual psychophysiological therapy incorporating biofeedback training by any modality (face-to-face with the patient), with psychotherapy (eg, insight oriented, behavior modifying or supportive psychotherapy); approximately 45-50 minutes	XXX	1.90	10	50	10	70	0.0290
93660	Evaluation of cardiovascular function with tilt table evaluation, with continuous ECG monitoring and intermittent blood pressure monitoring, with or without pharmacological intervention	000	1.89	15	50	15	80	0.0244

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95921 and 95922

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Neurology Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 64,581 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We analyzed the times that 95921 and 95922 were reported together. Of that total, approximalely 30% will go to this code. (70% will go to code 95922X)

Specialty Neurology Frequency 25833 Percentage 40.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95923

SUMMARY OF RECOMMENDATION

CPT Code:95923 Tracking Number BB4 Original Specialty Recommended RVU: **0.90**
Presented Recommended RVU: **0.90**
Global Period: XXX RUC Recommended RVU: **0.90**

CPT Descriptor: Testing of autonomic nervous system function; sudomotor, including 1 or more of the following: quantitative sudomotor axon reflex test (QSART), silastic sweat imprint, thermoregulatory sweat test, and changes in sympathetic skin potential)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A patient develops severe burning sensation affecting his toes and proximal foot. Standard laboratory tests are unremarkable. On exam, there is no compelling sensory loss and normal reflexes. The electromyogram and nerve conduction studies are within normal limits. Testing of the autonomic nervous system, specifically sudomotor function, is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 96.30%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Pre-service work includes review of the patient's records regarding the indication for the test and the clinical question.

Description of Intra-Service Work: Intra-service work includes supervision of patient preparation and performance of the test by the technician. Sympathetic nerve fibers to the sweat glands are stimulated at standard sites by the iontophoresis of acetylcholine and the evoked sweat response is measured by sudometers. Optimally the test is performed on one forearm site and three lower extremity sites in order to determine the severity and distribution of the sympathetic deficit. Thermoregulatory sweat test is a test of sympathetic nerves that supply the skin and involves dusting the skin with an indicator powder which changes color when the patient sweats in response to raising patient's temperature in a heat cabinet. Sympathetic skin potentials are evoked through electrical stimulation of the skin and recordings are made over the palm and soles of the feet. The skin potential change is carried by autonomic nerve fibers and determines if these fibers are working normally. The results of these measures are reviewed, data is interpreted, and a clinical correlation of the findings is done based on the patient's history.

Description of Post-Service Work: Post-service work includes generating, reviewing, and signing the study report based on the findings of the tests. Findings are discussed with the referring physician as appropriate.

   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95923

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 22104
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate national usage at 4 times the Medicare rate.

Specialty Neurology Frequency 18568 Percentage 84.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,526
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2010 Medicare utilization from RUC database

Specialty Neurology Frequency 4642 Percentage 84.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 95923

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: **Testing of autonomic nervous system function; cardiovagal innvervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breating with recorded R-R internal, Valsalva ratio, and 30:15 ratio**

Global Period: XXX Meeting Date: April, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The societies convened a consensus panel of physicians to develop recommended inputs. The physicians on the panel represent a variety of geographic locations and practice settings.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The comparison code for 95921, is the existing codes (with RUC-approved inputs from 2000-2001).

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The technician explains the procedure and asks detailed questions on medications, previous surgeries and other exclusions that may alter the outcome of testing. Patient is encouraged to empty bladder before testing begins.

The technician assists the patient in lying on the exam table and answers any questions the patient may have. An arm and finger blood pressure cuff is attached.

Service Clinical Labor Activities:

The technician instructs the patient in baseline breathing and coaches the patient through deep breathing maneuvers, giving feedback on the number of seconds left in each maneuver.
If needed, balloon monitoring effort during inhalation and expiration is also provided by the technician.

Multiple Valsalva tests are performed –lying flat and from a mild tilt position. The patient rests between each maneuver.

The technician works to ensure the patient understands and complies with test specific instructions during the entirety of testing and assesses the patient for any reactions during testing, including blood pressure response to the Valsalva maneuver.

Post-Service Clinical Labor Activities:

The technician obtains resting blood pressure reading and removes arm and finger cuff, If a patient needs additional recuperation time, the technician stays with the patient, monitoring vital signs and assisting the patient with ambulating back to the dressing room.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: **Testing of autonomic nervous system function; vasomotor adrenergic innveration (sympathetic adrenergic function), including beat-to-beat blood pressure and RR interval changes during Valsalva maneuver and at least 5 minutes of passive tilt.**

Global Period: XXX Meeting Date: April, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The societies convened a consensus panel of physicians to develop recommended inputs. The physicians on the panel represent a variety of geographic locations and practice settings.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The comparison code for 95922 is the existing codes (with RUC-approved inputs from 2000-2001).

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The technician explains the procedure and asks detailed questions on medications, previous surgeries and other exclusions that may alter the outcome of testing. Patient is gowned if clothing is too restrictive for adequate access to sites necessary for testing. Patient is encouraged to empty bladder before testing begins.

The technician assists the patient in lying on the exam table and answers any questions the patient may have. ECG electrodes are placed, blood pressure and finger cuffs are administered and a respiratory monitoring belt is attached to the patient.

Service Clinical Labor Activities:

The technician instructs the patient in baseline breathing and coaches the patient through multiple sets of deep breathing maneuvers, giving feedback on the number of seconds left in each maneuver. The patient is allowed to rest for 2 minutes between each set of breathing maneuvers.

Multiple Valsalva tests are performed –lying flat and from a mild tilt position. The patient rests between each maneuver. The patient then rests for 5 minutes before being placed in full heads up tilt position. Prior to tilt testing, the technician records the blood pressure and acquires baseline blood pressure

readings to compare to system readings. During tilt testing, the technician monitors heart rate and blood pressure and observes the patient for any adverse effects.

The technician works to ensure the patient understands and complies with test specific instructions during the entirety of testing and assesses the patient for any reactions during testing, including blood pressure response to the Valsalva maneuver.

Post-Service Clinical Labor Activities:

The patient is allowed to rest for several minutes post testing. The technician obtains multiple (maximum of 8 minutes) resting blood pressure readings and removes arm and finger cuff, electrodes, respiratory belts and any additional monitoring equipment. If a patient needs additional recuperation time, the technician stays with the patient, monitoring vital signs and assisting the patient with ambulating back to the dressing room.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: **Testing of autonomic nervous system function; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt**

Global Period: XXX Meeting Date: April, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The societies convened a consensus panel of physicians to develop recommended inputs. The physicians on the panel represent a variety of geographic locations and practice settings.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The comparison codes for 9592XX are 95921 and 95922, because the new code is a combination of those two codes provided on the same day.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The technician explains the procedure and asks detailed questions on medications, previous surgeries and other exclusions that may alter the outcome of testing.

The technician assists the patient in lying on the exam table and answers any questions the patient may have. ECG electrodes are placed, blood pressure and finger cuffs are administered and a respiratory monitoring belt is attached to the patient.

Service Clinical Labor Activities:

The technician instructs the patient in baseline breathing and coaches the patient through deep breathing maneuvers, giving feedback on the number of seconds left in each maneuver.

The technician works to ensure the patient understands and complies with test specific instructions during the entirety of testing and assesses the patient for any reactions during testing, including blood pressure response to the Valsalva maneuver.

Prior to tilt testing, the technician records the blood pressure and acquires 10 minutes of baseline blood pressure readings. During tilt testing, the technician monitors heart rate and blood pressure and observes the patient for any adverse effects.

Post-Service Clinical Labor Activities:

The technician obtains multiple resting blood pressure readings and removes arm and finger cuff, electrodes, respiratory belts and any additional monitoring equipment. If a patient needs additional recuperation time, the technician stays with the patient, monitoring vital signs and assisting the patient with ambulating back to the dressing room.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: **Testing of autonomic nervous system function; sudomotor, including 1 or more of the following quantitative sudomotor axon reflex tests (QSART), silastic sweat imprinting (SIT), thermoregulatory sweat test (TST), and changes in sympathetic skin potential.**

Global Period: XXX Meeting Date: April, 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: The societies convened a consensus panel of physicians to develop recommended inputs. The physicians on the panel represent a variety of geographic locations and practice settings.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: The comparison code for 95923 is the existing codes (with RUC-approved inputs from 2000-2001).

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The technician explains the procedure and asks detailed questions on medications, previous surgeries and other exclusions that may alter the outcome of testing. Patient is encouraged to empty bladder before testing begins.

The technician assists the patient in lying on the exam table and answers any questions the patient may have.

For QSART testing: the patient may need to be gowned if clothing restricts access to skin. The technician assembles 4 capsules used for stimulation and recording and cleans multiple recording sites on the patient's arms, leg and foot. The capsules are secured and stimulation grounds and wires are attached. Surface skin temperature is verified. Warmers may be used at capsule site to ensure adequate skin temperature. The tech verifies the patient can feel a stimulus.

For SIT testing: electrodes are placed on the hands and feet

For TST testing: Vital signs (weight, height, temperature) are recorded. The patient is gowned and the technician assembles and secures capsules used for recording.

