We randomly assigned 1800 patients with three-vessel or left main coronary artery disease to undergo CABG or PCI (in a 1:1 ratio). For all these patients, the local cardiac surgeon and interventional cardiologist determined that equivalent anatomical revascularization could be achieved with either treatment. A noninferiority comparison of the two groups was performed for the primary end point — a major adverse cardiac or cerebrovascular event (i.e., death from any cause, stroke, myocardial infarction, or repeat revascularization) during the 12-month period after randomization. Patients for whom only one of the two treatment options would be beneficial, because of anatomical features or clinical conditions, were entered into a parallel, nested CABG or PCI registry.

RESULTS

Most of the preoperative characteristics were similar in the two groups. Rates of major adverse cardiac or cerebrovascular events at 12 months were significantly higher in the PCI group (17.8%, vs. 12.4% for CABG; P=0.002), in large part because of an increased rate of repeat revascularization (13.5% vs. 5.9%, P<0.001); as a result, the criterion for noninferiority was not met. At 12 months, the rates of death and myocardial infarction were similar between the two groups; stroke was significantly more likely to occur with CABG (2.2%, vs. 0.6% with PCI; P=0.003).

CONCLUSIONS

CABG remains the standard of care for patients with three-vessel or left main coronary artery disease, since the use of CABG, as compared with PCI, resulted in lower rates of the combined end point of major adverse cardiac or cerebrovascular events at 1 year. Coronary-artery bypass grafting (CABG) was introduced in 1968 and rapidly became the standard of care for symptomatic patients with coronary artery disease.[1] Advances in coronary surgery (e.g., off-pump CABG, smaller incisions, enhanced myocardial preservation, use of arterial conduits, and improved postoperative care) have reduced morbidity, mortality, and rates of graft occlusion.[2-6]

Percutaneous coronary intervention (PCI) was introduced in 1977.[7] Experience with this approach, coupled with improved technology, has made it possible to treat increasingly complex lesions and patients with a history of clinically significant cardiac disease, risk factors for coronary artery disease, coexisting conditions, or anatomical risk factors.[8,9] Several trials comparing PCI involving bare-metal stents with CABG in patients with multivessel disease (e.g., the Arterial Revascularization Therapies Study Part I [ARTS I], the Medicine, Angioplasty, or Surgery Study for Multivessel Coronary Artery Disease [MASS II; Current Controlled Trials number, ISRCTN66068876], the Argentine Randomized Study of Coronary Angioplasty with Stenting versus Coronary Bypass Surgery in Patients with Multiple Vessel Disease [ERACI-II], and the Angina with Extremely Serious Operative Mortality Evaluation [AWESOME]) showed similar survival rates but higher revascularization rates among patients with bare-metal stents at 5 years. Others have shown a significant long-term survival advantage with surgery (e.g., the Stent or Surgery [SOS] study).[10-12] Studies comparing PCI involving drug-eluting stents with CABG have generally been smaller and nonrandomized.[13-24]

Data from randomized, controlled trials of drug-eluting stents as compared with bare-metal stents have shown significant reductions in the rate of repeat intervention, with similar rates of death and myocardial infarction.[25] These improvements have led to expanded use of PCI in patients with complex coronary anatomical features, though most randomized trials comparing drug-eluting stents and bare-metal stents excluded such patients. According to current guidelines,[26] CABG remains the treatment of choice for patients with severe coronary artery disease, including those with left main coronary artery disease and those with three-vessel disease. There is a lack of data from adequately powered randomized trials of PCI in such patients. Thus, PCI is being performed in this group without adequate support from evidence-based medicine and randomized clinical trials.[27]

In the Synergy between PCI with Taxus and Cardiac Surgery (SYNTAX) trial, we assessed the optimal revascularization strategy for patients with previously untreated three-vessel or left main coronary artery disease and defined the populations of patients for whom only one revascularization method will be effective.

METHODS

STUDY DESIGN

The SYNTAX trial is a prospective, clinical trial conducted in 85 sites and approved by the institutional review board at each participating center. The study had an "all-comers" design involving the consecutive enrollment of all eligible patients with three-vessel or left main coronary artery disease at sites in 17 countries in Europe and the United States. The study design has been described previously.[28] Criteria for study and registry enrollment and outcome data are described in the Supplementary Appendix. The authors designed the study, as part of their role on the steering committee, in collaboration with the sponsor, Boston Scientific. The sponsor was involved in collection and source verification of the data, with oversight by an independent clinical events committee. The sponsor's biostatisticians performed the analyses; however, data analyses were verified independently by a statistician on the data and safety monitoring committee. The authors wrote the manuscript and vouch for the completeness and accuracy of the data gathering and analysis.

SELECTION AND RANDOMIZATION OF PATIENTS

A local interventional cardiologist and cardiac surgeon at each site prospectively evaluated eligible patients with previously untreated three-vessel coronary disease and those with left main coronary artery disease (alone or with one-, two-, or three-vessel disease). Inclusion and exclusion criteria are listed in the Methods section of the Supplementary Appendix. Patients in whom it was determined that equivalent anatomical revascularization could be achieved with either CABG or PCI involving Taxus Express paclitaxel-eluting stents (Boston Scientific) were randomly assigned to undergo one of the two treatment options by means of an interactive voice-responding system. Ran-

Downloaded from www.nejm.org at DUKE MEDICAL CENTER LIBRARY on March 16, 2009 .
Copyright © 2009 Massachusetts Medical Society. All rights reserved.

domization was stratified at each site according to the presence or absence of left main coronary artery disease and medically treated diabetes (diabetes for which the patient was receiving oral hypoglycemic agents or insulin at the time of enrollment). Patients for whom only one treatment option was suitable were entered into a parallel, nested registry: the PCI registry for CABG-ineligible patients and the CABG registry for PCI-ineligible patients.

All diagnostic angiograms and electrocardiograms were reviewed by staff at an independent core laboratory (Cardialysis, Rotterdam, the Netherlands) who were unaware of the treatment assignments. Diagnostic angiograms were scored, according to the SYNTAX score algorithm,[29] at the site and at the core laboratory. In addition, staff at an independent central chemistry laboratory (Covance, Indianapolis and Geneva) who were unaware of treatment assignments assessed selected variables.

The institutional review board at each site approved the protocol, and all patients provided written informed consent. The protocol and consent forms were consistent with the Food and Drug Administration's Guidance for Industry E6 Good Clinical Practice, the Declaration of Helsinki, the International Conference on Harmonisation, and all local regulations, as appropriate.

REVASCULARIZATION AND PHARMACOLOGIC TREATMENT

Patients were treated with the intention of achieving complete revascularization of all vessels at least 1.5 mm in diameter with stenosis of 50% or more, as identified by the local interventional cardiologist and cardiac surgeon. The surgical technique for CABG, the approaches used for stent implantation, and the postprocedure medication regimen were chosen according to local clinical practice. In patients who underwent PCI, antiplatelet medication was prescribed on the basis of the directions for use of the Taxus Express stent and local clinical practice. In most centers, thienopyridines were continued even after 6 months, with 71.1% of patients receiving them at 12 months. Aspirin was prescribed indefinitely for all patients who underwent randomization. Use of the standard of postintervention care was recommended.[30] Procedural details are described in the Methods section of the Supplementary Appendix.

PRIMARY END POINT

The primary clinical end point was a composite of major adverse cardiac and cerebrovascular events (i.e., death from any cause, stroke, myocardial infarction, or repeat revascularization) throughout the 12-month period after randomization. An independent clinical events committee (including cardiologists, cardiac surgeons, and a neurologist; see the list in the Supplementary Appendix) adjudicated all primary clinical end points, staged procedures, and cases in which the sternum was reopened.

STATISTICAL ANALYSIS

The primary analysis was a noninferiority comparison of the two treatments for the primary end point of adverse binary cardiac or cerebrovascular events in all patients who underwent randomization (on an intention-to-treat basis). If the one-sided 95% upper confidence limit for the difference was less than the prespecified delta value (6.6%), PCI with the drug-eluting stents would be considered to be noninferior to CABG in the overall randomized cohort. The noninferiority margin was based on historical data (see the Methods section in the Supplementary Appendix). We calculated the means (±SD) for continuous variables in each of the two groups and compared them using Student's t-test. Binary variables are reported as counts and percentages, and differences between the two groups were assessed by means of the chi-square or Fisher's exact test. Cumulative event rates were estimated by means of the Kaplan–Meier method. In addition, the 12-month rates of major adverse cardiac or cerebrovascular events were analyzed on the basis of the SYNTAX score and compared with the use of a chi-square test. The SYNTAX score reflects a comprehensive anatomical assessment, with higher scores indicating more complex coronary disease; a low score was defined as ≤22, an intermediate score as 23 to 32, and a high score as ≥33 (see the Supplementary Appendix for details).

RESULTS

STUDY PARTICIPANTS

From March 2005 through April 2007, a total of 4337 patients with previously untreated three-vessel or left main coronary artery disease (or both) were screened (Fig. 1). After consideration by the local

Downloaded from www.nejm.org at DUKE MEDICAL CENTER LIBRARY on March 16, 2009 .
Copyright © 2009 Massachusetts Medical Society. All rights reserved.

interventional cardiologist and cardiac surgeon and after written informed consent was obtained, 3075 patients (70.9%) were included in the study. Of these, 1800 patients were randomly assigned to undergo CABG (897 patients) or PCI with drug-eluting stents (903 patients) at sites in the United States (245 patients) and in Europe (1555 patients). The reasons for exclusion of the remaining 1262 patients are listed in Figure 1. Only one treatment option was suitable in 1275 patients (29.4%), who were enrolled in the nested registry for CABG (1077 patients) or PCI (198 patients).

Patients in the two groups were well balanced with regard to most of the baseline demographic and clinical characteristics (Table 1). The proportion of patients with blood pressure of 130/80 mm Hg or higher was significantly larger in the PCI group. The numbers of current smokers, patients with elevated triglyceride levels (≥150 mg per deciliter [1.7 mmol per liter]), and patients with reduced high-density lipoprotein cholesterol levels (<40 mg per deciliter [1.0 mmol per liter] for men or <50 mg per deciliter [1.3 mmol per liter] for women) were higher in the CABG group. A total of 38.8% of patients in the CABG group and 39.5% of those in the PCI group had left main coronary artery disease, with or without additional diseased vessels. Approximately 25% of patients had medically treated diabetes, of whom about one third required insulin. Moreover, nearly half the patients (45.8%) met the criteria for the metabolic syndrome.[33] More than 20% of patients in both groups were considered to be at high surgical risk, on the basis of a European System for Cardiac Operative Risk Evaluation (euroSCORE)[31] value of 6 or more (24.9% in the CABG group and 24.7% in the PCI group, P=0.94) and a Parsonnet score[32] of 15 or more (20.2% and 20.5%, respectively; P=0.87).

Overall, more than 4 clinically significant coronary lesions were treated per patient (mean, 4.4 for CABG and 4.3 for PCI); among all patients in both groups, total occlusion was identified in 23.1%, and 72.8% had a bifurcation lesion (Table 1). These results, together with other lesion characteristics, resulted in an average raw SYNTAX score of 29.1 in the CABG group and 28.4 in the PCI group (P=0.19) (Table 1).

The length of time between randomization and performance of the study procedure, the duration of the procedure, and the duration of the post-procedural hospital stay were significantly greater with CABG than with PCI (Table 1). A higher proportion of patients had complete revascularization after CABG than after PCI (63.2% vs. 56.7%, P=0.005). Medical management at discharge differed between the CABG and PCI groups: patients who underwent CABG received less pharmacologic treatment, whereas those who underwent PCI were consistently treated with antiplatelet medications (Table 2). In the CABG group, off-pump surgery was performed in 15.0% of patients, one or more arterial grafts were used in 97.3% of patients, and an average of 2.8 conduits and 3.2 distal anastomoses per patient were performed. In the PCI group, 14.1% of patients underwent staged procedures, 63.1% had at least one bifurcation or trifurcation treated, more than four stents on average were implanted per patient, and a third of patients had placement of stents with a total length of more than 100 mm.

A greater proportion of patients in the CABG registry had characteristics of severe lesions — including large proportions of patients with total occlusion (56.4%), bifurcation (80.8%), lesions that were more than 20 mm in length (31.5%), and heavy calcification (32.7%) — than in either randomized group or the PCI registry (Table 2 in the Supplementary Appendix). Together with other anatomical characteristics, these features resulted in an average raw SYNTAX score of 37.8±13.3 among the patients in the CABG registry (Table 2 in the Supplementary Appendix). In contrast, the prevalence of cardiac risk factors and the prevalence of coexisting conditions were increased among patients enrolled in the PCI registry. A total of 30.2% of these patients had diabetes, 40.4% had previously had a myocardial infarction, 19.3% had a diagnosis of chronic obstructive pulmonary disease, 14.1% had a history of transient ischemic attacks or stroke, and 4.7% were dependent on pacemakers — leading to average surgical scores that were higher than in the other groups of patients (euroSCORE value, 5.8±3.1; and Parsonnet score, 14.4±9.5) (Table 2 in the Supplementary Appendix).

PRIMARY OUTCOME

Preprocedural rates of major adverse cardiac or cerebrovascular events were low and did not differ significantly between the two groups (0.9% in the CABG group and 0.3% in the PCI group, P=0.13) (Table 6 in the Supplementary Appendix), as was the case for in-hospital rates. The preprocedural

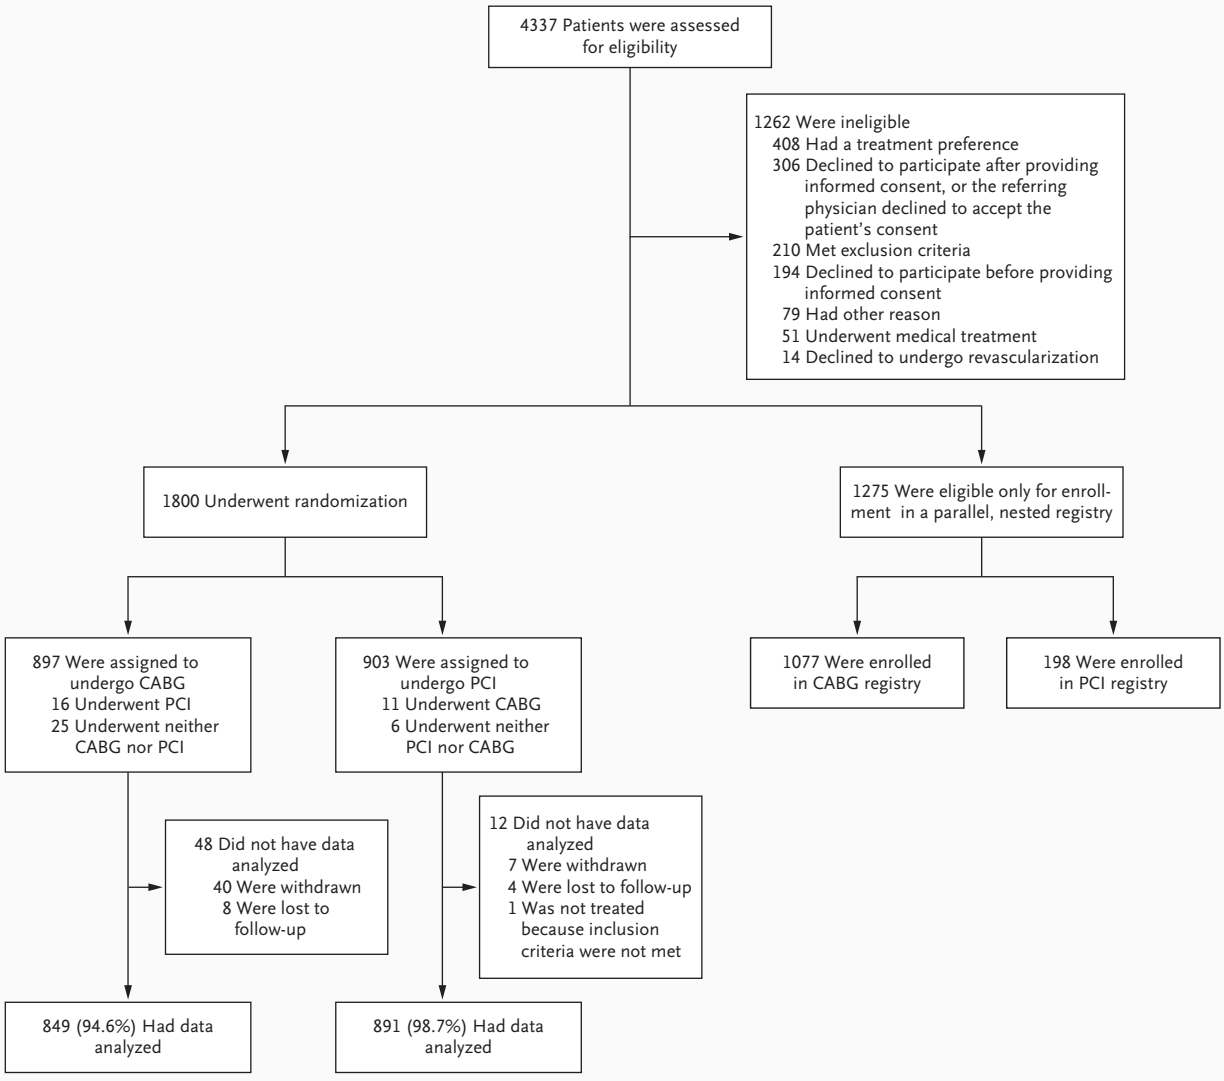

Figure 1. Enrollment and Randomization of Patients with Previously Untreated Three-Vessel or Left Main Coronary Artery Disease in the SYNTAX Trial.

The trial used an "all-comers" design. Exclusion criteria were previous intervention, acute myocardial infarction, and concomitant surgery. Patients meeting either of the first two exclusion criteria were, according to the trial design, excluded without consultation of the local interventional cardiologist and cardiac surgeon. The need for concomitant surgery was discussed with the local interventional cardiologist and cardiac surgeon. Data for patients who were assigned to one treatment but underwent the other and for those who did not undergo either revascularization procedure were analyzed in an intention-to-treat manner. CABG denotes coronary-artery bypass grafting, and PCI percutaneous coronary intervention.

rates of two of the individual components of the primary outcome, stroke and myocardial infarction, were similar in the two groups (Table 2 in the Supplementary Appendix). At 12 months, the incidence of major adverse cardiac or cerebrovascular events was lower in the CABG group (12.4%) than in the PCI group (17.8%, P=0.002) (Fig. 2 and Table 3). Thus, the absolute difference in the 12-month rate of major adverse cardiac or cerebrovascular events between the two groups was 5.5 percentage points, with an upper 95% confidence interval of 8.3 percentage points. The results of an as-treated analysis were similar: the 12-month rate of major adverse cardiac or cerebrovascular events was 12.3% with CABG and 17.6% with PCI (P=0.002).

Complete revascularization — %	56.7	63.2	0.005

* Plus–minus values are means ±SD. Data are given for the intention-to-treat population. P values, the average SYNTAX score, the average number of lesions, and the percentages of patients with total occlusion and bifurcation were calculated at the core laboratory. The European System for Cardiac Operative Risk Evaluation (euroSCORE) value could range from 0 to 18, with increasing values reflecting a higher predicted operative mortality.[31] The Parsonnet score could range from 0 to 47, with increasing values reflecting a higher predicted in-hospital mortality.[32] The SYNTAX score reflects a comprehensive anatomical assessment, with scores ranging from 0 to 83 and higher scores indicating more complex coronary disease (see the Supplementary Appendix for details). CABG denotes coronary-artery bypass grafting, HDL high-density lipoprotein, and PCI percutaneous coronary intervention.

† The body-mass index is the weight in kilograms divided by the square of the height in meters.

‡ Medically treated diabetes was defined as diabetes for which the patient was receiving oral hypoglycemic agents or insulin at the time of enrollment.

Downloaded from www.nejm.org at DUKE MEDICAL CENTER LIBRARY on March 16, 2009 .
Copyright © 2009 Massachusetts Medical Society. All rights reserved.

In the intention-to-treat population, 19 patients would need to be treated with CABG to avoid the primary outcome in 1 patient; the numbers needed to treat to avoid specific components of the outcome were 14 for revascularization, 119 for death, and 71 for myocardial infarction. The number needed to treat with PCI to avoid stroke in 1 patient was 60.

SECONDARY OUTCOME

The rate of repeat revascularization at 12 months was significantly higher among patients in the PCI group than among those in the CABG group (13.5% vs. 5.9%, P<0.001) (Table 3). Most patients who underwent repeat revascularization were treated with PCI rather than CABG. The rate of stroke was significantly higher with CABG than with PCI at 12 months, even though the two groups were well balanced with regard to carotid artery disease and other risk factors for stroke (Table 3). At 12 months, the two groups had similar rates of death from any cause or myocardial infarction and of the combined end point of death from any cause, stroke, or myocardial infarction (Table 3). The rate of death from cardiac causes was greater with PCI than with CABG (3.7% vs. 2.1%, P=0.05); the rate of death from noncardiac causes, although not significant, was higher with CABG (1.4% vs. 0.7%, P=0.13). The 12-month rates of symptomatic graft occlusion (in the CABG group) and stent thrombosis (in the PCI group) were similar (P=0.89) (Table 3).

OUTCOMES ACCORDING TO THE SYNTAX SCORE

In the CABG group, the binary 12-month rates of major adverse cardiac or cerebrovascular events were similar among patients with low SYNTAX scores (0 to 22, 14.7%), those with intermediate scores (23 to 32, 12.0%), and those with high scores (≥33, 10.9%) (Fig. 3). In contrast, in the PCI group, the rate of major adverse cardiac or cerebrovascular events was significantly increased among patients with high SYNTAX scores (23.4%) as compared with those with low scores (13.6%) or intermediate scores (16.7%) (P=0.002 for high vs. low scores; P=0.04 for high vs. intermediate scores) (Fig. 3). There was a significant interaction between SYNTAX score and treatment group (P=0.01); patients with low or intermediate scores in the CABG group and in the PCI group had similar rates of major adverse cardiac or cerebrovascular events, whereas among patients with high scores, the event rate was significantly increased in the PCI group (Fig. 3).

* Percentages are from the intention-to-treat analysis. ACE denotes angiotensin-converting enzyme, CABG coronary-artery bypass grafting, and PCI percutaneous coronary intervention.

OUTCOMES IN SUBGROUPS

The subgroups of patients with left main or three-vessel coronary artery disease were prespecified, and the study had a statistical power of 80% for each subgroup. However, the overarching statistical test was a noninferiority assessment of data from all patients with either left main coronary artery disease or three-vessel coronary disease (or both). Since noninferiority was not proven in this

Downloaded from www.nejm.org at DUKE MEDICAL CENTER LIBRARY on March 16, 2009 .

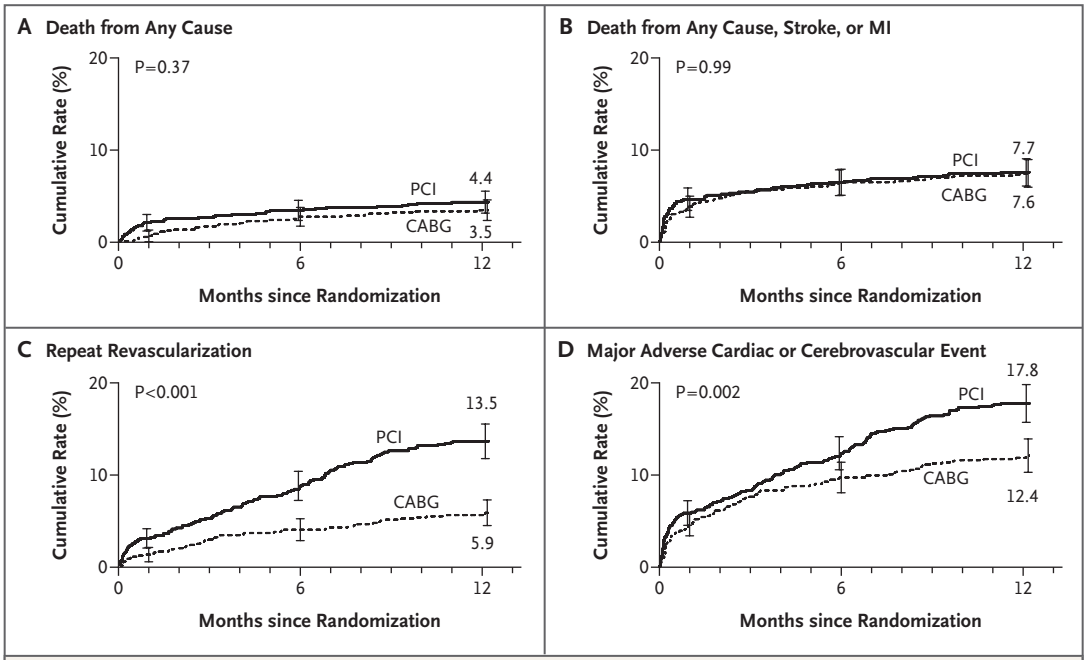

Figure 2. Rates of Outcomes among the Study Patients, According to Treatment Group.

Kaplan–Meier curves are shown for the percutaneous coronary intervention (PCI) group and the coronary-artery bypass grafting (CABG) group for death from any cause (Panel A); death, stroke, or myocardial infarction (MI) (Panel B); repeat revascularization (Panel C); and the composite primary end point of major adverse cardiac or cerebrovascular events (Panel D). The two groups had similar rates of death from any cause (relative risk with PCI vs. CABG, 1.24; 95% confidence interval [CI], 0.78 to 1.98) and rates of death from any cause, stroke, or MI (relative risk with PCI vs. CABG, 1.00; 95% CI, 0.72 to 1.38). In contrast, the rate of repeat revascularization was significantly increased with PCI (relative risk, 2.29; 95% CI, 1.67 to 3.14), as was the overall rate of major adverse cardiac or cerebrovascular events (relative risk, 1.44; 95% CI, 1.15 to 1.81). The I bars indicate 1.5 SE. Relative risks were calculated from the binary rates. P values were calculated with the use of the chi-square test.

cohort, specific information for each subgroup is of an observational nature and is hypothesis generating. The 12-month rate of major adverse cardiac or cerebrovascular events among patients with left main coronary artery disease was similar in the CABG and PCI groups (13.7% and 15.8%, respectively; P=0.44). Although the rate of repeat revascularization among patients with left main coronary artery disease was significantly higher in the PCI group (11.8%, vs. 6.5% in the CABG group; P=0.02), this result was offset by a significantly higher rate of stroke in the CABG subgroup of patients with left main coronary artery disease (2.7%, vs. 0.3% in the corresponding PCI subgroup; P=0.01). A total of 36.6% of patients with left main coronary artery disease also had three-vessel disease. A post hoc analysis of the rates of major adverse cardiac or cerebrovascular events in the subgroups of patients with left main coronary artery disease revealed a higher rate among those who also had two- or three-vessel disease than among those with left main coronary artery disease alone or in combination with one-vessel disease (Fig. 6 in the Supplementary Appendix).

The 12-month rate of major adverse cardiac or cerebrovascular events among patients with three-vessel disease in the absence of left main coronary artery disease was significantly increased in the PCI group as compared with the CABG group (19.2% vs. 11.5%, P<0.001) (Fig. 6 in the Supplementary Appendix), as was the rate of repeat revascularization (14.6% vs. 5.5%, P<0.001). The rate of death from any cause, stroke, or myocardial infarction in this subgroup was similar with PCI and CABG (8.0% and 6.6%, respectively; P=0.39).

Comparisons of data for the cohort with left main coronary artery disease and the cohort with three-vessel disease showed that the cohort with three-vessel disease had higher rates of previous

* Percentages are from the intention-to-treat analysis. P values were calculated with the use of the chi-square test, unless otherwise noted. CABG denotes coronary-artery bypass grafting, MI myocardial infarction, and PCI percutaneous coronary intervention.
† The P value was calculated with the use of Fisher's exact test.
‡ One patient randomly assigned to undergo CABG and seven patients randomly assigned to undergo PCI underwent both repeat PCI and repeat CABG.
§ Stent thrombosis was adjudicated according to the protocol definition.

myocardial infarction, diabetes, poor left ventricular ejection fraction, and lesions with adverse characteristics (lesions that were totally occluded, bifurcated, or long). In addition, the cohort with three-vessel disease had increased numbers of treated vessels and lesions per patient.

DISCUSSION

The SYNTAX trial was designed to compare current surgical and percutaneous techniques in patients with three-vessel or left main coronary artery disease (or both). For the primary end point, the 12-month rate of major adverse cardiac or cerebrovascular events, the noninferiority of PCI as compared with CABG was not demonstrated; CABG proved to be superior. Therefore, the findings with regard to components of the primary end point and subgroup analyses can only be considered as hypothesis-generating. Rates of death and myocardial infarction at 1 year were similar between patients who underwent CABG and those who underwent PCI with drug-eluting stents, whereas the rate of stroke was increased in the CABG group and the rate of repeat revascularization was increased in the PCI group.

Rates of repeat revascularization at 12 months were low in the PCI group, given the high rates of several known predictors of restenosis: lesions characterized by bifurcation or trifurcation (>80%), multivessel disease (>60%), diabetes (>25%), and lesions that were long (>20 mm in length, 20%) or totally occluded (>25%). This rate of repeat revascularization is lower than the rates reported

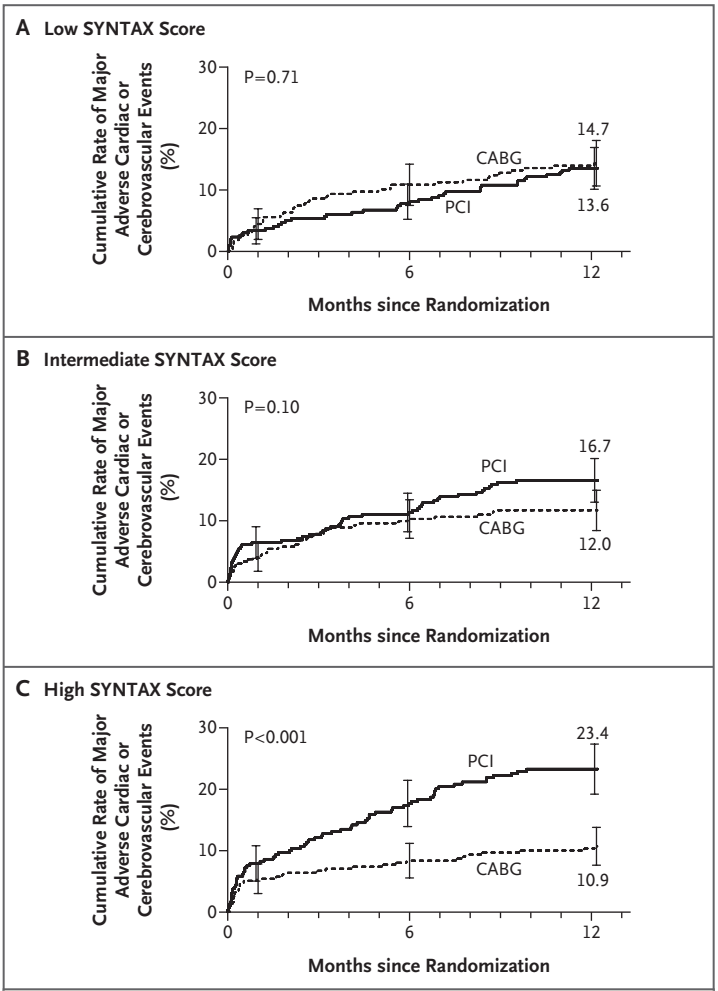

Figure 3. Rates of Major Adverse Cardiac or Cerebrovascular Events among the Study Patients, According to Treatment Group and SYNTAX Score Category.

Kaplan–Meier curves are shown for the percutaneous coronary intervention (PCI) group and the coronary-artery bypass grafting (CABG) group for major adverse cardiac or cerebrovascular events at 12 months. The 12-month event rates were similar between the two treatment groups for patients with low SYNTAX scores (0 to 22) (Panel A) or intermediate SYNTAX scores (23 to 32) (Panel B). Among patients with high SYNTAX scores (≥33, indicating the most complex disease), those in the PCI group had a significantly higher event rate at 12 months than those in the CABG group. SYNTAX scores were calculated at the core laboratory. The I bars indicate 1.5 SE. P values were calculated with the use of the chi-square test.

in previous comparative trials involving patients with less-complex clinical profiles and lesions.[10] The increase in the rate of repeat revascularization with PCI as compared with CABG did not appear to translate into a significant overall increase in the rate of death or myocardial infarction, although longer-term follow-up is needed. The risk of repeat revascularization after PCI needs to be balanced against the invasiveness of CABG and the risk of stroke, as previously reported in a meta-analysis of 23 studies comparing CABG and PCI, in which procedure-related strokes were found to be more common after CABG (in 1.2% of patients, vs. 0.6% of those undergoing PCI; P<0.001), without a concomitant decrease in survival.[34]

Recently, concern has been expressed about the possibility of an increased risk of late stent thrombosis with drug-eluting stents. In the SYNTAX trial, most cases of stent thrombosis occurred within 30 days after the procedure, and the 12-month rate of stent thrombosis in the PCI group was similar to the rate of symptomatic graft occlusion in the CABG group. However, as described in the literature, stent thrombosis often has more serious consequences for patients (rate of death, approximately 30%; rate of myocardial infarction, >60%)[35,36] than does graft occlusion, which often results only in angina leading to revascularization.

The use of antiplatelet medication was high among patients in the PCI group (with 71.1% receiving a thienopyridine at 12 months). There was an imbalance between the two groups with regard to general medical management apart from thienopyridine use. Thienopyridine therapy was not mandated beyond 6 months in the PCI group, since the study was designed to compare current CABG and PCI practices, including medication regimens. The low rate of stroke among patients who underwent PCI may have resulted from the use of highly effective dual-antiplatelet therapy, which prevents thromboembolic events; additional treatment with antiplatelet drugs might therefore benefit patients undergoing CABG. In addition, more patients in the CABG group than in the PCI group declined to participate after providing consent; in general, this imbalance was due to the greater invasiveness of CABG.

The SYNTAX score was designed to predict outcomes related to anatomical characteristics and, to a lesser extent, the functional risk of occlusion for any segment of the coronary-artery bed (as reflected by the Leaman score[37]). In our study, the raw SYNTAX score was predictive of outcomes in patients who underwent PCI. In particular, among patients in the PCI group with high SYNTAX scores, not only was the overall rate of major adverse cardiac or cerebrovascular events significantly increased, but also the rate of the composite components of death, stroke, and myocardial

Downloaded from www.nejm.org at DUKE MEDICAL CENTER LIBRARY on March 16, 2009 .
Copyright © 2009 Massachusetts Medical Society. All rights reserved.

infarction was slightly raised (11.9%, vs. 7.6% in the CABG group; P=0.08). This finding suggests that a percutaneous approach should be avoided in patients with high SYNTAX scores. Similar results were reported after the stratification of patients with three-vessel disease in the ARTS II registry.[38] Retrospective analysis of the ability of the SYNTAX score to predict outcome is currently being performed and is anticipated to be used to evaluate the relative weight of the individual score components. Additional validation of the score in other populations of patients is also needed. Outcomes in the surgical group of our randomized cohort were not influenced by the SYNTAX score.

The completeness of revascularization (i.e., whether all identified lesions were treated) was determined after the procedure by the investigator. The rate of complete revascularization was lower in both treatment groups in our study than in previous studies.[14,15,21,23,39] This result is most likely due to a different definition of completeness of treatment used in the earlier trials and the more complex anatomical characteristics of the patients in our trial.