Service Clinical Labor Activities:

For QSART testing: The technician fills the capsules with a mixture of acetylcholine and water. The technician starts the recordings, verifying there are no leaks in the capsules and that the baseline recording is stable. Stimulation is begun, and the technician review latency and volume throughout the procedures. Once stimulation is complete, the nerves are monitored during a short period of rest.

For SIT testing: The technician stimulates sweat glands and applies a thin layer of moldable silastic material to the skin.

For TST: The technician and patient apply faces mask during powder application. The technician applies powder to the patient's entire body and places a thermal probe on the skin and in the patient's mouth. The patient is assisted into the heat box and observed throughout the testing for increased body temperature or sweat production. Probes are also used to control the heat lamps in the box.

Post-Service Clinical Labor Activities:

For all three tests: Capsules are removed and patient is monitored to ensure vital signs are normal.

For SIT testing: the number of droplets, size and distribution are reported

For TST: The patient is removed from the box at a rate slow enough to ensure the body has time to adjust to temperature changes. Photos are taken, computer scanning performed to map the areas of increased sweat production. Patient's weight is recorded. After the majority of powder is brushed off the patient, the technician assists the patient to the shower and provides additional instructions to ensure the powder is washed off safely.

AMA/Specialty Society RVS Update RUC Summary of Recommendations

January 2012

Intraoperative Neurophysiology Monitoring

The CPT Editorial Panel deleted CPT code 95920 *Intraoperative neurophysiology testing, per hour* and created two new add-on codes to describe continuous intraoperative neurophysiology monitoring in the operating room and remotely due to new technology available to perform these services.

95940 ***Continuous intraoperative neurophysiology monitoring in the operating room, one on one monitoring requiring personal attendance, each 15 minutes***

The RUC reviewed the survey results for code 95940 and determined that the survey respondents overestimated the physician work required to perform this service, incorrectly accounting for the entire monitoring encounter not basing their response on the time increment indicated in the descriptor. Therefore, the RUC compared the 95940 to 64566 *Posterior tibial neurostimulation, percutaneous needle electrode, single treatment, includes programming* (work RVU = 0.60 and total time = 15 minutes) and determined these services required the same physician work, time and intensity to perform. The RUC also compared 95940 to similar services 96571 *Photodynamic therapy by endoscopic application of light to ablate abnormal tissue via activation of photosensitive drug(s); each additional 15 minutes* (work RVU = 0.55) and 97814 *Acupuncture, 1 or more needles; with electrical stimulation, each additional 15 minutes of personal one-on-one contact with the patient, with re-insertion of needle(s)* (work RVU = 0.55) and determined that these services are less intense than 95940. **The RUC recommends a work RVU of 0.60 and 15 minutes intra-service time for CPT code 95940.**

95941 ***Continuous intraoperative neurophysiology monitoring, from outside the operating room (remote or nearby) or for monitoring of more than one case while in the operating room, per hour***

The RUC reviewed the survey results for code 95941 and determined that the survey respondents overestimated the physician work required to perform this service. Therefore, the RUC compared the 95941 to 31627 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with computer-assisted, image-guided navigation* (work RVU = 2.00 and intra-time = 60 minutes) and determined these services required the same physician work, time and intensity to perform. For additional support the RUC also compared 95941 to similar services 95957 *Digital analysis of electroencephalogram (EEG) (eg, for epileptic spike analysis)* (work RVU = 1.98 and intra-time = 60 minutes) and determined that these services require similar physician work and the same amount of time to perform.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC noted some concern that this service may be reported for monitoring a number of patients simultaneously. The specialty society indicated that they included a question on the survey asking the typical number of patients monitored by the physician and respondents indicated that one patient is typically being monitored by the physician. Additionally, the RUC reviewed the range of add-on services with intra-service time ranging from 50-70 minutes, with work RVUs ranging from 1.00 to 5.00, and agreed that this 60 minute code at 2.00 work RVUs reported for multiple patients is in the appropriate physician work range relative to other similar services in the RBRVS. **The RUC recommends a work RVU of 2.00 for CPT code 95941.**

Practice Expense
The RUC noted that although CPT code 95941 is performed in the non-facility approximately 5% of the time, direct practice expense inputs for medical supplies and equipment were accepted as modified by the Practice Expense Subcommittee.

New Technology/New Services
The RUC recommends that these services be reviewed in three years to review the number of times this service is reported together by the same physician on the same day once this utilization data is available.

Work Neutrality
The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Source of Current Work RVU*	Work RVU Recommendation
Medicine **Neurology and Neuromuscular Procedures** **Intraoperative Neurophysiology** Codes 95940, 95941 describe ongoing neurophysiologic monitoring, testing and data interpretation distinct from performance of specific type(s) of baseline neurophysiologic study(s) performed during surgical procedures. When the service is performed by the surgeon or anesthesiologist, the professional services are included in the surgeon's or anesthesiologist's primary service code(s) for the procedure and are not reported separately. Do not report these codes for automated monitoring devices that do not require continuous attendance by a professional qualified to interpret the testing and monitoring. Recording and testing ~~is~~ are performed either personally or by a technologist who is physically present with the patient during the service. Supervision is performed either in the operating room or by real time connection outside the operating room. The monitoring professional must be solely dedicated to performing the **intraoperative neurophysiologic** monitoring and must be available to intervene at all times during the service as necessary, for the reported time period(s). For any given period of time spent providing these services, the service takes full attention and, therefore, other clinical activities beyond providing and interpreting of monitoring cannot be provided during the same period of time. Throughout the monitoring, there must be provisions for continuous and immediate communication directly with the operating room team in the surgical suite. One or more simultaneous cases may be reported **(95941).** When monitoring more than one procedure, there must be the immediate ability to transfer patient monitoring to another monitoring professional during the surgical procedure should that individual's exclusive attention be required for another procedure. Report 95941 for all **remote or non-one on one** monitoring time connected to each case regardless of overlap with other cases ~~(95941).~~ Codes 95940, 95941 include only the ongoing neurophysiologic monitoring time distinct from performance of specific type(s) of baseline neurophysiologic study(s) ~~(51785 (needle EMG urethral sphincter)~~, 95860-95870 (needle EMG's), 95900-95904 (nerve conduction), 95928 , 95929 (central motor evoked potential), 95933-95937, 95961, 95962 (cortical and subcortical mapping) or interpretation of specific type(s) of baseline neurophysiologic study(s) (92585, 95822, 95925~~,~~95930). For 95940 and 95941, the baseline neurophysiologic study(s) should be reported not more than once per operative session. The time spent performing or interpreting the baseline neurophysiologic study(s) should not be counted as intraoperative monitoring, but represents separately reportable procedures. For procedures that last beyond midnight, report services using the day on which the monitoring began and using the total time monitored. Code 95940 is reported per 15 minutes of service. Code 95940 requires reporting only the portion of ~~the~~ time the monitoring professional was physically present in the operating room providing one-on-one patient monitoring, and no other cases may be monitored at the same time. Report continuous intraoperative neurophysiologic monitoring in the operating room (95940) in addition to the services related to monitoring from outside the operating room (95941).					

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Code 95941 should be used once per hour even if multiple methods of neurophysiologic monitoring are used during the time. Code 95941 requires the monitoring of neurophysiological data that is collected from the operating room continuously on-line in real time via a secure data link. When reporting 95941, real-time ability must be available through sufficient data bandwidth transfer rates to view and interrogate the neurophysiologic data contemporaneously.

Report 95941 for all cases in which there was no physical presence by the monitoring professional in the operating room during the monitoring time **or when monitoring more than one case in an operating room.** It is also used to report the time of monitoring physically performed outside of the operating room in those cases where monitoring occurred both within and outside the operating room. Do not report 95941 if the monitoring lasts 30 minutes or less.

Intraoperative neurophysiology monitoring codes 95940 and 95941 are each used to report the total duration of respective time spent ~~**by a physician**~~ providing each service, even if that time is not in a single continuous block.

D +95920		~~Intraoperative neurophysiology testing, per hour (List separately in addition to code for primary procedure~~ ~~(Use 95920 in conjunction with the study performed, 92585, 95822, 95860, 95861, 95867, 95868, 95870, 95900, 95904, 95925 95937)~~ (95920 has been deleted. To report, see 95940, 95941) ~~(Code 95920 describes ongoing electrophysiologic testing and monitoring performed during surgical procedures. Code 95920 is reported per hour of service, and includes only the ongoing electrophysiologic monitoring time distinct from performance of specific type[s] of baseline electrophysiologic study[s] [95860, 95861, 95867, 95868, 95870, 95900, 95904, 95928, 95929, 95933 95937] or interpretation of specific type[s] of baseline electrophysiologic study[s] [92585, 95822, 95870, 95925- 95928, 95929, 95930]. The time spent performing or interpreting the baseline electrophysiologic study[s] should not be counted as intraoperative monitoring, but represents separately reportable procedures. Code 95920 should be used once per hour even if multiple electrophysiologic studies are performed. Do not report 95920 if recording lasts 30 minutes or less. The baseline electrophysiologic study[s] should be used once per operative session. For procedures that last beyond midnight, report services using the day on which the monitoring began and using the total hours monitored)~~	ZZZ	N/A

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95940 Tracking Number P1 Original Specialty Recommended RVU: **0.72**
Presented Recommended RVU: **0.60**
Global Period: ZZZ RUC Recommended RVU: **0.60**

CPT Descriptor: Continuous intraoperative neurophysiology monitoring in the operating room, one on one monitoring requiring personal attendance, each 15 minutes (List separately in addition to code for primary procedure)
(Use 959X1 in conjunction with the study performed, 92585, 95822, 95860-95870, 95900-95904, 95925-95937)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32-year-old woman has new onset of seizures and MRI evidence of a mass in the right frontal lobe consistent with a glioma. A decision was made to resect the tumor. Intraoperative neurophysiologic testing and monitoring was ordered to avoid damaging or resecting motor pathways during surgery.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 1%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician (or other qualified health care provider) changes into operating room clothing and reviews medical records and imaging.