Although our study provides important information about current treatment of coronary artery disease, there are limitations. First, the 12-month follow-up period may not be sufficient to reflect the true long-term effect of CABG as compared with PCI with drug-eluting stents on cardiac-related health. However, our early results in terms of major adverse cardiac or cerebrovascular events are similar to those of a meta-analysis[34] of trials comparing CABG and PCI with predominantly bare-metal stents. The meta-analysis showed that the rate of major adverse cardiac or cerebrovascular events was lower with CABG than with PCI and that patients who underwent CABG had fewer repeat revascularization procedures than patients who underwent PCI. After 5 years of follow-up, the meta-analysis did not show any significant differences in rates of survival between the CABG and PCI groups,[34] although other studies have shown differences in mortality.[10-12]

Second, the use of medication differed between the groups in our study, reflecting variations in standard care of patients between the two treatment groups. Third, more patients withdrew, after randomization, from the CABG group than from the PCI group. Fourth, although randomization was conducted in a blinded manner, with clinicians and participants unaware of future treatment assignments, it was not possible to blind the performance of the treatment. Finally, the definition of myocardial infarction was based on a surgical definition (the finding of a new Q-wave on electrocardiography, in association with a value for the creatine kinase MB fraction that was five times the upper limit of the normal range), which may have resulted in less severe cases of myocardial infarction being overlooked.

In conclusion, the results of our trial show that CABG, as compared with PCI, is associated with a lower rate of major adverse cardiac or cerebrovascular events at 1 year among patients with three-vessel or left main coronary artery disease (or both) and should therefore remain the standard of care for such patients.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes Screen

April 2012

Repair of Arterial and Venous Blockage

In September 2011, CPT Codes 35475 *Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel* and 35476 *Transluminal balloon angioplasty, percutaneous; venous* were identified in the CMS High Expenditure Procedure Codes screen.

35475
The RUC reviewed survey results of 84 diagnostic and interventional radiologists and interventional nephrologists and determined that physician work values were overestimated at the 25th percentile, 7.00 work RVUs. The RUC confirmed that 35475 is also reported with 36147 *Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report* (work RVU=3.72) and 75962 *Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation* (work RVU=0.54) and that the Multiple Procedure Payment Reduction rule is applied to 36147 when performed with another service. Therefore, there is no duplication of physician work when these services are performed on the same day. To obtain an accurate value for this service, the RUC reviewed CPT code 37224 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty (work RVU=9.00)* and determined that by removing 1.86 work RVUs to account for the multiple procedure reduction and 0.54 work RVUs accounting for the radiologic supervision and interpretation included in code 37224, the resulting value would be 6.60 work RVUs. The RUC agreed that this value accurately describes the physician work inherent in code 35475. To justify a work RVU of 6.60 for this service, the RUC reviewed CPT code 34812 *Open femoral artery exposure for delivery of endovascular prosthesis, by groin incision, unilateral* (work RVU=6.74, pre-75, intra-45, post-30) and determined that these services required similar physician work, time and intensity components. **The RUC recommends a work RVU of 6.60 for CPT Code 35475.**

35476
The RUC reviewed the survey results from 85 diagnostic and interventional radiologists and interventional nephrologists and determined that the 25th percentile work RVU of 5.10 appropriately accounts for the physician work required to perform this service. This code is also reported with 36147 *Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report* (work RVU=3.72) and 75962 *Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation* (work RVU=0.54). The RUC noted that the Multiple Procedure Payment Reduction rule is applied to 36147 when performed with another service. Therefore, there is no duplication of physician work when these services are performed on the same day. The RUC compared 35476 to CPT code

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

37220 *Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU= 8.15) and determined that removing 1.86 to account for the multiple procedure payment rule and 0.54 for supervision and interpretation would appropriately derive a comparable work RVU of 5.75 to the recommended value for 35476. The RUC also reviewed CPT Code 52276 *Cystourethroscopy with direct vision internal urethrotomy* (work RVU=4.99) and agreed that with identical intra-service time of 35 minutes these services should be valued similarly. **The RUC recommends a work RVU of 5.10 for CPT code 35476.**

Practice Expense:
The RUC reviewed and approved practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

Work Neutrality
The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (●New)	CPT Descriptor	Global Period	Work RVU Recommenda-tion
⊙35475	Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel	000	6.60
⊙35476	Transluminal balloon angioplasty, percutaneous; venous (For radiological supervision and interpretation, use 75978)	000	5.10

Global Period: 000 RUC Recommended RVU: **6.60**

CPT Descriptor: Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 70-year-old woman with chronic kidney disease has an upper extremity AV hemodialysis access, with signs and symptoms of inflow stenosis. The AV shunt is accessed (separately reported) and arteriography of the inflow vessels performed (separately reported) revealing a stenosis central to the arterial anastomosis for which percutaneous angioplasty is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 97%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 98%

Description of Pre-Service Work: Based on patient symptoms, signs, physical findings and pre-procedural studies, estimate the range of angioplasty balloons, wires, catheters and insufflation devices which may be required, and ensure availability. Assess need for stand-by devices that might be needed emergently (eg, covered stents). Review results of preadmission testing, with special attention to anticoagulant or antiplatelet therapy, contrast allergy, electrolytes, BUN, creatinine, and CBC to assure patient suitability for planned procedure. Reexamine patient to make sure that physical findings have not changed and update H&P. Discuss procedure detail plan, including alternatives and risks with patient and family. Obtain informed consent for procedure and conscious sedation. Mark access sites. Check interventional suite to ensure proper function and configuration of imaging equipment including compliance with radiation safety issues. Ensure all technical personnel have been familiarized with the upcoming procedure and techniques and that they are fully familiar with all required devices. Ensure the patient is appropriately positioned on the table and intravenous access has been achieved. Don radiation protection gear and ensure that all who will be in the interventional suite do likewise. Supervise sterile prep of access site(s) and subsequent draping. Perform pre-procedural "time-out."

Description of Intra-Service Work: The operator administers or supervises administration of moderate sedation. A guidewire is passed through the transitional sheath previously placed for angiography (separately coded) and advanced in a retrograde direction to the periarterial anastomosis. The transitional sheath is exchanged for a larger caliber sidearm exchange sheath. A guidewire and diagnostic catheter are then directed under fluoroscopic guidance through the arterial anastomosis and retrograde into the proximal artery; catheter manipulation may be required (separately coded). Once the catheter is positioned in the proximal artery, contrast is injected for antegrade angiogram imaging of the distal artery, the arterial anastomosis, and the juxta anastomotic access, and to clarify the degree of stenosis. An angioplasty balloon catheter is selected for size and estimated inflation pressure requirements to successfully dilate the stenosis. A guidewire is

reinserted, the diagnostic catheter removed, and, using fluoroscopy, the balloon catheter is positioned in the artery bridging the stenosis. Under fluoroscopic guidance, the balloon is inflated to complete balloon effacement. The balloon catheter is then withdrawn, a diagnostic catheter reinserted into the proximal artery, contrast injected, and a follow-up antegrade angiogram performed. Typically , the stenosis is persistent and additional inflation procedures with the same (or new) angioplasty balloon catheters are required. Upon successful dilation of the stenosis, a final antegrade angiogram is performed to verify that no vessel rupture has occurred and that there is unrestricted flow into the AV access with appropriate contrast runoff. The catheter, guidewire, and sheath are then sequentially removed, and hemostasis of the venotomy site achieved using manual compression or surgical closure.

Description of Post-Service Work: Apply sterile dressings. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Repeat patient exam and assessment of vital signs and perfusion of treated limb multiple times in recovery area, as needed. Monitor AV shunt puncture site for hematoma. Discuss findings and treatment with family and patient (when awake). All appropriate medical records are completed, with copy to referring physician.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Geraldine McGinty, M.D., Zeke Silva, M.D., Sean Tutton, M.D., Michael Hall, M.D., Robert L Vogelzang, M.D., Gerald A. Niedzwiecki, M.D., Robert Kossmann, M.D., and Chet Amedia, M.D.		
Specialty(s):	SIR, ACR, RPA		
CPT Code:	35475		
Sample Size:	2166	**Resp N:** 84	**Response:** 3.8 %
Description of Sample:	The specialty societies performed a random survey of diagnostic radiologists, interventional radiologists and interventional nephrologists. In addition, the specialty societies convened an expert panel to review the survey data.		

	Low	25th pctl	Median*	75th pctl	High

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
37224	000	9.00	**RUC Time**

CPT Descriptor Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
52344	000	7.05	**RUC Time**	2,654

CPT Descriptor 1 Cystourethroscopy with ureteroscopy; with treatment of ureteral stricture (eg, balloon dilation, laser, electrocautery, and incision)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization

CPT Descriptor 2

Other Reference CPT Code	Global	Work RVU	Time Source
37220	000	8.15	**RUC Time**

CPT Descriptor Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal angioplasty

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 21 **% of respondents:** 25.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 35475**	**Key Reference CPT Code:** 37224	**Source of Time RUC Time**
Median Pre-Service Time	26.00	48.00	
Median Intra-Service Time	43.00	80.00	
Median Immediate Post-service Time	23.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	

Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**92.00**	**158.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.81	3.81
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.86	3.67
Urgency of medical decision making	3.62	3.71
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.43	4.05
Physical effort required	4.10	3.90
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.38	4.52
Outcome depends on the skill and judgment of physician	4.14	4.24
Estimated risk of malpractice suit with poor outcome	4.43	4.19

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.38	4.05
Intra-Service intensity/complexity	3.76	3.52
Post-Service intensity/complexity	4.00	3.57

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
3. 75962 - Transluminal balloon angioplasty, peripheral artery other than renal, or other visceral artery, iliac or lower extremity, radiological supervision and interpretation
4. 36147- Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection[s] of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava)
5.

6. CPT	Descriptor	Global	RVU	Pre	Intra	Post	Total time	Source
7. 75962	Transluminal balloon angio	XXX	0.54				12	CMS/Other
8. 36147	Introduction of needle/ catheter	XXX	3.72	20	45	15	80	RUC

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35475

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Nephrology How often? Commonly

Specialty Diagnostic Radiology How often? Commonly

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 103206
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 35475 provided nationally in a one-year period is estimated to be 103,206.

Specialty Nephrology Frequency 30518 Percentage 29.56 %

Specialty Diagnostic Radiology Frequency 22314 Percentage 21.62 %

Specialty Interventional Radiology Frequency 10228 Percentage 9.91 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 34,402 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that CPT code 35475 was billed approximately 34,402 times for Medicare patients nationally in a one-year period.

Specialty Nephrology Frequency 10173 Percentage 29.57 %

Specialty Diagnostic Radiology Frequency 7441 Percentage 21.62 %

Specialty Interventional Radiology Frequency 3410 Percentage 9.91 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 35475

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:35476 Tracking Number Original Specialty Recommended RVU: **5.10**
Presented Recommended RVU: **5.10**
Global Period: 000 RUC Recommended RVU: **5.10**

CPT Descriptor: Transluminal balloon angioplasty, percutaneous; venous

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68 year old woman with chronic kidney disease has an upper extremity AV hemodialysis access, with signs and symptoms of outflow stenosis. The AV shunt is accessed (separately reported) and angiography of the outflow vessels performed (separately reported) revealing a stenosis of the venous outflow for which percutaneous angioplasty is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 95%

Is moderate sedation inherent to this procedure in the office setting? Yes
Percent of survey respondents who stated moderate sedation is typical in the office setting? 98%

Description of Pre-Service Work: Based on patient symptoms, signs, physical findings and pre-procedural studies, estimate the range of angioplasty balloons, wires, catheters and insufflation devices which may be required, and ensure availability. Assess need for stand-by devices that might be needed emergently (eg, covered stents). Review results of preadmission testing, with special attention to anticoagulant or antiplatelet therapy, contrast allergy, electrolytes, BUN, creatinine, and CBC to assure patient suitability for planned procedure. Reexamine patient to make sure that physical findings have not changed and update H&P. Discuss procedure detail plan, including alternatives and risks with patient and family. Obtain informed consent for procedure and conscious sedation. Mark access sites. Check interventional suite to ensure proper function and configuration of imaging equipment including compliance with radiation safety issues. Ensure all technical personnel have been familiarized with the upcoming procedure and techniques and that they are fully familiar with all required devices. Ensure the patient is appropriately positioned on the table and intravenous access has been achieved. Don radiation protection gear and ensure that all who will be in the interventional suite do likewise. Supervise sterile prep of access site(s) and subsequent draping. Perform pre-procedural "time-out."

Description of Intra-Service Work: After the outflow stenosis has been identified (separate), the operator administers or supervises administration of moderate sedation. A guidewire is passed through the transitional sheath previously placed for angiography and advanced in an antegrade direction through the fistula, draining and central veins, to terminate in the superior vena cava. The transitional sheath is exchanged for a larger caliber exchange sheath with a sidearm port. An angioplasty balloon catheter is selected for size and estimated inflation pressure requirements to successfully dilate the identified stenosis. Using fluoroscopy, the balloon catheter is positioned in the vein to bridge the stenosis. Under fluoroscopic guidance, the balloon is inflated to complete balloon effacement. The angioplasty balloon catheter is then

withdrawn and contrast injected to perform a follow-up antegrade angiogram. Typically, the stenosis is persistent and additional inflation procedures with the same (or new) angioplasty balloon catheters are required. Upon successful dilation of the stenosis, a final antegrade angiogram is performed to verify that no vessel rupture has occurred and that there is unrestricted flow into the draining veins. The catheter, guidewire, and sheath are then sequentially removed, and hemostasis of the venotomy site achieved using manual compression or surgical closure.

Description of Post-Service Work: Apply sterile dressings. As needed, assist team in moving patient to stretcher. Discuss post-procedure care with recovery area staff. Write post-procedure orders for care and pain medication. Write brief procedure note. Record contrast volume and radiation exposure time. Review all films and dictate interpretation. Monitor AV shunt puncture site for hematoma. Discuss findings and treatment with family and patient (when awake). All appropriate medical records are completed, with copy to referring physician.

SURVEY DATA

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
3. 75978 - Transluminal balloon angioplasty, venous (eg, subclavian stenosis), radiological supervision and interpretation
4. 36147- Introduction of needle and/or catheter, arteriovenous shunt created for dialysis (graft/fistula); initial access with complete radiological evaluation of dialysis access, including fluoroscopy, image documentation and report (includes access of shunt, injection[s] of contrast, and all necessary imaging from the arterial anastomosis and adjacent artery through entire venous outflow including the inferior or superior vena cava)
5.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 35476

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology How often? Commonly

Specialty Nephrology How often? Commonly

Specialty Interventional Radiology How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 786450
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 35476 provided nationally in a one-year period is estimated to be 786,450.

Specialty Diagnostic Radiology Frequency 264483 Percentage 33.62 %

Specialty Nephrology Frequency 204792 Percentage 26.04 %

Specialty Interventional Radiology Frequency 73533 Percentage 9.34 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 262,150 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that CPT code 35476 was billed approximately 262,150 times for Medicare patients nationally in a one-year period.

Specialty Diagnostic Radiology Frequency 88161 Percentage 33.62 %

Specialty Nephrology Frequency 68264 Percentage 26.04 %

Specialty Interventional Radiology Frequency 24511 Percentage 9.34 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 35476

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SS Rec Summary

INSTRUCTIONS

Insert information and data into all applicable cells except IWPUT and TOTAL TIME. These cells will automatically calculate.

Hide columns and rows that do not contain data.

REF = Key Reference code data

CURRENT = Current data (Harvard or RUC) for code being surveyed. If this is a new code, this row will be blank.

SVY = Survey data - as it appears on the Summary of Recommendation form.

REC = Specialty Society recommended data as it appears on the Summary of Recommendation form.

ISSUE: Repair of Arterial and Venous Blockage

CPT Code: 35475 & 35476
Specialty Society('s) SIR, ACR, & RPA

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:
35475 – Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel
35476 - Transluminal balloon angioplasty, percutaneous; venous

Global Period: 000 Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Society of Interventional Radiology, American College of Radiology, and the Renal Physicians Association convened a consensus panel to review and finalize the practice expense data for codes 35475 and 35476.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Since 35475 and 35476 are existing codes, we used the PEAC-approved data as the basis for the practice expense inputs for code 35475 and 35476.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic & referral forms
- Coordinate pre-surgery services
- Schedule space and equipment in facility
- Follow-up phone calls & prescriptions

Service Clinical Labor Activities:

Post-Service Clinical Labor Activities:

CPT Code: 35475 & 35476
Specialty Society('s) SIR, ACR, & RPA

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
35475 – Transluminal balloon angioplasty, percutaneous; brachiocephalic trunk or branches, each vessel
35476 – Transluminal balloon angioplasty, percutaneous; venous

Global Period: 000 Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Society of Interventional Radiology, American College of Radiology, and the Renal Physicians Association convened a consensus panel to review and finalize the practice expense data for codes 35475 and 35476.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Since 35475 and 35476 are existing codes, we used the PEAC-approved data as the basis for the practice expense inputs for codes 35475 and 35476.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
- Complete pre-service diagnostic & referral forms
- Coordinate pre-surgery services
- Follow-up phone calls & prescriptions

Service Clinical Labor Activities:
- Review charts
- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Sedate/apply anesthesia
- Assist physician in performing procedure
- Assist physician/ CS monitoring
- Assist MD with image acquisition
- Circulate throughout procedure
- Monitor pt. following service/check tubes, monitors, drains
- Clean room/equipment by physician staff
- Check dressings & wound/ home care instructions /coordinate office visits /prescriptions

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS Request - NPRM for 2012

April 2012

Cholecystectomy

In the Notice for Proposed Rulemaking, CMS indicated that the agency received comments regarding a potential relativity problem between CPT codes 47600 *Cholecystectomy*; and 47605 *Cholecystectomy; with cholangiography*. It appears that the visits do not appropriately reflect the relativity of these two services, and 47600 should not have more time and visits associated with the service than 47605. The specialty society recognized that the value for code 47605 may be incorrect. The RUC recommended that codes 47600 and 47605 be resurveyed for physician work and practice expense.

The specialty societies indicated and the RUC agreed that there is compelling evidence that the typical patient receiving these services have changed. In current practice, the typical patient undergoing an open procedure has been converted from a laparoscopic approach due to severity of disease, difficult adhesions from prior abdominal surgery and/or difficulties with defining ductal and other anatomy. The specialty societies indicated that more than 80% of Medicare patients undergoing open cholecystectomy are scheduled and started as laparoscopic and are then converted to open. Per Medicare guidelines, only the definitive procedure can be reported, and in this instance, it would be the open procedures 47600 or 47605. The physician reports the open procedure and ICD-9 code V64.41 *Laparoscopic surgical procedure converted to open procedure*. The American College of Surgeons summarizes the rationale and approval process for the vignettes for 47600 and 47605 in the attached memorandum.

47600 Cholecystectomy
In April 2012, the RUC reviewed the survey results from 50 general surgeons and determined that the survey median work RVU of 20.00 and intra-service time of 120 minutes appropriately account for the physician work and time required to perform this service. The survey respondents indicated and the RUC agreed that 2-99232 *Subsequent hospital care visits* are appropriate to care for this typical patient who has had been converted to an open procedure. The RUC compared 47600 to the key reference service 44140 *Colectomy, partial; with anastomosis* (work RVU = 22.59 and 150 minutes intra-service time) and determined that 44140 requires 30 minutes more intra-service time and more physician work to perform. For further support, the RUC compared 47600 to similar MPC code 38100 *Splenectomy; total (separate procedure)* (work RVU = 19.55 and 120 intra-service time) and 49203 *Excision or destruction, open, intra-abdominal tumors, cysts or endometriomas, 1 or more peritoneal, mesenteric, or retroperitoneal primary or secondary tumors; largest tumor 5 cm diameter or less* (work RVU = 20.13 and 120 minutes intra-service time) and determined that a work RVU of 20.00 for 47600 places this service in proper rank order. **The RUC recommends a work RVU of 20.00 for CPT code 47600.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

47605 Cholecystectomy; with cholangiography
In April 2012, the RUC reviewed the survey results from 50 general surgeons and determined that the survey median work RVU of 21.00 and intra-service time of 135 minutes appropriately account for the physician work and time required to perform this service. The survey respondents indicated and the RUC agreed that two 99232 *Subsequent hospital care visits* are appropriate to care for this typical patient who has had been converted to an open procedure. The RUC compared 47605 to the key reference service 44140 *Colectomy, partial; with anastomosis* (work RVU = 22.59 and 150 minutes intra-service time) and determined that 44140 requires 15 minutes more intra-service time and more physician work to perform. The RUC noted that the median value of 21.00 for CPT code 47605 and significant increases to intra-time and post-op work addresses the current rank order anomaly and places this service in the proper rank order with 47600. For further support, the RUC compared 47605 to similar MPC code 38100 *Splenectomy; total (separate procedure)* (work RVU = 19.55 and 120 intra-service time) and 33883 *Placement of proximal extension prosthesis for endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); initial extension* (work RVU = 21.09 and 120 minutes intra-service time), which is more intense and complex to perform, but requires less post-operative visits than 47605. **The RUC recommends a work RVU of 21.00 for CPT code 47605.**

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
47600		Cholecystectomy;	090	20.00
47605		with cholangiography	090	21.00

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Subject: Typical Patient Undergoing Open Cholecystectomy

At the request of CMS, the American College of Surgeons and the Society of American Gastrointestinal and Endoscopic Surgeons recently conducted an American Medical Association Relative Value Scale Update Committee (AMA RUC) survey for codes 47600 *Cholecystectomy* and 47605 *Cholecystectomy; with cholangiography*. During the presentation of physician work recommendations at the April RUC meeting, a question was raised regarding the typical patient vignettes on the surveys.

We would like to take this opportunity to provide the information presented to the AMA RUC Research Subcommittee regarding the typical patient, along with the supporting peer-reviewed literature. Because the Centers for Medicare and Medicaid Services (CMS) may not have been included on the Research Subcommittee conference call and follow-up e-mails where this information was discussed, we would also request that this information be forwarded to CMS with the AMA RUC recommendations.

The 2005 vignette for 47600 indicated the typical patient was a *scheduled* open procedure. Code 47605, which was last surveyed in 2000 as a mini-survey, did not have a vignette. Prior to conducting the current AMA RUC survey, the College convened an expert panel of general surgeons who perform both laparoscopic cholecystectomy (LC) and open cholecystectomy (OC) to discuss the vignettes for these two codes. The expert panel was in total agreement that, unlike other major abdominal procedures (e.g., colectomy), in current clinical practice, cholecystectomy is typically performed laparoscopically. In addition, a review of literature indicates that the *typical* patient in current practice who undergoes OC is an LC to OC conversion and not a scheduled OC.

There are many reasons to convert from LC to OC, including severity of disease, adhesions from prior abdominal surgery and/or difficulties with defining ductal anatomy. As the *rate* of OC compared with LC decreases (significantly), the *percentage* of patients undergoing conversion at operation has increased, such that the *typical* patient is now an LC to OC conversion. Based on this information, the Research Subcommittee discussed and then approved survey vignettes that describe LC to OC conversion as the typical patient for 47600 and 47605. This methodology of reviewing physician work related to the typical patient is consistent with every other vignette used for an AMA RUC survey and is consistent with valuing physician work.

As Table 1 shows, the total number of cholecystectomies has declined 12 percent since the year the previous vignette was written for 47600 (2004). This decrease is the result of medical management and non-surgical interventions for treating gall bladder disease.

Table 1 also shows that the percentage of OC compared with LC has declined significantly (20% to 11%). In the non-Medicare-aged population, OC is performed significantly less often than LC. A national study of over 80,000 patients undergoing cholecystectomy from 1999-2005 indicated the percentage of OC compared with LC was ten percent.[1]

OC as % of LC	***20%***	***19%***	***17%***	***16%***	***15%***	***14%***	***12%***	***11%***

Notes: LC refers to laparoscopic cholecystectomy. OC refers to open cholecystectomy.

A review of recent literature indicates that the national rate of LC to OC conversion varies annually between five and ten percent. [2,3,4,5,6] Given the data that the national percentage of OC compared with LC is 11% or less, and the national rate of conversion is between five and ten percent, the typical patient undergoing OC is an LC to OC conversion.

Although the gold standard for surgical treatment of gallbladder disease is laparoscopic cholecystectomy, patients with suspected perforation, cancer, very large stones, end stage liver disease, bleeding disorders, and some with morbid obesity are not candidates for laparoscopic cholecystectomy. These patients, who are scheduled for an open procedure,

are more complex and require the same physician work as the patients who are converted from LC to OC. However, these patients scheduled for elective open cholecystectomy are in the distinct minority and the most common patients are approached first laparoscopically, and then converted to open, based upon operative findings.

As we noted above, CMS may not have been included on the Research Subcommittee conference call and follow-up E-mails where this information was discussed. Therefore, we request that this information be forwarded to CMS with the RUC recommendations. If you have any questions, please contact Jenny Jackson at jjackson@facs.org or at (202) 672-1506.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:47600 Tracking Number n/a Original Specialty Recommended RVU: **20.00**
Presented Recommended RVU: **20.00**
Global Period: 090 RUC Recommended RVU: **20.00**

CPT Descriptor: Cholecystectomy;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An obese patient presents with right upper quadrant pain and ultrasound-demonstrated cholecystitis. Laparoscopic evaluation reveals a severely inflamed gallbladder and the operation is converted to an open procedure to more safely remove the gallbladder.

Percentage of Survey Respondents who found Vignette to be Typical: 72%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management.. Review and obtain informed consent, including the possiblity of conversion, with witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available Assist in transfer of patient from gurney to operating table. Monitor/assist with positioning of patient. Place or supervise placement of Foley catheter. Assist anesthesia team with line placement and induction of anesthesia and intubation. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Laparoscopy is commenced through a small incision. Physiologic changes are monitored. The appropriate trocar and camera are inserted, and the assistants' role to retract and insure adequate video image is reconfirmed. A thorough exploration of the abdominal cavity is undertaken visually prior to placing the other access ports. Additional ports are placed via small skin incisions. The liver is retracted appropriately, and other instruments are used to perform as detailed an exploratory laparoscopy as possible, viewing the small bowel, colon, stomach, spleen, and pelvic viscera. Adhesions between the gallbladder and adjacent duodenum are lysed to allow adequate elevation and lateral traction of the gallbladder. If the gallbladder is distended it is decompressed and the contents aspirated and sent for culture if indicated. Once it is determined that inflammation, aberrant anatomy, bleeding or other factors preclude a safe laparoscopic approach, the procedure is converted to open. All the laparoscopic intruments and ports are removed. A laparotomy incision is made with attention to hemostasis. Once safe entry into the peritoneum is achieved adherent underlying structures, if present are freed as needed. Retractors are placed to maintain adequate exposure. A manual and

visual exploration of the upper abdomen is carried out with the objective of inspecting the liver, gallbladder, pancreas, stomach, duodenum, and adjacent colon. Adhesions among these organs are sharply divided and hemostasis ensured. The apex of the fundus of the gallbladder is retracted superiorly. Adhesions to the colon, duodenum, stomach, omentum, and colonic mesentery, if present, are incised with sharp dissection. The infundibulum of the gallbladder is identified in order to expose the Triangle of Calot. Careful dissection in this triangle achieves exposure of the cystic duct which is then dissected from the surrounding tissue and adjacent liver. Care is taken to prevent stones from migrating into the common bile duct. Dissection is carried further to identify and isolate the cystic artery. Utmost care is taken to achieve the critical view of safety before any structure is divided. Careful inspection is undertaken to assess for and delineate aberrant anatomy. At the surgeon's discretion, dissection of the gallbladder may start at the fundus and proceed toward the infundibulum while observing the principles of anatomic identification. Once satisfactory identification of all of these structures has been accomplished, the gallbladder is then dissected from its fossa. The cystic artery is ligated or clipped and transected. The cystic duct is then ligated or clipped at the level of the infundibulum and more proximally, and transected. The gallbladder is removed from the abdomen. It is inspected and opened on the back table to assess pathologic change and to ensure a single ductal system as well as to retrieve stones. Inspection of the fossa for hemostasis is carried out and achieved with either suture or electrocautery. The surgical field, including the areas of adhesiolysis, is also inspected. The entire area of dissection is irrigated with copious amounts of irrigant solution, which is then aspirated. Inspection of the gallbladder fossa and the areas of adhesiolysis is repeated. The cystic artery and cystic duct stumps are inspected to ensure the ligatures are securely in place. At the discretion of the surgeon, a drain may be placed in the subhepatic. A sponge, lap-pad, instrument, and needle count is completed and confirmed to be accurate. The abdominal wound is closed with care to assure hemostasis and elimination of dead space.

Description of Post-Service Work:
Post-operative Work - Hospital: Apply sterile dressings as necessary. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Instruct nursing staff in care of drains, tubes and other devices. Review post-operative labs if required. Discuss procedure and outcome with family. Write postoperative note. Dictate operative report and copy referring physician(s). Call referring physician(s). Patient is discharged from recovery room. Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Examine patient, including reviewing vital signs and confirming as necessary. Auscultate heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Assess need for continued antibiotics, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs (especially liver chemistries, amylase, and lipase) and films (if indicated), medications, diet, and patient activity. Chart patient progress notes daily. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Manage drain, if installed, and remove when appropriate. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when taking adequate nutrition and pain control is adequate with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Post-operative Work - Office: Review interval chart notes. Examine and talk with patient. Assess pain scores and adequacy of analgesia. Remove staples or sutures and drain, when appropriate. Review activity and restrictions. Check for presence of post-operative hematoma/seroma and assess need for aspiration. Monitor diet caloric intake by weight. Answer patient/family questions. Write medication prescriptions. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart. Review activity permission with patient and write appropriate permission.

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 11 **% of respondents:** 22.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 47600**	**Key Reference CPT Code:** 44140	**Source of Time** **RUC Time**
Median Pre-Service Time	70.00	60.00	
Median Intra-Service Time	120.00	150.00	
Median Immediate Post-service Time	30.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	155.0	140.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	62.0	62.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**475.00**	**480.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)		(of those that selected Key Reference code)
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.18	3.40
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.36	3.70
Urgency of medical decision making	4.27	3.30
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.91	3.80
Physical effort required	4.18	3.80
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.00	4.20
Outcome depends on the skill and judgment of physician	4.09	4.30
Estimated risk of malpractice suit with poor outcome	4.00	3.90

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.55	3.70
Intra-Service intensity/complexity	4.09	4.10
Post-Service intensity/complexity	3.27	3.60

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Codes 47600 and 47605 were identified for review by CMS in the NPRM for 2012. CMS received one public comment regarding a potential relativity problem. In the Rule, CMS states:

We believe that the difference in physician time and visits is the cause for the difference in work RVU for these codes. However, upon clinical review, it does not appear that these visits appropriately reflect the relativity of these two services, as CPT code 47600 should not have more time and visits associated with the service than CPT code 47605. Therefore, we are asking the AMA RUC to review these two cholecystectomy CPT codes, 47600 and 47605.

Compelling Evidence - Change in patient population

In 2005, when 47600 was last reviewed, compelling evidence was presented and accepted regarding advances in technology that have led to a change in medical management (eg, medications) and non-surgical interventions (eg, ERCP) for treating gall bladder disease, resulting in a more complex patient presenting for surgery. The work RVU accepted by the RUC in 2005 was less than the specialty recommendation.

Since 2005, there have been further changes in the clinical picture of the patient who requires an open cholecystectomy. The patient in current practice most typically is a patient who has been converted from a laparoscopic cholecystectomy (LC) to open cholecystectomy (OC). There are many reasons convert from LC to OC, including severity of disease, adhesions from prior abdominal surgery and/or difficulties with defining ductal and other anatomy. As the *rate* of OC compared with LC decreases (significantly), the *percentage* of patients undergoing conversion at operation has increased, such that the typical patient (>50%) is now a patient with an initial LC who due to the technical factors noted above is then converted to an OC. This conversion requires greater intra-service work (complexity and intensity) than is reflected in the current value of 47600.

Pre-time

Pre-time package 4 (Difficult Patient/Difficult Procedure) is recommended, with additional positioning time to account for work related to the initial laparoscopic positioning prior to conversion to an open procedure.

Recommendation

The American College of Surgeons and the Society of American Gastrointestinal and Endoscopic Surgeons conducted a RUC survey for code 47600. The survey data indicate more intra-time and more hospital work.
The current survey data support an increase in the work RVU for 47600 relative to the key reference code, MPC codes, and almost 70 additional inpatient services recently reviewed by the RUC and CMS with work RVUs from 18 to 24.

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST	HVs	OVs
2005	47600	Cholecystectomy;	17.48	0.068	420	60	115	30	4	3
2012	*47600*	*Recommendation*	*20.00*	*0.073*	*475*	*70*	*120*	*30*	*5*	*3*

Key Reference Comparison

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST	HVs	OVs
2005	44140	Partial removal of colon	22.59	**0.079**	480	60	150	30	7	3
2012	*47600*	*Recommendation*	*20.00*	*0.073*	*475*	*70*	*120*	*30*	*5*	*3*

MPC Comparison

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST	HVs	OVs
2005	**38100**	Removal of spleen total	**19.55**	**0.078**	442	60	120	30	6	2
2012	*47600*	*Recommendation*	***20.00***	***0.073***	*475*	*70*	*120*	*30*	*5*	*3*
2005	**44140**	Partial removal of colon	**22.59**	**0.079**	480	60	150	30	7	3

The current survey data confirm that code 47600 is undervalued. The ACS and SAGES believe there has been a change in the typical patient since 2005 to support compelling evidence for a different work RVU and **we recommend the survey median work RVU of 20.00**.

The table below includes almost 70 codes reviewed by the RUC and CMS with the following parameters: reviewed 2005-2011; work RVUs from 18.00 to 24.00; and inpatient procedure. The codes in this table offer additional support for the recommendation of 20.00 work RVUs for 47600. The recommendation for code 47605 has also been included to show rank order relativity with 47600 and the other codes in the table.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 47600

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 17,084 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database information for 2010

Specialty general surgery Frequency 15283 Percentage 89.45 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 47600

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:47605 Tracking Number

Original Specialty Recommended RVU: **21.00**
Presented Recommended RVU: **21.00**
RUC Recommended RVU: **21.00**

Global Period: 090

CPT Descriptor: Cholecystectomy; with cholangiography

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An obese patient presents with right upper quadrant pain and ultrasound-demonstrated cholecystitis. Laparoscopic evaluation reveals a severely inflamed gallbladder and the operation is converted to an open procedure to more safely remove the gallbladder. Preoperative elevated liver enzymes and the need for anatomic clarity mandate intraoperative cholangiogram.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Select and order the appropriate antibiotic(s) and confirm timing and administration. Assure appropriate selection, timing, and administration of DVT prophylaxis. Assess need for beta-blockers, order as required. Review preadmission work-up, with particular attention to imaging information and reports. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management.. Review and obtain informed consent, including the possiblity of conversion, with witness. Review length and type of anesthesia with anesthesiologist. Verify that all required instruments and supplies are available Assist in transfer of patient from gurney to operating table. Monitor/assist with positioning of patient. Place or supervise placement of Foley catheter. Assist anesthesia team with line placement and induction of anesthesia and intubation. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Laparoscopy is commenced through a short small. Physiologic changes are monitored. The appropriate trocar and camera are inserted, and the assistants' role to retract and insure adequate video image is reconfirmed. A thorough exploration of the abdominal cavity is undertaken visually prior to placing the other access ports. Additional ports are placed via small skin incisions. The liver is retracted appropriately, and other instruments are used to perform as detailed an exploratory laparoscopy as possible, viewing the small bowel, colon, stomach, spleen, and pelvic viscera. Adhesions between the gallbladder and adjacent duodenum are lysed to allow adequate elevation and lateral traction of the gallbladder. If the gallbladder is distended it is decompressed and the contents aspirated and sent for culture if indicated. Once it is determined that inflammation, aberrant anatomy, bleeding or other factors preclude a safe laparoscopic approach, the procedure is converted to open. All the laparoscopic intruments and ports are removed. A laparotomy incision is made with attention to hemostasis. Once safe entry into the peritoneum is achieved adherent

underlying structures, if present are freed as needed. Retractors are placed to maintain adequate exposure. A manual and visual exploration of the upper abdomen is carried out with the objective of inspecting the liver, gallbladder, pancreas, stomach, duodenum, and adjacent colon. Adhesions among these organs are sharply divided and hemostasis ensured. The apex of the fundus of the gallbladder is retracted superiorly. Adhesions to the colon, duodenum, stomach, omentum, and colonic mesentery, if present, are incised with sharp dissection. The infundibulum of the gallbladder is identified in order to expose the Triangle of Calot. Dissection continues to achieve exposure of the cystic duct which is then dissected from the surrounding tissue and adjacent liver. Care is taken to prevent stones from migrating into the common bile duct. Dissection is carried further to identify and isolate the cystic artery. Utmost care is taken to achieve the critical view of safety before any structure is divided. When this anatomy is unclear or there are other indications for evaluating the ductal structures, a cholangiogram is performed. A catheter is introduced via the gallbladder or cystic duct and secured in place. The catheter is flushed and then using fluoroscopy or plain x-ray imaging, the cholangiogram is performed. During the acquisition of images, the patient is rotated to the right to avoid superimposing the ducts over the spine and then the patient is moved from Trendelenberg to reverse Trendelenberg to ensure that the ducts within liver are visualized and that the contrast flows into the duodenum. Once the cholangiogram is complete then the catheter is removed. Careful inspection is undertaken to assess for and delineate aberrant anatomy using the images obtained from the cholangiogram to guide surgical strategy. At the surgeon's discretion, dissection of the gallbladder may start at the fundus and proceed toward the infundibulum while observing the principles of anatomic identification. Once satisfactory identification of all of these structures has been accomplished, the gallbladder is then dissected from its fossa. The cystic artery is ligated or clipped and transected. The cystic duct is then ligated or clipped at the level of the infundibulum and more proximally, and transected. The gallbladder is removed from the abdomen. It is inspected and opened on the back table to assess pathologic change and to ensure a single ductal system as well as to retrieve stones. Inspection of the fossa for hemostasis is carried out and achieved with either suture or electrocautery. The surgical field, including the areas of adhesiolysis, is also inspected. The entire area of dissection is irrigated with copious amounts of irrigant solution, which is then aspirated. Inspection of the gallbladder fossa and the areas of adhesiolysis is repeated. The cystic artery and cystic duct stumps are inspected to ensure the ligatures are securely in place. At the discretion of the surgeon, a drain may be placed in the subhepatic. A sponge, lap-pad, instrument, and needle count is completed and confirmed to be accurate. The abdominal wound is closed with care to assure hemostasis and elimination of dead space.

Description of Post-Service Work:
Post-operative Work - Hospital: Apply sterile dressings as necessary. Monitor patient during reversal of anesthesia, protecting the wound with a hand so that wound disruption does not occur with an unrestrained cough. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Instruct nursing staff in care of drains, tubes and other devices. Review post-operative labs if required. Discuss procedure and outcome with family. Write postoperative note. Dictate operative report and copy referring physician(s). Call referring physician(s). Patient is discharged from recovery room. Write orders for transferring to general surgical floor and discuss ongoing care with floor nurses. Examine patient, including reviewing vital signs and confirming as necessary. Auscultate heart, lungs, and abdomen for bowel sounds. Manage dressings to wounds daily, monitoring status of incision, looking for signs of infection. Continue prophylaxis for DVT. Monitor daily for adequacy. Assess need for beta-blockers, order as required. Assess need for continued antibiotics, order as required. Monitor and document patient progress. Assess pain scores and adequacy of analgesia. Monitor fluid and electrolyte status and renal function. Review nursing/other staff patient chart notes. Write orders for labs (especially liver chemistries, amylase, and lipase) and films (if indicated), medications, diet, and patient activity. Chart patient progress notes daily. Answer patient and family questions. Answer nursing/other staff questions. Advance diet, as appropriate. Manage drain, if installed, and remove when appropriate. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions (ie, diet, activity, bathing) are discussed with the patient, family members and discharging nurse. The patient is discharged when taking adequate nutrition and pain control is adequate with oral analgesics. All appropriate medical records are completed, including day of discharge progress notes, discharge summary, discharge instructions, and insurance forms.

Post-operative Work - Office: Review interval chart notes. Examine and talk with patient. Assess pain scores and adequacy of analgesia. Remove staples or sutures and drain, when appropriate. Review activity and restrictions. Check for presence of post-operative hematoma/seroma and assess need for aspiration. Monitor diet caloric intake by weight. Answer patient/family questions. Write medication prescriptions. Post discharge labs/films are ordered and reviewed. Discuss progress with referring physician(s) (verbal and written). Dictate progress notes for medical chart. Review activity permission with patient and write appropriate permission.

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012				
Presenter(s):	Christopher Senkowski, MD FACS; Charles Mabry, MD FACS; Don Selzer, MD FACS				
Specialty(s):	general surgery (ACS, SAGES)				
CPT Code:	47605				
Sample Size:	816	**Resp N:**	50	**Response:** 6.1 %	
Description of Sample:	Random selection from ACS and SAGES membership database				

	Low	25th pctl	Median*	75th pctl	High
Service Performance Rate	0.00	1.00	**4.00**	6.00	35.00

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
44140	090	22.59	**RUC Time**

CPT Descriptor Colectomy, partial; with anastomosis

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
38100	090	19.55	**RUC Time**	2,749

CPT Descriptor 1 Splenectomy; total (separate procedure)

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
44140	090	22.59	**RUC Time**	25,612

CPT Descriptor 2 Colectomy, partial; with anastomosis

Other Reference CPT Code	Global	Work RVU	Time Source

CPT Descriptor

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 15 **% of respondents:** 30.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 47605**	**Key Reference CPT Code:** 44140	**Source of Time** **RUC Time**
Median Pre-Service Time	70.00	60.00	
Median Intra-Service Time	135.00	150.00	
Median Immediate Post-service Time	30.00	30.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	155.0	140.00	
Median Discharge Day Management Time	38.0	38.00	
Median Office Visit Time	62.0	62.00	
Prolonged Services Time	0.0	0.00	
Median Subsequent Observation Care Time	0.0	0.00	
Median Total Time	**490.00**	**480.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)	(of those that selected Key Reference code)	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.73	3.73
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.60	3.67
Urgency of medical decision making	4.13	3.47
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.40	4.07
Physical effort required	4.40	4.07
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.33	4.00
Outcome depends on the skill and judgment of physician	4.33	4.20
Estimated risk of malpractice suit with poor outcome	4.53	3.87

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	3.73	3.60
Intra-Service intensity/complexity	4.40	4.13
Post-Service intensity/complexity	3.47	3.47

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Codes 47600 and 47605 were identified for review by CMS in the NPRM for 2012. CMS received one comment regarding a potential relativity problem. In the Rule, CMS states:

We believe that the difference in physician time and visits is the cause for the difference in work RVU for these codes. However, upon clinical review, it does not appear that these visits appropriately reflect the relativity of these two services, as CPT code 47600 should not have more time and visits associated with the service than CPT code 47605. Therefore, we are asking the AMA RUC to review these two cholecystectomy CPT codes, 47600 and 47605.

Compelling Evidence - Change in patient population

Since **2000**, when 47605 was last reviewed (using a mini-survey), advances in technology have led to a change in medical management (eg, medications) and non-surgical interventions (eg, ERCP) for treating gall bladder disease. This has resulted in a more complex patient presenting for surgery. In addition, similar to the compelling evidence presented in the SoR for CPT 47605, the patient in current practice who undergoes open cholecystectomy is typically a patient that has been converted from a laparoscopic cholecystectomy (LC) to open cholecystectomy (OC). There are many reasons to convert from LC to OC, including severity of disease, adhesions from prior abdominal surgery, difficulties with defining ductal anatomy, and/or failure to perform a cholangiogram laparoscopically to better define ductal anatomy, and conversion to open is chosen as the best and safest alternative. As the *rate* of OC compared with LC decreases (significantly), the *percentage* of patients undergoing conversion at operation has increased, such that the typical patient (>50%) is now an LC to OC conversion. This conversion requires greater intra-service work (time and complexity).

Pre-time

Pre-time package 4 (Difficult Patient/Difficult Procedure) is recommended, with additional positioning time to account for work related to the initial laparoscopic positioning prior to conversion to an open procedure.

Recommendation

The American College of Surgeons and the Society of American Gastrointestinal and Endoscopic Surgeons conducted a full RUC survey for code 47605. The survey data indicate significantly more intra-time, one additional hospital visit, and one additional office visit when compared with the RUC database information from a mini-survey in 2000.

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST	HVs	OVs
2000	47605	Cholecystectomy; w-cholangiogram	15.98	**0.075**	387	75	90	30	4	2
2012	*47605*	*Recommendation*	*21.00*	***0.073***	*490*	*70*	*135*	*30*	*5*	*3*

The current survey data support an increase in the work RVU for 47605 relative to the key reference code and MPC codes.

Key Reference Comparison

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST	HVs	OVs
2005	**44140**	Partial removal of colon	**22.59**	**0.079**	480	60	150	30	7	3
2012	***47605***	*Recommendation*	***21.00***	***0.073***	*490*	*70*	*135*	*30*	*5*	*3*

MPC Comparison

RUC Year	CPT	DESC	RVW	IWPUT	Tot Time	PRE	INTRA	POST	HVs	OVs
2005	**38100**	Removal of spleen total	**19.55**	**0.078**	442	60	120	30	6	2
2012	***47605***	*Recommendation*	***21.00***	***0.073***	*490*	*70*	*135*	*30*	*5*	*3*
2005	**44140**	Partial removal of colon	**22.59**	**0.079**	480	60	150	30	7	3

The current survey data confirm that code 47605 is undervalued. The ACS and SAGES believe there has been a significant change in the typical patient and technology since 2000 to support compelling evidence for a different work RVU and **we recommend the survey median work RVU of 21.00**. The incremental difference of 1.00 work RVUs between 47605 and 47600 accounts for the increased intra-operative work (time and complexity) to perform a cholangiogram.

The table below includes almost 70 codes reviewed by the RUC and CMS with the following parameters: reviewed 2005-2011; work RVUs from 18.00 to 24.00; and inpatient procedure. The codes in this table offer additional support for the recommendation of 21.00 work RVUs for 47605. The recommendation for code 47600 has also been included to show rank order relativity with 47605 and the other codes in the table.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 47605

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty general surgery How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National frequency not available

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,201
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database information for 2010

Specialty general surgery Frequency 3859 Percentage 91.85 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 47605

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor:

47600	Cholecystectomy;
47605	Cholecystectomy; with cholangiography

Global Period: 090 **Meeting Date:** April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Advisors of ACS and SAGES discussed the current details for 47600 and 47605 which include standard times for pre-service, discharge, and office visits for these facility-only codes.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

The Advisors of ACS and SAGES discussed the current details for 47600 and 47605 and agree that the standard times for pre-service, discharge, and office visits for these facility-only codes are appropriate. Minor adjustments were made to the supplies. Equipment time was modified to reflect changes in the number of office visits for 47605. These are facility only codes, therefore no inputs are recommended for the non-facility category.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Standard 90-day global pre-time (60 minutes) as indicated on PE spreadsheet.

Service Clinical Labor Activities:

Standard inpatient discharge (12 minutes) as indicated on PE spreadsheet.

Post-Service Clinical Labor Activities:

Standard office visit post-time (per office visit) as indicated on PE spreadsheet.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes Screen

April 2012

Lithotripsy

In September 2011, CPT Code 50590 *Lithotripsy, extracorporeal shock wave* was identified in the CMS High Expenditure Procedure Codes screen.

The RUC reviewed the survey results from 39 urologists and recommends that the current work RVU of 9.77, which is below the survey 25th percentile, be maintained. The specialty society recommended and the RUC agreed that three office visits (one 99212 and two 99213s) and a half-day discharge management service (99238) accurately describe the post operative physician work to clinically evaluate the patient and order diagnostic tests to reduce the risk of capillary damage, parenchymalor or subcapsular hemorrhage following the procedure. The RUC compared 50590 to key reference service 52648 *Laser vaporization of prostate, including control of postoperative bleeding, complete* (work RVU=12.15) and noted that although intra service times were identical, 52648 is a more intense procedure, with greater total time, compared to the surveyed code. The RUC also compared 50590 to CPT code 29891 *Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect* (work RVU=9.67) and determined that physician time and intensity components were analogous and thus the codes should be valued similarly**. The RUC recommends a work RVU of 9.77 for CPT code 50590.**

Practice Expense:
The RUC reviewed and approved practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommenda-tion
50590	Lithotripsy, extracorporeal shock wave	090	9.77 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

SUMMARY OF RECOMMENDATION

CPT Code:50590 Tracking Number Original Specialty Recommended RVU: **9.77**
Presented Recommended RVU: **9.77**
Global Period: 090 RUC Recommended RVU: **9.77**

CPT Descriptor: Lithotripsy, extracorporeal shock wave

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 66-year-old man has a 1.5 cm radio-opaque stone in the left renal pelvis which is symptomatic.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 69% , In the ASC 31%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 18%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work:
Pre-Service Work- Day before surgery:
- Review pre-op lab results
- Review medical record
- Write pre-op orders (to be emailed or faxed to hospital)
- Obtain and review all imaging studies

Pre-Service work- Day of surgery:
- Change into scrub clothes.
- Review surgical procedure, post-op recovery in and out of hospital with patient and family
- Physician sign and explain informed consent in holding area
- Mark “site of surgery”, “side” in holding area
- Answer patient and family questions, be sure informed consent is in record
- Speak to anesthesiologist about expected length of procedure and any special concerns (ie., jet ventilator; heart rate, gated or non-gated)
- Transfer patient to lithotriper
- "Time out" for patient identification
- Wait for anesthesiologist to administer general anesthetic
- Put on lead apron, radiation eye protection and insert ear plugs

Description of Intra-Service Work:
- Position patient into shockwave focal point in the X, Y and Z axes

- Check cardiac rate; decide on "gated" or "ungated" treatment plan
- Check visualization of stone on monitors
- Start treatment
- Perform intermittent fluoroscopy to check on stone for movement
- Stop shocks every 100 – 200 shocks to assess stone fragmentation. As stone fragments, reposition patient multiple times to maintain shockwave focal point on stone(s) during treatment
- Adjust intensity of shockwave, gradually increasing intensity levels during treatment
- Conclude treatment when the maximum allowable number of shocks have been delivered
- Place Foley catheter if indicated
- Move patient off lithotripter

Description of Post-Service Work:
Post-service work, same day as procedure through discharge

- Wait for anesthesiologist to awaken patient
- Remove Foley catheter if indicated
- Assist in transfer of patient from lithotriptor to post-op stretcher
- Accompany anesthesiologist with patient to recovery area
- Assist in transfer of patient to recovery area bed
- Review recovery area care and medications with staff
- Discuss procedure with patient as necessary in recovery area when awake
- Conduct post-op pain assessment
- Write any further necessary orders, check pain status
- Dictate operative report
- Call referring physician as necessary
- Meet with family or friend, give pre-printed post op instructions and prescriptions as indicated. (This was also discussed with patient before procedure).

Post-op Office work- After discharge from hospital:

- Examine patient and check for ecchymosis, check vital signs
- Conduct post-op pain assessment
- Check urinalysis
- Check serum creatinine
- KUB X-ray if indicated
- Renal ultrasound if indicated
- Answer questions from patient and family
- Write necessary prescriptions
- Schedule next office visit
- Dictate patient progress notes for office medical record
- Dictate letter to referring physician

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Thomas Cooper, MD; Christopher Gonzalez, MD; Thomas Turk, MD, Martin Dineen, MD		
Specialty(s):	Urology		
CPT Code:	50590		
Sample Size:	134	**Resp N:** 39	**Response:** 29.1 %
Description of Sample:	A random list of 1500-2000 AUA members was pulled. An email was sent to these members to confirm whether or not they performed the procedure in question and if they would be interested in completing a survey. If an affirmative response was received, a survey was sent to the member.

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
52648	090	12.15	**RUC Time**

CPT Descriptor Laser vaporization of prostate, including control of postoperative bleeding, complete (vasectomy, meatotomy, cystourethroscopy, urethral calibration and/or dilation, internal urethrotomy and transurethral resection of prostate are included if performed)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
29891	090	9.67	**RUC Time**	478

CPT Descriptor 1 Arthroscopy, ankle, surgical, excision of osteochondral defect of talus and/or tibia, including drilling of the defect

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
54522	090	10.25	**RUC Time**	12,958

CPT Descriptor 2 Full thickness graft, free, including direct closure of donor site, forehead, cheeks, chin, mouth, neck, axillae, genitalia, hands, and/or feet; 20 sq cm or less

Other Reference CPT Code	Global	Work RVU	Time Source
14060	090	9.23	**RUC Time**

CPT Descriptor Adjacent tissue transfer or rearrangement, eyelids, nose, ears and/or lips; defect 10 sq cm or less

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 9 **% of respondents:** 23.0 **%**

TIME ESTIMATES (Median)	**CPT Code: 50590**	**Key Reference CPT Code:** 52648	**Source of Time** **RUC Time**

Technical skill required	3.22	3.56
Physical effort required	2.67	3.44
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.89	3.22
Outcome depends on the skill and judgment of physician	3.78	3.89
Estimated risk of malpractice suit with poor outcome	3.33	3.33

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.56	3.33
Intra-Service intensity/complexity	3.11	3.56
Post-Service intensity/complexity	3.33	3.22

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AUA expert panel reviewed the survey data and recommended the current work RVU be maintained at 9.77 RVU. The current value of 9.77 is below the 2012 RUC survey 25th percentile of 10.00 and the survey median of 10.90. The technology for performing lithotripsy has not changed, the patient population has not changed, and the procedure time has not changed (as the time is dictated by the technology, which has not changed). The expert panel selected the time package 3 Straightforward patient/difficult procedure.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 50590

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 68024
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimation of nationwide utilization is 25% more than Medicare.

Specialty Urology Frequency 67730 Percentage 99.56 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 54,419 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. From RUC database for 2010.

Specialty Urology Frequency 54180 Percentage 99.56 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 50590

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Facility Direct Inputs

CPT Long Descriptor: Lithotripsy, extracorporeal shock wave

Global Period: 090 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AUA expert panel consists of ten urologists who represent urological practices, both academic and private settings, from across the United States. They represent the states of Washington, Illinois, New York, Connecticut, Kentucky, Florida and Tennessee. The panel reviews current RUC practice expense information, requests input for supplies and equipment from several urology practices, reviews the information, makes recommendations and submits them to the AMA.

The current RUC Database (2012 v. 1) claims data, Place of Service, states that 98.75% of ESWL is performed in a facility (hospital outpatient, hospital inpatient, ASC, and other hospital sites) and 1.25% is performed in "Physician Office". The AUA is unable to find any practice that performs "in-office" lithotripsy on Medicare patients. The reason for this is that the global fee of $821.67 (physician fee $569.79) leaves a balance of $251.88 which is of course insufficient to cover the cost of lease, rental or ownership of a lithotripter. AUA did find several physician practices in New York State, that do perform "in office" lithotripsy on **non**-Medicare patients; in those cases the physician practice has negotiated a separate contract with a both a company that leases lithotripters and the private insurance company that reimburses for the service. The AUA further notes that since the implementation of the RBRVS Medicare Fee Schedule in January, 1992, we have not received one comment about the in-office global payment for ESWL. Therefore, the AUA has no available data for Practice Expense for "in-office" ESWL.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: We will use the current inputs provided by the 2012 RUC database for CPT code 50590 to develop new practice expense inputs for supplies and equipment.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms

Coordinate pre-surgery services

Schedule space and equipment in facility

Provide pre-service education/obtain consent

Follow-up phone calls and prescriptions

Service Clinical Labor Activities:

None

Post-Service Clinical Labor Activities:

Conduct phone calls/call in prescriptions

Provide services when patient returns to office for follow-up

Greets patient

Takes them to exam room and provide gown

Takes vitals

Make sure all records are available for physician

Schedule follow-up visits

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes Screen

April 2012

Transurethral Destruction of Prostate Tissue

In September 2011, CPT Code 53850 *Transurethral destruction of prostate tissue; by microwave thermotherapy* was identified in the CMS High Expenditure Procedure Codes screen.

The RUC reviewed the survey results from 33 urologists and recommends that the current work RVU of 10.08 should be maintained. The RUC noted that while the surveyed intra service time of 60 minutes is a reduction from current intra service time of 90 minutes, the post operative visits have increased from two 99213 visits currently assigned to this code to four visits, per the survey data. The RUC noted that there has been a change in technology which now delivers the therapy at a higher temperature putting patients more at risk for clots. The RUC agreed that the increased intensity due to new technology and patients who are more at risk for clots following the procedure does warrant an increase in post operative visits; however, they determined that one 99212, two 99213s and one 99214 visits were more appropriate compared to the survey results.

To justify the current value, the RUC wanted to ensure the reduction in intra-service time was equal to the increase in post operative visits warranted by the change in patient population. The RUC calculated the difference between the current and surveyed intra service time (30 minutes) and multiplied by the current IWPUT (.0643), resulting in a work RVU of 1.93. The current post operative visits include 1.94 work RVUs (two 99213s). The RUC recommended post operative visits result in a work RVU of 3.92. The difference between the current and recommended post operative visits is a work RVU of 1.98. Therefore, the RUC noted that the difference between intra service time and post operative visits was roughly the same. To further support this value, the RUC reviewed CPT code 45190 *Destruction of rectal tumor (eg, electrodesiccation, electrosurgery, laser ablation, laser resection, cryosurgery) transanal approach* (work RVU=10.42, pre-80, intra-60, post-45) and determined that these two services require the same intra-service time of 60 minutes and are similar in work. The RUC also reviewed codes 53852 *Transurethral destruction of prostate tissue; by radiofrequency thermotherapy* (work RVU=10.83, pre-60, intra-58, post-45) and 52647 (work RVU=11.30, pre-60, intra-45, post-45) and determined that the intra service times and work are similar. **Therefore, the RUC recommends a work RVU of 10.08 for CPT code 53850.**

Practice Expense:
The Practice Expense Subcommittee understood that previously 2/3 of physician time was allocated to assist physician in performing the procedure. However, the new technology delivers higher intensity/temperature and now requires the nurse to assist 100% of the time.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
53850	Transurethral destruction of prostate tissue; by microwave thermotherapy	090	10.08 (No Change)

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:53850 Tracking Number Original Specialty Recommended RVU: **10.08**
Presented Recommended RVU: **10.08**
Global Period: 090 RUC Recommended RVU: **10.08**

CPT Descriptor: Transurethral destruction of prostate tissue; by microwave thermotherapy

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old male, suffering from mild to moderate prostatic obstruction. Responded insufficiently to watchful waiting and medical therapies, such as alpha blockers and 5 alpha reductase inhibitors. Patient seeks alternative to more invasive surgical prostatic procedures.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 9%, In the office 91%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 15%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 39%

Description of Pre-Service Work:
Pre-Service Work- Day before surgery

• Review pre-op lab results
•Review medical record
•Obtain and review all imaging studies

Pre-Service work- Day of surgery

•Change into scrub clothes.
•Review surgical procedure, post-op recovery with patient and family
•Answer patient and family questions, be sure informed consent is in record
•Review prostate ultrasound report for prostate size and urethral length;
•If prostate ultrasound has not been performed prior to procedure do at this time to measure urethral length and prostate volume
•Using transrectal ultrasound perform a prostate anesthetic block with lidocaine
•Position patient on procedure table in supine position
•Insert urethral catheter and drain bladder
•Fill bladder with 60 cc of Lidocaine/Marcaine mixture
•Remove catheter
•After catheter is removed inject urethra with 10 cc of 2% xylocaine jelly and place penis clamp
•Wait 10 minutes for local anesthetic to take effect

•Put patient in frog leg position
•Insert thermo-sensing probe thermometer into rectum
•Insert TUMT treatment catheter and inflate balloon
•Perform Limited Ultrasound to check balloon position

Description of Intra-Service Work:
•Start microwave device
•Calibration – Physician chooses protocol and Control Unit begins a 5-step calibration that last 4 to 6 minutes.
•Ramp Up –3 to 7 minutes.
•Treatment Begins – Depending on particular brand of device treatment lasts from 30 to 45 minutes
•Check treatment catheter balloon position every 10 minutes with ultrasound
•Cool-down Phase – Upon completion of treatment the physician begins a 5 minute cool-down of the urethral temperature.
•Remove rectal probe
•Remove treatment catheter

Description of Post-Service Work:

•Place Foley catheter for patient to wear home
•Print-out the data sheet documenting the procedure
•Move patient off of treatment table
•Discuss post op care with patient and family or friend
•Review printed instructions
•Write prescriptions if necessary

Post-op Office visit work-

•Return to office in 3 to 7 days for catheter removal
•Discuss voiding trial results
•Discuss urinalysis results
•Set up follow-up office visits at 4, 8 and 12 weeks

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Thomas Cooper, MD; Christopher Gonzalez, MD; Thomas Turk, MD; Martin Dineen, MD		
Specialty(s):	Urology		
CPT Code:	53850		
Sample Size:	77	**Resp N:** 33	**Response:** 42.8 %
Description of Sample:	A random list of 1500-2000 AUA members was pulled. An email was sent to these members to confirm whether or not they performed the procedure in question and if they would be interested in completing a survey. If an affirmative response was received, a survey was sent to the member.

Intra-Service intensity/complexity	3.67	3.48
Post-Service intensity/complexity	3.24	3.19

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AUA recommends that this procedure retain the current work RVU of 10.08, which is below the survey median of 11.00 and the 25th percentile of 10.50. Since 2006, this procedure has decreased by over 50% from its highest utilization of 34,994 to the 2010 utilization of 15,222. Although there is no peer reviewed literature on this topic, it is recognized in the urologic community that this procedure is now most commonly performed on patients who are poor candidates for anesthesia and anticipated difficulty with post-anesthesia care. These patients are typically in urinary retention and must have an indwelling Foley catheter due to their benign prostatic hyperplasia. In addition, this procedure is also used to treat patients who are on warfarin, and other anticoagulants, as the drug does not need to be stopped to have the procedure performed. This procedure is performed to allow the patient to become catheter free. This unique patient sub-population has more surgical co-morbidities since introduction of the procedure. Of note, the intra-service time for this procedure has decreased from 90 minutes to 60 minutes according to survey respondents, however, the patient population as noted has self-selected to a more difficult and challenging group of patients to manage.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 53850

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 19027
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate. We believe that this procedure is performed nationwide approximately 25% more in the commercial and Medicare market combined.

Specialty Urology Frequency 18856 Percentage 99.10 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15,222 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. From the RUC database for 2010

Specialty Urology Frequency 15086 Percentage 99.10 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 53850

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Transurethral destruction of prostate tissue; by microwave thermotherapy

Global Period: 090 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AUA expert panel consists of ten urologists who represent urological practices, both academic and private settings, from across the United States. They represent the states of Washington, Illinois, New York, Connecticut, Kentucky, Florida and Tennessee. The panel reviews current RUC practice expense information, requests input for supplies and equipment from several urology practices, reviews the information, makes recommendations and submits them to the AMA.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: We are using the practice expense spreadsheet from the current RUC database for 53850 TUMT.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Chart is reviewed by clinical staff to verify that correct procedure is ordered for the patient.
- Room is prepared and exam table is covered with paper.
- Patient is greeted and a gown is provided.
- Patient education and consent is obtained.
- Review with patient each step of the treatment and answer patient questions.
- Obtain vitals
- Set up the equipment (microwave unit and ultrasound machine) and sets up the supplies needed for the procedure.
- Assist the physician with positioning and padding of patient in the supine position.
- Assist the physician with the preparation and draping of the patient.
- Assist the physician with the local anesthesia prior to the procedure.

Service Clinical Labor Activities:

- Performs a time-out with physician to make sure proper procedure and proper patient is being treated.

- Clinical staff person hands supplies and equipment to the physician during procedure.
- Assist the physician with repositioning patient after procedure.

Post-Service Clinical Labor Activities:

- Clean the room and disinfect microwave unit.

- Provide follow up information to patient.
- Discuss any adverse reaction at insertion site.
- Confers with the MD verbally for any last minute instructions for patient.
- Next appointment is set up for patient while checking out.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Re-Review Families of New/Revised Codes Screen

April 2012

CT Angiography-PE Only

These services were most recently identified in the Nov. 28, 2011 Final Rule for 2012. CMS requested that the RUC re-review specific codes in a family of CT angiography services that were recently reviewed and bundled. In January 2012, the RUC reviewed the CMS identified family of services and recommended that CPT codes 72191 *Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing* and 74175 *Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing* be referred to the PE Subcommittee to review in April 2012 to determine if any practice expense anomalies exist between the new bundled code 74174 *Computed tomographic angiography, abdomen and pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing* and these individual codes. The RUC determined that review of physician work is not necessary at this time. The PE Subcommittee reviewed the practice expense inputs and noted that the expert panel overestimated the clinical staff time needed for the CT tech to *Assist the physician in performing procedure/computer post processing,* recommending 57 minutes rather than the 33 minutes needed for the same input for 74174. Practice expense inputs were revised to align with the 30 minutes of physician work intraservice time typical for the family of codes. An additional clinical staff time of 3 minutes was added for computer post processing, resulting in a total of 33 minutes for *Assist the physician in performing procedure/computer post processing*. **The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
72191		Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing (Do not report 72191 in conjunction with 73706 or 75635. For CTA aorto-iliofemoral runoff, use 75635) (Do not report 72191 in conjunction with 74175. For a combined computed tomographic angiography abdomen and pelvis study, use 74174)	XXX	1.81 (PE Input Recommendations Only)
74175		Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing (Do not report 74175 in conjunction with 73706 or 75635. For CTA aorto-iliofemoral runoff, use 75635) (Do not report 74175 in conjunction with 72191. For a combined computed tomographic angiography abdomen and pelvis study, use 74174)	XXX	1.90 (PE Input Recommendations Only)

CPT Code: 74175 and 72191
Specialty Society('s) ACR

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:
74175 - Computed tomographic angiography, abdomen, with contrast material(s), including noncontrast images, if performed, and image postprocessing

72191 - Computed tomographic angiography, pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing

Global Period: XXX Meeting Date: 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology convened a consensus panel to finalize the practice expense data for CPT codes 72191 and 74175.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Since both 72191 and 74175 are existing PEAC reviewed codes, and our expert panel felt no change in practice had occurred in the interim, we used the RUC-approved data as the basis for the practice expense inputs. For 2012, a new bundled code for CTA of the abdomen and pelvis was created. Accordingly, we included the inputs 74174 (*Computed tomographic angiography, abdomen and pelvis, with contrast material(s), including noncontrast images, if performed, and image postprocessing*) and 74178 (*Computed tomography, abdomen and pelvis; without contrast material in one or both body regions, followed by contrast material(s) and further sections in one or both body regions*), and 76377 (*3D rendering with interpretation and reporting of computed tomography, magnetic resonance imaging, ultrasound, or other tomographic modality; requiring image postprocessing on an independent workstation*) since 74178 and 76377 were used as the building blocks for 74174 at the February 2011 RUC meeting.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Retrieve prior appropriate imaging exams and hang for MD review, verify orders, review the chart to incorporate relevant clinical information

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Education/instruction/counseling/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Acquire images
- Assist physician in performing procedure/ Computer post processing
- Clean room/equipment by physician staff
- Process films, hang films and review study with interpreting MD prior to patient discharge

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS/Other-Utilization over 500,000 Screen

April 2012

CT Abdomen

In February 2008, CPT Code 74170 *Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections* was identified in the CMS/Other-Utilization over 500,000 screen.

The RUC reviewed the survey results from 75 radiologists and recommends that the current work RVU of 1.40, which is below the survey 25th percentile, be maintained. The RUC noted that in April 2010, three codes were created to report the combination of computed tomography of the abdomen and pelvis. As a result, Medicare utilization has significantly decreased from 859,320 in 2010 to 145,235 in 2011 for code 74170. The RUC reviewed key reference service 74178 *Computed tomography, abdomen and pelvis; without contrast material in one or both body regions, followed by contrast material(s) and further sections in one or both body regions* (work RVU=2.10) and agreed that although intensity components are similar, 74178 requires 12 more minutes of intra-service time and should be valued higher. The RUC compared 74170 to 73718 *Magnetic resonance (eg, proton) imaging, lower extremity other than joint; without contrast material(s)* (work RVU=1.35) and determined that these two services require the same physician work and time and therefore should be valued similarly. The RUC also agreed that a work RVU of 1.40 will maintain proper rank order within the family of CT codes, including 74160 *Computed tomography, abdomen; with contrast material(s)* (work RVU=1.27) and 74150 *Computed tomography, abdomen; without contrast material* (work RVU=1.19). **The RUC recommends a work RVU of 1.40 for CPT Code 74170.**

Practice Expense:
The RUC reviewed and approved practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
74170	Computed tomography, abdomen; without contrast material, followed by contrast material(s) and further sections (For a combined CPT abdomen and pelvis study, see 74176-74178) (To report 3D rendering, see 76376, 76377) (For computed tomographic colonography, diagnostic, see 74261-74262. For computer tomographic colonography, screening, use 74263) (Do not report 74150-74170 in conjunction with 74261-74263)	XXX	1.40 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes

April 2012

Transvaginal and Transrectal Ultrasound

In September 2011, CPT Codes 76830 *Ultrasound, transvaginal* and 76872 *Ultrasound, transrectal* were identified in the CMS High Expenditure Procedure Codes screen.

76830 *Ultrasound, transvaginal*
The RUC reviewed the survey results from 120 radiologists and obstetricians/gynecologists and recommends that the current work RVU of 0.69, which is below the survey 25th percentile, be maintained for CPT Code 76830. The RUC noted that 76830 is billed with 76856 *Ultrasound, pelvic (nonobstetric), real time with image documentation; complete* and determined that there is no overlap of physician work when the services are performed on the same date of service. The RUC reviewed physician time and recommends the survey median times of 5 minutes of pre-time, 10 minutes of intra-service time and 10 minutes of post-time. The RUC noted that post-service time increased from 5 minutes in 2005 to 10 minutes in this survey and agreed that since there is an increased rate of sepsis following the procedure, there should be more time allocated for patient discussion. The RUC compared 76830 to the key reference code 76817 *Ultrasound, pregnant uterus, real time with image documentation, transvaginal* (work RVU=0.75 and intra-time=10 minutes) and determined that the urgency of medical decision making and risk of malpractice with poor outcomes is greater in 76817 compared to the surveyed code. Thus, the reference code should be valued higher. The RUC also reviewed 20600 *Arthrocentesis, aspiration and/or injection; small joint or bursa (eg, fingers, toes)* (work RVU=0.66 pre-11, intra-5 and post-5) and determined that these two services require similar intensity and total time. Finally, to further justify a work RVU of 0.69, the RUC reviewed CPT Code 65205 *Removal of foreign body, external eye; conjunctival superficial* (work RVU=0.71, pre-5, intra-5, post-5) and agreed that the overall work is similar. **The RUC recommends a work RVU of 0.69 for CPT Code 76830.**

76872 *Ultrasound, transrectal*
The RUC reviewed the results of 69 radiologists and urologists and recommends that the current work RVU of 0.69 be maintained, which is below the survey 25th percentile for CPT Code 76872. The RUC noted that although 76872 is also billed with 55700 *Biopsy, prostate; needle or punch, single or multiple, any approach* and 76942 *Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision*, this procedure is typically not used for cancer, but rather to determine therapy to relieve patients of primary bladder neck obstruction. Therefore, there is no duplication of physician work when these services are reported on the same day. The RUC reviewed CPT Code 76881 *Ultrasound, extremity, nonvascular, real-time with image documentation; complete* (work RVU=0.63) and agreed that 76872 requires 10 more minutes and should be valued higher. In addition, the RUC reviewed 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work RVU=0.81) and determined that although 76700 requires less time, it is a more intense procedure and should be valued higher

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

than the surveyed code. A work RVU of 0.69 maintains proper rank within this family of services. **The RUC recommends a work RVU of 0.69 for CPT Code 76872.**

Practice Expense:
The RUC reviewed and approved practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT Code (●New)	CPT Descriptor	Global Period	Work RVU Recommendation
76830	Ultrasound, transvaginal (For obstetrical transvaginal ultrasound, use 76817) (If transvaginal examination is done in addition to transabdominal non-obstetrical ultrasound exam, use 76830 in addition to appropriate transabdominal exam code)	XXX	0.69 (No Change)
76872	Ultrasound, transrectal (Do not report 76872 in conjunction with 0249T)	XXX	0.69 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:76830 Tracking Number Original Specialty Recommended RVU: **0.69**
Presented Recommended RVU: **0.69**
Global Period: XXX RUC Recommended RVU: **0.69**

CPT Descriptor: Ultrasound, transvaginal

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 25-year-old woman was diagnosed with a complex right ovarian cyst six weeks ago by trans-abdominal pelvic ultrasound. The lesion was presumed to represent a benign hemorrhagic cyst. After six weeks the patient has a persisting right adenexal mass on physical examination. A transvaginal examination ultrasound of the pelvis is ordered for further evaluation and characterization.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work:
- Review the reason for the exam and any pertinent clinical history.
- Review any prior applicable imaging studies.