Description of Intra-Service Work: The physician personally performs the intraoperative monitoring or testing process during one or more aspects of the procedure, and provides a diagnostic interpretation of these neurophysiologic tests in real time during the surgery. Data collection typically is from multiple data channels of electromyography (EMG), electroencephalography (EEG), or evoked potentials (EPs). Data are compared to a baseline diagnostic test recorded immediately prior to when the monitoring began. Data are reviewed on several screen displays either simultaneously or sequentially. This in-room service involves personal investigation and resolution of technical issues that may compromise the monitoring. The provider personally consults with the surgeon or anesthesiologist about the neurophysiologic status and the clinical implications as appropriate throughout the procedure. To accomplish this, the provider compares responses over time, actively tests structures to assess the integrity (i.e., measures resopnses to electric stimulations of the extremities or brain), and interprets the findings in order to localize abnormalities and assess the potential implications. This information is communicated directly to the surgeon and anesthesiologist and adjustments in the procedure are recommended as necessary. The impact of adjustments are then monitored and communicated. Ongoing neurophysiologic diagnostic testing procedures typically involve averaging hundreds or thousands of individual trials of microvolt or nanovolt data collection in 16-32 channels, which are measured in millisecond or microsecond accuracies.

Description of Post-Service Work: The physician changes out of operating room clothing and prepares a report for the portions of the procedure performed during the intraoperative monitoring.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
95954	XXX	2.45	**RUC Time**

CPT Descriptor Pharmacological or physical activation requiring physician attendance during EEG recording of activation phase (eg, thiopental activation test)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
92012	XXX	0.92	**RUC Time**	6,806,813

CPT Descriptor 1 Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; intermediate, established patient

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
77300	XXX	0.62	**RUC Time**	1,695,583

CPT Descriptor 2 Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician

Other Reference CPT Code	Global	Work RVU	Time Source
99245	XXX	3.77	**RUC Time**

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 80 minutes face-to-face with the patient and/or family.

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 15 **% of respondents:** 23.4 **%**

TIME ESTIMATES (Median)	**CPT Code: 95940**	**Key Reference CPT Code:** 95954	**Source of Time RUC Time**
Median Pre-Service Time	0.00	5.00	
Median Intra-Service Time	15.00	60.00	
Median Immediate Post-service Time	0.00	5.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	

Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**15.00**	**70.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.00	3.53
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	4.07
Urgency of medical decision making	4.80	4.07
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.67	4.27
Physical effort required	3.20	2.87
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.33	4.00
Outcome depends on the skill and judgment of physician	4.60	4.40
Estimated risk of malpractice suit with poor outcome	3.80	3.80

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.20	3.20
Intra-Service intensity/complexity	4.67	4.27
Post-Service intensity/complexity	2.73	2.87

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A consensus panel representing members of each of the 6 surveying specialties met via conference call and email to develop recommendations. The societies believe the survey respondents gave time data according to the entire time (median of 2 hours) they are in the operating room for the case, rather than the increments of 15 minutes that the code describes.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached table.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95920

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Sometimes

Specialty Audiology How often? Rarely

Specialty PM&R How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 14936
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate the national rate at 4 times the Medicare frequency.

Specialty Neurology Frequency 4929 Percentage 33.00 %

Specialty Audiology Frequency 1942 Percentage 13.00 %

Specialty PM&R Frequency 2988 Percentage 20.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,734
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We looked at 2010 Medicare utilization for 95920 and estimate a very small (2.5%) percentage would be reported as 959X1.

Specialty Neurology	Frequency 1233	Percentage 33.02 %
Specialty Audiology	Frequency 0	Percentage 0.00 %
Specialty PM&R	Frequency 747	Percentage 20.00 %

Do many physicians perform this service across the United States? No

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95920

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:95941 Tracking Number P1 Original Specialty Recommended RVU: **2.09**
Presented Recommended RVU: **2.00**
Global Period: ZZZ RUC Recommended RVU: **2.00**

CPT Descriptor: Continuous intraoperative neurophysiology monitoring, from outside the operating room (remote or nearby) or for monitoring of more than one case while in the operating room, per hour (List separately in addition to code for primary procedure)
(Use 95941 in conjunction with the study performed 92585, 95822, 95860-95870, 95900-95904, 95925-95937)
(For time spent waiting on standby before monitoring, use 99360)
(For electrocorticography, use 95829)
(For intraoperative EEG during nonintracranial surgery, use 95955)
(For intraoperative functional cortical or subcortical mapping, see 95961-95962)
(For intraoperative neurostimulator programming and analysis, see 95970-95975)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 56-year-old man complains of three months of leg weakness and two episodes of falling. Neurologic exam showed increased lower extremity reflexes, an upgoing right toe, and mildly decreased lower extremity sensation. Imaging showed cervical spondylosis producing severe spinal canal stenosis and cervical myelopathy. Surgery was scheduled for spinal cord decompression with cervical anterior and posterior instrumentation. Intraoperative neurophysiologic monitoring was ordered to monitor spinal cord integrity during the procedure.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 4%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: n/a

Description of Intra-Service Work: The physician (or other qualified health care provider) provides an interpretation of diagnostic neurophysiologic tests in real time during the surgery. The interpretations are made by viewing tracings on a remote computer screen similar to the screen used by the technologist in the operating room. Data collection typically is from 16-32 data channels of electromyography (EMG), electroencephalography (EEG), or evoked potentials (EPs). Data are compared to baseline EMG, EEG, or EPs recorded just prior to the intraoperative monitoring. This patient's data are reviewed typically on 4-8 different screen displays that can be viewed either simultaneously or sequentially. The physician supervises the direct electrical scalp stimulation of 200-600 volts with precautions to prevent injury or seizures. The physician screens for and identifies changes that occur during surgery and determining if they present a risk of clinical harm, as opposed to changes due to other causes. When investigating causes of change, the physician applies knowledge of the patient's medical history and physical findings, imaging findings, anesthetic changes, technical details of the testing,

and what the surgeon is doing. The physician then arrives quickly at a diagnostic assessment of risk, severity, and location. The physician informs the surgeon and anesthesiologist of the risk. The physician may recommend clinical changes in anesthetic or surgical techniques to reduce risk of neurologic injury. The physician then measures the adequacy of response to interventions. To make these determinations the physician supervises performance of and provides diagnostic interpretations of the ongoing results of neurophysiologic testing procedures. This typically involves averaging hundreds or thousands of individual trials of microvolt or nanovolt data collection in 16-32 channels, which are measured to millisecond or microsecond accuracies.

Description of Post-Service Work: Prepare a report of the diagnostic interpretations made during surgery.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? Yes

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
99292	ZZZ	2.25	**RUC Time**

CPT Descriptor Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99233	XXX	2.00	**RUC Time**	21,952,122

CPT Descriptor 1 Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A detailed interval history; A detailed examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is unstable or has developed a significant complication or a significant new problem. Physicians typically spend 35 minutes at the bedside and on the patient's hospital floor or unit.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95810	XXX	2.50	**RUC Time**	311,700

CPT Descriptor 2 Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist

Other Reference CPT Code	Global	Work RVU	Time Source
95813	XXX	1.73	**RUC Time**

CPT Descriptor Electroencephalogram (EEG) extended monitoring; greater than 1 hour

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 12 **% of respondents:** 18.1 **%**

TIME ESTIMATES (Median)	**CPT Code: 95941**	**Key Reference CPT Code:** 99292	**Source of Time** **RUC Time**

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached table.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 95920

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology How often? Sometimes

Specialty Audiology How often? Rarely

Specialty PM&R How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 582548
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate the national rate at 4 times the Medicare frequency.

Specialty Neurology Frequency 192241 Percentage 33.00 %

Specialty Audiology Frequency 79200 Percentage 13.59 %

Specialty PM&R Frequency 116510 Percentage 20.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 145,637 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We looked at 2010 Medicare utilization for 95920 and estimate the vast majority (97.5%) would be reported as 95941.

Specialty Neurology Frequency 48061 Percentage 33.00 %

Specialty Audiology Frequency 0 Percentage 0.00 %

Specialty PM&R Frequency 29128 Percentage 20.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 95920

AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2012

Neonatal Pediatric Transport

In October 2011, the CPT Editorial Panel created CPT codes 99485 and 99486 to describe the non face-to-face services provided by physicians to supervise interfacilty transport care of critically ill or critically injured pediatric patients.

99485 *Supervision by a control physician of interfacility transport care of the critically ill or critically injured pediatric patient, 24 months of age or younger, includes two way communication with transport team before transport, at the referring facility and during the transport, including data interpretation and report; first 30 minutes*

CPT code 99485 was surveyed for the January 2012 RUC meeting. The RUC reviewed the survey results from 84 neonatologists, pediatric intensivists, pediatric emergency physicians and pediatric transport medicine physicians and noted that the survey median work RVU of 1.50 appropriately accounts for the physician work required to perform this service. The RUC was concerned that the total service time was 7 minutes more than the key reference service CPT code 99339 *Individual physician supervision of a patient (patient not present) in home, domiciliary or rest home (eg, assisted living facility); 15-29 minutes* (work RVU = 1.25). It was clarified that CPT code 99339 requires 40 minutes total time and 99485 requires 47 because the typical patients are critically ill or critically injured as opposed to the key reference code, which are not. The intra-service time of the code is the same as the key reference code, however it was clarified that due to the unique severity in the conditions of this subset of patients there is more planning and preparation required by the control physician in the pre-service and more documentation that the control physician must complete in the post-service, which accounts for an additional 5 minutes in the pre-service and 2 minutes in the post-service time as compared to the key reference code.

The RUC also discussed assigning 47 minutes to a code that is stated as 30 minutes in the descriptor. The CPT Editorial Panel representative clarified that according to CPT guidelines, code 99485 is used to report the first 16-45 minutes of direction on a given date and should only be used once even if time spent by the physician is discontinuous. Do not report services of 15 minutes or less or any time when another physician is reporting 99466-99467. Coding instructions only apply once the intra-service has begun and does not include pre- and post-service time. Once the 46th minute is reached the second code 99486 (add-on) should be reported. To further justify the survey median work RVU of 1.50, the RUC reviewed CPT code 99203 *Office or other outpatient visit for the evaluation and management of a new patient* (work RVU=1.42), because this also has a intra-service time of 20 minutes and although it is face-to-face, the typical patient is less critical. Only a small portion of the pediatric transports (estimated at less than 10%) should report code 99485 because it only applies to the most complex patients. **The RUC recommends a work RVU of 1.50 for CPT code 99485**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

99486 *Supervision by a control physician of interfacility transport care of the critically ill or critically injured pediatric patient, 24 months of age or younger, includes two way communication with transport team before transport, at the referring facility and during the transport, including data interpretation and report; each additional 30 minutes*

CPT code 99486 was surveyed for the January 2012 RUC meeting. The RUC reviewed the survey results from 71 neonatologists, pediatric intensivists, pediatric emergency physicians, pediatric transport medicine physicians and recommends the survey median work RVU of 1.30. The specialty society indicated and the RUC agreed that 25 minutes intra-service time appropriately accounts for the physician time required to perform this service. The specialty society explained that the intra-service time for 99486 is higher than the intra-service time for the base code 99485, 25 and 20 minutes respectively, because in order to report both codes more than 45 minutes of intra-service time is required (30 minutes threshold required to report 99485 and greater than 15 minutes threshold required to report 99486). If you add the intra-service time for 99485 (20 minutes) and the intra-service time for 99486 (25 minutes), that 45 minutes total intra-service time is achieved. The RUC determined that this time differential is appropriate. The RUC compared 99486 to key reference service 99340 *Individual physician supervision of a patient (patient not present) in home, domiciliary or rest home (eg, assisted living facility); 30 minutes or more* (work RVU = 1.80, 30 minutes intra-service time, 60 minutes total time) and determined that although the typical patient for 99486 is critically ill or critically injured, the key reference service requires more physician work and time and should be valued higher. The RUC compared 99486 to the key MPC reference code 13102 *Repair, complex, trunk; each additional 5 cm or less* (work RVU=1.24, 25 minutes intra-service time) and determined that both codes are ZZZ globals, have the same intra-service time and should be valued similarly. Only a small portion of the pediatric transports (estimated at less than 10%) should report code 99486 because it only applies to the most complex patients. **The RUC recommends a work RVU of 1.30 for CPT code 99486**.

CPT Editorial Panel:
During discussion of the new neonatal pediatric transport codes 99485, 99486, the RUC noted that there may be overlap in reporting of the existing critical care interfacility transport codes 99466 or 99467. The RUC recommended that either the Neonatal Pediatric Transport guidelines or a parenthetical instruction be added following codes 99485 and 99486 to instruct users that it is not appropriate to report codes 99485 and 99486 in addition to codes 99466 and 99467 by the same physician. The following language was added as a parenthetical instruction: (Do not report 99485 or 99486 in conjunction with 99466, 99467 when performed by the same physician).

Practice Expense:

This service is primarily performed in a facility, so there are no direct practice expense inputs associated with this service.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Category I **Evaluation and Management** **Inpatient Neonatal Intensive Care Services and Pediatric and Neonatal Critical Care Services** **Pediatric Critical Care Transport**				
Codes (99466, 99467) are used to report the physical attendance and direct face-to-face care by a physician during the interfacility transport of a critically ill or critically injured pediatric patient 24 months of age or younger. Codes 99485, 99486 are used to report the control physician non-face-to-face supervision of interfacility transport of a critically ill or critically injured pediatric patient 24 months of age or younger. These codes are not reported together for the same patient by the same physician. For the purpose of reporting ~~codes~~ 99466 and 99467, face-to-face care begins when the physician assumes primary responsibility of the pediatric patient at the referring ~~hospital/~~facility, and ends when the receiving ~~hospital/~~facility accepts responsibility for the pediatric patient's care. Only the time the physician spends in direct face-to-face contact with the patient during the transport should be reported. Pediatric patient transport services involving less than 30 minutes of face-to-face physician care should not be reported using 99466, 99467. Procedure(s) or service(s) performed by other members of the transporting team may not be reported by the supervising physician. Codes 99485, 99486 are used to report control physician non-face-to-face supervision of interfacility pediatric critical care transport, which includes all two way communication between the control physician and the specialized transport team prior to transport, at the referring facility and during transport of the patient back to the receiving facility. The "control" physician is the physician directing transport services. These codes do not include pre-transport communication between the control physician and the referring facility before or following patient transport. These codes are only reported for patients 24 months or younger who are critically ill or critically injured. The control physician provides treatment advice to a specialized transport team ~~of providers~~ who are present and delivering the hands-on patient care.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The control physician does not report any services provided by the specialized transport team. The control physician's non-face-to-face time begins with the first contact by the control physician with the specialized transport team and ends when the patient's care is handed over to the receiving facility team. ~~These codes do not include face-to-face hands on transport care by the supervising physician.~~ Time spent with the individual patient's transport team and reviewing data submissions should be recorded. Refer to 99466 and 99467 for face-to-face transport care of the critically ill/injured patient. Time spent with the individual patient's transport team and reviewing data submissions should be recorded. Code 99485 is used to report the first 16-45 minutes of direction on a given date and should only be used once even if time spent by the physician is discontinuous. Do not report services of 15 minutes or less or any time when another physician is reporting 99466-99467. (Do not report 99485 or 99486 in conjunction with 99466, 99467 when performed by the same control physician)

For the definition of the critically injured …

The non face to face direction of emergency care to a patient's transporting staff by a physician located in a hospital or other facility by two-way communication is not considered direct face-to-face care and should not be reported with 99466, 99467. Physician-directed non face to face emergency care through outside voice communication to transporting staff personnel is reported with 99288 or 99466, 99467 based upon the age and clinical condition of the patient.

Emergency department services …

~~The following~~ All non face to face transport supervision services (99288, 99485, 99486) are included when performed in conjunction with the services reported with 99466 and 99467, ~~during the pediatric patient transport by the physician providing critical care~~ and may not be reported separately: ~~routine monitoring evaluations (eg, heart rate, respiratory rate, blood pressure, and pulse oximetry), the interpretation of cardiac output measurements (93562), chest X-rays (71010, 71015, 71020), pulse oximetry (94760, 94761, 94762), blood gases and information data stored in computers (eg, ECGs, blood pressures, hematologic data) (99090), gastric intubation (43752, 43753), temporary transcutaneous pacing (92953), ventilatory management (94002, 94003, 94660, 94662) and vascular access procedures (36000, 36400, 36405, 36406, 36415, 36591, 36600). Any services performed which are not listed above should be reported separately. All services of the control physician during time reported are included in 99485, 99486.~~ Services provided by the specialized transport team during non-face-to-face transport supervision are not reported by the control physician.

Code 99466 is used to report …

Code 99485 is used to report the first 30 minutes of non-face-to-face supervision of an interfacility transport of a critically ill or critically injured pediatric patient and should be reported only once per date of service. Code 99486 is used to report each additional 30 minutes beyond the initial 30 minutes. Non-face-to-face interfacility transport ~~less than~~ 15 minutes or less is not reported.