Description of Intra-Service Work:
- Supervise the sonographer performing the exam.
- Interpret the ultrasound exam, which may include evaluation of the following structures:
  - Uterus including evaluation of the endometrium
  - Ovaries
  - Cul de sac
  - Parametrium
- Compare the exam and correlate the findings to previous studies.
- Dictate report for the medical record.

Description of Post-Service Work:
- Discuss and explain findings with patient
- Review and sign final report.
- Discuss findings with referring physician.

The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.03	2.67
Urgency of medical decision making	3.00	3.30
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.47	3.33
Physical effort required	2.43	2.53
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.63	2.57
Outcome depends on the skill and judgment of physician	3.70	3.47
Estimated risk of malpractice suit with poor outcome	3.53	3.90

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	2.07	2.00
Intra-Service intensity/complexity	3.37	3.07
Post-Service intensity/complexity	2.73	2.43

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 76830

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Obstetrics/Gynecology How often? Commonly

Specialty Diagnostic Radiology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1371576
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by 76830 provided nationally in a one-year period is estimated to be 1,371,576.

Specialty Obstetrics/Gynecology Frequency 818282 Percentage 59.65 %

Specialty Diagnostic Radiology Frequency 448643 Percentage 32.71 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 457,192 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that CPT code 76830 will be billed approximately 457,192 times for Medicare patients nationally in a one-year period.

Specialty Obstetrics/Gynecology Frequency 272761 Percentage 59.66 %

Specialty Diagnostic Radiology Frequency 149548 Percentage 32.71 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 76830

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:76872 Tracking Number Original Specialty Recommended RVU: **0.69**
Presented Recommended RVU: **0.69**
Global Period: XXX RUC Recommended RVU: **0.69**

CPT Descriptor: Ultrasound, transrectal;

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74 year old man with voiding difficulty not responsive to alpha blockers or 5-alpha reductase inhibitors and a PSA of 0.8 is being evaluated for possible invasive or minimally-invasive prostate surgery. Transrectal prostate ultrasound is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 68%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 14%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work:
- Obtain and review pertinent records and previous history, laboratory studies
- Check ultrasound equipment
- Explain procedure to patient again
- Position patient on his left side with knees flexed

Description of Intra-Service Work:
- Perform digital rectal exam before inserting probe
- Gently insert transrectal ultrasound probe into rectum
- Allow one minute for anal sphincter to accommodate to probe
- Adjust ultrasound image controls to size of prostate
- Using coronal image, measure prostate height and width
- Using sagittal image measure prostatic urethral length
- Freeze image to calculate prostate volume from previous measurements
- Note presence or absence of hypoechoic areas
- Note presence or absence of prostatic calcifications
- Note presence or absence of prostatic cysts
- Note presence or absence of prostate median lobe
- If median prostate lobe present, note size
- Evaluate seminal vesicles
- Print image on thermal paper or transfer image to PACS

Description of Post-Service Work:

- Explain findings to patient
- Dictate diagnostic findings report
- Complete facility or non-facility paperwork

SURVEY DATA

Technical skill required	3.93	3.93
Physical effort required	3.18	3.23
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.93	3.03
Outcome depends on the skill and judgment of physician	3.78	3.78
Estimated risk of malpractice suit with poor outcome	3.10	3.28

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.05	3.18
Intra-Service intensity/complexity	3.65	3.73
Post-Service intensity/complexity	3.18	3.40

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 76872

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology How often? Commonly

Specialty Diagnostic Radiology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 327402
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that 25% more of these procedures are performed nationwide.

Specialty Urology Frequency 306320 Percentage 93.56 %

Specialty Diagnostic Radiology Frequency 7405 Percentage 2.26 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 261,922 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2010 Medicare data estimates that CPT code 76872 was billed approximately 261,922 times for Medicare patients nationally in a one-year period.

Specialty Urology Frequency 245060 Percentage 93.56 %

Specialty Diagnostic Radiology Frequency 5925 Percentage 2.26 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Ultrasound, transvaginal;

Global Period: XXX Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACOG and ACR convened a consensus panel to review and finalize the practice expense data for code 76830.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Since 76830 is an existing code, we used the PEAC approved data as the basis for the practice expense inputs for code 76830.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Retrieve prior images for comparison

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Assist physician in performing procedure/ acquire images
- Clean room/equipment by physician staff
- Process images, complete data sheet, present images and data to the interpreting physician

Post-Service Clinical Labor Activities:

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: Ultrasound, transrectal;

Global Period: XXX Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AUA and ACR convened a consensus panel to review and finalize the practice expense data for code 76872.

One important change comes from the report of the Ultrasound Workgroup at the January 2012 RUC meeting. Currently, 76872 includes an ultrasound room (EL015) and related equipment (ED024, ER029). This was changed to an Ultrasound, portable (EQ250).

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: Since 76872 is a current code, the information on the PE spreadsheet will be compared to the existing clinical staff, staff time, supplies, and equipment in the RUC database.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Retrieve prior images for comparison

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient
- Assist physician in performing procedure/acquire images
- Obtain vital signs
- Clean room/equipment by physician staff
- Clean ultrasound probe
- Process images, complete data sheet, present images and data to the interpreting physician

Post-Service Clinical Labor Activities:

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes screen

April 2012

Radiotherapy Dose Plan IMRT

In the July 19, 2011, Proposed Rule for 2012, CMS requested that the RUC review high expenditure services. CPT code 77301 was selected because it had not been reviewed in almost ten years. In September 2011, the Relativity Assessment Workgroup reviewed this service and recommended that the specialty societies submit action plans for January 2012. In January 2012 the RUC recommended that this service be surveyed for physician work and practice expense in April 2012.

77301 ***Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications***
The RUC reviewed the survey results from 90 radiation oncologists and agreed with the specialty society that the survey respondents accurately estimated the physician work involved in this service: intra-service time= 160 minutes and post-service time= 35 minutes. Currently, 77301 has 30 minutes of pre-service time, however, the specialty explained that the three primary work components involved in this service, image acquisition, contouring and dose prescription are all performed in the intra-service time. The survey was modified and approved by the Research Subcommittee to preclude pre-service physician work and add a more robust description of intra-service work. The RUC agreed that this reallocation more accurately apportions the time required to complete this service. Finally, the RUC noted that while this procedure is intensive and completed over several hours, CPT code 77301 is only reported once per course of therapy.

The RUC reviewed the survey respondents' estimated physician work values and agreed that the current work RVU of 7.99, just below the survey's 25th percentile, accurately reflects the physician work involved in the service. To justify this value, the RUC compared the surveyed code to key reference service 77435 *Stereotactic body radiation therapy, treatment management, per treatment course, to 1 or more lesions, including image guidance, entire course not to exceed 5 fractions* (work RVU= 11.87) and agreed that while the services are fundamentally similar with a high degree of complex planning, imaging evaluation and clinical correlation, the reference code has greater intra-service time compared to 77301, 201 minutes and 160 minutes, respectively. In addition, the RUC reviewed MPC CPT code 95951 *Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, combined electroencephalographic (EEG) and video recording and interpretation (eg, for presurgical localization), each 24 hours* (work RVU= 5.99) and agreed that the two services have similar physician work. However, 77301 has 45 more minutes of physician time compared to the reference code and thus should be valued higher. **The RUC recommends a work RVU of 7.99 for CPT code 77301.**

Practice Expense: The RUC reviewed and approved the direct practice expense inputs as recommended by the Practice Expense Subcommittee.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
77301		Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications (Dose plan is optimized using inverse or forward planning technique for modulated beam delivery [eg, binary, dynamic, MLC] to create highly conformal dose distribution. Computer plan distribution must be verified for positional accuracy based on dosimetric verification of the intensity map with verification of treatment set-up and interpretation of verification methodology)	XXX	7.99 (No Change)

SUMMARY OF RECOMMENDATION

CPT Code:77301 Tracking Number Original Specialty Recommended RVU: **7.99**
Presented Recommended RVU: **7.99**
Global Period: XXX RUC Recommended RVU: **7.99**

CPT Descriptor: Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 68-year-old male presenting with clinically localized, high grade adenocarcinoma of the prostate, PSA 16ng/ml. CT simulation is done and an IMRT plan is to be generated for radiation therapy to the prostate, seminal vesicles and pelvic nodes, and dose escalated radiation to the prostate and seminal vesicles.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work:

Description of Intra-Service Work:
• Before the planning scans are transferred from the CT simulator into the treatment planning software, the radiation oncologist reviews the suitability of the patient positioning on the scanner and the planning CT scans obtained with the patient immobilized as ordered, to verify the visual integrity of the image data set to be used for dose calculations, clear recognition of any implanted fiducials to be used for later image guidance, appropriate administration of any contrast material used, and consistency of internal anatomy (rectal filling, bladder filling, bowel gas etc) with reference to expectations based on recent diagnostic imaging scans (15 min)

• The planning CT scans are uploaded into the treatment planning software, where the radiation oncologist again reviews the patient's internal anatomy with special attention to the tumor-bearing regions seen on relevant prior diagnostic imaging studies, including MRI and/or PET scan (5 min)

• The CT simulation images are fused with selected diagnostic image sets (MR images of the pelvis in this case) using image fusion techniques. The fusion is then manually adjusted by the physician to ensure accurate matching of fiducial markers and internal anatomy (15 minutes).

• The radiation oncologist outlines target volumes on the fused data set on each 3mm planning scan slice. The gross tumor volume (GTV), representing radiographically evident cancer-containing volume, is expanded into the clinical target volume (CTV), which includes the zone of potential microscopic disease extension. In the prostate case vignette, the GTV

is the prostate gland and the CTV includes the adjacent seminal vesicle, bilateral internal iliac nodes, sub-aortic pre-sacral nodes from S1-S3, and external iliac nodes out to the inguinal ligament. These contours are made slice by slice on the fused scans. Planning target volumes (PTV) are added to the initial and boost Clinical Target Volumes, which accounts for setup error and intrafraction motion. These are asymmetric margins, depending on expected organ motion and deformation, risk of toxicity to surrounding organs and type of image guidance used. (40 min)

• Important organs at risk (OARs) are also contoured on each 3 mm planning scan slice and labeled; for the prostate case vignette, these include pelvic small bowel loops, rectum and rectosigmoid, bilateral femoral heads, bladder, and penile bulb. The urethra is also identified to avoid an inadvertent dose "hotspot" in that structure. Identify and outline any fiducial markers in the prostate. (40 min)

• Prescribe the intended dose to elements of the PTV, to include the prostate, seminal vesicles, and pelvic lymph nodes. (3 min)

• Define partial dose/volume tolerances for each OARs and specify normal tissue and tumor dose constraints for the inverse planning algorithm. (8 min)

• Designate priorities (or rankings) of the target volumes and OAR's for the inverse planning algorithm. (2 min)

• Evaluate initial plan to determine whether intended goal dose to PTV and dose constraints to OARs have been achieved. (8 min)

• Work with the dosimetrist and physicist to modify the optimization parameters iteratively to achieve an acceptable dose to the target volumes while respecting the normal tissue tolerance doses. During this process, multiple plans are generated and compared with reference to adequacy of tumor coverage, location of dose "hot spots" and "cold spots", and risk of normal tissue injury based on the dose volume histograms for tumor and critical normal tissues until a properly optimized plan is selected. (20 min)

• The planned dose for that patient is delivered to a phantom (diode array or equivalent). A comparison plan is calculated based on the patient plan, and the physician compares the delivered dose to the comparison plan using quantitative metrics (gamma analysis, DTA, or other quantities) to confirm that there are no significant variations between the two measurements. (5 min)

Description of Post-Service Work:

• Review graphical and tabular summaries of dose volume histograms for target structures and OARs for compliance with plan specifications, review planar (axial, coronal, sagittal) illustrations of the approved dose distribution within the patient, and sign an e-copy of these elements of the plan documentation for storage in the treatment planning system backup files

• Verify that patient setup instructions have been entered into the appropriate place within the electronic medical record and that the beam angles, and gantry positions unique to the patient's plan have been entered into the section of the electronic medical record that will record and verify each treatment given

• Sign the IMRT prescription in the patient's electronic medical record

• Discuss with members of the treatment team (physicist, dosimetrist, therapist, nurse) patient-specific considerations regarding implementation of the IMRT plan

• Dictate IMRT procedure note

SURVEY DATA

RUC Meeting Date (mm/yyyy)	04/2012		
Presenter(s):	Najeeb Mohideen, MD, Michael Kuettel, MD, PhD, Dwight Heron, MD and Gerald White		
Specialty(s):	Radiation Oncology		
CPT Code:	77301		
Sample Size:	880	**Resp N:** 90	**Response:** 10.2 %
Description of Sample:	We discussed our sample selection process with the Research Subcommittee prior to fielding the survey. We published a blurb in the Society weekly communication that asked for people to complete a health policy survey. We collected those names and sent them a survey. We also sent surveys to ALL of our members who have indicated in their membership file that this is a modality they practice. Finally, we sent additional surveys to another 250 randomly selected active, US members.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 77301 is an IMRT planning code billed once per course of treatment for an IMRT case which has PC and TC. The PC describes the physician work associated with IMRT planning . There is an IMRT delivery code, CPT 77418, that is coded separately to describe the delivery of radiation and the delivery codes do NOT include physician work.

ASTRO conducted a survey and collected 90 random surveys. ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining the current RVU of 7.99 for CPT code 77301. Our rationale for that recommendation is based on multiple factors and is described below.

Vignette

The Medicare data indicates that our original vignette describing a patient with high risk prostate cancer in *2001* is in fact the most reported diagnosis (ICD 185) for this CPT code. Therefore, we used the original vignette, with extraneous information removed (and approved by the research subcommittee) in this survey and 95 % of our survey respondents felt the vignette was typical.

Codes Reported on the Same Day

The data in the "Same Day Billings from CMS" file shows that no codes are billed frequently with 77301. A basic radiation dosimetry calculation is billed approximately 52% of the time with 77301. CPT Code 77300 has 15 minutes of physician work and 0.62 wRVUs. CPT code 77300 is a separate and distinct service from 77301. It describes the work related to performing a primary and a secondary confirmatory calculation to get to the monitor units that the therapist enters into the treatment machine (Linac) that will be delivered per field. Calculating the relationship between dose and Monitor Units requires specific inputs related to this calculation and machine output factors characteristic of the linear accelerator and this determines the number of Monitor Units the therapist enters to deliver the treatment as prescribed by the physician.

Time

Our current surveyed total time is 195 minutes (0, 160, 35), which is essentially the same as the current total time of 196 minutes (30, 131, 35). The total time is broken out slightly different in the current survey, than in the RUC database.

There has been much debate and confusion about XXX codes and whether they have pre/post work. There are many RO XXX codes that do not have pre and/or post time. We believe it is appropriate for this code to have post time. However, we believe all other activities would be appropriately considered intra time. We brought this issue to the research subcommittee prior to fielding the survey. We were granted permission to remove the "pre time" question/definition from the survey and provide a more robust definition of intra time for the survey respondents.

While the vignette is unchanged from 2000, at that time IMRT was predominantly used as a boost to the prostate after intial 3D external beam radiation therapy to the pelvis. Currently the technology permits us (and it is typical) to do the pelvic volumes and prostate boost as one IMRT plan with no separate 3 D plan. Hence this increases the number of target volumes and critical structures contoured and the number of different critical structures that has to be kept within specific dose constraints and is appropriately reflected in the surveyed intraservice time of 160 minutes.

IWPUT

The current IWPUT for CPT code 77301 is 0.0499. With our recommendations our IWPUT will be 0.045. The difference in these two intensities relates to shift in time from pre to intra. The survey responders picked CPT 77435 as the reference service codes and also scored CPT 77301 as less intense than the reference service code. We believe our current recommendations supports this slight change in IWPUT, maintains the relationship between the surveyed code and the reference service code and stays in line with other radiation oncology IWPUTs.

Comparison to the Key Reference Services:

Our recommendations maintain relativity within the radiation oncology family. The key reference service code, 77435 Stereotactic body radiation therapy, treatment management, per treatment course, to 1 or more lesions, including image guidance, entire course not to exceed 5 fractions is also an XXX code, has a total time of 250 minutes, an IWPUT of 0.0523 and a wRVU of 11.87. The surveyed code has less time and fewer RVUs than the reference code but nearly equal intensity. Both codes are fundamentally similar with a high degree of complex planning, image evaluation and clinical correlation, in collaboration with the medical physicist and dosimetrist. However 77435 was ranked slightly higher in urgency of medical decision making and psychological stress in view of the real time delivery of ultra high doses of radiation during radiosurgery and thus merits the higher IWPUT of 0.0523 in comparison to 77301 which has an IWPUT of 0.045. Both 77301 and 77435 may be reported only once during the entire course of therapy. We believe that this was an appropriate selection by our survey respondents and fits nicely with our survey data. Our recommendations also fit nicely with CPT code 77427 Radiation treatment management, 5 treatments which has a total time of 101 minutes, a wRVU of 3.37 and an IWPUT of 0.0345.

Relativity will also be maintained compared to other codes on the MPC list. For example, CPT code 95951 Monitoring for localization of cerebral seizure focus by cable or radio, 16 or more channel telemetry, combined electroencephalographic (EEG) and

video recording and interpretation (eg, for presurgical localization), each 24 hours has a total time of 150 minutes, a wRVU of 5.99 and an IWPUT of 0.066. This code describes the physician work of analyzing and interpreting seizure activity over this period to localize the seizure source. The surveyed code has 45 more minutes (195 vs 150) and a lower IWPUT (0.045 vs 0.066). Another MPC code, 99475 Initial inpatient pediatric critical care, per day, for the evaluation and management of a critically ill infant or young child, 2 through 5 years of age has a total time of 165 minutes, a wRVU of 11.25 and an IWPUT of 0.0943. Our recommendations maintain relativity compared to this code. The surveyed code has 30 more intra minutes but a significantly lower IWPUT and RVU.

Volume Growth:
Volume Growth for IMRT planning has plateaued over the last couple years.

IMRT in the Office Setting

		2012		2011		2010	
77301	IMRT Planning	0%	90,639	8%	90,214	6%	83,884

Building Block
The consensus panel also used a building block to validate our recommendations. Again, IMRT planning code reflects a "complete course" of therapy including, at a minimum, acquisition and 3 D Rendering of CT volumes, 3D target volume contouring and special dosimetry measurements throughout the volume. The following codes were used as a "cross check" of our recommendation. The 3D target contouring work approximates the work of CPT 77295, 3D simulation, (4.56), the patient specific special measurements at multiple points throughout the target volumes approximates + three 77331,Special radiation dosimetry measurement, (3 x 0.87) + the CT acquisition and 3D rendering is similar to the work of one 77014,CT scan for radiation therapy guide, (0.85) and one 76376, 3D render w/o postprocess, (0.20) = 8.22, which is right in line with our median of 8.00. These codes would not be billed along with this new code.

Recommendations:
We are recommending the current RVUw of 7.99, pre-service: zero minutes, median intra time of 160 minutes and post service times of 35 minutes, for a total time of 195 minutes. We believe our 90 person survey supports our recommendations.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. The data in the “Same Day Billings from CMS” file shows that no codes are billed frequently with 77301. A basic radiation dosimetry calculation is billed approximately 52% of the time with 77301. CPT Code 77300 has 15 minutes of physician work and 0.62 wRVUs. CPT code 77300 is a separate and distinct service from 77301. It describes the work related to performing a primary and a secondary confirmatory calulation to get to the monitor units that the therapist enters into the treatment machine (Linac) that will be delivered per field. Calculating the relationship between dose and Monitor Units requires specific inputs related to this calculation and machine output factors characteristic of the linear accelerator and this determines the number of Monitor Units the therapist enters to deliver the treatment as prescribed by the physician.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77301

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 130000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate that approximatley 130,000 IMRT plans are done nationally in a one-year period. The median age for prostate cancer is 68, so most prostate IMRT cases would be in the Medicare population. We estimated an additional 35,000 cases to account for the prostate cancers in the non Medicare population and the other types of cancers treated with IMRT (a little less than half of the Medicare utilization number).

Specialty Radiation Oncology Frequency 123500 Percentage 95.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 90,639 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Radiation Oncology Frequency 86109 Percentage 95.00 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 77301

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Code: 77301
Specialty Society('s) ASTRO

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor: *Intensity modulated radiotherapy plan, including dose-volume histograms for target and critical structure partial tolerance specifications*

Global Period: XXX **Meeting Date:** 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

ASTRO developed these PE recommendations by Consensus Panel. The Panel had several radiation oncologists and medical physicists. The group reviewed the existing direct practice expense inputs for this procedure as well as several other radiation oncology codes.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

We did not include a reference code with these recommendations, as the surveyed code is an existing code. We did include the existing direct PE inputs as for reference on the spreadsheet.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The nursing staff will Complete pre-service diagnostic & referral forms, discuss the forms and necessary referrals with the patient and make calls to the practices to which the patient has been referred as necessary.

Service Clinical Labor Activities:

The nursing staff will greet patient, provide gowning and ensure appropriate medical records are available for the procedure. They will then obtain vital signs and Provide pre-service education/obtain consent.

The Radiation Therapist will prepare room, equipment, supplies for the CT based procedure. Once the nursing staff has completed their work with the patient, the Radiation Therapist will Prepare and position patient on the CT table.

The Radiation Therapist Aligns the patient with respect to the scan center of the CT scan and the plane of the CT table using three or four externally mounted lasers that are positioned in the same way as the alignment lasers in the linac treatment room. They then mark the patient with radiopaque markers, and then take multiple AP and Lat scout scans and adjust patient position after each scout such that at the end of the process the patient is aligned without rotation in the x,y and z axis and the external markers are appropriately centered for the area to be imaged and that the patient is comfortable in this position, or else this is adjusted.

The Radiation Therapist then selects the appropriate CT technique based on the anticipated needs of the IMRT process, acquires and processes the CT data set scan. They then discuss the acquired images with the physician, evaluating appropriate bladder, rectal filling. After approval, the patient is marked with tattoos at the external markers or at a preselected isocenter. The data is then transferred to the treatment planning computer.

The medical physicist evaluates the planning CT for artifacts and Hounsfield Unit anomalies. He or she will then evaluate fusion image data sets for appropriate voxel characteristics and if acceptable fuse image data sets.

The contouring phase:

A combination of the medical physicist and medical dosimetrist contour the external contour(s) of the patient, table and devices, review all M.D. created contours with physician, interpolate contours & create expansions for CTV and PTV based on M.D. contouring and Rx, create density overrides, review the entire final 3-D contour set with physician.

After the initial contouring is completed, the medical physicist will review all contours for high spatial frequency characteristics that may interfere with the sampling voxels of the optimization algorithm kernel. Perform contour vertex expansion/reduction as necessary.

The Medical Physicist will perform Boolean operations on contours to resolve optimization constraint and objective conflicts and create synthetic structure contours for use in optimization and evaluation.

Next is the planning phase:

The dosimetrist will enumerate critical normal tissues adjacent to tumor volume, enter partial dose/volume objectives and constraints for normal tissues and PTV's, Dosimetrist, physicist and physician create initial gantry and table angles for field families, Evaluate initial plan for goodness of fit for tumor and normal tissue dose constraints, Modify tumor and normal tissue dose constraints if necessary to re-run plan, iterate plan until dose constraints are acceptable, typically creating a series of possible optimization endpoints for later comparison and selection.

After initial optimizations are completed, the medical physicist will evaluate dose plan distribution and objective function values for excessive influence of non-unit density HU values, modify and override densities as necessary. The physicist will then re-run plans with optimized parameters. He or she will then evaluate and rank plans for physics and radiobiological-based optimization using a dose response index for the probability of uncomplicated tumor control.

After the physician has completed the review of the above described plan and options and selected the final isodose plan to be delivered, the dosimetrist will review plan, transfer to R&V system, create synthetic orthogonal isocenter digitally reconstructed radiographs, calculate and transfer phantom planar dose sets and create staff worklists.

Delivery verification process:

In the final stage, the medical physicist verifies the plan by delivering the dose distribution to a phantom with appropriate dose measuring devices. The physicist will acquire, process and review phantom/film/EPID or diode Dosimetry referenced to ion chamber single point dosimetry to confirm correct dose delivery compared with graphical plan. He or she will prepare a gamma analysis (distance to agreement and relative dose correspondence) for Physician review. Investigate any anomalous results and modify isodose plan, dose rate, etc. as necessary.

Post-Service Clinical Labor Activities:

At the conclusion of the image acquisition portion of the procedure the Radiation Therapist will clean and replace equipment used for the patient. The nursing staff will coordinate necessary prescriptions with the physician and call the pharmacy, instruct the patient and perform follow up phone calls to the patient.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes screen

April 2012

Visual Field Exams

In July 2011, CPT code 92083 *Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 degrees, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* (work RVU=0.50), was identified through the CMS High Expenditure Procedural Codes screen. In January 2012, the RUC recommended that the specialty societies survey this service. CPT codes 92081 and 92082, which are part of this family of services were recently reviewed in April 2010 and were not resurveyed.

In April 2012, the RUC reviewed the survey results from 116 ophthalmologists and optometrists for CPT code 92083 and determined that the work RVU of 0.50, the survey's 25th percentile accounts for the physician work required to perform this service. The RUC discussed that survey respondents included post-service time which should not be included based on the RUC guidelines developed for 92081 and 92082 in 2005. The RUC also agreed that the respondents underestimated the physician work involved in the intra-service time because they did not recognize that the interpretation and creation of the report is included in the intra-service time, as stated in the descriptor. Nothing has changed about the service since it was last reviewed in 2005 so for consistency and recognition of the interpretation and creation of the report being part of intra-service work, the RUC agreed that times should be modified from the survey to 3 minutes pre-service, 10 minutes intra-service and 0 minutes post-service. The RUC compared 92083 to key reference CPT code 92082 *Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)* (work RVU=0.40) and determined that 92083 requires slightly more physician time and is more intense to perform, justifying the higher RVU value. **The RUC recommends a work RVU of 0.50 for CPT code 92083.**

Practice Expense
The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommenda-tion
92081		Visual field examination, unilateral or bilateral, with interpretation and report; limited examination (eg, tangent screen, Autoplot, arc perimeter, or single stimulus level automated test, such as Octopus 3 or 7 equivalent)	XXX	0.30 (No Change) RUC Reviewed in April 2010
92082		intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)	XXX	0.40 (No Change) RUC Reviewed in April 2010
92083		extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 degrees, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2) (Gross visual field testing (eg, confrontation testing) is a part of general ophthalmological services and is not reported separately)	XXX	0.50 (No Change)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:92083 Tracking Number Original Specialty Recommended RVU: **0.50**
Presented Recommended RVU: **0.50**
Global Period: XXX RUC Recommended RVU: **0.50**

CPT Descriptor: Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 degrees, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: The patient is a 69 year old with a 3-year history of open angle glaucoma

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's chart is reviewed for pertinent data and prior visual field results. The refractive error is determined from the past record or from neutralization of the current spectacles. The refractive correction for perimetry is calculated. The appropriate level of visual field to be performed is determined.

Description of Intra-Service Work: The extensive test results for each eye are reviewed by the physician to assess the reliability and consistency of the responses. Multiple data points are compared with previous visual fields to determine the extent, distribution, pattern and change of the visual field loss. Global indices are reviewed and compared to prior studies. An interpretation and report is generated for the patient record. Interpretation of the visual field results for each separately including reliability, normality, abnormality, change or artifact is recorded by the physician in the chart.

Description of Post-Service Work:

Modifier -51 Exempt Status
Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

New Technology/Service:
Is this new/revised procedure considered to be a new technology or service? No

KEY REFERENCE SERVICE:

Key CPT Code	Global	Work RVU	Time Source
92082	XXX	0.40	**RUC Time**

CPT Descriptor Visual field examination, unilateral or bilateral, with interpretation and report; intermediate examination (eg, at least 2 isopters on Goldmann perimeter, or semiquantitative, automated suprathreshold screening program, Humphrey suprathreshold automatic diagnostic test, Octopus program 33)

KEY MPC COMPARISON CODES:
Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
95900	XXX	0.42	**RUC Time**	1,352,877

CPT Descriptor 1 Nerve conduction, amplitude and latency/velocity study, each nerve; motor, without F-wave study

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
77300	XXX	0.62	**RUC Time**	1,706,082

CPT Descriptor 2 Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician

Other Reference CPT Code	Global	Work RVU	Time Source
92134	XXX	0.50	**RUC Time**

CPT Descriptor Scanning computerized ophthalmic diagnostic imaging, posterior segment, with interpretation and report, unilateral or bilateral; retina)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 56 **% of respondents:** 48.2 **%**

TIME ESTIMATES (Median)	**CPT Code: 92083**	**Key Reference CPT Code:** 92082	**Source of Time** **RUC Time**
Median Pre-Service Time	3.00	3.00	
Median Intra-Service Time	10.00	8.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	

Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**13.00**	**11.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)		**(of those that selected Key Reference code)**
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.11	3.63
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.11	3.70
Urgency of medical decision making	3.54	3.23
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.55	3.29
Physical effort required	2.68	2.57
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.48	3.16
Outcome depends on the skill and judgment of physician	4.00	3.68
Estimated risk of malpractice suit with poor outcome	3.84	3.59

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.14	2.80
Intra-Service intensity/complexity	3.59	3.21
Post-Service intensity/complexity	3.89	3.41

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code (CPT *92083 Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 degrees, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)* was selected for review by CMS because it has a high volume and has not been reviewed since August 2005. Currently, it has an intra-service work of 0.50 WRVU with times of 3/10/0. The other two codes in the family were reviewed in April 2010 and were not resurveyed. It has been the RUC's position that, for all of the codes in this family, the intra-service work includes the interpretation and report. The test is used to follow the progression of patients with glaucoma and to evaluate neurologic, optic nerve and retinal pathology. There has been no significant change in technology related to this service since it was previously surveyed in 2005.

There were 116 respondents (11.6% response rate) to the joint AAO-AOA survey and over 90% felt that the vignette was typical. The 25th percentile WRVU was 0.50 and the median WRVU 0.55. The median times were 5/8/5 minutes. The predominant reference code chosen was CPT 92082, a less-sophisticated visual field test. Both the surveyed code and the reference code have "unilateral or bilateral" in the descriptor. The code is typically associated with an office visit on the day of service**.**

An expert consensus panel composed ophthalmologists and optometrists familiar with the RUC process and visual field testing reviewed the survey results. The panel felt that the pre-service time of 5 minutes was too long and that the values for intra-service and post-service time should conform to the RUC guideline developed for 92081 and 92082. That guideline established that there was no post-service time and all of the physician work should be captured in the intra-service time. After consideration of these factors, the consensus panel adjusted the survey times slightly and is recommending **4/10/0 minutes, which is one minute more pre-service time than the primary reference service (3/8/0),** but one minute less than the survey value. The consensus group felt that the intra-service time was unchanged from the 10 minutes in the data base.

The panel also reviewed the evaluation of the work of 92083 when compared to the reference code. Survey respondents indicated that the mental effort and judgment, technical skill and psychological stress were all greater than the reference code. The panel agreed. The panel felt that the 25th percentile accurately captured the work of the test and therefore the **societies are recommending a WRVU of 0.50 which is the 25th percentile in the survey. This is the same as the current value of the code.**

There are other recently RUC-valued XXX codes with similar times and work values. CPT 92134 (*Scanning computerized ophthalmic diagnostic imaging, posterior segment, with interpretation and report, unilateral or bilateral; retina)* has a WRVU of 0.50 and times of 7/10/0. The panel felt that the intra-service work of 92083 was slightly more intense although the pre-time was shorter. CPT 92133 *Scanning computerized ophthalmic diagnostic imaging, posterior segment, with interpretation and report, unilateral or bilateral; optic nerve* also has a WRVU of 0.50 and times of 3/10/0. CPT 76536 *Ultrasound, soft tissues of head and neck (eg, thyroid, parathyroid, parotid), real time with image documentation* (RUC 2009, WRVU=0.56, 4/10/4) and CPT *93279 Programming device evaluation (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with physician analysis, review and report; single lead pacemaker system* (RUC 2008, wrvu=.65, 5/10/5) have similar times and slightly higher WRVUs.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) Billed with an office visit

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

CPT Code	Pre	Intra	Post-	Total Time	Work RVU	Global Period
92002	5	15	5	25	.88	XXX
92004	5	25	10	40	1.82	XXX
92012	5	15	5	25	.92	XXX
92014	5	24	8	37	1.42	XXX
99213	3	15	5	23	.97	XXX

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) N/A

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology How often? Commonly

Specialty Optometry How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,600,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. RUC database

Specialty Ophthalmology Frequency 2000000 Percentage 76.92 %

Specialty Optometry Frequency 600000 Percentage 23.07 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 92083

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

Visual field examination, unilateral or bilateral, with interpretation and report; extended examination (eg, Goldmann visual fields with at least 3 isopters plotted and static determination within the central 30 degrees, or quantitative, automated threshold perimetry, Octopus program G-1, 32 or 42, Humphrey visual field analyzer full threshold programs 30-2, 24-2, or 30/60-2)

Global Period: **XXX** Meeting Date: **April 2012**

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The societies convened a panel of experts to review and develop inputs by phone and email.**

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: **This is an existing code and so the current inputs of 92083 should be compared as well as two lower level codes (92081/82).**

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Not applicable.

Service Clinical Labor Activities:

The ophthalmic tech assures that the appropriate referral forms are complete and that the medical record is available for the physician. The tech also ensures that all supplies and equipment are available for the visual field test. The patient's name and birth date are entered into the machine and the type of visual field is selected from the menu. The staff seats the patient comfortably at the instrument. Detailed instructions are provided about what to expect and when and how to respond to the stimuli. The necessary spectacle correction is entered from information determined by the physician. An eye patch is placed over the opposite eye. This lens is placed as close as possible to the eye without the eyelashes touching it. The clicker response device is placed in the patient's hand and demonstrated to the patient. The patient is reminded to maintain forward fixation. Once the procedure is completed and the patient has been escorted back to the lane, the clinical staff confirms the patient information and then enters all of the isopter data that was collected into to the record.

Post-Service Clinical Labor Activities:

Not applicable.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes screen

April 2012

Cardiovascular Stress Tests

CMS identified code 93015 for cardiovascular stress test for review in the 2012 Medicare Proposed Rule because it had not been reviewed since before 2006 and had CY 2010 allowed charges of greater than $10 million at the specialty level. Related codes 93016 and 93018 were also surveyed and RUC reviewed in April 2012, as part of the Agency's request to review the entire family of services.

93015 ***Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with physician supervision, with interpretation and report***
The RUC reviewed the survey data from 76 cardiologists and agreed with the specialty societies that there is no compelling evidence that the physician work has changed since the last valuation and recommends to maintain the current value of 0.75, below the survey's 25th percentile. The RUC reviewed the median survey physician times and noted that the respondents overestimated the pre and post time as it is not an accurate reflection of the physician time involved in the service. The RUC agreed that the current pre and post times are more appropriate for this service and recommends the following physician time components: pre-service time= 2 minutes, intra-service time= 20 minutes, post-service time= 4 minutes.

To justify the current work RVU of 0.75, the RUC reviewed CPT codes 76885 *Ultrasound, infant hips, real time with imaging documentation; dynamic (requiring physician manipulation)* (work RVU= 0.74) and CPT code 95971 *Electronic analysis of implanted neurostimulator pulse generator system (eg, rate, pulse amplitude, pulse duration, configuration of wave form, battery status, electrode selectability, output modulation, cycling, impedance and patient compliance measurements); simple spinal cord, or peripheral (ie, peripheral nerve, sacral nerve, neuromuscular) neurostimulator pulse generator/transmitter, with intraoperative or subsequent programming* (work RVU= 0.78) and agreed that both had comparable physician work and identical intra-service times compared to the surveyed code. Therefore, the recommended value is appropriately aligned relative to similar services. **The RUC recommends a work RVU of 0.75 for CPT code 93015.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93016 ***Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with physician supervision, without interpretation and report***
The RUC reviewed the survey data from 53 cardiologists and agreed with the specialty societies that there is no compelling evidence that the physician work has changed since the last valuation and recommends to maintain the current value of 0.45, below the survey's 25th percentile. The RUC noted that while the current total time of 58 minutes, is overstated, the proposed median survey times were also too high. The RUC agreed that CPT codes 93016, physician supervision only, and 93018, physician interpretation and report only, should have times that are similar to that of CPT code 93015. Therefore, the RUC recommends the following physician time components for 93016: pre-service time= 2 minutes, intra-service time= 15 minutes, post-service time= 2 minutes.

To justify the current work RVU of 0.45, the RUC reviewed CPT code 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (work RVU= 0.38) and agreed that while the two services have identical intra-service time of 15 minutes, the surveyed code has pre and post time and thus should be valued slightly higher. In addition, the RUC reviewed CPT code 94620 *Pulmonary stress testing; simple (eg, 6-minute walk test, prolonged exercise test for bronchospasm with pre- and post-spirometry and oximetry)* (work RVU= 0.64) and noted that while both services have the same intra-service times, the reference code should be valued higher than 93016 because of greater total time, 40 minutes compared to 19 minutes. **The RUC recommends a work RVU of 0.45 for CPT code 93016.**

93018 ***Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; interpretation and report only***
The RUC reviewed the survey data from 61 cardiologists and agreed with the specialty societies that there is no compelling evidence that the physician work has changed since the last valuation and recommends to maintain the current value of 0.30, below the survey's 25th percentile. However, the RUC disagreed with the proposed median survey time values for this service as it is an increase over the current times for this service. The RUC agreed that CPT codes 93016, physician supervision only, and 93018, physician interpretation and report only, should have times that are similar to that of CPT code 93015. Therefore, the RUC recommends the following physician time components for 93018: pre-service time= 2 minute, intra-service time= 5 minutes, post-service time= 4 minutes.

To justify the current work RVU of 0.30, the RUC reviewed CPT code 72114 *Radiologic examination, spine, lumbosacral; complete, including bending views, minimum of 6 views* (work RVU= 0.32) and agreed that the two services have analogous physician work and times and should be valued similarly. In addition, the RUC compared 93018 to the work RVUs of 93015 and 93016 and agreed that a work RVU of 0.30 was appropriate because when it is added to 93016 the work RVU is the same, 0.75, as 93015. **The RUC recommends a work RVU of 0.30 for CPT code 93018.**

Practice Expense: The RUC reviewed and accepted the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

SUMMARY OF RECOMMENDATION

CPT Code:93015 Tracking Number Original Specialty Recommended RVU: **0.75**
Presented Recommended RVU: **0.75**
Global Period: XXX RUC Recommended RVU: **0.75**

CPT Descriptor: Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with physician supervision, with interpretation and report

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 55-year-old male with hypertension, active lifestyle, high cholesterol, prior cigarette use with chest discomforts during exercise. His office resting ECG is normal. A stress test is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work:
- Review medical records and chart
- Answer patient questions for obtaining informed consent
- Determine clinical questions to be answered and appropriateness of study

Description of Intra-Service Work:
- Discuss recent history with the patient
- Examine the patient
- Assess new symptoms since test was ordered
- View resting ECG for adequacy to proceed with stress testing
- Assess pharmacologic stress versus treadmill
- Supervise pharmacologic medication stress infusion if necessary
- Assess adequacy of data collection
- Treat arrhythmias, ischemic responses, hypo- or hypertension, or other untoward medical events
- Treat non cardiac side effects of pharmacologic stress testing
- Interpret multiple serial ECG's for timing, morphology, and degree of ST segment changes and timing of ST segment resolution
- Review and analyze for reporting purposes: starting and ending hemodynamics, arrhythmias, symptoms (especially chest pain), and functional capacity
- Dictate a report for the medical record including whether study is positive, negative , or non-diagnostic for ischemic response

Description of Post-Service Work:

- Review, edit, sign report
- Discuss with patient and/or referring physician any critical results that need to be communicated immediately

Time Segments (Mean)		
Pre-Service intensity/complexity	3.36	2.91
Intra-Service intensity/complexity	4.18	3.87
Post-Service intensity/complexity	3.27	3.26

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CMS identified code 93015 for cardiovascular stress test for review in the Physician Fee Schedule Proposed Rule for 2012 because it had not been reviewed since before 2006 and had CY 2010 allowed charges of greater than $10 million at the specialty level. Related codes 93016 and 93018 were also surveyed in compliance with this request. Additionally, CMS identified ECG code 93000 under this logic. That code, and related code 93010, will be reviewed for the October 2012 meeting. We note this because none of these codes—93015, 93016, 93018, 93000, or 93010—were available to be used in the reference service list for this family of codes.

A panel of ACC physicians familiar with the service reviewed the survey data. The response was robust and the survey was completed by physicians who have experience with this service. Survey respondents most frequently compared 93015 to 99214, a level four office visit for an established patient. These respondents indicated 93015 to be slightly more intense/complex in most aspects, with the exception of mental effort related to range of diagnoses and amount/complexity of information to be analyzed. These relationships support the survey median of 1.40, just below the 99214 value of 1.50.

A notable portion of respondents also compared 93015 to 78454, rest or stress planar myocardial perfusion imaging. These respondents found 93015 to be more intense/complex in some areas (6) and less intense/complex in others (5). These relationships again support the survey median of 1.40, just above the 78454 value of 1.34.

The median RVW of 1.40 is higher than the current value of 0.75. Despite the above-mentioned comparisons, the panel does not believe compelling evidence exists for increased valuation and recommends maintaining the current value of 0.75. The panel also recommends the median survey times of 5 minutes preservice, 20 minutes intraservice, and 5 minutes postservice time, updating the current values of 2, 15, and 4, respectively.

For further validation of these recommendations, the panel considered additional comparator codes with similar times and values (see summary spreadsheet). 93294, 92579, 94660, and 93280 have values work values between 0.65 and 0.77 with a range from 4-10 minutes preservice, 15-25 minutes intraservice, and 5-10 minutes postservice time. These comparators further support the recommendation for maintenance of the RVW and updated times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) This code can be reported in tandem with cardiac imaging procedures that require rest and stress elements (stress CT, stress MR, stress SPECT). These studies are typically separate from each other, performed at different times of the day. They are interpreted at different times of the day and in different areas of the facility. They are not typically reported by the same physician, and often are reported by physicians in different groups.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93015

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3200000
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on utilization trends in the RUC database, and an estimation that half of these services are provided to the Medicare population.

Specialty cardiology Frequency 2800000 Percentage 87.50 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,600,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on utilization data trends in the RUC database.

Specialty cardiology Frequency 1400000 Percentage 87.50 %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93015

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work:
- Review medical records and chart
- Answer patient questions for obtaining informed consent
- Determine clinical questions to be answered and appropriateness of study

Description of Intra-Service Work:
- Discuss recent history with the patient
- Examine the patient
- Assess new symptoms since test was ordered
- View resting ECG for adequacy to proceed with stress testing
- Assess pharmacologic stress versus treadmill
- Supervise pharmacologic medication stress infusion if necessary
- Assess adequacy of data collection
- Treat arrhythmias, ischemic responses, hypo- or hypertension, or other untoward medical events
- Treat non cardiac side effects of pharmacologic stress testing

Description of Post-Service Work:
- Document clinical status of patient during stress test
- Discuss with patient and/or referring physician any critical values results that need to be communicated immediately

Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**19.00**	**23.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.50	3.10
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.60	3.11
Urgency of medical decision making	3.90	2.60
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.80	2.90
Physical effort required	3.00	2.50
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.80	2.70
Outcome depends on the skill and judgment of physician	4.00	3.20
Estimated risk of malpractice suit with poor outcome	4.00	3.00

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	3.60	2.90
Intra-Service intensity/complexity	3.90	3.10
Post-Service intensity/complexity	2.40	2.90

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 93016 for supervision of cardiovascular stress test is related to 93015 for cardiovascular stress test, which CMS identified for review in the Physician Fee Schedule Final Rule for 2012.

A panel of ACC physicians familiar with the service reviewed the survey data. The response was robust and the survey was completed by physicians who have experience with this service. Survey respondents most frequently compared 93016 to 99213, a level three office visit for an established patient. These respondents indicated 93016 to be more intense/complex in all aspects except postservice work.

However, selection of a key reference service was diffuse (as shown in the summary spreadsheet), and the survey median of 0.80 is below the 99213 value of 0.97. Nearly as many respondents compared 93016 to 99212, a level two office visit for an established patient. These respondents indicated 93016 to be of greater or equal intensity/complexity in all aspects except postservice work. These relationships support the survey median of 0.80, higher than the 0.48 value for 99212.

Finally, the same number of respondents who selected 99212 also compared 93016 to 93280, dual pacemaker device programming. These respondents indicated 93016 to be more intense/complex in every aspect except postservice work, where it was equal. These relationships again support the survey median of 0.80, just above the 93280 value of 0.77.

The median RVW of 0.80 is higher than the current value of 0.45. Despite the above-mentioned comparisons, the panel does not believe compelling evidence exists for increased valuation and recommends maintaining the current value of 0.45. The panel also recommends the median survey times of 5 minutes preservice, 15 minutes intraservice, and 1.5 minutes postservice time, updating the current values of 10, 38, and 10, respectively. The panel emphasizes that 93016 was last reviewed in 1993, while 93015 and also 93018 were reviewed in 2005. The panel feels this new survey accurately reflects the time required to perform this service.

For validation of these recommendations, the panel considered additional comparator codes with similar times and values (see summary spreadsheet). 93920, 93287, 99201, 96102, and 93268 have work values between 0.43 and 0.52 with a range from 2-5 minutes preservice, 7.5-15 minutes intraservice, and 5-13.5 minutes postservice time. These comparators further support the recommendation for maintenance of the RVW and updated times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☒ Multiple codes are used to maintain consistency with similar codes.
   ☒ Historical precedents.
   ☒ Other reason (please explain) Physicians often report two of the three codes (93016, 93017,or 93018) depending which aspects of the total service (93015) they provide. These services are temporally separate from each other. They are not typically reported by the same physician, but are likely reported by physicians in the same group. The construction of this family of codes as a technical/professional split means that a provider who provides both of these services is still only reporting the same amount of physician work as the comprehensive code, 93015.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93016

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93018 Tracking Number Original Specialty Recommended RVU: **0.30**
Presented Recommended RVU: **0.30**
Global Period: XXX RUC Recommended RVU: **0.30**

CPT Descriptor: Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; interpretation and report only

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: 55-year-old male with hypertension, active lifestyle, high cholesterol, prior cigarette use with chest discomforts during exercise. His office resting ECG is normal. A stress test is ordered.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 5%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work:
- Review medical records and chart

Description of Intra-Service Work:
- Assess adequacy of data acquisition
- Interpret resting ECG
- Interpret multiple serial ECG's for timing, morphology, and degree of ST segment changes and timing of STsegment resolution
- Review and analyze for reporting purposes: starting and ending hemodynamics, arrhythmias, symptoms (especially chest pain) , and functional capacity
- Dictate a report for the medical record including whether study is positive, negative, or non-diagnostic forischemic response

Description of Post-Service Work:
- Review, edit, sign report
- Discuss with patient and/or referring physician any critical values results that need to be communicated immediately

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 93018 for interpretation/report of cardiovascular stress test is related to 93015 for cardiovascular stress test, which CMS identified for review in the Physician Fee Schedule Final Rule for 2012.

A panel of ACC physicians familiar with the service reviewed the survey data. The response was robust and the survey was completed by physicians who have experience with this service. Survey respondents most frequently compared 93018 to 93224, review and interpretation of external ECG rhythm recording. These respondents indicated 93018 to be more intense/complex in most aspects, but did feel the intraservice work was equally difficult. This aligns with the survey median of 0.60, slightly higher than the 0.52 value for 93224.

Reference selection was again diffuse (as shown in the summary spreadsheet). The same number of respondents compared 93018 to 78454, rest or stress planar myocardial perfusion imaging. These respondents indicated 93018 to be more intense/complex in all aspects except postservice work.

A large portion also compared 93018 to 93213, a level three office visit for an established patient. These respondents indicated 93018 to be more intense/complex in some aspects (6) and less intense/complex in others (5). Taken together, all of these relationships support the median survey value of 0.60.

The median RVW of 0.60 is higher than the current value of 0.30. Despite the above-mentioned comparisons, the panel does not believe compelling evidence exists for increased valuation and recommends maintaining the current value of 0.30. The panel also recommends the median survey times of 2 minutes preservice, 7 minutes intraservice, and 6 minutes postservice time, updating the current times of 2, 5, and 5, respectively.

For validation of these recommendations, the panel considered additional comparator codes with similar times and values (see summary spreadsheet). 77081, 74020, 93293, and 74022 have work values between 0.22 and 0.32 with a range from 1-5 minutes preservice, 3-10 minutes intraservice, and 1-5 minutes postservice time. These comparators further support the recommendation for maintenance of the RVW and updated times.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☒ Multiple codes are used to maintain consistency with similar codes.
   ☒ Historical precedents.
   ☒ Other reason (please explain) Physicians often report two of the three codes (93016, 93017,or 93018) depending which aspects of the total service (93015) they provide. These services are temporally separate from each other. They are not typically reported by the same physician, but are likely reported by physicians in the same group. The construction of this family of codes as a technical/professional split means that a provider who provides both of these services is still only reporting the same amount of physician work as the comprehensive code, 93015.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Specialty Society('s) ACC

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

93015 Cardiovascular stress test using maximal or submaximal treadmill or bicycle exercise, continuous electrocardiographic monitoring, and/or pharmacological stress; with physician supervision, with interpretation and report

93017 tracing only, without interpretation and report

Global Period: XXX Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A cardiology specialty panel discussed the practice expense requirements for the two stress test codes that contain PE and determined that standardized benchmarks for the most common clinical labor practice expenses apply when available (greet/gown, vitals, room preparation, room cleaning). No adjustment was made to the patient preparation time of 8 minutes to account for placement of the 10 leads necessary to secure viable data. Intraservice time was updated to reflect the newly completed survey of 93015, which includes more time-intensive data entry that requires additional data fields. All other times were crosswalked from the existing reference code.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes.

Comparison Code: 93015

Rationale: 93015 was resurveyed. The PE inputs are identical for 93017.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Staff completes pre-service diagnostic and referral forms

Staff schedules stress testing and reviews with patient protocols used regarding need for fasting, medications to be taken or not taken before stress testing, proper clothing for testing, etc.

Service Clinical Labor Activities:

Staff reviews chart and patient clinical information day of test to confirm preparedness of patient for testing and any safety issues

Patient greeting and appropriate gowning for testing

Obtain vital signs

Review procedure protocol with patient, risks and safety concerns and obtain consent

Prepare room, equipment, and supplies

Prepare patient skin with 10 electrodes assuring good electrical contact to eliminate artifact, demonstrate protocol of interacting with treadmill, monitor and other safety concerns

Monitor patient while completing treadmill protocol to acceptable clinical endpoints, including warm up, exercise and cool down

Continue monitoring for protocol completion and until patient returns to baseline

Remove and discard electrodes, assist patient clean up and clean up of equipment and room

Complete stress testing report forms/data entry and gather all clinical information and EKG tracings for physician review and interpretation

Review discharge instructions, stress test results, and coordinate need for future treatments and prescriptions

Post-Service Clinical Labor Activities:

None.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS/Other - Utilization over 500,000 screen

April 2012

Extremity Studies

In April 2011, CPT codes 93925, 93926, 93970 were identified review by the RUC through the CMS/Other - utilization over 500,000 screen. At the February 2011 RUC meeting, a survey was requested by the Relativity Assessment Workgroup since the codes had "CMS/Other" inputs.

The RUC discussed the compelling evidence that the technology and patient population has changed significantly since the last review of these services. The fundamental physician work for these services has increased due to new technology that was not available in 1995, at the last review. All the arteries below the knee can now be reviewed. In addition, this has led to an increase in the amount of images to be reviewed by the physician. The typical interventions were essentially never performed almost 20 years ago, but are now essential to the procedure. The increased work is also detailed in practice guidelines from accrediting agencies that now show clinical necessity for the additional work of reviewing the tibial arteries. Finally, there has been a change in patient population. The percentage of diabetics has increased in the U.S. since the last review. The typical patient is now a diabetic with heavily calcified vessels which are more complex and take more time to review. The RUC agreed that there is compelling evidence that the physician work has significantly changed since the last valuation.

93925 ***Duplex scan of lower extremity arteries or arterial bypass grafts; complete bilateral study***
The RUC reviewed the survey results from 63 physicians and recommends the median survey physician time components: pre-service time= 5 minutes, intra-service time= 15 minutes, and post-service time= 5 minutes. The RUC agreed that 5 minutes of pre-service time is appropriate to evaluate the patient because an Evaluation and Management service is not typically performed on the same date and same physician. The RUC reviewed the survey respondents' estimated physician work value for this service and agree with the specialty that 0.90 work RVU, the survey median, accurately values this service. To justify this value, the RUC reviewed the key reference service 93306 *Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, with spectral Doppler echocardiography, and with color flow Doppler echocardiography* (work RVU= 1.30) and agreed that while the physician work is similar, the reference code should be valued higher due to greater intra-service time, 20 minutes compared to 15 minutes. In addition, the RUC reviewed CPT code 92012 *Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; intermediate, established patient* (work RVU= 0.92) and noted that the two service have analogous physician work and identical time components. Given this, the two services should be valued similarly. Finally the RUC reviewed CPT code 73700 *Computed tomography, lower extremity; without contrast material* (work RVU= 1.00) and agreed that the two services should be valued similarly, given the analogous physician work and time components. **The RUC recommends a work RVU of 0.90 for CPT code 93925.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

93926 ***Duplex scan of lower extremity arteries or arterial bypass grafts; unilateral or limited study***
The RUC reviewed the survey results from 59 physicians and recommends the median survey physician time components: pre-service time= 5 minutes, intra-service time= 10 minutes, and post-service time= 5 minutes. The RUC agreed that 5 minutes of pre-service time is appropriate to evaluate the patient because a Evaluation and Management service is not typically performed on the same date and same physician. The RUC reviewed the survey respondents' estimated physician work value for this service and agree with the specialty that 0.70 work RVU, the survey median, accurately values this service. To justify this value, the RUC reviewed the key reference code 76776 *Ultrasound, transplanted kidney, real time and duplex Doppler with image documentation* (work RVU= 0.76) and agreed that the two services have identical physician time components and both describe the same spectrum of work. Given this, the surveyed code is correctly valued similar to 76776. In addition, the RUC compared 93926 to reference code 76817 *Ultrasound, pregnant uterus, real time with image documentation, transvaginal* (work RVU= 0.75) and agree that because the two services employ the same technology and have almost identical physician time components, the two service should be valued similarly. **The RUC recommends a work RVU of 0.70 for CPT code 93926.**

93970 ***Duplex scan of extremity veins including responses to compression and other maneuvers; complete bilateral study***
The RUC reviewed the survey results from 53 physicians and recommends the median survey physician time components: pre-service time= 3 minutes, intra-service time= 15 minutes, and post-service time= 5 minutes. The RUC agreed that 3 minutes of pre-service time is appropriate to evaluate the patient because a Evaluation and Management service is not typically performed on the same date and same physician. The RUC reviewed the survey respondents' estimated physician work value for this service and agree with the specialty that 0.70 work RVU, the survey median, accurately values this service. To justify this value, the RUC compared 93970 to key reference code 93971 *Duplex scan of extremity veins including responses to compression and other maneuvers; unilateral or limited study* (work RVU= 0.45) and agreed that while the physician work is comparable, the surveyed code should be valued higher due to greater intra-service time compared to the reference code, 15 minutes and 10 minutes, respectively. In addition, the RUC reviewed CPT code 76700 *Ultrasound, abdominal, real time with image documentation; complete* (work RVU= 0.81) and noted that while the surveyed code has five more minutes of intra-service time, 76700 is a more intense procedure and should be valued higher than 93970. **The RUC recommends a work RVU of 0.70 for CPT code 93970.**

Practice Expense: The RUC reviewed and accepted the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.

SUMMARY OF RECOMMENDATION

CPT Code:93925 Tracking Number Original Specialty Recommended RVU: **0.90**
Presented Recommended RVU: **0.90**
Global Period: XXX RUC Recommended RVU: **0.90**

CPT Descriptor: Duplex scan of lower extremity arteries or arterial bypass grafts; complete bilateral study

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old diabetic smoker has bilateral lifestyle-limiting lower extremity intermittent claudication unresponsive to maximal medical therapy. A duplex scan is ordered to determine if percutaneous intervention is possible. A complete bilateral duplex scan of the femoral, popliteal, and tibial arteries is performed

Percentage of Survey Respondents who found Vignette to be Typical: 87%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review the noninvasive diagnostic test requisition form, noting the patient's medical history, risk factors and clinical history providing the indication for the examination. Review previous diagnostic studies for the patient that may be used for comparative surveillance or to diagnose disease progression.

Description of Intra-Service Work: Supervise technologist identification of the arterial structures of both lower extremities; including the common femoral, profunda femoris, superficial femoral, popliteal, tibial-peroneal trunk, anterior tibial, posterior tibial and peroneal arteries. Examine recordings of B-mode images, angle-corrected Doppler velocity spectra and colorflow imaging in all standard locations, per protocol. Evaluate additional specific Doppler velocities, B-mode images and colorflow data provided from identified areas of stenosis, including data from pre-stenotic, intra-stenotic and post-stenotic regions of the affected arteries. Ensure that all Doppler velocity spectra have been accurately angle-corrected. Estimate severity of stenosis based on angiographically-determined grading scales. Synthesize final interpretation, taking into account all available data to estimate severity of stenosis, impact of sequential stenoses, calcification, and collateralization. Render interpretation indicating the severity, location, and length of the arterial occlusive disease and/or insufficiency in the involved segments. Provide comparison to previous studies, when prior results are available. Identify etiology of the patient's arterial disease. Dictate report.

Description of Post-Service Work: Reviewed and sign report. Send copy of report to the referring physician and/or primary care provider. Archive study. Provide a verbal report of critical results directly to the referring physician.

Intra-Service intensity/complexity	3.71	3.71
Post-Service intensity/complexity	2.94	3.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

Code 93925 was among 24 codes identified by CMS and for which review by the RUC was requested based on low RVUs and utilization greater than 500,000. At the February 2011 RUC meeting, survey was requested by the RAW since the code had "CMS/Other" inputs.

Compelling Evidence

There is compelling evidence that the work of 93925 has changed since this code was presented at the First Five-Year Review in 1995. Accrediting bodies have established detailed practice guidelines for this procedure recommending study components that were not performed when this very old CPT code was created. Additional work now includes extensive colorflow ultrasound assessment of below-knee popliteal, tib-peroneal trunk, and tibial arteries searching for angioplasty, atherectomy and endovascular stent sites. These are interventions that were essentially never done in any significant volume 25 years ago but are very common now, and providers ordering these exams expect accurate anatomic delineation of their status. Colorflow technology did not have wide commercial availability, and ultrasound technology had insufficient sensitivity to evaluate tibial arteries when 93925 was initially created. Compared to review of static images printed on x-ray film, new archiving technology on video screens provides for the interpretation of more images, more sophisticated velocity waveforms, and the post-processing of the acquired data.

Comparison with Key Reference Service 93306

Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, complete, with spectral Doppler echocardiography, and with color flow Doppler echocardiography

93306 was presented at the RUC in April 2007 and has a work RVU of 1.30. 93306, providing ultrasound and colorflow diagnostics of the heart, describes the same modalities of physician work as 93925. 93306 and 93925 share the same pre-service time of 5 minutes. 93306 has 2 additional minutes of immediate post-service times, compared to 93925. Importantly, 93306 has five additional minutes of intra time, and this 25% intra time difference accounts for the lower recommended median survey RVW of 0.90 for 93925, compared to the RVW of 1.30 for the key reference service. Considered from a pure mathematical relationship, the 15/20 intra-time relationship would support a value of 0.75 x 1.30 = 0.98 for 93925, and the small differences in post-service time account for the difference. Thus, the comparison with key reference 93306 fully supports the median survey value of 0.90 for 93925.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
93306	1.30	0.052	32	5	20	7
93925	0.90	0.045	25	5	15	5

Comparison with E&M Service 99213

Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

99213 was presented at the Third Five-Year Review in February 2006. It has a work RVU of 0.97. The physician time required for interpretation of B-mode ultrasound images, color-flow images and Doppler spectra in 93925 differ only by two minutes of pre time compared to the time involved in 99213. Both codes have identical intra-times of 15 minutes. Based on this comparison, the median survey value of 0.90 for 93925 is appropriate.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post

99213	0.97	0.053	23	3	15	5
93925	0.90	0.045	25	5	15	5

Comparison with Extremity CT scan 73700
Computed tomography, lower extremity; without contrast material

73700 was presented at the RUC in October 2009 and has a work RVU of 1.00. Comparison of the clinical services indicates that 73700 represents an examination of one lower extremity while 93925 is a complete bilateral exam. The physician time required for interpretation of B-mode ultrasound images, color-flow images and Doppler spectra in 93925 are exactly the same as the time involved in the CT code 73700. Both codes have identical physician work intra times of 15 minutes. Based on this comparison, the median survey value of 0.90 for 93925 is justified.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
73700	1.00	0.052	25	5	15	5
93925	0.90	0.045	25	5	15	5

Conclusion: For this code we provided three comparisons. The first relates 93925 to a similar diagnostic test modality, echocardiography. The second compares 93925 to a cognitive service (99213) while the third comparison represents an assessment of the same body part by two different diagnostic testing modalities. In each case, the comparison supports the median survey value of 0.90 for this complete bilateral arterial duplex exam. We believe the three-way comparison strengthens the justification for 0.90 even more.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93925

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology How often? Commonly

Specialty Vascular Surgery How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
586,176 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2010 Medicare Data

Specialty Cardiology Frequency 181715 Percentage 31.00 %

Specialty Vascular Surgery Frequency 82065 Percentage 14.00 %

Specialty Radiology Frequency 52756 Percentage 9.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93925

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Intra-Service intensity/complexity	3.00	3.10
Post-Service intensity/complexity	2.70	2.80

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background
Code 93926 was among 24 codes identified by CMS and for which review by the RUC was requested based on low RVUs and utilization greater than 500,000. At the February 2011 RUC meeting, survey was requested by the RAW since the code had "CMS/Other" inputs.

Compelling Evidence
There is compelling evidence that the work of 93926 has changed since this code was presented at the First Five-Year Review in 1995. Accrediting bodies have established detailed practice guidelines for this procedure recommending study components that were not performed when this very old CPT code was created. Additional work now includes extensive colorflow ultrasound assessment of below-knee popliteal, tib-peroneal trunk, and tibial arteries searching for angioplasty, atherectomy and endovascular stent sites. These are interventions that were essentially never done in any significant volume 25 years ago but are very common now, and providers ordering these exams expect accurate anatomic delineation of their status. Colorflow technology did not have wide commercial availability, and ultrasound technology had insufficient sensitivity to evaluate tibial arteries when 93926 was initially created. Compared to review of static images printed on x-ray film, new archiving technology on video screens provides for the interpretation of more images, more sophisticated velocity waveforms, and the post-processing of the acquired data.

Comparison with Key Reference Service 76776
Ultrasound, transplanted kidney, real time and duplex Doppler with image documentation

76776 was presented at the RUC in September 2005 and has a work RVU of 0.76. 76776, providing ultrasound and colorflow diagnostics of transplanted kidney, describes the same spectrum of physician work as 93926. 76776 has identical pre-service, intraservice and immediate post-service times as 93926. Based on this comparison, the median survey value of 0.70 for 93926 is justified.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
76776	0.76	0.054	20	5	10	5
93926	0.70	0.048	20	5	10	5

Comparison with E&M Service 99231
Subsequent hospital care, per day, for the evaluation and management of a patient, which requires at least 2 of these 3 key components: A problem focused interval history; A problem focused examination; Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the patient is stable, recovering or improving. Physicians typically spend 15 minutes at the bedside and on the patient's hospital floor or unit.

99231 was presented at the Third Five-Year Review in February of 2006 and has a work RVU of 0.76. The physician time required for interpretation of B-mode ultrasound images, color-flow images and Doppler spectra in 93926 is exactly the same as that involved in E&M code 99231. Both codes have a physician intra time of 10 minutes. Based on this comparison, the survey median value of 0.70 for 93925 is justified.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
99231	0.76	0.054	20	5	10	5
93926	0.70	0.048	20	5	10	5

Comparison with Blood flow ultrasound code 76817

Ultrasound, pregnant uterus, real time with image documentation, transvaginal

76817 was presented at the RUC in April 2002 and has a work RVU of 0.75. 76817 employs the same technology as 93926, albeit with a different ultrasound transducer than 93925. 76817 and 93925 have the same pre-service time of 5 minutes, and exactly the same intra-service time of 10 minutes. 76817 has three more minutes of immediate post-service time (8 minutes vs. 5 minutes). Overall, this comprises an excellent relativity comparison and serves to justify the median survey value of 0.70 for 93926

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
76817	0.75	0.046	32	5	10	8
93926	0.70	0.048	20	5	10	5

Conclusion: In this additional rationale we provide comparisons of 93926 arterial duplex ultrasound to a key reference exam, which is an ultrasound of another body part, and to an E&M cognitive service, and finally to a second RUC-surveyed ultrasound code. In each case, the survey median of 0.70 is well justified based on service components, physician time, and procedural intensity.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93926

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 209,208 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2010 Medicare Data

Specialty Vascular Surgery	Frequency 104604	Percentage 50.00 %
Specialty Cardiology	Frequency 33474	Percentage 16.00 %
Specialty Radiology	Frequency 12553	Percentage 6.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93926

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:93970 Tracking Number Original Specialty Recommended RVU: **0.70**
Presented Recommended RVU: **0.70**
Global Period: XXX RUC Recommended RVU: **0.70**

CPT Descriptor: Duplex scan of extremity veins including responses to compression and other maneuvers; complete bilateral study

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year-old woman with lung cancer and a prior history of lower extremity deep venous thrombosis presents with new onset bilateral lower extremity pain and swelling. A bilateral venous duplex ultrasound is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review the noninvasive diagnostic test requisition form, noting the patient's medical history, risk factors and clinical history providing the indication for the examination. Review previous diagnostic studies for the patient that may be used for comparative surveillance or to diagnose disease progression.

Description of Intra-Service Work: Supervise technologist identification of the venous structures of both lower extremities; including the common femoral, superficial femoral, popliteal, tibial-peroneal trunk(s), paired peroneal veins, paired posterior tibial veins, greater saphenous, and lesser saphenous. Document presence and direction of flow within each of these veins as well as compressibility, respiratory variation and response to augmentation. When thrombus is present, describe echogenicity vs. echolucency. Describe whether thrombus is fully occlusive or non-occlusive. Evaluate and characterize incidental perivascular anatomic structures including adjacent lymphadenopathy, soft tissue edema, or soft tissue collections such as hematoma or abscess, or synovial cysts such as popliteal (Baker's) cysts. Render interpretation indicating the severity and chronicity of the venous occlusive disease in the involved venous segments. Provide comparison to previous studies when prior results are available. Comment on etiology of the patient's venous disease. Dictate report.

Description of Post-Service Work: Reviewed and sign report. Send copy of report to the referring physician and/or primary care provider. Archive the study. Provide a verbal report of critical results, such as acute deep venous thrombosis, to the referring physician.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Background

Code 93970 was among 24 codes identified by CMS and for which review by the RUC was requested based on low RVUs and utilization greater than 500,000. At the February 2011 RUC meeting, survey was requested by the RAW since the code had "CMS/Other" inputs.

Compelling Evidence

There is compelling evidence that the work of 93970 has changed since this code was presented at the First Five-Year Review in 1995. Accrediting bodies (eg ICAVL, ACR) have established detailed practice guidelines for this procedure recommending study components that were not performed when this very old CPT code was created. Additional work now includes colorflow ultrasound assessment and compression ultrasonography of tibial-peroneal trunk veins, posterior tibial veins and peroneal veins. Colorflow technology did not have wide commercial availability, and ultrasound technology had insufficient sensitivity to evaluate calf veins when 93970 was initially created, so this is all new. Compared to review of static images printed on x-ray film, new archiving technology on video screens provides for the interpretation of more images, more sophisticated velocity waveforms with precise time assessments, and the post-processing of the acquired data.

Comparison with Key Reference Service 93971

Duplex scan of extremity veins including responses to compression and other maneuvers; unilateral or limited study

93971 was presented at the RUC in April 2011 and has a work RVU of 0.45. 93971, providing interpretation of a *single* limb lower extremity venous duplex exam, describes the same spectrum of physician work as 93970, but twice as many images, color-flows and Doppler spectra are reviewed in the bilateral study. The two services have the identical pre-service and immediate post-service times. 93970, the complete bilateral study, has five additional minutes of intra time and the 33% intra time difference correlates with the recommended median survey RVW of 0.70 compared to the RVW of 0.45 for the key reference service.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
93971	0.45	0.027	18	3	10	5
93970	0.70	0.033	23	3	15	5

Comparison with E&M Service 99213

Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

99213 was presented at the Third Five-Year Review in April of 2006. It has a work RVU of 0.97. The physician pre-, intra-, and post-service times required for interpretation of B-mode ultrasound images, color-flow images and Doppler spectra in 93970 are identical to the time involved in E&M code 99213. 99213 has a work RVU of 0.97, and we are recommending the median survey RVU of 0.70 for 92970, or 0.27 lower RVU than the E&M service. Since the times are exactly the same, this 0.27 RVU difference must reflect a slightly lower intensity of diagnostic exam compared to that of the face-to-face E&M, and we believe that to be the case. Nevertheless, a reduction below the median survey value of 0.70 for 93970 would overtly disrupt the relativity between 93970 and 99213.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
99213	0.97	0.053	23	3	15	5

93970	0.70	0.033	23	3	15	5

Comparison with MPC CPT Code 76700
Ultrasound, abdominal, real time with image documentation; complete

76700, an MPC CPT Code, was presented to the RUC at the Third Five-Year Review in August 2005. It has a work RVU of 0.81. The intra-time for 76700 is 10 minutes compared to 15 minutes for 93970. Pre times are equal at 5 minutes, and the physician post-service times differ by one minute (table). Both tests involve interpretation of ultrasound diagnostic information. Comparing the relativity of physician work for this high volume MPC code, the median survey value of 0.70 for 93970 is justified.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
76700	0.81	0.065	17	3	10	4
93970	0.70	0.033	23	3	15	5

Conclusion: In this rationale, we compared the recommended work RVU of bilateral complete venous duplex ultrasound, 93970, to that of a clinically similar, RUC-reviewed ultrasound blood flow study (93971). We also compared 93970 to a cognitive service (99213), and we compared it to a similar diagnostic ultrasound exam on the MPC list (76700). When considered independently, each of these comparisons provides a strong justification for the median survey RVW of 0.70, but when one considers that these three comparisons include one same-modality service, one purely cognitive service and one complimentary modality service, it is difficult to think that the work RVU for this code could be anything other than 0.70.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93970

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery How often? Commonly

Specialty Cardiology How often? Commonly

Specialty Radiology How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. An estimate for the number of times this service is performed nationally in a one-year period is unknown.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,599,899 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 2010 Medicare Data

Specialty Vascular Surgery Frequency 287982 Percentage 18.00 %

Specialty Cardiology Frequency 271983 Percentage 17.00 %

Specialty Radiology Frequency 239985 Percentage 15.00 %

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93970

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Specialty Society('s) SVS, ACR and ACC

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

- 93925 *Duplex scan of lower extremity arteries or arterial bypass grafts; complete bilateral study*
- 93926 *Duplex scan of lower extremity arteries or arterial bypass grafts; unilateral or limited study*
- 93970 *Duplex scan of extremity veins including responses to compression and other maneuvers; complete bilateral study*
- 93971 *Duplex scan of extremity veins including responses to compression and other maneuvers; unilateral or limited study*

Global Period: XXX **Meeting Date:** 04/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The multispecialty organizations (SVS, ACR and ACC) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these procedures.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

A reference code was not included in these recommendations because they are existing codes. We included the current direct PE inputs for reference.