(For total body cooling of neonates, see 0260T, 0261T)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99485 Tracking Number Q1 Original Specialty Recommended RVU: **1.50**
Presented Recommended RVU: **1.50**
Global Period: XXX RUC Recommended RVU: **1.50**

CPT Descriptor: Supervision by a control physician of interfacility transport care of the critically ill or critically injured pediatric patient, 24 months of age or younger, includes two way communication with transport team before transport, at the referring facility and during the transport, including data interpretation and report; first 30 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34-week critically ill or critically injured neonate is delivered at a level I hospital and the community provider requests a transfer to the physician's hospital. The ground transport team consisting of a nurse and respiratory therapist is dispatched to the level I hospital. After the team evaluates the patient, they contact the control physician to discuss the case. The physician and team remain in two-way communication and decide together on the appropriate management and interventions for the child before and during transport back to the control physician's hospital.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The transport control physician receives a report on a request to transport a critically ill pediatric patient and determines with the specialized transport team the appropriate form of transportation, the urgency of the transport, the appropriate mode of transport, the type of team members needed to meet the patient's needs, and any required special equipment or medications.

Description of Intra-Service Work: The transport control physician discusses the planned patient treatment with the specialized transport team before and after leaving the initial facility where care is provided and continues to be in contact with the specialized transport team during the transport to the receiving facility. The control physician maintains two-way communication availability to the transport team throughout the transport.

Description of Post-Service Work: The transport control physician documents the total contact time with the specialized transport team and summarizes the consultative advice provided to the specialized transport team before and during patient transport.

Intra-Service intensity/complexity	4.14	3.69
Post-Service intensity/complexity	3.25	2.92

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

A joint AAP-SCCM expert panel reviewed the survey results and given the quality of the data, recommended the survey medians. This recommendation is further substantiated by the fact that patients cared for under code 99485 are critically ill/critically injured, while they are not under the key reference service (99339).

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Transport supervision of a critically ill or injured pediatric patient will typically be reported in conjunction with NICU/PICU critical care service codes.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

3.	CPT Code	Global Period	Pre-Service	Intra-Service	Post-Service	Total Time
4.	9948X1	XXX	15	20	12	47
5.	9948X2	ZZZ	0	25	0	25
6.	99471	XXX	30	180	30	240
7.	99472	ZZZ	20	90	30	140

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:99486 Tracking Number Q2 Original Specialty Recommended RVU: **1.30**
Presented Recommended RVU: **1.30**
Global Period: ZZZ RUC Recommended RVU: **1.30**

CPT Descriptor: Supervision by a control physician of interfacility transport care of the critically ill or critically injured pediatric patient, 24 months of age or younger, includes two way communication with transport team before transport, at the referring facility and during the transport, including data interpretation and report; each additional 30 minutes

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34-week critically ill or critically injured neonate is delivered at a level I hospital and the community provider requests a transfer to the physician's hospital. The ground transport team consisting of a nurse and respiratory therapist is dispatched to the level I hospital. After the team evaluates the patient, they contact the control physician to discuss the case. The physician and team remain in two-way communication and decide together on the appropriate management and interventions for the child before and during transport back to the control physician's hospital. 9948X1 has been reported and 9948X2 is reported for each additional 30 minutes. This is an add-on code.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 49%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 13%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The transport control physician discusses the planned patient treatment with the specialized transport team before and after leaving the initial facility where care is provided and continues to be in contact with the specialized transport team during the transport to the receiving facility. The control physician maintains two-way communication availability to the transport team throughout the transport.

Description of Post-Service Work: N/A

AMA/Specialty Society RVS Update RUC Summary of Recommendations
CMS High Expenditure Procedure Codes screen

April 2012

Shaving of Epidermal or Dermal Lesions

At the January 2012 RUC meeting, the specialty society requested that shaving of epidermal or dermal lesions codes 11300-11313 be validated for physician time and work prior to surveying the Mohs surgery codes 17311 and 17312. CPT Mohs surgery codes 17311 and 17312 were identified through the CMS High Expenditure Procedural screen and are scheduled to be reviewed by the RUC at the April 2013 meeting. The RUC recommended review to validate physician time for codes 11300-11313 at the April 2012 meeting.

The RUC agreed with the specialty society that the previous CMS valuation of assigning these codes an RVU based on a percentage of another code was flawed. This flawed methodology provides compelling evidence to review the work RVUs.

11300 Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.5 cm or less
The RUC reviewed the survey results from 76 dermatologists for 11300 and determined that the 25th percentile work RVU of 0.60 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 9 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC used magnitude estimation and compared 11300 to reference code key reference service 12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU = 0.84) and MPC code 11721 Debridement *of nail(s) by any method(s); 6 or more* (work RVU = 0.54) and determined that the work required to perform this service is appropriate relative to these two services. **The RUC recommends a work RVU of 0.60 for CPT code 11300.**

11301 Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.6 to 1.0 cm
The RUC reviewed the survey results from 76 dermatologists for 11301 and determined that the 25th percentile work RVU of 0.90 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11301 to 11300 which requires 5 minutes less intra-service time to shave a smaller size lesion and determined the 0.90 maintains the proper rank order for this family of services. The RUC compared 11301 to reference code key reference service

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

12001 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.5 cm or less* (work RVU = 0.84), which requires slightly less physician work and time, 10 versus 15 minutes respectively, to perform than 11301. **The RUC recommends a work RVU of 0.90 for CPT code 11301.**

11302 Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 1.1 to 2.0 cm
The RUC reviewed the survey results from 76 dermatologists for 11302 and determined that the median work RVU of 1.16 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11302 to 11301 which requires 5 minutes less intra-service time to shave a smaller size lesion and determined the 1.16 maintains the proper rank order for this family of services. The RUC also compared 11302 to 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14), which requires slightly less physician work and time, 15 versus 20 minutes respectively, to perform than 11302. **The RUC recommends a work RVU of 1.16 for CPT code 11302.**

11303 Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter over 2.0 cm
The RUC reviewed the survey results from 76 dermatologists for 11303 and determined that the 25th percentile work RVU of 1.25 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11303 to 11302 which requires 2 minutes less intra-service time to shave a smaller size lesion and determined the 1.25 maintains the proper rank order for this family of services. The RUC compared 11303 to key reference code 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14 and 15 minutes intra service time) and MPC code 11755 *Biopsy of nail unit (eg, plate, bed, matrix, hyponychium, proximal and lateral nail folds) (separate procedure)* (work RVU = 1.31 and 25 minutes intra-service time) to support the recommended value. **The RUC recommends a work RVU of 1.25 for CPT code 11303.**

11305 Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 0.5 cm or less

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC noted that podiatry is the dominant provider of this service. APMA determined not to participate in the survey process, however, sent a letter of support for these work RVU recommendations.

The RUC reviewed the survey results from 66 dermatologists for 11305 and determined that the 25th percentile work RVU of 0.80 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11305 to 11300, and determined that 11305 requires 4 more minutes of intra-service time and is more intense and complex to perform than on the trunk, arms or legs. The RUC also compared 11305 to key reference code 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14) and determined that 11305 requires less physician work and time to perform, 14 and 15 minutes intra-service time, respectively. The RUC determined a work RVU of 0.80 maintains the proper rank order for this family of services. **The RUC recommends a work RVU of 0.80 for CPT code 11305.**

11306 Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 0.6 to 1.0 cm
The RUC reviewed the survey results from 66 dermatologists for 11306 and determined that the survey median work RVU of 1.18 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11306 to 11301, and determined that 11306 requires 3 minutes more intra-service time and is more intense and complex to perform than on the trunk, arms or legs. The RUC compared 11306 to key reference code 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14), which requires less physician work and time to perform, 18 and 15 minutes intra-service time, respectively. The RUC determined a work RVU of 1.18 maintains the proper rank order for this family of services. **The RUC recommends a work RVU of 1.18 for CPT code 11306.**

11307 Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 1.1 to 2.0 cm
The RUC reviewed the survey results from 66 dermatologists for 11307 and determined that the 25th percentile work RVU of 1.20 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11307 to 11302, and determined that 11307 requires 1 minute more intra-service time and is more

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

intense and complex to perform than on the trunk, arms or legs. The RUC compared 11307 to key reference code 12002 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 2.6 cm to 7.5 cm* (work RVU = 1.14), which requires less physician work and time to perform, 21 and 15 minutes intra-service time, respectively. The RUC determined a work RVU of 1.20 maintains the proper rank order for this family of services. **The RUC recommends a work RVU of 1.20 for CPT code 11307.**

11308 Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter over 2.0 cm
The RUC noted that podiatry is the dominant provider of this service. APMA determined not to participate in the survey process, however, sent a letter of support for these work RVU recommendations.