Please describe in detail the clinical activities of your staff:

CPT Codes 93925, 93926, 93970 and 93971

Pre-Service Clinical Labor Activities:
Retrieve prior imaging exams, labs and pathology reports. Hang for MD review, verify orders, review chart to incorporate relevant clinical information.

Post-Service Clinical Labor Activities:
Documentation

93925 ***Duplex scan of lower extremity arteries or arterial bypass grafts; complete bilateral study***

Intra-Service Clinical Labor Activities:
The technologist/sonographer/examiner should introduce him/herself and explain why the complete bilateral lower extremity arterial duplex examination is being performed and explain the procedure to the patient. In addition, respond to questions and concerns about any aspect of the examination. Patient assessment must be performed before the duplex exam is started. This includes assessment of the patient's ability to tolerate the procedure and an evaluation of any contra-indications to the procedure. The technologist/sonographer/examiner should **o**btain a pertinent history and review the patient's medical record.

Throughout each exam, sonographic characteristics of normal and abnormal tissues, structures, and blood flow must be observed so that scanning technique can be adjusted as necessary to optimize image quality and spectral waveform characteristics. The patient's physical and mental status is assessed and monitored during the examination, and modifications are made to the procedure plan according to changes in the patient's clinical condition during the procedure. Sonographic findings are analyzed throughout the course of the examination to ensure that sufficient data is provided to the physician to direct patient management and render a final diagnosis.

The standard exam includes multiple acoustic windows and patient positioning techniques with complete bilateral assessment of the following vessels in their entirety: common femoral, profunda femoris, superficial femoral, popliteal, anterior tibial, posterior tibial, and peroneal arteries. Evidence of plaque formation within the vessel lumen, wall calcification or dilatation should be documented. Doppler spectral analysis is used to quantify disease severity and should include assessment for presence or absence of flow. When flow is present, evaluation will include peak systolic velocity, end diastolic velocity, and waveform analysis [e.g., systolic upstroke / acceleration, pulsatility, spectral broadening, turbulence and flow direction]. At a minimum, spectral analysis should be obtained in all vessel segments as well as proximal, throughout and distal to any region where flow disturbance is identified. All Doppler derived velocity information must be performed at an angle of 60 degrees or less with respect to the direction of blood flow, and Doppler cursor alignment is recommended parallel to the vessel walls.

Anatomic variants should be documented. Areas of stenosis will be assessed with attention to pre-stenotic, stenotic and post-stenotic Doppler waveform analysis. Data are reviewed to ensure that a complete and comprehensive evaluation has been performed and documented. All technical findings required to complete the final interpretation are recorded on a worksheet, logbook or within a PACS data collection system so that the findings can be classified according to the laboratory's diagnostic criteria based on published or internally validated data.

Documentation includes date, clinical indication(s), technologist performing the exam, and the exam summary in a vascular laboratory log book or other appropriate method, i.e., computer software. The technologist/sonographer assembles preliminary results as provided by internal guidelines.

93926 ***Duplex scan of lower extremity arteries or arterial bypass grafts; unilateral or limited study***

Intra-Service Clinical Labor Activities:
The technologist/sonographer/examiner should introduce him/herself and explain why the complete bilateral lower extremity arterial duplex examination is being performed and explain the procedure to the patient. In addition, respond to questions and concerns about any aspect of the examination. Patient assessment must be performed before the duplex exam is started. This includes assessment of the patient's ability to tolerate the procedure and an evaluation of any contra-indications to the procedure. The technologist/sonographer/examiner should **o**btain a pertinent history and review the patient's medical record.

Throughout each exam, sonographic characteristics of normal and abnormal tissues, structures, and blood flow must be observed so that scanning technique can be adjusted as necessary to optimize image quality and spectral waveform characteristics. The patient's physical and mental status is assessed and monitored during the examination, and modifications are made to the procedure plan according to changes in the patient's clinical condition during the procedure. Sonographic findings are analyzed throughout the course of the examination to ensure that sufficient data is provided to the physician to direct patient management and render a final diagnosis.

The standard exam includes multiple acoustic windows and patient positioning techniques with unilateral or limited assessment of the following vessels in their entirety: common femoral, profunda femoris, superficial femoral, popliteal, anterior tibial, posterior tibial, and peroneal arteries. Evidence of plaque formation within the vessel lumen, wall calcification or dilatation should be documented. Doppler spectral analysis is used to quantify disease severity and should include assessment for presence or absence of flow. When flow is present, evaluation will include peak systolic velocity, end diastolic velocity, and waveform analysis [e.g., systolic upstroke / acceleration, pulsatility, spectral broadening, turbulence and flow direction]. At a minimum, spectral analysis should be obtained in all vessel segments as well as proximal, throughout and distal to any region where flow disturbance is identified. All Doppler derived velocity information must be performed at an angle of 60 degrees or less with respect to the direction of blood flow, and Doppler cursor alignment is recommended parallel to the vessel walls.

Anatomic variants should be documented. Areas of stenosis will be assessed with attention to pre-stenotic, stenotic and post-stenotic Doppler waveform analysis. Data are reviewed to ensure that a complete and comprehensive evaluation has been performed and documented. All technical findings required to complete the final interpretation are recorded on a worksheet, logbook or within a PACS data collection system so that the findings can be classified according to the laboratory's diagnostic criteria based on published or internally validated data.

Documentation includes date, clinical indication(s), technologist performing the exam, and the exam summary in a vascular laboratory log book or other appropriate method, i.e., computer software. The technologist/sonographer assembles preliminary results as provided by internal guidelines.

93970 ***Duplex scan of extremity veins including responses to compression and other maneuvers; complete bilateral study***

Intra-Service Clinical Labor Activities:
Throughout each exam, sonographic characteristics of normal and abnormal tissues, structures, and blood flow are continually observed. The patient's physical and mental status are assessed and monitored during the examination. Modifications may be made to the procedure plan according to changes in the patient's clinical status. Also, sonographic findings are analyzed throughout the course of the examination to ensure that sufficient data is provided to render a final diagnosis.

The examination is performed with the patient in the supine position and the head of the bed elevated approximately 12 inches with the leg externally rotated slightly. This is the position of choice for viewing the common femoral vein (CFV), femoral vein (FV), deep femoral vein, (DFV), great saphenous vein (GSV), popliteal vein, and posterior tibial veins, (PTV). Reverse Trendelenburg may be used as an alternate position. The patient may be turned prone or to the lateral decubitus position to view the popliteal vein, peroneal and proximal posterior tibial veins, small saphenous vein and soleal veins. Positioning the patient slightly to the opposite side which is being evaluated, when pregnant or if abnormal CFV signals are present may normalize the side in question.

Use appropriate duplex instrumentation with appropriate frequencies for the vessels being examined. This includes display of both two-dimensional structure and motion in real-time and Doppler ultrasonic signal documentation with spectral analysis with or without color Doppler imaging, videotape, film or digital storage of static images and/or cineloop.

A complete bilateral venous duplex evaluation performs the following on both lower extremities. The study incorporates both B-mode and color Doppler imaging along with Doppler spectral analysis. The common femoral, deep femoral (origin), femoral, popliteal, posterior tibial, peroneal, and great saphenous veins should be interrogated in their entirety. In select cases, and when indicated, the small saphenous, gastrocnemius branches, soleal, anterior tibial and perforating veins are examined. Transverse transducer compressions must be performed every 2 cms or less and representative images are obtained per lab protocol. Typically samples are taken at the proximal CFV, saphenofemoral junction, proximal femoral vein, mid or distal femoral vein, popliteal and at the mid/distal PTV. Compression of the peroneal veins should be documented at the mid/distal calf as well.

When pathology (thrombus or intraluminal echoes) is present, compressibility, appearance, location, and extent should be documented. The B-Mode image should demonstrate the degree of compressibility, presence of intraluminal echoes, and dilation to assist in describing characteristic of aging the thrombus. The technologist should differentiate between brightly echogenic or hypoechoic thrombi, partially or totally non-compressible segments, and between unattached proximal tips and attached thrombi. Spectral and/or color Doppler are used to further support the diagnosis and to document spectral waveform profiles. A representative Doppler spectral waveform should be obtained from the same levels as noted above for documentation of compression: i.e. common femoral, femoral, popliteal segments. The posterior tibial and peroneal veins are evaluated for flow using color Doppler, preferable on a transverse view. .Doppler spectral analysis is performed in the sagittal plane, with an appropriate vessel

angle. It is not required to angle correct, however, if angle correction is utilized, it must be at 60 degrees or less and aligned with the vessel wall. To accurately assess venous waveform profiles, flow is characterized according to its spontaneity, phasicity, and the presence of brisk augmented venous flow with proximal or distal augmentation. To ensure complete interrogation, spectral waveforms are performed while utilizing proximal or distal compression of the limb to demonstrate augmentation.

Incidental findings, such as Baker's Cyst, seroma, hematoma, lymph node, mass, etc. must be reported. Characterization of such findings should include measurements of size and/or presence of blood flow.
All information collected during the study is organized and archived. Each image and Doppler spectrum is double-checked to ensure accuracy and completeness of labeling. Preliminary technical findings are synthesized for assessment by the interpreting physician.

93971 ***Duplex scan of extremity veins including responses to compression and other maneuvers; unilateral or limited study***

Intra-Service Clinical Labor Activities:
Throughout each exam, sonographic characteristics of normal and abnormal tissues, structures, and blood flow are continually observed. The patient's physical and mental status are assessed and monitored during the examination. Modifications may be made to the procedure plan according to changes in the patient's clinical status. Also, sonographic findings are analyzed throughout the course of the examination to ensure that sufficient data is provided to render a final diagnosis.

AMA/Specialty Society RVS Update Committee Summary of Recommendations
CMS High Expenditure Procedure Codes

April 2012

Immunotherapy Injections-PE Only

This service was identified by CMS in July 2011 through the CMS High Expenditure Procedural Codes screen. In January 2012, the RUC noted that this service has not been reviewed in the last 6 years and recommended the practice expense be reviewed for the family of services at the April 2012 meeting. The time for administration of injections was reduced from 2 minutes to 1 minute for 1 injection and 4 minutes to 2 minutes for 2 or more injections. **The RUC reviewed and approved the direct practice expense inputs with minor modifications as recommended by the Practice Expense Subcommittee.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
95115		Professional services for allergen immunotherapy not including provision of allergenic extracts; single injection	XXX	0.00 (PE Input Recommendations Only)
95117		Professional services for allergen immunotherapy not including provision of allergenic extracts; 2 or more injections	XXX	0.00 (PE Input Recommendations Only)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

95115 Professional services for allergen immunotherapy not including provision of allergenic extracts; single injection
95117 2 or more injections

Global Period: XXX **Meeting Date:** April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Joint Council of Allergy, Asthma and Immunology and American Academy of Otolaryngic Allergy convened a consensus group of ten physicians (five from each organization). The group met by conference call and developed its recommendations.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

We have provided three reference codes: Code 90471 describes a very similar service (immunization administration through percutaneous, intradermal, subcutaneous, or intramuscular injection) and has very similar practice expense details compared with 95115 and 95117. The main differences are that 90471 has physician work RVUs and 95115 and 95117 do not. Additionally, 90471 will typically be billed with an E/M service, while 95115 and 95117 are typically not billed with an E/M service. We also provide the previously approved direct expense inputs for 95115 and 95117 as references for the current recommendation. We note that these codes are being reviewed at the request of CMS because 95117 was identified as a high-volume code and it has not been reviewed since 2002. There have been no changes to the code descriptors.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
N/A

Service Clinical Labor Activities:
Clinical staff retrieves the patient chart; determines dosage for injection; greets patient; takes brief history including current medications; responds to patient questions since last injection; obtains consent; retrieves patient's immunotherapy vial, confirms with patient, and documents correct vial / correct patient; prepares injection for administration; positions patient for injection and cleans injection site; administers injection; checks injection site and monitors patient intermittently; discusses possibility of delayed reaction with patient; reaffirms that patient understands how to recognize a reaction and what to do if a reaction occurs; determines schedule for next injection; and cleans room.

Post-Service Clinical Labor Activities:
N/A

AMA/Specialty Society RVS Update Committee Summary of Recommendations
Re-Review Families of New/Revised Codes screen

April 2012

Evoked Potentials and Reflex Studies-PE Only

These services were most recently identified in the Nov 28, 2011 Final Rule for 2012. CMS requested that the RUC re-review specific codes in a family of services that were recently reviewed. In January 2012, the RUC reviewed the CMS identified family of services and recommended that codes 95925 and 95926 be referred to the PE Subcommittee to review in April 2012 to determine if any practice expense anomalies exist between 95938 or 95939 and these codes. The RUC determined that review of physician work is not necessary at this time. Practice expense inputs were revised to align with accepted standards and the intra-service time for *Assist the physician in performing procedure* was revised to reflect the typical time needed when a patient is being tested for one limb as compared to two limbs. **The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
95925		Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in upper limbs (Do not report 95925 in conjunction with 95926)	XXX	0.54 (PE Input Recommendations Only)
95926		in lower limbs (Do not report 95926 in conjunction with 95925)	XXX	0.54 (PE Input Recommendations Only)
95938		in upper and lower limbs (Do not report 95938 in conjunction with 95925, 95926)	XXX	0.86 (PE Input Recommendations Only)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

95928		Central motor evoked potential study (transcranial motor stimulation); upper limbs (Do not report 95928 in conjunction with 95929)	XXX	1.50 (PE Input Recommendations Only)
95929		lower limbs (Do not report 95929 in conjunction with 95928)	XXX	1.50 (PE Input Recommendations Only)
95939		in upper and lower limbs (Do not report 95939 in conjunction with 95928, 95929)	XXX	2.25 (PE Input Recommendations Only)

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Long Descriptor:

95925 Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in upper limbs

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from each of the 4 surveying specialties met and communicated via email via to develop recommendations.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Review requisition. Assess for special needs, e.g. anxiolytic requirements, sleep deprivation, bring pain medicines or sleep medicines. Obtain authorization from insurance carrier. Give patient instructions for test preparation (regarding skin and hair lotion, anxiolytic instructions, etc.) and what to expect on the day of testing. Check availability of nurse to administer medication.

Intra-Service Clinical Labor Activities:

Prepare room, supplies, and equipment. Greet and gown patient. Take history and perform brief exam. Establish patient testing strategy. Explain procedure. Contact supervising physician for special needs or problems. Have patient go to bathroom. Position the patient in a comfortable chair. Calibrate machine and set chosen testing parameters. Assist physician in conducting the test. Coach patient to relax better or fall asleep, despite electric shocks. Test first limb, requiring 500-1000 trials of stimulation, excluding trials with muscle contamination. Repeat testing on first limb two or three times. Repeat procedure for second limb. Remove electrodes and clean up patient, including carefully removing electrode gel from hair. Release patient. Give discharge instructions.

Post-Service Clinical Labor Activities:

Complete worksheets and technical interpretation. Clean room and equipment. Clean and sterilize electrodes. Restock supplies. Prepare data for interpretation. Place data on storage disk. Complete medical records and other forms.

CPT Long Descriptor:

95928 Central motor evoked potential study (transcranial motor stimulation); in upper limbs

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from the surveying specialties met and communicated via email to develop recommendations.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
Review requisition. Assess for contraindications. e.g. implanted devices, skull defects, history of seizures. Assess for confounding factors, e.g. diabetes, peripheral neuropathy, known neuromuscular disorders. Obtain authorization from insurance carrier. Give patient instructions for test preparation (regarding skin and hair lotion, anxiolytic instructions, etc.) and what to expect on the day of testing. Check availability of nurse to administer any medication.

Intra-Service Clinical Labor Activities:

Prepare room, supplies, and equipment. Greet and gown patient. Take history and perform brief exam or head and limbs. Establish patient testing strategy. Explain procedure. Review with supervising physician for special needs or problems. Position the patient on a comfortable exam table. Assist physician in conducting the test. Together, place electrodes in correct muscles and identify best places to try first as stimulation sites. Coach the patient to relax better despite the brain stimulation. Coach the patient to improve the test by slightly contracting muscle being tested. Test the first muscle in the first limb, requiring series of stimulation trials, excluding trials with muscle contamination. Continue trials with slight variations in stimulation site and stimulus intensity. Identify the optimal stimulus sites and intensity for best motor responses. Repeat testing on first muscle in the first limb two or three times. Repeat the procedure with the stimulator moved to the spine. Repeat the procedure with the stimulator moved over the plexus. Measure distances among the stimulation sites and recording site. Repeat the three-site procedure for the second and the third muscles on the first limb. Repeat that whole procedure for second limb. Remove electrodes and clean up patient. Release patient. Give discharge instructions.

Post-Service Clinical Labor Activities:

Complete worksheets and technical interpretation. Clean room and equipment. Restock supplies. Prepare data for interpretation. Place data on storage disk. Complete medical records and other forms.

Intra-Service Clinical Labor Activities:

Prepare room, supplies, and equipment. Greet and gown patient. Take history and perform brief exam or head and limbs. Establish patient testing strategy. Explain procedure. Review with supervising physician for special needs or problems. Position the patient on a comfortable exam table. Assist physician in conducting the test. Together, place electrodes in correct muscles and identify best places to try first as stimulation sites. Coach the patient to relax better despite the brain stimulation. Coach the patient to improve the test by slightly contracting muscle being tested. Test the first muscle in the first limb, requiring series of stimulation trials, excluding trials with muscle contamination. Continue trials with slight variations in stimulation site and stimulus intensity. Identify the optimal stimulus sites and intensity for best motor responses. Repeat testing on first muscle in the first limb two or three times. Repeat the procedure with the stimulator moved to the spine. Repeat the procedure with the stimulator moved over the plexus. Measure distances among the stimulation sites and recording site. Repeat the three-site procedure for the second and the third muscles on the first limb. Repeat that whole procedure for second limb. Remove electrodes and clean up patient. Release patient. Give discharge instructions.

Post-Service Clinical Labor Activities:

Complete worksheets and technical interpretation. Clean room and equipment. Restock supplies. Prepare data for interpretation. Place data on storage disk. Complete medical records and other forms.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
XXX Global Period
Non Facility Direct Inputs

CPT Long Descriptor:

95938 Short-latency somatosensory evoked potential study, stimulation of any/all peripheral nerves or skin sites, recording from the central nervous system; in upper and lower limbs

(Do not report 95938 in conjunction with 95925, 95926)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from each of the 4 surveying specialties met and communicated via email via to develop recommendations.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Review requisition. Assess for special needs, e.g. anxiolytic requirements, sleep deprivation, bring pain medicines or sleep medicines. Obtain authorization from insurance carrier. Give patient instructions for test preparation (regarding skin and hair lotion, anxiolytic instructions, etc.) and what to expect on the day of testing. Check availability of nurse to administer medication.

Intra-Service Clinical Labor Activities:

Prepare room, supplies, and equipment. Greet and gown patient. Take history and perform brief exam. Establish patient testing strategy. Explain procedure. Contact supervising physician for special needs or problems. Have patient go to bathroom. Position the patient in a comfortable chair. Calibrate machine and set chosen testing parameters. Assist physician in conducting the test. Coach patient to relax better or fall asleep, despite electric shocks. Test first limb, requiring 500-1000 trials of stimulation, excluding trials with muscle contamination. Repeat testing on first limb two or three times. Repeat procedure for second limb. Give patient a bathroom break and short timeout. Repeat procedure for third limb. Repeat procedure for fourth limb. Remove electrodes and clean up patient, including carefully removing electrode gel from hair. Release patient. Give discharge instructions.

Post-Service Clinical Labor Activities:

Complete worksheets and technical interpretation. Clean room and equipment. Clean and sterilize electrodes. Restock supplies. Prepare data for interpretation. Place data on storage disk. Complete medical records and other forms.

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

CPT Long Descriptor:

95939 Central motor evoked potential study (transcranial motor stimulation); in upper and lower limbs

(Do not report 95939 in conjunction with 95928, 95929)

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A consensus panel representing members from the surveying specialties met and communicated via email and developed recommendations.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

We provided the PE inputs for 95939 that were approved in April 2011 RUC meeting.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:
Review requisition. Assess for contraindications. e.g. implanted devices, skull defects, history of seizures. Assess for confounding factors, e.g. diabetes, peripheral neuropathy, known neuromuscular disorders. Obtain authorization from insurance carrier. Give patient instructions for test preparation (regarding skin and hair lotion, anxiolytic instructions, etc.) and what to expect on the day of testing. Check availability of nurse to administer any medication.

Intra-Service Clinical Labor Activities:

Prepare room, supplies, and equipment. Greet and gown patient. Take history and perform brief exam or head and limbs. Establish patient testing strategy. Explain procedure. Review with supervising physician for special needs or problems. Position the patient on a comfortable exam table. Assist physician in conducting the test. Together, place electrodes in correct muscles and identify best places to try first as stimulation sites. Coach the patient to relax better despite the brain stimulation. Coach the patient to improve the test by slightly contracting muscle being tested. Test the first muscle in the first limb, requiring series of stimulation trials, excluding trials with muscle contamination. Continue trials with slight variations in stimulation site and stimulus intensity. Identify the optimal stimulus sites and intensity for best motor responses. Repeat testing on first muscle in the first limb two or three times. Repeat the procedure with the stimulator moved to the spine. Repeat the procedure with the stimulator moved over the plexus. Measure distances among the stimulation sites and recording site. Repeat the three-site procedure for the second and the third muscles on the first limb. Repeat that whole procedure for second limb. Repeat procedure for third limb. Repeat procedure for fourth limb. Remove electrodes and clean up patient. Release patient. Give discharge instructions.

Post-Service Clinical Labor Activities:

Complete worksheets and technical interpretation. Clean room and equipment. Restock supplies. Prepare data for interpretation. Place data on storage disk. Complete medical records and other forms.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2011

Molecular Pathology-Tier 1

The CPT Editorial Panel has developed a new coding structure to describe molecular pathology services, based on the efforts and recommendations of the Molecular Pathology Coding Workgroup convened beginning in October 2009. In October 2010 and February 2011, the Panel accepted 92 Tier 1 codes, which are a list of gene-specific and genomic analysis CPT codes for high-volume molecular pathology services. These services were previously reported with a series of "stacking codes." The RUC understands that payment for these services is currently based on a mixture of payment methodologies, including the physician fee schedule and the clinical lab fee schedule. CMS has requested that the RUC review data provided by the College of American Pathologists to provide the agency with more information as a policy is developed to determine which payment schedule is appropriate for these services. In April 2011, the specialty presented information on 18 Tier I codes, with the intent to provide data on additional 52 services in September 2011. At this time, the specialty indicated that physician interpretation is not typically required for the remaining 22 Tier I codes.

81206 ***BCR/ABL1 (t[9;22]) (eg, chronic myelogenous leukemia) translocation analysis; major breakpoint, qualitative or quantitative***
A survey of 62 pathologists indicated that the median time for 81206 was 15 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that the work is similar to 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37). **The RUC recommends a work RVU of 0.37 for CPT code 81206**.

81207 ***BCR/ABL1 (t[9;22]) (eg, chronic myelogenous leukemia) translocation analysis; minor breakpoint, qualitative or quantitative***
A survey of 30 pathologists indicated that the median time for 81207 was 11 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that the work is slightly more work and reflects higher intensity than 88302 Level II – *Surgical pathology, gross and microscopic examination* (time = 11 minutes, work RVU = 0.13). **The RUC recommends a work RVU of 0.15 for CPT code 81207.**

81208 ***BCR/ABL1 (t[9;22]) (eg, chronic myelogenous leukemia) translocation analysis; other breakpoint, qualitative or quantitative***
A survey of 16 pathologists indicated that the median time for 81208 was 18 minutes and the specialty recommended work value reflects a 25th percentile work RVU of 0.46. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. However, the RUC agreed that a work RVU of 0.46 accurately values this service relative to 81206 and 81207. In addition, 81208 requires slightly more physician work and time to perform compared to 88141 *Cytopathology, cervical or vaginal (any reporting system), requiring interpretation by physician* (total time = 16 minutes, work = 0.42). **The RUC recommends a work RVU of 0.46 for CPT code 81208.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81220 ***CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis; common variants (eg, ACMG/ACOG guidelines)***
A survey of 32 pathologists indicated that the median time for 81220 was 10 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that 81220 requires slightly more work to perform and is more intense than 88302 Level II – *Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13). **The RUC recommends a work RVU of 0.15 for CPT code 81220**.

81221 ***CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis;*** **known familial variants**
A survey of 13 pathologists indicated that the median time for 81221 was 20 minutes and the specialty recommended work value reflects a 25th percentile work RVU of 0.40. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. However, the RUC agreed that a work RVU of 0.40 appropriately values this service relative to 81220 and 81222. In addition, 81221 requires less work and intensity to perform compared to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report (*total time = 20 minutes, work = 0.52). **The RUC recommends a work RVU of 0.40 for CPT code 81221.**

81222 ***CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis;*** **duplication/deletion variants**
A survey of 6 pathologists indicated that the median time for 81222 was 13 minutes and reflects a median work RVU of 0.22. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. The RUC compared 81222 to 88304 *Level III Surgical pathology, gross and microscopic examination* (total time = 15 minutes, work = 0.22) and determined the physician work required to perform these services are equal. The RUC recommends the physician work for 81222 be crosswalked to 88304. In addition the RUC agreed that a work RVU of 0.22 places this service in the proper rank order relative to 81220 and 81221. **The RUC recommends a work RVU of 0.22 for CPT code 81222.**

81223 ***CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis;*** **full gene sequence**
A survey of 9 pathologists indicated that the median time for 81223 was 20 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. However, the RUC agreed that a work RVU of 0.40 is appropriate as 81223 requires the same physician work to perform as 81221. In addition, 81223 requires less physician work and intensity to perform compared to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work = 0.52), therefore places the surveyed service in the proper rank order. **The RUC recommends a work RVU of 0.40 for CPT code 81223.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81224 ***CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis;*** **intron 8 poly-T analysis (eg, male infertility)**
A survey of 14 pathologists indicated that the median time for 81224 was 10 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. The RUC agreed with the specialty that 81224 requires slightly more physician work to perform and is more intense compared to 88302 Level II – *Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13). **The RUC recommends a work RVU of 0.15 for CPT code 81224**.

81240 ***F2 (prothrombin, coagulation factor II) (eg, hereditary hypercoagulability) gene analysis; 20210G>A variant***
A survey of 42 pathologists indicated that the median time for 81240 was 7 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that the physician work required to perform 81240 is equivalent to 88302 Level II *Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13) and should be crosswalked. **The RUC recommends a work RVU of 0.13 for CPT code 81240.**

81241 ***F5 (coagulation Factor V) (eg, hereditary hypercoagulability) gene analysis; Leiden variant***
A survey of 41 pathologists indicated that the median time for 81241 was 8 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that the physician work required to perform 81241 is equivalent to 88302 Level II *Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13) and should be crosswalked. **The RUC recommends a work RVU of 0.13 for CPT code 81241.**

81243 ***FMR1 (Fragile X mental retardation 1) (eg, fragile X mental retardation) gene analysis; evaluation to detect abnormal (eg, expanded) alleles***
A survey of 13 pathologists indicated that the median time for 81243 was 15 minutes and the specialty recommended work value reflects a 25th percentile work RVU of 0.37. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 900 annually in the Medicare population) and few pathologists are currently performing this test. The RUC compared 81243 to 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work = 0.37) and determined 81243 requires the same physician work to perform, which is supported by the survey 25th percentile work RVU of 0.37. **The RUC recommends a work RVU of 0.37 for CPT code 81243.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81244 ***FMR1 (Fragile X mental retardation 1) (eg, fragile X mental retardation) gene analysis; characterization of alleles (eg, expanded size and methylation status)***
A survey of 11 pathologists indicated that the median time for 81244 was 20 minutes and the specialty recommended work value reflects a 25th percentile work RVU of 0.51. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 100 annually in the Medicare population) and few pathologists are currently performing this test. However, the RUC agreed that work RVU of 0.51 appropriately values this service relative to the work and intensity of 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52). **The RUC recommends a work RVU of 0.51 for CPT code 81244.**

81256 ***HFE (hemochromatosis) (eg, hereditary hemochromatosis) gene analysis; common variants (eg, C282Y, H63D)***
A survey of 18 pathologists indicated that the median time for 81256 was 7 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that the physician work is equivalent to 88302 *Level II Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13) and therefore should be crosswalked. **The RUC recommends a work RVU of 0.13 for CPT code 81256**.

81270 ***JAK2 (Janus kinase 2) (eg, myeloproliferative disorder) gene analysis; V617F variant***
A survey of 46 pathologists indicated that the median time for 81270 was 10 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC agreed with the specialty that 81270 requires slightly more physician work and is more intense to perform compared to 88302 Level II – *Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13). **The RUC recommends a work RVU of 0.15 for CPT code 81270.**

81275 ***KRAS (v-Ki-ras2 Kirsten rat sarcoma viral oncogene) (eg, carcinoma) gene analysis; variants in codons 12 and 13***
A survey of 43 pathologists indicated that the median time for 81275 was 20 minutes and reflects a 25th percentile work RVU of 0.50. The RUC agreed that survey 25th percentile work RVU of 0.50 appropriately values this service relative to the work and intensity required to perform 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work = 0.52). **The RUC recommends a work RVU of 0.50 for CPT code 81275.**

81291 ***MTHFR (5,10-methylenetetrahydrofolate reductase) (eg, hereditary hypercoagulability) gene analysis; common variants (eg, 677T, 1298C)***
A survey of 16 pathologists indicated that the median time for 81291 was 10 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 5,000 annually in the Medicare population) and few pathologists are currently performing this test. The RUC agreed with the specialty that 81291 requires slightly more physician work to perform than 88302 Level II – *Surgical pathology, gross and microscopic examination* (total time = 11 minutes, work RVU = 0.13). **The RUC recommends a work RVU of 0.15 for CPT code 81291.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81315 ***PML/RARalpha, (t(15;17)), (PML-RARA regulated adaptor molecule 1) (eg, promyelocytic leukemia) translocation analysis; common breakpoints (eg, intron 3 and intron 6), qualitative or quantitative***
A survey of 27 pathologists indicated that the median time for 81243 was 15 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. The RUC compared 81315 to 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work = 0.37) and determined that the surveyed code requires the same physician work to perform and therefore should be crosswalked. **The RUC recommends a work RVU of 0.37 for CPT code 81315.**

81316 ***PML/RARalpha, (t(15;17)), (PML-RARA regulated adaptor molecule 1) (eg, promyelocytic leukemia) translocation analysis; single breakpoint (eg, intron 3, intron 6 or exon 6), qualitative or quantitative***
A survey of 15 pathologists indicated that the median time for 81316 was 12 minutes, however, the specialty recommended that the work valuation was overstated by these respondents. The RUC noted that less than 30 pathologists responded to the survey for this code. This code is rarely performed (estimated 1,000 annually in the Medicare population) and few pathologists are currently performing this test. The RUC compared 81316 to 88304 *Level III Surgical pathology, gross and microscopic examination* (total time = 15 minutes, work = 0.22) and determined that the surveyed code requires the same physician work to perform and therefore should be crosswalked. **The RUC recommends a work RVU of 0.22 for 81316.**

Practice Expense
The specialty provided data based on assumed batch sizes and modified these batch size estimates to ensure maximum efficiency for today's practice. However, these assumptions should be re-examined when greater experience is available for these services.

Work Neutrality
Reviewing the Medicare utilization data for 83912 *Molecular diagnostics; interpretation and report* (work RVU = 0.37) and the specialty's estimate of utilization of these individual services, the RUC understands that these recommendations will be work neutral to the family.

New Technology
The entire set of molecular pathology codes should be re-reviewed after claims data are available and there is experience with the new coding system. The time, work valuation, and practice expense inputs should all be reviewed again in the future as these estimates are based on a good faith effort using available information in 2011.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Pathology and Laboratory **Molecular Pathology**				
Molecular pathology procedures are medical laboratory procedures involving the analyses of nucleic acid to detect variants in genes that may be indicative of germline (eg, constitutional disorders) or somatic (eg, neoplasia) conditions, or to test for histocompatibility antigens (eg, HLA). Code selection is typically based on the specific gene(s) that is being analyzed. Genes are described using Human Genome Organization (HUGO) approved gene names and are italicized in the code descriptors. When the gene name is represented by an abbreviation, the abbreviation is listed first, followed by the full gene name italicized in parentheses (eg, "F5 *[coagulation Factor V]*"), except for the HLA series of codes. Proteins or diseases commonly associated with the genes are listed as examples in the code descriptors. The examples do not represent all conditions in which testing of the gene may be indicated. Codes that describe tests to assess for the presence of gene variants (see definitions) use common gene variant names. Typically, all of the listed variants would be tested. However, these lists are not exclusive. If other variants are also tested in the analysis, they would be included in the procedure and not reported separately. Full gene sequencing should not be reported using codes that assess for the presence of gene variants unless specifically stated in the code descriptor. The molecular pathology codes include all analytical services performed in the test (eg, cell lysis, nucleic acid stabilization, extraction, digestion, amplification, and detection). Any procedures required prior to cell lysis (eg, microdissection, codes 88380 and 88381) should be reported separately. The molecular pathology codes include all analytical services performed in the test (eg, cell lysis, nucleic acid stabilization, extraction, digestion, amplification, and detection). Any procedures required prior to cell lysis (eg, microdissection, codes 88380 and 88381) should be reported separately. The results of the procedure may require interpretation by a. When only the interpretation and report are performed, modifier 26 may be appended to the specific molecular pathology code. All analyses are qualitative unless otherwise noted. For microbial identification, see 87149-87153 and 87470-87801, and 87900-87904. For in situ hybridization analyses, see 88271-88275 and 88365-88368. Molecular pathology procedures that are not specified in 81200-81350 should be reported using the appropriate methodology codes in the 83890-83914 and 88384-88386 series.

Human Leukocyte Antigen (HLA) typing is performed to assess compatibility of recipients and potential donors as a part of solid organ and hematopoietic stem cell pretransplant testing. HLA testing is also performed to identify HLA alleles and allele groups (antigen equivalents) associated with specific diseases and individualized responses to drug therapy (eg, HLA-B*27 and ankylosing spondylitis and HLA-B*57:01 and abacavir hypersensitivity) as well as other clinical uses. One or more HLA genes may be tested in specific clinical situations (eg, HLA-DQB1 for narcolepsy and HLA-A, -B, -C, -DRB1 and -DQB1 for kidney transplantation). Each HLA gene typically has multiple variant alleles or allele groups that can be identified by typing. For HLA result reporting, a low resolution HLA type is denoted by a two digit HLA name (eg, A*02) and high resolution typing is denoted by a greater number of digits (eg, A*02:02, *03:01:01:01, and C*03:04P). If additional testing is required to resolve ambiguous allele combinations for high resolution typing, it is included in the HLA typing code. The gene names have been italicized similar to the other molecular pathology codes. (For HLA antigen typing by non-molecular pathology techniques, see 86812-86822)

February 25, 2011

Barbara Levy, MD
Chair, RVS Update Committee
American Medical Association
515 N. State St.
Chicago, IL 60654

Re: New Molecular Pathology CPT Codes

Dear Dr. Levy:

The College of American Pathologists (CAP) supports physician fee schedule placement of the 28 Tier 1 molecular pathology codes approved at the October 2010 CPT Meeting, and the 9 Tier 2 codes approved at the February 2011 CPT meeting, as they all have a professional interpretive component. However, the Centers for Medicare and Medicaid Services (CMS) and the AMA/Specialty Society Relative Value Scale Update Committee (RUC) have specifically requested that the CAP bring forward at this time only proposed values for April 2011 RUC review that typically include physician interpretation.

The 28 Tier 1 codes and 9 Tier 2 codes identified in CAP's plan for review at the April RUC have been reviewed by a subgroup of CAP molecular pathologists together with our RBRVS workgroup. Of these 37 codes, 10 were determined to have their interpretation typically performed by a PhD at this time. These services are currently not typically performed in typical molecular pathology laboratories, but rather in subspecialty laboratories.

Therefore, in response to CMS' and the RUC's direct request, only the following codes will be presented at the April RUC meeting, because the interpretation of these codes is typically performed by a physician. In addition, the CAP reviewed the recently approved CPT codes from the February CPT meeting and determined which codes are typically interpreted by physicians.

As you know, at the February meeting, the RUC approved a plan outlining how CAP proposes to move forward in developing recommended values and direct practice expense inputs for the molecular pathology codes approved by the CPT Editorial Panel at its October 2010 and February 2011 meetings. This plan is to survey for April 2011 the 28 Tier 1 molecular codes and the 9 Tier 2 codes approved by CPT in February. Because of the RUC directive, 27 codes will be surveyed for the April RUC meeting. The remaining molecular codes approved at the February CPT meeting and identified as typically including physician work will be surveyed for the September 2011 RUC meeting.

Below please find the codes to be surveyed for the April 2011 RUC meeting, codes to be surveyed for the September 2011 RUC meeting, and codes not scheduled to be surveyed at this time.

Codes to be Surveyed for April 2011 RUC Meeting

Tier 1

●BXXX2	*BCR/ABL1 (t[9;22])* (eg, chronic myelogenous leukemia) translocation analysis; major breakpoint, qualitative or quantitative
●BXXX3	minor breakpoint, qualitative or quantitative
●BXXX4	other breakpoint, qualitative or quantitative
●CXXX1	*CFTR (cystic fibrosis transmembrane conductance regulator)* (eg, cystic fibrosis) gene analysis; common variants (eg, ACMG/ACOG guidelines)
●CXXX2	known familial variants
●CXXX3	duplication/deletion variants
●CXXX4	full gene sequence
●CXXX5	intron 8 poly-T analysis (eg, male infertility)
●FXXX1	*F2 (prothrombin, coagulation factor II)* (eg, hereditary hypercoagulability) gene analysis; 20210G>A variant
●FXXX2	*F5 (coagulation Factor V)* (eg, hereditary hypercoagulability) gene analysis; Leiden variant
●FXXX4	*FMR1 (Fragile X mental retardation 1)* (eg, fragile X mental retardation) gene analysis; evaluation to detect abnormal (eg, expanded) alleles
●FXXX5	characterization of alleles (eg, expanded size and methylation status)
●HXXX2	*HFE (hemochromatosis)* (eg, hereditary hemochromatosis) gene analysis; common variants (eg, C282Y, H63D)
●JXXX1	*JAK2 (Janus kinase 2)* (eg, myeloproliferative disorder) gene analysis; V617F variant
●KXXX1	*KRAS (v-Ki-ras2 Kirsten rat sarcoma viral oncogene)* (eg, carcinoma) gene analysis; variants in codons 12 and 13
●MXXX2	*MTHFR (5,10-methylenetetrahydrofolate reductase)* (eg, hereditary hypercoagulability) gene analysis; common variants (eg, 677T, 1298C)
●PXXX1	*PML/RARalpha, (t(15;17)), (PML-RARA regulated adaptor molecule 1)* (eg, promyelocytic leukemia) translocation analysis; common breakpoints (eg, intron 3 and intron 6), qualitative or quantitative
●PXXX2	single breakpoint (eg, intron 3, intron 6 or exon 6), qualitative or quantitative

Tier 2

●L2XX1	Molecular pathology procedure, Level 1 (eg, identification of single germline variant [eg, SNP] by techniques such as restriction enzyme digestion or melt curve analysis)
●L2XX2	Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)

●L2XX3 Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon)

●L2XX4 Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)

●L2XX5 Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)

●L2XX6 Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)

●L2XX7 Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)

●L2XX8 Molecular pathology procedure, Level 8 (eg, analysis of 26-50 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of >50 exons, sequence analysis of multiple genes on one platform)

●L2XX9 Molecular pathology procedure, Level 9 (eg, analysis of >50 exons in a single gene by DNA sequence analysis)

Codes to be Surveyed for September 2011 RUC Meeting

Tier 1

●BXXX6 *BRAF (v-raf murine sarcoma viral oncogene homolog B1)* (eg, colon cancer), gene analysis, V600E variant

●CXXX6 *CYP2C19 (cytochrome P450, family 2, subfamily C, polypeptide 19)* (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *4, *8, *17)

●CXXX7 *CYP2D6 (cytochrome P450, family 2, subfamily D, polypeptide 6)* (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *4, *5, *6, *9, *10, *17, *19, *29, *35, *41, *1XN, *2XN, *4XN)

●CXXX8 *CYP2C9 (cytochrome P450, family 2, subfamily C, polypeptide 9)* (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *5, *6)

●CXXX9 *VKORC1 (vitamin K epoxide reductase complex, subunit 1)* (eg, warfarin metabolism), gene analysis, common variants (eg, 1639/3673)

●FXXX6 *FLT3 (fms-related tyrosine kinase 3)* (eg, acute myeloid leukemia), gene analysis, internal tandem duplication (ITD) variants (ie, exons 14, 15)

●HXXX3 *HBA1/HBA2 (alpha globin 1 and alpha globin 2)* (eg, alpha thalassemia, Hb Bart hydrops fetalis syndrome, HbH disease), gene analysis, for common deletions or variant (eg, Southeast Asian, Thai, Filipino, Mediterranean, alpha3.7, alpha4.2, alpha20.5, and Constant Spring)

● IXXX2 *IGH@ (Immunoglobulin heavy chain locus)* (eg, leukemias and lymphomas, B-cell), gene rearrangement analysis to detect abnormal clonal population(s); amplification methodology (eg, polymerase chain reaction)

●IXXX3 direct probe methodology (eg, Southern blot)

●IXXX4 *IGH@ (Immunoglobulin heavy chain locus)* (eg, leukemia and lymphoma, B-cell), variable region somatic mutation analysis

●IXXX5 *IGK@ (Immunoglobulin kappa light chain locus)* (eg, leukemia and lymphoma, B-cell), gene rearrangement analysis, evaluation to detect abnormal clonal population(s)

●IXXX6 Comparative analysis using Short Tandem Repeat (STR) markers; patient and comparative specimen (eg, pre-transplant recipient and donor germline testing, post-transplant non-hematopoietic recipient germline [eg, buccal swab or other germline tissue sample] and donor testing, twin zygosity testing, or maternal cell contamination of fetal cells)

+●IXXX7 each additional specimen (eg, additional cord blood donor, additional fetal samples from different cultures, or additional zygosity in multiple birth pregnancies) (List separately in addition to code for primary procedure)

●IXXX8 Chimerism (engraftment) analysis, post hematopoietic stem cell transplantation specimen, includes comparison to previously performed baseline analyses; without cell selection

●IXXX9 with cell selection (eg, CD3, CD33), each cell type

●MXXX3 *MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2)* (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

●MXXX4 known familial variants

●MXXX5 duplication/deletion variants

●MXXX6 *MSH2 (mutS homolog 2, colon cancer, nonpolyposis type 1)* (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

●MXXX7 known familial variants

●MXXX8 duplication/deletion variants

●MXXX9 *MSH6 (mutS homolog 6 [E. coli])* (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

●MXX10 known familial variants

●MXX11 duplication/deletion variants

●MXX12 Microsatellite instability analysis (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) of markers for mismatch repair deficiency (eg, BAT25, BAT26), includes comparison of neoplastic and normal tissue, if performed

●MXX13 *MECP2 (methyl CpG binding protein 2)* (eg, Rett syndrome) gene analysis; full sequence analysis

●MXX14 known familial variant

●MXX15 duplication/deletion variants

●NXXX3 *NPM1 (nucleophosmin)* (eg, acute myeloid leukemia) gene analysis, exon 12 variants

●PXXX3 *PMS2 (postmeiotic segregation increased 2 [S. cerevisiae])* (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

●PXXX4 known familial variants

●PXXX5 duplication/deletion variants

●SXXX2 *SNRPN/UBE3A* (*small nuclear ribonucleoprotein polypeptide* N and ubiquitin protein ligase E3A) (eg, Prader-Willi syndrome and/or Angelman syndrome), methylation analysis

●SXXX3 *SERPINA1* (*serpin peptidase inhibitor, clade A, alpha-1 antiproteinase, antitrypsin, member 1)* (eg, alpha-1-antitrypsin deficiency), gene analysis, common variants (eg, *S and *Z)

●TXXX1 *TCB@ (T cell antigen receptor, beta)* (eg, leukemia and lymphoma), gene rearrangement analysis to detect abnormal clonal population(s); using amplification methodology (eg, polymerase chain reaction)

●TXXX2 using direct probe methodology (eg, Southern blot)

●TXXX3 *TCG@ (T cell antigen receptor, gamma)* (eg, leukemia and lymphoma), gene rearrangement analysis, evaluation to detect abnormal clonal population(s)

●UXXX1 *UGT1A1 (UDP glucuronosyltransferase 1 family, polypeptide A1)* (eg, irinotecan metabolism), gene analysis, common variants (eg, *28, *36, *37)

●HLXX1 HLA Class I and II typing, low resolution (eg, antigen equivalents); *HLA-A, -B, -C, -DRB1/3/4/5, and -DQB1*

●HLXX2 *HLA-A, -B, and -DRB1/3/4/5* (eg, verification typing)

●HLXX3 HLA Class I typing, low resolution (eg, antigen equivalents); complete (ie, *HLA-A*, *-B*, and *-C*)

●HLXX4 one locus (eg, *HLA-A*, *-B*, or *-C*), each

●HLXX5 one antigen equivalent (eg, *B*27*), each

●HLXX6 HLA Class II typing, low resolution (eg, antigen equivalents); HLA-*DRB1/3/4/5* and *-DQB1*

- ●HLXX7 one locus (eg, *HLA-DRB1/3/4/5, -DQB1, -DQA1, -DPB1*, or *-DPA1*), each
- ●HLXX8 one antigen equivalent, each
- ●HLXX9 HLA Class I and II typing, high resolution (ie, alleles or allele groups), *HLA-A, -B, -C,* and *-DRB1*
- ●HLX10 HLA Class I typing, high resolution (ie, alleles or allele groups); complete (ie, *HLA-A, -B,* and -C)
- ●HLX11 one locus (eg, *HLA-A, -B,* or -C), each
- ●HLX12 one allele or allele group (eg, *B*57:01P*), each
- ●HLX13 HLA Class II typing, high resolution (ie, alleles or allele groups); one locus (eg, *HLA-DRB1, -DRB3,-DRB4, -DRB5, -DQB1, -DQA1, -DPB1,* or *-DPA1*), each
- ●HLX14 one allele or allele group (eg, *HLA-DQB1*06:02P*), each

Codes not being surveyed at this time per RUC/CMS directive to CAP

(October 2010 CPT Meeting)

●AXXX1 *ASPA* (*aspartoacylase*) (eg, Canavan disease) gene analysis; common variants (eg, E285A, Y231X)

●BXXX1 *BCKDHB* (*branched-chain keto acid dehydrogenase E1, beta polypeptide*) (eg, Maple syrup urine disease) gene analysis; common variants (eg, R183P, G278S, E422X)

●BXXX5 *BLM (Bloom syndrome, RecQ helicase-like)* (eg, Bloom syndrome) gene analysis, 2281del6ins7 variant

●FXXX3 *FANCC (Fanconi anemia, complementation group C) (*eg, Fanconi anemia, type C) gene analysis; common variant (eg, IVS4+4A>T)

●GXXX1 *G6PC (glucose-6-phosphatase, catalytic subunit)* (eg, Glycogen storage disease, Type 1a, von Gierke disease) gene analysis; common variants (eg, R83C, Q347X)

●GXXX2 *GBA (glucosidase, beta, acid)* (eg, Gaucher disease) gene analysis; common variants (eg, N370S, 84GG, L444P, IVS2+1G>A)

●HXXX1 *HEXA (hexosaminidase A (alpha polypeptide)* (eg, Tay-Sachs disease) gene analysis; common variants (eg, 1278insTATC, 1421+1G>C, G269S)

●IXXX1 *IKBKAP (inhibitor of kappa light polypeptide gene enhancer in B-cells, kinase complex-associated protein)* (eg, familial dysautonomia) gene analysis; common variants (eg, 2507+6T>C, R696P)

●MXXX1 *MCOLN1* (*mucolipin 1*) (eg, Mucolipidosis, type IV) gene analysis; common variants (eg, IVS3-2A>G, del6.4kb)

●SXXX1 *SMPD1(sphingomyelin phosphodiesterase 1, acid lysosomal)* (eg, Niemann-Pick disease, Type A) gene analysis; common variants (eg, R496L, L302P, fsP330)

(February 2011 CPT Meeting)

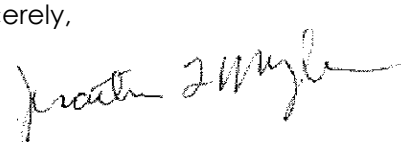
●BXXX7 *BRCA1, BRCA2 (breast cancer 1 and 2)* (eg, hereditary breast and ovarian cancer) gene analysis; full sequence analysis and common duplication/deletion variants in *BRCA1* (ie, exon 13 del 3.835kb, exon 13 dup 6kb, exon 14-20 del 26kb, exon 22 del 510bp, exon 8-9 del 7.1kb)

●BXXX8 185delAG, 5385insC, 6174delT variants

●BXXX9 uncommon duplication/deletion variants

●BXX10 *BRCA1 (breast cancer 1)* (eg, hereditary breast and ovarian cancer) gene analysis; full sequence analysis and common duplication/deletion variants (ie, exon 13 del 3.835kb, exon 13 dup 6kb, exon 14-20 del 26kb, exon 22 del 510bp, exon 8-9 del 7.1kb)

●BXXX11 known familial variant



●BXX12 *BRCA2* (*breast cancer 2*) (eg, hereditary breast and ovarian cancer) gene analysis; full sequence analysis

- ●BXX13 known familial variant
- ●CXX10 Cytogenomic constitutional (genome-wide) microarray analysis; interrogation of genomic regions for copy number variants (eg, Bacterial Artificial Chromosome [BAC] or oligo-based comparative genomic hybridization [CGH] microarray analysis)
- ●CXX11 interrogation of genomic regions for copy number and single nucleotide polymorphism (SNP) variants for chromosomal abnormalities
- ●LXXX1 Long QT syndrome gene analyses (eg, *KCNQ1, KCNH2, SCN5A, KCNE1, KCNE2, KCNJ2, CACNA1C, CAV3, SCN4B, AKAP, SNTA1, and ANK2)*; full sequence analysis
- ●LXXX2 known familial sequence variant
- ●LXXX3 duplication/deletion variants

If you have any questions or concerns, please contact Kim Chisolm, Assistant Director of Economic Affairs at (202) 354-7118 or kchisol@cap.org.

Thank you for providing us the opportunity to present this plan.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81206 Tracking Number M1 Original Specialty Recommended RVU: **0.39**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: BCR/ABL1 (t[9;22]) (eg, chronic myelogenous leukemia) translocation analysis; major breakpoint, qualitative or quantitative

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54-year-old man diagnosed with chronic myelogenous leukemia (CML) on maintenance therapy with imatinib mesylate sees his oncologist for a routine follow-up visit. Molecular studies at diagnosis confirmed the presence of a Philadelphia chromosome with the major breakpoint translocation joining the BCR and ABL1 genes. The patient feels well and has no complaints, and a hemogram in the office demonstrates normal white cell, red cell, and platelet counts. A sample of anticoagulated peripheral blood is submitted to the laboratory for quantitative assessment of BCR/ABL1 major breakpoint transcript level.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality total cellular RNA is isolated and stored under RNase-free conditions. Working in duplicate from this point, reverse transcriptase is used to convert RNA to cDNA followed by quantitative real-time PCR amplification using primers for both the BCR/ABL1 major breakpoint translocation as well as a 'housekeeping gene' necessary to normalize BCR/ABL1 expression levels. Thephysician reviews the real-time PCR tracings to determine the status of the of BCR/ABL1 major breakpoint transcripts, that the assay is performing at acceptable sensitivity, and whether RNA degradation or inhibitors of PCR are present. The physician reviews duplicate values as well as the ratio of BCR/ABL1 to housekeeping gene expression for patient and control samples. Values are converted to an international reporting standard using a previously-determined correction factor for the laboratory's assay. The physician composes a report that describes the transcript status and copy number, and compares these results with the patient's previous results. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Intra-Service intensity/complexity	3.69	3.86
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.39.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?
35,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.
Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 83912-26

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81208 Tracking Number M3 Original Specialty Recommended RVU: **0.46**
Presented Recommended RVU: **0.46**
Global Period: XXX RUC Recommended RVU: **0.46**

CPT Descriptor: BCR/ABL1 (t[9;22]) (eg, chronic myelogenous leukemia) translocation analysis ;other breakpoint, qualitative or quantitative

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old woman visits her primary care physician complaining of abdominal discomfort. Splenomegaly is identified on physical examination. A hemogram demonstrates leukocytosis with a left shift along with modest anemia and thrombocytopenia. Cytogenetic analysis demonstrates a classic Philadelphia chromosome, but studies for BCR/ABL1 major and minor breakpoints are negative. A sample of anticoagulated peripheral blood is submitted to the laboratory for assessment of the uncommon BCR/ABL1 'micro'(u) translocation breakpoint.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality total cellular RNA is isolated and stored under RNase-free conditions. Working in duplicate from this point, reverse transcriptase is used to convert RNA to cDNA followed by qualitative real-time PCR amplification using primers specific for the BCR/ABL1 micro(u) breakpoint translocation as well as a 'housekeeping gene. Thephysician reviews the real-time PCR tracings to the status of a BCR/ABL1 micro breakpoint translocation and whether RNA degradation or inhibitors of PCR are present. The physician composes a report which specifies the status of the translocation. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Pre-Service intensity/complexity	0.00	0.00
Intra-Service intensity/complexity	3.73	3.55
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.46.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated and subjected to multiplex PCR. Following exonuclease I and shrimp alkaline phosphatase treatment, a second reaction using allele specific primer extension (ASPE) amplifies either the normal or mutant allele sequences. Extension products are hybridized to color-coded microspherical beads specific for normal and mutant alleles. The fluorescent signal ratio of mutant to normal alleles is calculated, and the physician examines the allelic ratios to determine the mutation and zygosity status. The physician composes a report which specifies the patient's mutation status and residual risk based on ethnic background. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81221 Tracking Number M5 Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis; known familial variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 1-year-old Caucasian boy whose 6-year-old brother was previously diagnosed with cystic fibrosis is brought by his mother to the pediatrician for genetic testing. The brother was previously demonstrated to be a compound heterozygote carrying one copy each of the common CFTR DeltaF508 mutation as well as a rare variant not included in assays which test for common variants of CFTR but known to cause cystic fibrosis. An anticoagulated peripheral blood sample is sent to the laboratory for testing of these known mutations.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality DNA is isolated from whole blood and subjected to PCR amplification for the respective CFTR gene exons which contain the known familial mutations. Following exonuclease I and shrimp alkaline phosphatase treatment, each PCR product undergoes bidirectional Sanger dideoxynucleotide chain termination sequencing using appropriate forward and reverse primers. Sequencing products are analyzed on a capillary electrophoresis instrument and electropherograms printed for visual inspection and transferred to a software program to identify potential nucleotide sequence changes. The physician composes a report specifying the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.40.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.28.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.tacking codes for the TC and 83912 for the PC.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81223 Tracking Number M7 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis; full gene sequence

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 17-year-old Caucasian female with chronic rhino-sinusitis, idiopathic bronchiectasis and two sweat chloride measurements in the intermediate range (40-60 meq/L) is suspected by her pediatrician of having an atypical form of cystic fibrosis. A tube of anticoagulated peripheral blood is submitted to the laboratory for full CFTR gene sequence analysis.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality DNA is isolated from whole blood and subjected to 29 individual PCR amplification reactions whose products encompass the entire coding sequence, exon-intron boundaries and portions of 5' and 3'-untranslated regions of the CFTR gene. Following exonuclease I and shrimp alkaline phosphatase treatment, each PCR product undergoes bidirectional Sanger dideoxynucleotide chain termination sequencing using appropriate forward and reverse primers. Sequencing products are analyzed on a capillary electrophoresis instrument and electropherograms printed for visual inspection and transferred to a software program to identify potential nucleotide sequence changes. The physician composes a report specifying the patient's mutation status to include information from a literature and database search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Intra-Service intensity/complexity	4.60	4.40
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.52.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

CPT Descriptor: CFTR (cystic fibrosis transmembrane conductance regulator) (eg, cystic fibrosis) gene analysis; intron 8 poly-T analysis (eg, male infertility

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: Following recent consultation with his family physician regarding his wife's difficulty in conceiving a child, a 34-year-old Caucasian male is referred to an urologist for infertility workup. Further examination reveals bilateral absence of the vas deferens. The urologist recommends genetic analysis of the CFTR gene to look for common CFTR mutations and assess the intron 8 poly-T region frequently associated with male infertility. An anticoagulated peripheral blood sample is forwarded to the laboratory for testing.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated and subjected to multiplex PCR. Following exonuclease I and shrimp alkaline phosphatase treatment, a second reaction using allele specific primer extension (ASPE) amplifies either normal or mutant allele sequences including poly-T length variants. Extension products are hybridized to color-coded microspherical beads specific for normal and mutant alleles as well as poly-T length variants in intron 8. The fluorescent signal ratio of mutant, normal and poly-T alleles is calculated, and the physician examines the allelic ratios to determine the mutation, zygosity and specific poly-T allele status. The physician composes a report which specifies the patient's mutation and poly-T status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.22.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81240 Tracking Number M9 Original Specialty Recommended RVU: **0.15**
Presented Recommended RVU: **0.13**
Global Period: XXX RUC Recommended RVU: **0.13**

CPT Descriptor: F2 (prothrombin, coagulation factor II) (eg, hereditary hypercoagulability) gene analysis; 20210G>A variant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old man with anxiety and kidney stones presented with two-week history of shortness of breath and pleuritic chest pain. Diagnostic workup revealed multiple bilateral pulmonary emboli. There was a vague history of other family members having "clotting problems." A sample of anticoagulated peripheral blood is submitted to the laboratory for F2 (Prothrombin, coagulation factor II) mutation testing for the 20210G>A variant.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated. The genomic region containing the site of the F2 20210G>A mutation site is amplified by PCR and the amplicon is then subjected to melting curve analysis. The physician examines the melting curve plot of red fluorescent signal vs. temperature, as well as the plot of the negative first derivative of red fluorescent signal vs. temperature. Based on the analysis of these curves, and comparison to the results obtained with wild type and mutant controls, the physician determines the F2 20210G>A mutation and zygosity status. He or she composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Intra-Service intensity/complexity	2.67	3.00
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.15.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.17.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81243 Tracking Number M11 Original Specialty Recommended RVU: **0.37**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: FMR1 (Fragile X mental retardation 1) (eg, fragile X mental retardation) gene analysis; evaluation to detect abnormal (eg, expanded) alleles

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 17-year-old man with moderate mental retardation (IQ 50 - 60) of above average height with a long narrow face, close set eyes, a highly arched palate, a prominent mandible, joint laxity in his fingers, and macroorchidism, presents to a physician for evaluation for the etiology of his mental retardation. Although his mother was of normal intelligence, his family history was remarkable for having an 18-year-old sister with a mild learning disability, a maternal aunt with premature ovarian failure, and a 68-year-old maternal grandfather with a progressive neurological illness characterized by development of a tremor, followed by difficulties with balance and occasional falling. A previously performed karyotype was normal. A sample of anticoagulated peripheral blood is submitted to the laboratory for FMR1 gene testing.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated. The genomic region containing the site of the CGG trinucleotide repeat region that is expanded in fragile X syndrome is amplified by using a PCR technique. The amplicon are then subjected to analysis using fluorescent capillary electrophoresis. The physician examines the electropherogram and compares it to a sizing ladder to determine the number of CGG repeats within the amplicon. Based on this analysis, the physician determines the patient's FMR1 allele status and whether additional characterization of alleles is necessary. He or she composes a report which specifies the patient's allele status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.37.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

CPT Descriptor: FMR1 (Fragile X mental retardation 1) (eg, fragile X mental retardation) gene analysis; characterization of alleles (eg, expanded size and methylation status)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: During a routine pediatric office visit, the mother of a 10-year-old girl describes what she considers to be unusual shyness leading to apparent social isolation, as well as occasional stereotypic behaviors such as hand wringing. The child attends regular school classes and her performance is somewhat below average. There is no family history of mental retardation or other neurologic problems. Both parents are healthy and of average intelligence and the patient has a 13-year-old brother who is otherwise healthy and performs well in school. The patient had a normal karyotype and array CGH study. FMR1 gene testing performed by gel-based PCR analysis revealed a single allele of normal CGG repeat size, but did not definitely show the presence of a second allele. A sample of anticoagulated peripheral blood is sent to the laboratory for Southern blot testing for fragile X syndrome utilizing a methylation specific enzyme.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, a large quantity of high quality genomic DNA is isolated. Gel electrophoresis of the extracted DNA is performed to assess DNA integrity. The DNA specimen undergoes double restriction digestion with the methylation-sensitive restriction enzyme EagI and the methylation-insensitive restriction enzyme EcoRI. The genomic fragments are separated by gel electrophoresis, transferred to a nylon membrane by capillary action, and hybridized to a labeled probe. The hybridization pattern is visualized on x-ray film by autoradiography. The physician examines the image, compares the observed fragments to a sizing ladder to estimate CGG repeat numbers, and analyzes the patterns generated to assess the methylation status of the promoter region of the expanded FMR1 allele. Based on this analysis the physiciandetermines the patient’s allele status, presence of expanded allele(s) and methylation status of the FMR1 promoter. He or she composes a report which specifies the patient's allele status, approximate allele sizes and promoter methylation status. The report is edited, signed and the results are communicated to the appropriate caregivers

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.51.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81256 Tracking Number M13 Original Specialty Recommended RVU: **0.15**
Presented Recommended RVU: **0.13**
Global Period: XXX RUC Recommended RVU: **0.13**

CPT Descriptor: HFE (hemochromatosis) (eg, hereditary hemochromatosis) gene analysis; common variants (eg, C282Y, H63D)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 38-year-old man is found to have elevated transferrin saturation (65%) and ferritin (800 ng/mL) on routine testing. The patient is otherwise healthy, and his family history is unremarkable. A sample of anticoagulated peripheral blood is submitted to the laboratory for testing for the HFE p. C282Y (c.845G>A) and p. H63D (c.187 C>G) hereditary hemochromatosis mutations.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated. The genomic regions containing the sites of the HFE p. C282Y (c.845G>A) and p. H63D (c.187 C>G) mutations are amplified by PCR and the amplicons are then subjected to melting curve analysis. The physician examines the melting curve plot of red and green fluorescent signals vs. temperature as well as the plot of the negative first derivatives of red and green fluorescent signals vs. temperature. Based on the analysis of these curves, and comparison to the results obtained with wild type and mutant controls, the physician determines the status of the p. C282Y (c.845G>A) and p. H63D (c.187 C>G) mutations and determines the patient's status as homozygous, heterozygous, or compound heterozygous for each of these mutations. He or she composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.15.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality DNA is isolated. Allele specific, real time PCR utilizing hydrolysis probes is performed to amplify a short region spanning the mutation site. Following amplification, genotyping is performed by allelic discrimination, using a mixture of two probes, one of which is specific for the wild type gene, and the other specific for the mutant gene. The physicianl examines a graphical display of the fluorescence signal for the patient's sample, compares the results to mutant and wild type controls, and determines the status of the JAK2 mutant allele. He or she composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.22.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81275 Tracking Number M15 Original Specialty Recommended RVU: **0.50**
Presented Recommended RVU: **0.50**
Global Period: XXX RUC Recommended RVU: **0.50**

CPT Descriptor: KRAS (v-Ki-ras2 Kirsten rat sarcoma viral oncogene) (eg, carcinoma) gene analysis, variants in codons 12 and 13

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male patient presents with fatigue and weight loss. A full history and physical was performed and blood is discovered in the stool. Gastrointestinal endoscopic examination is performed and a large mass lesion in the sigmoid colon is found. Biopsies are taken and demonstrate a moderately differentiated adenocarcinoma of colonic origin. Subsequent radiologic studies identify possible enlarged lymph nodes in the region of the mass lesion. A resection is performed and metastases are identified. KRAS mutation testing is ordered as the patient is a potential candidate for targeted therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: DNA is extracted from a tumor tissue sample. PCR is performed to detect KRAS mutations in a background of wild-type DNA in 8 separate reactions utilizing fluorescent probe-linked primers specific for each of the seven most common mutations in codons 12 and 13 of exon 2 of the KRAS gene, as well as a control reaction that amplifies a region of KRAS exon 4. Thephysicianananalyzes the fluorescent curves that are produced as the PCR products are generated for each reaction. The physician assesses the amplification of internal controls in each reaction and compares the difference between the crossing thresholds of the mutation assay and the control assay to the establish mutation status. The physician composes a report which specifies the mutation status of the patient's tumor and includes a comment on the implications of the lower limit of detection of the test relative to the tumor content of the sample. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88363. The committee calculated an RVU based on using the median survey time and IWPUT for 88363. This number was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.44.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated. The genomic regions containing the sites of the MTHFR c.677C>T and c.1298A>C variants are amplified by multiplex PCR and the resulting amplicons subjected to melting curve analysis. The physician examines the melting curve plots of red and green fluorescent signals vs. temperature as well as the negative first derivative plots of the melting curves. Based on this analysis and comparison of results with appropriate controls, the physician etermines the zygosity status of the c.677C>T and c.1298A>C variants and composes a report specifying the patient's genotype. The report is edited, signed and the results are communicated to appropriate caregivers.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320. The committee calculated an RVU based on using the median survey time and IWPUT for 86320. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.22.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81315 Tracking Number M17 Original Specialty Recommended RVU: **0.39**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: PML/RARalpha, (t(15;17)), (PML-RARA regulated adaptor molecule 1) (eg, promyelocytic leukemia) translocation analysis; common breakpoints (eg, intron 3 and intron 6), qualitative or quantitative

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old previously healthy man presented to his physician complaining of fatigue, weakness, dyspnea, and easy bruising. He was found to have an elevated white blood count, anemia, and severe thrombocytopenia. The peripheral blood smear demonstrated large numbers of promyelocytes. Laboratory studies indicated DIC was present. The patient was emergently started on all trans-retinoic acid an anthracycline and supportive therapy for his coagulopathy. Bone marrow aspiration was performed, cytogenetic studies were ordered, and anticoagulated marrow was immediately sent to the laboratory for PML/RARalpha translocation testing by quantitative real-time PCR.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: Upon receipt of the specimen, total RNA is isolated and assessed for quality. Quantitative real-time reverse transcriptase PCR is performed in three separate tubes to detect and quantify the bcr1, bcr2, and bcr3 breakpoints as well as the Abelson gene (ABL1) in each tube. The physician analyzes the blue fluorescent curves that are produced as the PCR products are generated to determine the status of the translocation. He or she relates the crossing threshold to previously generated standard curves for the PML-RARA and ABL transcripts to determine the normalized and absolute copy numbers of the PML-RARA transcripts present in the specimen at the time of testing. The physician composes a report that describes the transcript status, the specific isoform, and the normalized copy number. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code. The expert panel recommended an RVU of 0.39.

Intra-Service intensity/complexity	3.83	3.67
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291. The committee calculated an RVU based on using the median survey time and IWPUT for 88291. This number

was compared to the survey 25th percentile and the lower of the 25th percentile or calculated value based on comparison with the key reference code was recommended. The expert panel recommended an RVU of 0.31.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000
If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 83912-26

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

Meeting Date: April 2011

Global Period: XXX

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

CAP distributed practice expense surveys to various laboratories throughout the country, assuring that laboratories in various practice settings and sizes were included. The molecular pathologists and their lab managers (when applicable) submitted detailed practice expense recommendations to CAP for clinical labor, supplies, equipment and typical national batch size as well as the batch size in their particular laboratory.

CAP convened an expert panel, comprised of several molecular pathologists, members of the Economic Affairs Committee and the RUC subcommittee. The expert panel reviewed all the recommendations received. The panel adjusted the recommendations to adhere to applicable MoPath standards (i.e. confirm order, accession, extraction, set up, post time, etc). The panel also reviewed all the batch size data collected. The panel then made adjustments to clinical times, supplies and equipment based on batch size.

If you have provide any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

We did not use a comparison code for these recommendations.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical activities for these molecular pathology codes often fall into several broad subcategories. They include (when applicable):

- Confirm Orders
- Accession
- Extraction
- Set Up
- Gel
- Post Processing
- Review and Prepare

To facilitate review by the PEAC committee, we included broad categories of activities on the excel sheets. During our presentation we are prepared to walk the committee through the detail for each procedure, as requested. Although the activities fall into broad categories, the order and terminology is often different.

Below is a summary of our recommendations:

Tier	CPT Code	CPT Code Descriptor	Batch Size	Rec Times
Tier 1	BXXX2	*BCR/ABL 1; major breakpoint*	2	146
	BXXX3	*BCR/ABL 1; minor breakpoint*	1	176
	BXXX4	*BCR/ABL 1; other breakpoint*	1	176
	CXXX1	*CFTR (cystic fibrosis); common variants*	5	40
	CXXX2	*CFTR (cystic fibrosis); known familial variants*	1	211
	CXXX3	*CFTR (cystic fibrosis); duplication/deletion variants*	1	237
	CXXX4	*CFTR (cystic fibrosis); full gene sequence*	1	345
	CXXX5	*CFTR (cystic fibrosis); intron 8 poly-T analysis*	5	66
	FXXX1	*F2 gene analysis; 20210G>A variant*	5	39
	FXXX2	*F5 gene analysis; Leiden variant*	5	39
	FXXX4	*FMR1 (Fragile X mental retardation 1) gene analysis; evaluation to detect abnormal alleles*	5	67
	FXXX5	*FMR1 (Fragile X mental retardation 1) gene analysis; characterization of alleles*	1	174
	HXXX2	*HFE gene analysis; common variants*	5	68
	JXXX1	*JAK2 gene analysis; V617F variant*	3	116
	KXXX1	*KRAS gene analysis; variants in codons 12 and 13*	3	170
	MXXX2	*MTHFR gene analysis; common variants*	2	141
	PXXX1	*PML/RARalpha translocation analysis; common breakpoints*	1	150
	PXXX2	*PML/RARalpha translocation analysis; single breakpoints*	1	150

Tier	CPT Code	CPT Code Descriptor	Batch Size	Rec Times
Tier 2	L2XX1	*Molecular pathology procedure, Level 1 (eg, identification of single germline variant [eg, SNP] by techniques such as restriction enzyme digestion or melt curve analysis)*	2	89
	L2XX2	*Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)*	2	141
	L2XX3	*Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon)*	2	182
	L2XX4	*Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicon using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)*	2	205
	L2XX5	*Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)*	1	217
	L2XX6	*Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)*	1	228
	L2XX7	*Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)*	1	250
	L2XX8	*Molecular pathology procedure, Level 8 (eg, analysis of 26-50 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of >50 exons, sequence analysis of multiple genes on one platform)*	1	355
	L2XX9	*Molecular pathology procedure, Level 9 (eg, analysis of >50 exons in a single gene by DNA sequence analysis)*	1	455

Intra-Service Clinical Labor Activities:
N/A

Post-Service Clinical Labor Activities:

- Enter results in lab information system after physician interpretation.
- Prepare, pack and transport specimens and records for in-house storage and external storage

- Dispose of remaining specimens, spent chemicals/other consumables, and hazardous waste
- Clean Room
- Perform station maintenance including system rinse and dry
- Perform scheduled data management back-up

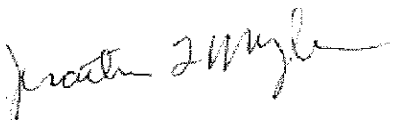
April 20, 2011

Sherry L. Smith, MS, CPA
Director
Physician Payment Policy and Systems
American Medical Association
515 North State Street
Chicago, Illinois 60654

Dear Ms. Smith,

This letter is in follow up to our conversation from last week in which we discussed some of the concerns of the RUC's Practice Expense Subcommittee concerning the molecular pathology codes.

One area of concern of the subcommittee members pertained to who was involved in determining the practice expense inputs. From our molecular experts, we compiled a list of laboratories for each code that performed the various assays. The expert panel then selected one laboratory to recommend practice expense inputs for each code. The laboratories selected represented a full spectrum of laboratory sizes as well as practice types. Academic institutions as well as large commercial laboratories were also included in the laboratories that provided inputs. Each laboratory also indicated to us what their typical batch size was and also recommended a typical batch size for all laboratories performing the test for that code.