The RUC reviewed the survey results from 66 dermatologists for 11308 and determined that the 25th percentile work RVU of 1.46 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate any duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11308 to 11303, and determined that 11308 requires 4 more minutes intra-service time and is more intense and complex to perform than on the trunk, arms or legs. For additional support the RUC compared 11308 to similar services 12014 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 5.1 cm to 7.5 cm* (work RVU = 1.57 and 20 minutes intra-service time) and MPC code 29445 *Application of rigid total contact leg cast* (work RVU = 1.78 and 30 minutes intra-service time) and determined that 11308 was less intense and complex to perform. The RUC determined a work RVU of 1.46 maintains the proper rank order for this family of services. **The RUC recommends a work RVU of 1.46 for CPT code 11308.**

11310 Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 0.5 cm or less
The RUC reviewed the survey results from 68 dermatologists for 11310 and determined that the median work RVU of 1.19 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate any duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11310 to 11305 and determined that 11310 requires 6 minutes more minutes of intra-service time and is more intense and complex to perform than on the scalp, neck, hands, feet, genitalia. The RUC determined a work RVU of 1.19 maintains the proper rank order for this family of services. The RUC compared 11310 to key reference code 11440 *Excision, other benign lesion including margins, except skin tag (unless listed elsewhere), face, ears, eyelids, nose, lips, mucous membrane; excised diameter 0.5 cm or less* (work RVU = 1.05) which requires less physician work and time to perform, 20 minutes and 10 minutes intra-service time, respectively. **The RUC recommends a work RVU of 1.19 for CPT code 11310.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

11311 Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 0.6 to 1.0 cm
The RUC reviewed the survey results from 68 dermatologists for 11311 and determined that the median work RVU of 1.43 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 10 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11311 to 11306, and determined 11311 requires 7 more minutes of intra-service time and is more intense and complex to perform than on the scalp, neck, hands, feet and genitalia. The RUC also compared 11311 to key reference code 12013 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 2.6 cm to 5.0 cm* (work RVU = 1.22) and determined 11311 requires more physician work and 10 more minutes of intra-service time to perform. The RUC determined a work RVU of 1.43 maintains the proper rank order for this family of services**. The RUC recommends a work RVU of 1.43 for CPT code 11311.**

11312 Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 1.1 to 2.0 cm
The RUC reviewed the survey results from 68 dermatologists for 11312 and determined that the median work RVU of 1.80 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 11 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11312 to 11307, and determined 11312 requires 9 more minutes of intra-service time and is more intense and complex to perform than on the scalp, neck, hands, feet and genitalia. The RUC compared 11312 to MPC code 29445 *Application of rigid total contact leg cast* (work RVU=1.78) which requires similar physician work and 30 minutes of intra-service time to perform. The RUC determined a work RVU of 1.80 maintains the proper rank order for this family of services. **The RUC recommends a work RVU of 1.80 for CPT code 11312.**

11313 Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter over 2.0 cm
The RUC reviewed the survey results from 68 dermatologists for 11313 and determined that the median work RVU of 2.00 appropriately accounts for the physician work required to perform this service. The RUC reduced the pre-service time to eliminate duplication of services already performed in the Evaluation and Management service. The RUC recommends 1 minute of pre-time positioning the patient and 5 minutes of scrub, dress, wait time to administer local anesthesia. Additionally, the specialty recommended and the RUC agreed to reduce the survey respondents immediate post-service time from 12 minutes to 5 minutes to account only for the immediate post-operative services related to treatment of the lesion. The RUC compared 11313 to 11308, and determined 11313 requires 9 more minutes of intra-service time and is more intense and complex to perform than on the scalp, neck, hands, feet and genitalia. The RUC noted that the survey 25th percentile work RVU of 1.68 would not appropriately account for the physician work required to perform this service and would cause a rank order anomaly with the smaller shave code for this same body region, CPT code 11312. The RUC also compared 11313 to similar service 12015 *Simple repair of superficial wounds of face, ears, eyelids, nose, lips and/or mucous membranes; 7.6 cm to 12.5 cm* (work RVU = 1.98 and 25 minutes intra-service time). The RUC

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

determined a work RVU of 2.00 maintains the proper rank order for this family of services. **The RUC recommends a work RVU of 2.00 for CPT code 11313.**

Shaving of epidermal or dermal lesion, single lesion

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:11300 Tracking Number Original Specialty Recommended RVU: 0.60
Presented Recommended RVU: 0.60
Global Period: 000 RUC Recommended RVU: 0.60

CPT Descriptor: Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.5 cm or less

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old female presents for the removal of an atypical pigmented lesion above the right breast with a diameter of 0.4cm. The lesion warrants complete removal for thorough pathologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 100%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Positioning: Based upon lesion location and the technical detail required of the procedure, the patient is positioned for maximum flexibility for the surgeon while maintaining patient comfort. Records are checked to confirm patient, procedure and site. A photograph of the lesion is taken, printed and scanned/inserted into the patient's chart. The area is prepped, anaesthetized and draped. Anesthesia is injected in both subcutaneous and dermal compartments so that it results in a "raising" of the lesion to facilitate appropriate dermal depth removal.

Description of Intra-Service Work: Based on lesion type, size, and skin location, relaxed skin tension lines are marked. The dermal thickness in the location is evaluated, and then a margin between 2 to 5 mm is delineated with a surgical marker. The outline of the mark is scored using a scalpel. Starting at one end of the lesion the dermis is incised at anywhere from a 30 to 60 degree angle, to coincide with the leading edge of the skin lesion and to ensure that the path of removal is fully under the lesion yet still in the dermis. Hemostasis is achieved as needed, usually with pressure or topical application of aluminum chloride. The angle of dissection is then straightened to run parallel to the axis of the lesion, while remaining in the dermis. The shave proceeds forward following the pre-determined marked outline. As the dissection proceeds, the lesion is retracted as needed. This is accomplished by the placement of an initial suture to mark a border or retraction hooks or non-crushing forceps. The suture location is documented. As the midpoint is reached the dermal depth is checked to ensure that the fat is not penetrated and that the lesion appears in the entirety of the removed sample. Following the outline and maintaining a 30 to 60% transverse exit angle the lesion is removed. Additional hemostasis is achieved as above. Should further hemostasis need to be achieved, a fast-absorbing suture ligature or electrocautery can be utilized.

Description of Post-Service Work: The treatment site is monitored for delayed bleeding. An appropriate dressing for location and size is chosen (larger lesions might require Duoderm or some other flexible temporary skin substitute) and applied. Side effects, including pain, infection, oozing, and scaring are once again discussed with the patient, and the patient is discharged with appropriate analgesics and wound care instructions. The specimen is sent to pathology with a request for thorough examination.

INTENSITY/COMPLEXITY MEASURES (Mean)		(of those that selected Key Reference code)
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	2.82	2.92
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.56	2.75
Urgency of medical decision making	2.64	2.89
Technical Skill/Physical Effort (Mean)		
Technical skill required	2.84	3.08
Physical effort required	2.56	2.89
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.61	2.84
Outcome depends on the skill and judgment of physician	3.00	3.21
Estimated risk of malpractice suit with poor outcome	2.68	2.81

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.38	2.64
Intra-Service intensity/complexity	2.55	3.02
Post-Service intensity/complexity	2.40	2.76

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) has conducted a random survey of this code. Using the member database we identified both surgical and non-surgical members on the assumption that both surgical and general dermatologists would have performed this procedure within the last twelve months. AAD distributed the survey(s) directly to the identified random sample of members.

The AAD Consensus Panel (CP) reviewed the survey data from 76 dermatologists and determined that the pre-service time package that should be selected is package 6. Modifications to the pre-service time package are made based on

the fact that this service is typically performed with an E&M service. Further modifications were made to the positioning time as specialized patient positioning is required for the success of the procedure. Both of these modifications are supported by the survey data. Therefore, the CP recommends pre-service time of 5 minutes evaluation, 2 minutes positioning. Further, the CP recommends that 4 minutes be removed from the post service time period, to make consistent with other similar surgical procedures.

The CP reviewed the surveyed code in comparison to the key reference code 12001 (Work RVU=0.84) and noted that although both the surveyed code and the reference code have the same intra-service time, 10 minutes, the reference code requires significantly more mental effort and judgment, technical skill, physical effort and overall is a more intense service to perform in comparison to the surveyed code.

In addition, the CP compared the surveyed code to MPC code 11721 (work RVU=0.54). The CP noted that the 11721 has 19 minutes of total service time and the surveyed code has 22 minutes of total service time.

		Pre	Intra	Post	Total	RVU
K-REF	12001	7	10	5	22	0.84
SVY	11300	7	10	5	22	0.60
MPC	11721	7	10	2	19	0.54

Based on these comparisons, the CP recommends 0.60 work RVUs, the 25th percentile for 11300.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Several of the shave codes are performed over 50% of the time with an evaluation and management service. To be consistent, it was the judgment of the CP that the entire family should be treated as if it was billed with an E&M, to maintain relativity across of the family. Thus, modifications were made to the pre-service time package extracting time to account for this type of reporting.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11300

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Commonly

Specialty Family Practice How often? Sometimes

Specialty Physicians Assistant How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 265326
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 3X Medicare Utilization

Specialty Dermatology Frequency 167023 Percentage 62.95 %

Specialty Family Practice Frequency 42240 Percentage 15.92 %

Specialty PAs, Internal Meds etc Frequency 56064 Percentage 21.13 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 88,442 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare claims data

Specialty Dermatology Frequency 55675 Percentage 62.95 %

Specialty Family Practice Frequency 14080 Percentage 15.92 %

Specialty PAs, Internal Meds Frequency 18688 Percentage 21.13 %

Do many physicians perform this service across the United States? Yes

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:11301 Tracking Number

Original Specialty Recommended RVU: 0.90
Presented Recommended RVU: 0.90
RUC Recommended RVU: 0.90

Global Period: 000

CPT Descriptor: Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.6 to 1.0 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old female presents for the removal of an atypical pigmented lesion above the right breast with a diameter of 0.8cm. The lesion warrants complete removal for thorough pathologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 100%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Positioning: Based upon lesion location and the technical detail required of the procedure, the patient is positioned for maximum flexibility for the surgeon while maintaining patient comfort. Records are checked to confirm patient, procedure and site. A photograph of the lesion is taken, printed and scanned/inserted into the patient's chart. The area is prepped, anaesthetized and draped. Anesthesia is injected in both subcutaneous and dermal compartments so that it results in a "raising" of the lesion to facilitate appropriate dermal depth removal.

Description of Intra-Service Work: Based on lesion type, size, and skin location, relaxed skin tension lines are marked. The dermal thickness in the location is evaluated, and then a margin between 2 to 5 mm is delineated with a surgical marker. The outline of the mark is scored using a scalpel. Starting at one end of the lesion the dermis is incised at anywhere from a 30 to 60 degree angle, to coincide with the leading edge of the skin lesion and to ensure that the path of removal is fully under the lesion yet still in the dermis. Hemostasis is achieved as needed, usually with pressure or topical application of aluminum chloride. The angle of dissection is then straightened to run parallel to the axis of the lesion, while remaining in the dermis. The shave proceeds forward following the pre-determined marked outline. As the dissection proceeds, the lesion is retracted as needed. This is accomplished by the placement of an initial suture to mark a border or retraction hooks or non-crushing forceps. The suture location is documented. As the midpoint is reached the dermal depth is checked to ensure that the fat is not penetrated and that the lesion appears in the entirety of the removed sample. Following the outline and maintaining a 30 to 60% transverse exit angle the lesion is removed. Additional hemostasis is achieved as above. Should further hemostasis need to be achieved, a fast-absorbing suture ligature or electrocautery can be utilized.

Description of Post-Service Work: The treatment site is monitored for delayed bleeding. An appropriate dressing for location and size is chosen (larger lesions might require Duoderm or some other flexible temporary skin substitute) and applied. Side effects, including pain, infection, oozing, and scaring are once again discussed with the patient, and the patient is discharged with appropriate analgesics and wound care instructions. The specimen is sent to pathology with a request for thorough examination.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) has conducted a random survey of this code. Using the member database we identified both surgical and non-surgical members on the assumption that both surgical and general dermatologists would have performed this procedure within the last twelve months. AAD distributed the survey(s) directly to the identified random sample of members.

The AAD Consensus Panel (CP) reviewed the survey data from 76 dermatologists and determined that the pre-service time package that should be selected is package 6. Modifications to the pre-service time package are made based on the fact that this service is typically performed with an E&M service. Further modifications were made to the positioning time as specialized patient positioning is required for the success of the procedure. Both of these modifications are supported by the survey data. Therefore, the CP recommends pre-service time of 5 minutes evaluation, 2 minutes positioning. Further, the CP recommends that 5 minutes be removed from the post service time period, to make consistent with other similar surgical procedures.

The CP reviewed the surveyed code in comparison to the key reference code 12001 (Work RVU=0.84) and noted that the surveyed code requires significantly more mental effort and judgment and greater risk for psychological stress in comparison to the reference code. Further, the CP noted that the total service time for the surveyed code exceeds the total service time for the reference code, 27 minutes and 22 minutes.

In addition, the CP compared the surveyed code to MPC code 56605 (work RVU=1.10). The CP noted that the 56605 has 35 minutes of total service time and the surveyed code has 27 minutes of total service time.

		Pre	Intra	Post	Total	RVU
MPC	56605	10	15	10	35	1.10
SVY	11301	7	15	5	27	0.90
K-Ref	12001	7	10	5	22	0.84

Based on these comparisons, the CP recommends 0.90 work RVUs, the 25th percentile for 11301.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Several of the shave codes are performed over 50% of the time with an evaluation and management service. To be consistent, it was the judgment of the CP that the entire family should be treated as if it was billed with an E&M, to maintain relativity across of the family. Thus, modifications were made to the pre-service time package extracting time to account for this type of reporting.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Pre-Service intensity/complexity	2.86	2.98
Intra-Service intensity/complexity	3.29	3.35
Post-Service intensity/complexity	3.00	3.11

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) has conducted a random survey of this code. Using the member database we identified both surgical and non-surgical members on the assumption that both surgical and general dermatologists would have performed this procedure within the last twelve months. AAD distributed the survey(s) directly to the identified random sample of members.

The AAD Consensus Panel (CP) reviewed the survey data from 76 dermatologists and determined that the pre-service time package that should be selected is package 6. Modifications to the pre-service time package are made based on the fact that this service is typically performed with an E&M service. Further modifications were made to the positioning time as specialized patient positioning is required for the success of the procedure. Both of these modifications are supported by the survey data. Therefore, the CP recommends pre-service time of 5 minutes evaluation, 3 minutes positioning. Further, the CP recommends that 5 minutes be removed from the post service time period, to make consistent with other similar surgical procedures.

The CP reviewed the surveyed code in comparison to the key reference code 11422 (Work RVU=1.68) and noted that the reference code requires significantly more mental effort and judgment, technical skill, physical effort and overall is a more intense service to perform in comparison to the surveyed code. Further, the CP noted that the total service time for the reference code exceeds the total service time for the surveyed code, 56 minutes and 36 minutes.

In addition, the CP compared the surveyed code to MPC code 11100 (work RVU=0.81). The CP noted that the 11100 has 22 minutes of total service time and the surveyed code has 33 minutes of total service time.

		Pre	Intra	Post	Total	RVU
K-Ref	11422	10	25	5	56	1.68
SVY	11302	6	20	5	31	1.16
MPC	11100	5	12	5	22	0.81

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Several of the shave codes are performed over 50% of the time with an evaluation and management service. To be consistent, it was the judgment of the CP that the entire family should be treated as if it was billed with an E&M, to maintain relativity across of the family. Thus, modifications were made to the pre-service time package extracting time to account for this type of reporting.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11302

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Commonly

Specialty Family Practice How often? Rarely

Specialty Physicians Assistant How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 321522
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare Claims Data

Specialty Dermatology Frequency 250788 Percentage 78.00 %

Specialty Family Practice Frequency 24179 Percentage 7.52 %

Specialty PAs, Plastics etc Frequency 46557 Percentage 14.48 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 107,174
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare claims data

Specialty Dermatology Frequency 83596 Percentage 78.00 %

Specialty Family Practice Frequency 8060 Percentage 7.52 %

Specialty PAs, Plastics et Frequency 15519 Percentage 14.48 %

Do many physicians perform this service across the United States? Yes

SUMMARY OF RECOMMENDATION

CPT Code:11303 Tracking Number Original Specialty Recommended RVU: **1.25**
Presented Recommended RVU: **1.25**
Global Period: 000 RUC Recommended RVU: **1.25**

CPT Descriptor: Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter over 2.0 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old female presents for the removal of an atypical pigmented lesion above the right breast with a diameter 2.3cm. The lesion warrants complete removal for thorough pathologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Positioning: Based upon lesion location and the technical detail required of the procedure, the patient is positioned for maximum flexibility for the surgeon while maintaining patient comfort. Records are checked to confirm patient, procedure and site. A photograph of the lesion is taken, printed and scanned/inserted into the patient's chart. The area is prepped, anaesthetized and draped. Anesthesia is injected in both subcutaneous and dermal compartments so that it results in a "raising" of the lesion to facilitate appropriate dermal depth removal.

Description of Intra-Service Work: Based on lesion type, size, and skin location, relaxed skin tension lines are marked. The dermal thickness in the location is evaluated, and then a margin between 2 to 5 mm is delineated with a surgical marker. The outline of the mark is scored using a scalpel. Starting at one end of the lesion the dermis is incised at anywhere from a 30 to 60 degree angle, to coincide with the leading edge of the skin lesion and to ensure that the path of removal is fully under the lesion yet still in the dermis. Hemostasis is achieved as needed, usually with pressure or topical application of aluminum chloride. The angle of dissection is then straightened to run parallel to the axis of the lesion, while remaining in the dermis. The shave proceeds forward following the pre-determined marked outline. As the dissection proceeds, the lesion is retracted as needed. This is accomplished by the placement of an initial suture to mark a border or retraction hooks or non-crushing forceps. The suture location is documented. As the midpoint is reached the dermal depth is checked to ensure that the fat is not penetrated and that the lesion appears in the entirety of the removed sample. Following the outline and maintaining a 30 to 60% transverse exit angle the lesion is removed. Additional hemostasis is achieved as above. Should further hemostasis need to be achieved, a fast-absorbing suture ligature or electrocautery can be utilized.

Description of Post-Service Work: The treatment site is monitored for delayed bleeding. An appropriate dressing for location and size is chosen (larger lesions might require Duoderm or some other flexible temporary skin substitute) and applied. Side effects, including pain, infection, oozing, and scaring are once again discussed with the patient, and the patient is discharged with appropriate analgesics and wound care instructions. The specimen is sent to pathology with a request for thorough examination

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) has conducted a random survey of this code. Using the member database we identified both surgical and non-surgical members on the assumption that both surgical and general dermatologists would have performed this procedure within the last twelve months. AAD distributed the survey(s) directly to the identified random sample of members.

The AAD Consensus Panel (CP) reviewed the survey data from 76 dermatologists and determined that the pre-service time package that should be selected is package 6. Modifications to the pre-service time package are made based on the fact that this service is typically performed with an E&M service. Further modifications were made to the positioning time as specialized patient positioning is required for the success of the procedure. Both of these modifications are supported by the survey data. Therefore, the CP recommends pre-service time of 6 minutes evaluation, 3 minutes positioning. Further, the CP recommends that 5 minutes be removed from the post service time period, to make consistent with other similar surgical procedures.

The CP reviewed the surveyed code in comparison to the key reference code 12002 (Work RVU=1.14) and noted that the surveyed code requires significantly more mental effort and judgment, technical skill, physical effort and overall is a more intense service to perform in comparison to the reference code. Further, the CP noted that the total service time for the surveyed code exceeds the total service time for the reference code, 36 minutes and 27 minutes.

In addition, the CP compared the surveyed code to MPC code 11755 (work RVU=1.31). The CP noted that the 11755 has 55 minutes of total service time and the surveyed code has 36 minutes of total service time.

		Pre	Intra	Post	Total	RVU
MPC	11755	15	25	15	55	1.31
SVY	11303	6	22	5	33	1.25
K-Ref	12002	7	15	5	27	1.14

Based on these comparisons, the CP recommends 1.25 work RVUs, the 25th percentile for 11303.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Several of the shave codes are performed over 50% of the time with an evaluation and management service. To be consistent, it was the judgment of the CP that the entire family should be treated as if it was billed with an E&M, to maintain relativity across of the family. Thus, modifications were made to the pre-service time package extracting time to account for this type of reporting.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Vignette Used in Survey: A 40 year old female presents for the removal of an atypical pigmented lesion on her scalp with a diameter of 0.4 cm. The lesion warrants complete removal for thorough pathologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 50%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Positioning: Based upon lesion location and the technical detail required of the procedure, the patient is positioned for maximum flexibility for the surgeon while maintaining patient comfort. Records are checked to confirm patient, procedure and site. A photograph of the lesion is taken, printed and scanned/inserted into the patient's chart. The area is prepped, anaesthetized and draped. Anesthesia is injected in both subcutaneous and dermal compartments so that it results in a "raising" of the lesion to facilitate appropriate dermal depth removal..

Description of Intra-Service Work: Based on lesion type, size, and skin location, relaxed skin tension lines are marked. The dermal thickness in the location is evaluated, and then a margin between 2 to 5 mm is delineated with a surgical marker. The outline of the mark is scored using a scalpel. Starting at one end of the lesion the dermis is incised at anywhere from a 30 to 60 degree angle, to coincide with the leading edge of the skin lesion and to ensure that the path of removal is fully under the lesion yet still in the dermis. Hemostasis is achieved as needed, usually with pressure or topical application of aluminum chloride. The angle of dissection is then straightened to run parallel to the axis of the lesion, while remaining in the dermis. The shave proceeds forward following the pre-determined marked outline. As the dissection proceeds, the lesion is retracted as needed. This is accomplished by the placement of an initial suture to mark a border or retraction hooks or non-crushing forceps. The suture location is documented. As the midpoint is reached the dermal depth is checked to ensure that the fat is not penetrated and that the lesion appears in the entirety of the removed sample. Following the outline and maintaining a 30 to 60% transverse exit angle the lesion is removed. Additional hemostasis is achieved as above. Should further hemostasis need to be achieved, a fast-absorbing suture ligature or electrocautery can be utilized.

Description of Post-Service Work: The treatment site is monitored for delayed bleeding. An appropriate dressing for location and size is chosen (larger lesions might require Duoderm or some other flexible temporary skin substitute) and applied. Side effects, including pain, infection, oozing, and scaring are once again discussed with the patient, and the patient is discharged

with appropriate analgesics and wound care instructions. The specimen is sent to pathology with a request for thorough examination

Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**25.00**	**27.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)		(of those that selected Key Reference code)
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.01	3.12
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	2.74	3.03
Urgency of medical decision making	2.74	3.09
Technical Skill/Physical Effort (Mean)		
Technical skill required	2.92	3.21
Physical effort required	2.60	3.04
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.74	3.00
Outcome depends on the skill and judgment of physician	3.06	3.21
Estimated risk of malpractice suit with poor outcome	2.74	2.96

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	2.58	2.81
Intra-Service intensity/complexity	2.69	3.00
Post-Service intensity/complexity	2.42	2.77

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) has conducted a random survey of this code. Using the member database we identified both surgical and non-surgical members on the assumption that both surgical and general dermatologists would have performed this procedure within the last twelve months. AAD distributed the survey(s) directly to the identified random sample of members.

The AAD Consensus Panel (CP) reviewed the survey data from 66 dermatologists and determined that the pre-service time package that should be selected is package 6. Modifications to the pre-service time package are made based on the fact that this service is typically performed with an E&M service. Further modifications were made to the positioning time as specialized patient positioning is required for the success of the procedure. Both of these modifications are supported by the survey data. Therefore, the CP recommends pre-service time of 5 minutes evaluation, 3 minutes positioning. Further, the CP recommends that 5 minutes be removed from the post service time period, to make consistent with other similar surgical procedures.

The CP reviewed the surveyed code in comparison to the key reference code 12002 (Work RVU=1.14) and noted that the reference code requires significantly more mental effort and judgment, technical skill, physical effort and overall is a more intense service to perform in comparison to the surveyed code.

In addition, the CP compared the surveyed code to reference code 69100 (work RVU=0.81). The CP noted that the 69100 has 7 minutes of pre-service time, 12 minutes of intra-service time and 5 minutes of post-service time which is very similar to the recommended time for 11305, 8 minutes of pre-service time, 14 minutes of intra-service time and 5 minutes of post time. Further comparison codes include MPC code 65205 (Work RVU=0.71). The CP noted that 65205 has 15 minutes of total service time as compared to the surveyed code which as 27 minutes of total service time.

	CPT Code	Pre	Intra	Post	Total	RVU
Key Ref	12002	7	15	5	27	1.14
Ref	69100	7	12	5	24	0.81
SVY	11305	6	14	5	25	0.80
MPC	65205	5	5	5	15	0.71

Based on these comparisons, the CP recommends 0.80 work RVUs, the 25th percentile for 11305.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) Several of the shave codes are performed over 50% of the time with an evaluation and management service. To be consistent, it was the judgment of the CP that the entire family should be treated as if it was billed with an E&M, to maintain relativity across of the family. Thus, modifications were made to the pre-service time package extracting time to account for this type of reporting.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 11305

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology How often? Sometimes

Specialty Podiatry How often? Commonly

Specialty Family Practice How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 346419
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimate 3X Medicare utilization

Specialty Dermatology Frequency 67760 Percentage 19.56 %

Specialty Podiatry Frequency 241455 Percentage 69.70 %

Specialty Family Practice, PAs etc Frequency 37206 Percentage 10.74 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 115,473
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare Claims Data

Specialty Dermatology Frequency 22587 Percentage 19.56 %

Specialty Podiatry Frequency 80485 Percentage 69.70 %

Specialty Family Practice, PAs etc Frequency 12402 Percentage 10.74 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 11305

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:11306 Tracking Number Original Specialty Recommended RVU: 1.18
Presented Recommended RVU: 1.18
Global Period: 000 RUC Recommended RVU: 1.18

CPT Descriptor: Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 0.6 to 1.0 cm

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40 year old female presents for the removal of an atypical pigmented lesion on her scalp with a diameter 0.8cm. The lesion warrants complete removal for thorough pathologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Positioning: Based upon lesion location and the technical detail required of the procedure, the patient is positioned for maximum flexibility for the surgeon while maintaining patient comfort. Records are checked to confirm patient, procedure and site. A photograph of the lesion is taken, printed and scanned/inserted into the patient's chart. The area is prepped, anaesthetized and draped. Anesthesia is injected in both subcutaneous and dermal compartments so that it results in a "raising" of the lesion to facilitate appropriate dermal depth removal.

Description of Intra-Service Work: Based on lesion type, size, and skin location, relaxed skin tension lines are marked. The dermal thickness in the location is evaluated, and then a margin between 2 to 5 mm is delineated with a surgical marker. The outline of the mark is scored using a scalpel. Starting at one end of the lesion the dermis is incised at anywhere from a 30 to 60 degree angle, to coincide with the leading edge of the skin lesion and to ensure that the path of removal is fully under the lesion yet still in the dermis. Hemostasis is achieved as needed, usually with pressure or topical application of aluminum chloride. The angle of dissection is then straightened to run parallel to the axis of the lesion, while remaining in the dermis. The shave proceeds forward following the pre-determined marked outline. As the dissection proceeds, the lesion is retracted as needed. This is accomplished by the placement of an initial suture to mark a border or retraction hooks or non-crushing forceps. The suture location is documented. As the midpoint is reached the dermal depth is checked to ensure that the fat is not penetrated and that the lesion appears in the entirety of the removed sample. Following the outline and maintaining a 30 to 60% transverse exit angle the lesion is removed. Additional hemostasis is achieved as above. Should further hemostasis need to be achieved, a fast-absorbing suture ligature or electrocautery can be utilized.

Description of Post-Service Work: The treatment site is monitored for delayed bleeding. An appropriate dressing for location and size is chosen (larger lesions might require Duoderm or some other flexible temporary skin substitute) and applied. Side effects, including pain, infection, oozing, and scaring are once again discussed with the patient, and the patient is discharged

with appropriate analgesics and wound care instructions. The specimen is sent to pathology with a request for thorough examination.