CAP's expert committee, which included members of our RBRVS workgroup as well as molecular experts, reviewed the practice expense inputs and batch sizes. Many of the steps are similar in various codes and allowed comparisons to be made. The batch sizes recommended to the RUC's Practice Expense Subcommittee from CAP were significantly larger than that recommended by the laboratories and the times for each step were typically a fraction of what the laboratory recommended.

In follow up to the Practice Expense Subcommittee's question concerning frequency, I indicated that in the existing coding scheme, it is not possible to reliably determine frequency data for the various codes. In fact, the AMA-CPT molecular pathology workgroup did investigate obtaining frequency data over a period of two years and ultimately concluded that reliable frequency data could not be obtained. Many laboratories would provide generalized percent distribution data, but would not provide specific numbers. However, the committee did conclude that the overwhelming highest volume test in frequency for molecular pathology was cystic fibrosis testing. This may not be applicable to the Medicare population. From review of the ICD 9 codes for the current way the professional services are coded (with CPT code 83912), it is not possible to reliably determine the frequency of molecular pathology codes under review. However, in our previous conversation, you indicated that the AMA would be willing to work with us using additional data available to the AMA to assist CAP in attempting to make this determination. For subcommittee guidance, anything with a batch size greater than two for any code listed in Tier 1 would be one of the higher frequency codes. Tier 2 codes are anticipated to be less than ten percent of total billed molecular pathology services and will not be considered high frequency codes. The batch size was increased in levels 1 through 4 to reduce times and maintain rank order with the rest of the Tier 2 codes.

I hope these comments have been helpful to you. Please do not hesitate to contact me if you have any questions.

Cordially,

,

Jonathan L. Myles, MD, FCAP
RUC Advisor
College of American Pathologists

13	**Confirm** orders	L033A	Lab Tech	1
14	**Accession** specimen, label and prepare specimen for storage until scheduled processing date	L033A	Lab Tech	6
15	**DNA Extraction**	L045A	Cytotechnologist	4
16	sort and rack specimen according to test requested			
17	place blood sample on rocker			
18	Place tips and microtiter plate on Qiagen 9604			
19	Remove cap from blood tube			
20	place blood sample in Qiagen 9604 rack and allow instrument to read bar code and aliquot blot into microtiter plate			
21	Create plate map for testing and IT interface			
22	Cap blood tube and return specimen to refrigerator until testing completed			
23	Place tips, reagents and microtiter plates on Qiagen M96			
24	Place microtiter plate with blood sample on Qiagen M96			
25	discard DNA extraction waste (liquids and solids)			
26	**PCR Set Up**			13
27	Assemble PCR Primers, buffer, etc… into plates			
28	combine reagents for PCR master mix			
29	Place tips, PCR reagents and PCR reaction plate on Biomek 2000			
30	Remove extracted DNA from Qiagen M96 and place on Biomek 2000			
31	Allow instrument to set up PCR reaction			
32	Cover plate with sealing mat			
33	discard Biomek 2000 tips from PCR set up			
34	Place PCR reaction plate in ABI 9700 thermal cycler, enter CF PCR program, and allow instrument to perform multiplex PCR			
35	Cover plate with sealing mat			
36	discard Biomek 2000 tips from PCR set up			
37	**Gel Check**	L045A	Cytotechnologist	13
38	Spin down PCR plate (Gel Check)			
39	Combine 2ul of Sample with 10 ul water (Gel Check)			
40	Add samples to E-Gel			
41	Photograph Gel			
42	Save Image and Annotate			
43	**PCR Post Processing 1**	L045A	Cytotechnologist	17
44	Create CIAP/EXO Mix			
45	Add Mix to plate			
46	Add samples to mix			
47	Place on 9700 Cycler			
48	**Dye Term Cycle**	L045A	Cytotechnologist	13
49	Prepare Sequencing plates			
50	Prepare Sequencing Big Dye Master Mix			
51	Aliquot Big Dye master mix			
52	Add template			
53	Seal, vortex, spin			
54	Place on 9700 Cycler			
55	**Dye Term Clean Up**	L045A	Cytotechnologist	24
56	Make fresh Sodium Acetat/ETOH			
57	Add to Sequencing Samples			
58	Spin Down for 20 min			
59	Invert plate on towels			
60	Quick spin plate			
61	Make fresh 70% ETOH			
62	Add ETOH to wells			
63	Spin for 5 min			
64	Quick spin plate			
65	Add Hi Di and Seq Standard			
66	Add Hi Di and Seq Standard			
67	Ensure sequencer is ready to load by changing buffers, water, and waste. Make sure “OUT” stack is empty			
68	**Sequencing**	L045A	Cytotechnologist	5
69	Load plate onto sequencer			
70	Create new sample sheet using batch name/sample number			
71	Check capillary array after run is completed			

	A	B	C	D
1	AMA Specialty Society RVS Update Committee Recommendation			**81221**
2	**Meeting Date: April 2011** **Specialty: Pathology** *Typical Batch Size - 2*			*CFTR (cystic fibrosis transmembrane conductance regulator)* (eg, cystic fibrosis) gene analysis; known familial variants
3		**CMS Code**	**Staff Type**	**Total Minutes**

14	**Accession** specimen, label and prepare specimen for storage until scheduled processing date	L033A	Lab Tech	6
15	**DNA Extraction**	L045A	Cytotechnologist	4
16	sort and rack specimen according to test requested			
17	place blood sample on rocker			
18	Place tips and microtiter plate on Janus PE			
19	Remove cap from blood tube			
20	Check the reagent levels.			
21	Check the waste container level.			
22	Verify availability of all necessary disposables			
23	Write ID # in the input tube (red cap) and output tube (blue cap).			
24	Confirm that Autopure LS, and computer are powered on.			
25	Confirm the system waste bottle is not full.			
26	Verify ID number on sample tube matches ID number on aliquot tube and transfer blood to input tube.			
27	Place samples into appropriate position in sample racks and verify that the input tube matches the output tube.			
28	Place sample racks into appropriate position on deck surface of Autopure LS.			
29	Enter user ID, password and log on.			
30	Initialize and Prime for the reagents			
31	On main menu start your run by clicking on “set up rack” and follow through.			
32	Enter the ID # for input and output tubes on the computer.			
33	Click on “select rack” and “start run”.			
34	After run, remove tubes from Autopure, discard input tubes			
35	Place output tubes in 65°C incubator for 1 hr			
36	Remove tubes, place them on a platform to rotate overnight at room tenperature .			
37	Place DNA output tubes in numerical order			
38	Transfer DNA to labeled 1.5 ml tubes.			
39	Pipette with 1ml pipette tip to completely dissolve DNA			
40	Quant on Flourometer or Spectramax. Remix, dilute and requant as necessary.			
41	Label side of tube with quant			
42	Place DNA in appropriate box.			
43	discard DNA extraction waste (liquids and solids)			
44	**PCR Set Up**	L045A	Cytotechnologist	28
45	Place tips, PCR reagents and PCR reaction plate into the hood.Prepare the PCR master mix.			
46	Add the master mix to the reagent plate			
47	Using extracted DNA make nessesary dilutions			
48	Add extracted DNA & control per well per sample			
49	Set up PCR reaction			
50	Cover plate with sealing mat, vortex and spin down in the plate centrifuge			
51	Place PCR reaction plate in ABI 9700 thermal cycler, enter CFDel/Dup PCR program, and allow instrument to perform multiplex PCR			
52	**PCR Post Processing**	L045A	Cytotechnologist	55
53	Pull the PCR reaction plate out of ABI 9700 thermal cycler to be stored or to proceed with next step			
54	Pull the loading mix reagents (HiDi Formamide and GeneScan 350 ROX Size Standard) out of the freezer, let them thaw out			
55	Make the loading mix by combining HiDi formamide and GeneScan 350 ROX Size Standard			
56	Spin down a PCR plate			
57	Add a loading mix into each well of an ABI optical plate			
58	Add pcr product to each well			
59	Cover the plate with septa and vortex the loading tray, and then spin down in the plate centrifuge.			
60	Place the plate in 95^{o}C heat block for 5 minutes, then place on ice until use			
61	Prepare 3100 instrument for capillary electrophoresis (upload plate map, add buffer, POP6, capillary array, 16-well septa)			
62	Generate the plate record with template in Excel			

	A	B	C	D

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2011

Molecular Pathology-Tier 1

The CPT Editorial Panel has developed a new coding structure to describe molecular pathology services, based on the efforts and recommendations of the Molecular Pathology Coding Workgroup convened beginning in October 2009. In October 2010 and February 2011, the Panel accepted 92 Tier 1 codes, which are a list of gene-specific and genomic analysis CPT codes for high-volume molecular pathology services. These services were previously reported with a series of "stacking codes." The RUC understands that payment for these services is currently based on a mixture of payment methodologies, including the physician fee schedule and the clinical lab fee schedule. CMS requested that the RUC review data provided by the College of American Pathologists to provide the agency with more information, as a policy is developed to determine which payment schedule is appropriate for these services. In April 2011, the RUC recommended physician work and time values for 18 Tier I codes. In September 2011, the specialty presented data on the remaining 52 services. At this time, the specialty indicated that interpretation is not typically performed by a physician for the remaining Tier I codes.

81225 CYP2C19 (cytochrome P450, family 2, subfamily C, polypeptide 19) (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *4, *8, *17)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81225 was 13 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that although the time associated with the key reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is slightly more than the surveyed code, 81225 is a more complex and intense service perform. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.37, the survey's 25th percentile, for CPT code 81225**.

81245 FLT3 (fms-related tyrosine kinase 3) (eg, acute myeloid leukemia), gene analysis, internal tandem duplication (ITD) variants (ie, exons 14, 15)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81245 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

more time than the surveyed code.. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.37, the survey's 25th percentile, for CPT code 81245**.

81350 UGT1A1 (UDP glucuronosyltransferase 1 family, polypeptide A1) (eg, irinotecan metabolism), gene analysis, common variants (eg, *28, *36, *37)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81350 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time than the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physicianwork and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.37, the survey's 25th percentile, for CPT code 81350**.

81227 CYP2C9 (cytochrome P450, family 2, subfamily C, polypeptide 9) (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *5, *6)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81227 was 14 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that although the time associated with the key reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is slightly more than the surveyed code, 81227 is a more complex and intense service to perform. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.38, the survey's 25th percentile, for CPT code 81227**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81355 VKORC1 (vitamin K epoxide reductase complex, subunit 1) (eg, warfarin metabolism), gene analysis, common variants (eg, -1639/3673)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81355 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that although the time associated with the key reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is slightly more than the surveyed code, 81355 is a more complex and intense service to perform. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.38, the survey's 25th percentile, for CPT code 81355**.

81310 NPM1 (nucleophosmin) (eg, acute myeloid leukemia) gene analysis, exon 12 variants

The RUC reviewed the survey data as presented by the specialty society which indicated that the 75th percentile for time for 81310 was 19 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time than the surveyed code.. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.39, the survey's 25th percentile, for CPT code 81310**.

81331 SNRPN/UBE3A (small nuclear ribonucleoprotein polypeptide N and ubiquitin protein ligase E3A) (eg, Prader-Willi syndrome and/or Angelman syndrome), methylation analysis

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81331 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time than the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.39, the survey's 25th percentile, for CPT code 81331**.

81265 Comparative analysis using Short Tandem Repeat (STR) markers; patient and comparative specimen (eg, pre-transplant recipient and donor germline testing, post-transplant non-hematopoietic recipient germline [eg, buccal swab or other germline tissue sample] and donor testing, twin zygosity testing, or maternal cell contamination of fetal cells)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81265 was 17 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with the key reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is exactly the same as the surveyed code, however, 81265 overall is a more complex and intense service to perform. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.40, the survey's 25th percentile, for CPT code 81265**.

81266 Comparative analysis using Short Tandem Repeat (STR) markers; each additional specimen (eg, additional cord blood donor, additional fetal samples from different cultures, or additional zygosity in multiple birth pregnancies)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81266 was 15 minutes. The RUC agreed that this time accurately reflects the amount of physician time required to perform the service. The RUC agreed with the specialty that although the time associated with the key reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is slightly more than the surveyed code, 81266 is overall a more intense procedure to perform. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.41, the survey's 25th percentile, for CPT code 81266**.

81267 Chimerism (engraftment) analysis, post transplantation specimen (eg, hematopoietic stem cell), includes comparison to previously performed baseline analyses; without cell selection
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81267 was 18 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

more time than the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires less physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.45, the survey's 25th percentile, for CPT code 81267**.

81268 Chimerism (engraftment) analysis, post-transplantation specimen (eg, hematopoietic stem cell), includes comparison to previously performed baseline analyses; with cell selection (eg, CD3, CD33), each cell type

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81268 was 20 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires similar time to perform compared to the surveyed code, 81268. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires less work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.51, the survey's 25th percentile, for CPT code 81268**.

81226 CYP2D6 (cytochrome P450, family 2, subfamily D, polypeptide 6) (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *4, *5, *6, *9, *10, *17, *19, *29, *35, *41, *1XN, *2XN, *4XN)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81226 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time to perform compared to the surveyed code, 81226. The specialty society also explained, and the RUC agreed, that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.43, the survey's 25th percentile, for CPT code 81226**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81301 Microsatellite instability analysis (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) of markers for mismatch repair deficiency (eg, BAT25, BAT26), includes comparison of neoplastic and normal tissue, if performed
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81301 was 20 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires similar physician time and intensity to perform compared to the surveyed code, 81301. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires less work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.50, the survey's 25th percentile, for CPT code 81301**.

81261 IGH@ (Immunoglobulin heavy chain locus) (eg, leukemias and lymphomas, B-cell), gene rearrangement analysis to detect abnormal clonal population(s); amplification methodology (eg, polymerase chain reaction)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81261 was 21 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires similar physician time and intensity to perform compared to the surveyed code, 81261. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires less work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.52, the survey's 25th percentile, for CPT code 81261**.

81342 TRG@ (T cell antigen receptor, gamma) (eg, leukemia and lymphoma), gene rearrangement analysis, evaluation to detect abnormal clonal population(s)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81342 was 25 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires less physician time and intensity to perform compared to the surveyed code, 81342. The specialty society also explained that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time **Based on these comparisons, the**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RUC recommends a work RVU of 0.57, the survey's 25th percentile, for CPT code 81342.

81264 IGK@ (Immunoglobulin kappa light chain locus) (eg, leukemia and lymphoma, B-cell), gene rearrangement analysis, evaluation to detect abnormal clonal population(s)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81264 was 22 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that although the key reference code 88182 *Flow cytometry, cell cycle or DNA analysis* (total time = 20 minutes, work RVU = 0.77) requires less time compared to the surveyed code, 81264, the reference code is overall a more intense service to perform. The RUC also compared this service to 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site*, (Intra-time=20 minutes, Work RVU=0.60) which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.58, the survey's 25th percentile, for CPT code 81264**.

81262 IGH@ (Immunoglobulin heavy chain locus) (eg, leukemias and lymphomas, B-cell), gene rearrangement analysis to detect abnormal clonal population(s); direct probe methodology (eg, Southern blot)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81262 was 20 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that although the key reference code 88182 *Flow cytometry, cell cycle or DNA analysis* (total time = 20 minutes, work RVU = 0.77) requires similar time compared to the surveyed code, 81262, the reference code is overall a more intense service to perform. The RUC also compared this service to 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site*, (Intra-time=20 minutes, Work RVU=0.60) which requires similar physician work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.61, the survey's 25th percentile, for CPT code 81262**.

81210 BRAF (v-raf murine sarcoma viral oncogene homolog B1) (eg, colon cancer), gene analysis, V600E variant
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81210 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time and intensity to perform compared to the surveyed code, 81210. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar physician work and time to perform. The

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

specialty society also explained that this service keeps rank order with Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons),* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.37, the survey's 25th percentile, for CPT code 81210**.

81263 IGH@ (Immunoglobulin heavy chain locus) (eg, leukemia and lymphoma, B-cell), variable region somatic mutation analysis
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81263 was 23 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires less work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons),* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.52, the survey's 25th percentile, for CPT code 81263**.

81332 SERPINA1 (serpin peptidase inhibitor, clade A, alpha-1 antiproteinase, antitrypsin, member 1) (eg, alpha-1-antitrypsin deficiency), gene analysis, common variants (eg, *S and *Z)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81332 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) is more than the surveyed code. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar work and time to perform. The specialty society also explained that this service keeps rank order with Tier 2 code 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat*), which the RUC recommended at this meeting 0.40 work RVUs for 15 minutes of intra-service time. **Based on these comparisons, the RUC recommends a work RVU of 0.40, the survey's 25th percentile, for CPT code 81332**.

81257 HBA1/HBA2 (alpha globin 1 and alpha globin 2) (eg, alpha thalassemia, Hb Bart hydrops fetalis syndrome, HbH disease), gene analysis, for common deletions or variant (eg, Southeast Asian, Thai, Filipino, Mediterranean, alpha3.7, alpha4.2, alpha20.5, and Constant Spring)
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time. The RUC agreed that 20 minutes accurately

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

reflects the amount of time required to perform the service. The RUC also agreed with the specialty that the time associated with the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) is similar compared to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.50 for CPT code 81257**.

81340 TRB@ (T cell antigen receptor, beta) (eg, leukemia and lymphoma), gene rearrangement analysis to detect abnormal clonal population(s); using amplification methodology (eg, polymerase chain reaction)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81340 was 25 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared the surveyed code to 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site* (Intra-service time=20minutes, Work RVU=0.60) and noted that the surveyed code required more time to perform than the reference code. The specialty society also explained that this service keeps rank order with Tier 2 code 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon,* which the RUC recommended at this meeting 0.50 work RVUs for 20 minutes of intra-service time **Based on these comparisons, the RUC recommends a work RVU of 0.63, the survey's 25th percentile, for CPT code 81340.**

81293 MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires much less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81293**.

81296 MSH2 (mutS homolog 2, colon cancer, nonpolyposis type 1) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants
The specialty society explained that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

RVU=0.38), which requires much less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81296**.

81299 MSH6 (mutS homolog 6 [E. coli]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is less complex and requires less physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81299**.

81303 MECP2 (methyl CpG binding protein 2) (eg, Rett syndrome) gene analysis; known familial variant
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. However, the surveyed code requires less intensity to perform than the reference code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is less complex and requires less physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81303**.

81304 MECP2 (methyl CpG binding protein 2) (eg, Rett syndrome) gene analysis; duplication/deletion variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is less complex and requires less physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81304**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81318 PMS2 (postmeiotic segregation increased 2 [S. cerevisiae]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* which the RUC recommended at this meeting 0.52 work RVUs for 28 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which is less complex and requires less physician work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.52 for CPT code 81318.**

81300 MSH6 (mutS homolog 6 [E. coli]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; duplication/deletion variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81404 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* which the RUC recommended at this meeting 0.65 work RVUs for 30 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.65 for CPT code 81300.**

81302 MECP2 (methyl CpG binding protein 2) (eg, Rett syndrome) gene analysis; full sequence analysis
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81404 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* which the RUC recommended at this meeting 0.65 work RVUs for 30 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.65 for CPT code 81302.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81294 MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; duplication/deletion variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* which the RUC recommended at this meeting 0.80 work RVUs for 30 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.80 for CPT code 81294.**

81297 MSH2 (mutS homolog 2, colon cancer, nonpolyposis type 1) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; duplication/deletion variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* which the RUC recommended at this meeting 0.80 work RVUs for 30 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.80 for CPT code 81297.**

81298 MSH6 (mutS homolog 6 [E. coli]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* which the RUC recommended at this meeting 0.80 work RVUs for 30 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.80 for CPT code 81298.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81319 PMS2 (postmeiotic segregation increased 2 [S. cerevisiae]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; duplication/deletion variants
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* which the RUC recommended at this meeting 0.80 work RVUs for 30 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC also compared this service to 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (intra-time=20 minutes, work RVU=0.52), which requires less work and time to perform. The RUC also compared this code to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.80 for CPT code 81319.**

81292 MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia,* which the RUC recommended at this meeting 1.40 work RVUs for 60 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared this code to 96204 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires more work and time to perform. The RUC also compared the surveyed code to 88325 *Consultation, comprehensive, with review of records and specimens, with report on referred material* (Intra-service time=80minutes, work RVU=2.50) and acknowledged that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 1.40 for CPT code 81292.**

81295 MSH2 (mutS homolog 2, colon cancer, nonpolyposis type 1) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia,* which the RUC recommended at this meeting 1.40 work RVUs for 60 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared this code to 96204 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires more work and time to perform. The RUC also compared the surveyed code to 88325 *Consultation, comprehensive, with review of records and specimens, with report on referred material* (Intra-service time=80minutes, work RVU=2.50) and acknowledged that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 1.40 for CPT code 81295.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81317 PMS2 (postmeiotic segregation increased 2 [S. cerevisiae]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis
The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 code 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia,* which the RUC recommended at this meeting 1.40 work RVUs for 60 minutes of intra-service time. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared this code to 96204 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Intra-time=40 minutes, work RVU=0.94) and noted that the surveyed code requires more work and time to perform. The RUC also compared the surveyed code to 88325 *Consultation, comprehensive, with review of records and specimens, with report on referred material* (Intra-service time=80minutes, work RVU=2.50) and acknowledged that the surveyed code requires less work and time to perform. **Based on these comparisons, the RUC recommends a work RVU of 1.40 for CPT code 81317.**

81341 TRB@ (T cell antigen receptor, beta) (eg, leukemia and lymphoma), gene rearrangement analysis to detect abnormal clonal population(s); using direct probe methodology (eg, Southern blot)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81341 was 19 minutes. The RUC agreed that this time accurately reflects the amount of physician time required to perform the service. The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (work RVU=0.45) The RUC agreed that this work RVU accurately reflected the amount of effort required to perform the service. The RUC compared this code to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (Intra-Service time=15 minutes, work RVU=0.38) and noted that the surveyed code requires more time and work to perform than the reference code. Further, the RUC compared the surveyed code to 95251 *Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; interpretation and report* (Intra-Service time=30 minutes, Work RVU=0.85) and noted that the surveyed code requires less work and time compared to this reference code. **Based on these comparisons, the RUC recommends 0.45 Work RVUs for 81341.**

81370 HLA Class I and II typing, low resolution (eg, antigen equivalents); HLA-A, -B, -C, -DRB1/3/4/5, and -DQB1
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81370 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site* (total time = 20 minutes, work RVU = 0.60) is more than the surveyed code. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which although

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

requires similar time to perform is overall a less complex and intense service to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.54, the survey's 25th percentile, for CPT code 81370**.

81371 HLA Class I and II typing, low resolution (eg, antigen equivalents); HLA-A, -B, and -DRB1/3/4/5 (eg, verification typing)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81371 was 30 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time=20 minutes, work RVU=0.52) is less than the surveyed code and that the reference code requires less intensity to perform. Further, the RUC also compared this service to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (intra-time=40 minutes, work RVU=0.94), which requires more work and time to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.60, the survey's 25th percentile, for CPT code 81371**.

81372 HLA Class I typing, low resolution (eg, antigen equivalents); complete (ie, HLA-A, -B, and -C)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81372 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for diagnosis, first evaluation episode, each site* (total time=20 minutes, work RVU=0.60) is more than the surveyed code and that the reference code requires more intensity to perform. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which although it requires similar time to perform, it is a less complex and intense service to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.52, the survey's 25th percentile, for CPT code 81372**.

81373 HLA Class I typing, low resolution (eg, antigen equivalents); one locus (eg, HLA-A, -B, or -C), each
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81373 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is similar compared to the surveyed code and that the reference code requires similar intensity to perform compared to this reference code. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which also requires similar time and intensity to perform compared to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.37, the survey's 25th percentile, for CPT code 81373**.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

81374 HLA Class I typing, low resolution (eg, antigen equivalents); one antigen equivalent (eg, B*27), each
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81374 was 13 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 86320 *Immunoelectrophoresis; serum* (total time = 17 minutes, work RVU = 0.37) is slightly more compared to the surveyed code and that the reference code requires slightly more intensity to perform compared to this reference code. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which also requires slightly more time to perform compared to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.34, the survey's 25th percentile, for CPT code 81374**.

81375 HLA Class II typing, low resolution (eg, antigen equivalents); HLA-DRB1/3/4/5 and -DQB1
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81375 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 88182 *Flow cytometry, cell cycle or DNA analysis* (total time = 20 minutes, work RVU = 0.77) is more than the surveyed code and that the reference code requires more intensity to perform. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which although it requires similar time to perform the reference code is a less complex and intense service to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.60, the survey's 25th percentile, for CPT code 81375**.

81376 HLA Class II typing, low resolution (eg, antigen equivalents); one locus (eg, HLA-DRB1/3/4/5, -DQB1, -DQA1, -DPB1, or -DPA1), each
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81376 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 88182 *Flow cytometry, cell cycle or DNA analysis* (total time = 20 minutes, work RVU = 0.77) is more than the surveyed code.. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which although it requires similar time to perform the reference code is less complex and intense service to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.50, the survey's 25th percentile, for CPT code 81376**.

81377 HLA Class II typing, low resolution (eg, antigen equivalents); one antigen equivalent, each
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81377 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC agreed with the specialty that the time associated with reference code 88172 *Cytopathology, evaluation of fine needle aspirate; immediate cytohistologic study to determine adequacy for*

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

diagnosis, first evaluation episode, each site (total time = 20 minutes, work RVU = 0.60) is more than the surveyed code. Further, the RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which although requires similar time to perform it is a less intense service to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.43, the survey's 25th percentile, for CPT code 81377**.

81378 HLA Class I and II typing, high resolution (ie, alleles or allele groups), HLA-A, -B, -C, and -DRB1
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81378 was 20 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The specialty society recommended and the RUC agreed that the best way to develop a work RVU for this service was to directly crosswalk it to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (work RVU=0.45). The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires similar time compared to the surveyed code, 81378. However, this reference code is a slightly more intense procedure to perform in comparison to the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar time to perform however, the surveyed code is more complex and intense to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.45 for CPT code 81378**.

81379 HLA Class I typing, high resolution (ie, alleles or allele groups); complete (ie, HLA-A, -B, and -C)
The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81379 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The specialty society recommended and the RUC agreed that the best way to develop a work RVU for this service was to directly crosswalk it to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (work RVU=0.45). The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time compared to the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar time to perform however, the surveyed code is more complex and intense to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.45 for CPT code 81379**.

81380 HLA Class I typing, high resolution (ie, alleles or allele groups); one locus (eg, HLA-A, -B, or -C), each

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey data as presented by the specialty society which indicated that the median physician time for 81380 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The specialty society recommended and the RUC agreed that the best way to develop a work RVU for this service was to directly crosswalk it to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (work RVU=0.45). The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time compared to the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar time to perform however, the surveyed code requires more intensity to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.45 for CPT code 81380**.

81381 HLA Class I typing, high resolution (ie, alleles or allele groups); one allele or allele group (eg, B*57:01P), each
The specialty society recommended and the RUC agreed that the best way to evaluate this service was to directly crosswalk it to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (Intra-service=12minutes, work RVU=0.45) as these services require the same time and intensity to perform. The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time compared to the surveyed code, 81381 and this reference code is a slightly more intense procedure to perform in comparison to the surveyed code. **Based on these comparisons, the RUC recommends a work RVU of 0.45 for CPT code 81381**.

81382 HLA Class II typing, high resolution (ie, alleles or allele groups); one locus (eg, HLA-DRB1, -DRB3,-DRB4, -DRB5, -DQB1, -DQA1, -DPB1, or -DPA1), each
The RUC reviewed the survey data as presented by the specialty society which indicated that the median physician time for 81382 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The specialty society recommended and the RUC agreed that the best way to develop a work RVU for this service was to directly crosswalk it to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (work RVU=0.45). The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time compared to the surveyed code, 81382 and this reference code is a slightly more intense procedure to perform in comparison to the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar time to perform however, the surveyed code is requires more complex and intense to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.45 for CPT code 81382**.

81383 HLA Class II typing, high resolution (ie, alleles or allele groups); one allele or allele group (eg, HLA-DQB1*06:02P), each

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81383 was 15 minutes. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The specialty society recommended and the RUC agreed that the best way to develop a work RVU for this service was to directly crosswalk it to 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node)* (work RVU=0.45). The RUC agreed with the specialty that the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (total time = 20 minutes, work RVU = 0.52) requires more time compared to the surveyed code, 81383 and this reference code is a slightly more intense procedure to perform in comparison to the surveyed code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), which requires similar time to perform however, the surveyed code is more complex and intense to perform. **Based on these comparisons, the RUC recommends a work RVU of 0.45 for CPT code 81383**.

Practice Expense

The specialty provided data based on assumed batch sizes and modified these batch size estimates to ensure maximum efficiency for today's practice. However the RUC agreed that the batch sizes should be re-examined when greater experience is available for these services. Further, The specialty society explained that the majority of these services are being crosswalked with minor differences to the practice expense inputs associated with the molecular pathology services that were approved at the April 2011 RUC Meeting. The remainder of the Molecular Pathology services, specifically, the HLA services, had new practice expense inputs. The PE Subcommittee reviewed all the recommended practice expense inputs over a conference call and during the PE Subcommittee meeting and made minor changes mostly pertaining to duplication in supplies and equipment, which were all subsequently approved by the RUC.

Work Neutrality

Reviewing the Medicare utilization data for 83912 *Molecular diagnostics; interpretation and report* (work RVU = 0.37) and the specialty's estimate of utilization of these individual services, the RUC understands that these recommendations will be work neutral to the family.

New Technology

The entire set of molecular pathology codes should be re-reviewed after claims data are available and there is experience with the new coding system. The physician time, work, and practice expense inputs should all be reviewed again in the future as these estimates are based on a good faith effort using available information in 2011.

Flagging in the RUC Database

The RUC recommends that all of the molecular pathology services with less than 30 survey responses should be flagged in the RUC database so that they are not used to validate the proposed work associated with any CPT codes under RUC review.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Source of Current Work RVU*	Work RVU Recommendation
Pathology and Laboratory **Molecular Pathology** **Tier 1 Molecular Pathology Procedures**					
Molecular pathology procedures are medical laboratory procedures involving the analyses of nucleic acid to detect variants in genes that may be indicative of germline (eg, constitutional disorders) or somatic (eg, neoplasia) conditions, or to test for histocompatibility antigens (eg, HLA). Code selection is typically based on the specific gene(s) that is being analyzed. Genes are described using Human Genome Organization (HUGO) approved gene names and are italicized in the code descriptors. Gene names were taken from tables of the HUGO Gene Nomenclature Committee (HGNC) at the time the CPT codes were developed. For the most part, Human Genome Variation Society (HGVS) recommendations were followed for the names of specific molecular variants. The familiar name is used for some variants because defined criteria were not in place when the variant was first described or because HGVS recommendations were changed over time (eg, intronic variants, processed proteins). When the gene name is represented by an abbreviation, the abbreviation is listed first, followed by the full gene name italicized in parentheses (eg, "F5 *[coagulation Factor V]*"), except for the HLA series of codes. Proteins or diseases commonly associated with the genes are listed as examples in the code descriptors. The examples do not represent all conditions in which testing of the gene may be indicated. Codes that describe tests to assess for the presence of gene variants (see definitions) use common gene variant names. Typically, all of the listed variants would be tested. However, these lists are not exclusive. If other variants are also tested in the analysis, they would be included in the procedure and not reported separately. Full gene sequencing should not be reported using codes that assess for the presence of gene variants unless specifically stated in the code descriptor. The molecular pathology codes include all analytical services performed in the test (eg, cell lysis, nucleic acid stabilization, extraction, digestion, amplification, and detection). Any procedures required prior to cell lysis (eg, microdissection, codes 88380 and 88381) should be reported separately. The molecular pathology codes include all analytical services performed in the test (eg, cell lysis, nucleic acid stabilization, extraction, digestion, amplification, and detection). Any procedures required prior to cell lysis (eg, microdissection, codes 88380 and 88381) should be reported separately. The results of the procedure may require interpretation by a physician. When only the interpretation and report are performed, modifier 26 may be appended to the specific molecular pathology code. All analyses are qualitative unless otherwise noted. For microbial identification, see 87149-87153 and 87470-87801, and 87900-87904. For in situ hybridization analyses, see 88271-88275 and 88365-88368.

Human Leukocyte Antigen (HLA) typing is performed to assess compatibility of recipients and potential donors as a part of solid organ and hematopoietic stem cell pretransplant testing. HLA testing is also performed to identify HLA alleles and allele groups (antigen equivalents) associated with specific diseases and individualized responses to drug therapy (eg, HLA-B*27 and ankylosing spondylitis and HLA-B*57:01 and abacavir hypersensitivity), as well as other clinical uses. One or more HLA genes may be tested in specific clinical situations (eg, HLA-DQB1 for narcolepsy and HLA-A, -B, -C, -DRB1 and -DQB1 for kidney transplantation). Each HLA gene typically has multiple variant alleles or alleles groups that can be identified by typing. For HLA result reporting, a low resolution HLA type is denoted by a two digit HLA name (eg, A*02) and intermediate resolution typing by a string of alleles or an NMDP (National Marrow Donor Program) code (eg, B*14:01/07N/08/12/14, B*39CKGN). Both low and intermediate resolution, both of which are considered low resolution for code assignment. and hHigh resolution typing resolves the common well defined (CWD) alleles and is usually denoted by a greaterat least 4 number of digits (eg, A*02:02, *03:01:01:01, A*26:01:01G, and C*03:04P), however, high resolution typing may include some ambiguities for rare alleles, which may be reported as a string of alleles or an NMDP code. If additional testing is required to resolve ambiguous allele combinations for high resolution typing, it this is included in the base HLA typing codes below. The gene names have been italicized similar to the other molecular pathology codes.					
●81370	Z39	HLA Class I and II typing, low resolution (eg, antigen equivalents); HLA-A, -B, -C, -DRB1/3/4/5, and -DQB1	XXX	N/A	0.54

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81210 Tracking Number Z1 Original Specialty Recommended RVU: **0.37**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: BRAF (v-raf murine sarcoma viral oncogene homolog B1) (eg, colon cancer), gene analysis, V600E variant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 54-year-old man with metastatic colorectal carcinoma is being considered for targeted therapy with anti-epidermal growth factor receptor (EGFR) monoclonal antibodies. Initial molecular studies indicate the tumor does not contain any of 12 common KRAS mutations at codons 12 or 13. A tumor-rich tissue sample is submitted for BRAF gene mutation testing.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: Paraffin is removed, and high quality DNA is isolated from the patient's tumor tissue. DNA is subjected to PCR amplification for exon 15 of the BRAF gene. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing on a capillary electrophoresis instrument. The pathologist evaluates the electropherograms to identify nucleotide sequence variants. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Median Total Time	**15.00**	**20.00**	
Other time if appropriate			

INTENSITY/COMPLEXITY MEASURES (Mean)	(of those that selected Key Reference code)	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	3.00	3.47
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.26	3.32
Urgency of medical decision making	3.53	3.53
Technical Skill/Physical Effort (Mean)		
Technical skill required	3.79	3.89
Physical effort required	2.63	3.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	3.21	3.37
Outcome depends on the skill and judgment of physician	3.47	3.63
Estimated risk of malpractice suit with poor outcome	3.21	3.32

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.26	3.58
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from 66 pathologists and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81210 is slightly less intense

and complex as 88291, although the median Work RVU = 0.52. The expert panel agreed that the median physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.37 appropriately values new CPT code 81210 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,000
If this is a recommendation from multiple specialties please estimate frequency <u>and percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States?

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88182

Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: CYP2C19 (cytochrome P450, family 2, subfamily C, polypeptide 19) (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *4, *8, *17)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60 year-old Caucasian man is seen by a cardiologist after experiencing an acute myocardial infarct. The physician is considering percutaneous coronary intervention for this patient and needs to place the patient on an anti-platelet drug (clopidogrel) to prevent clotting. To determine whether the standard 300 mg loading dose of clopidogrel should be altered, a sample of anticoagulated peripheral blood is submitted to the laboratory to test for common variants in the CYP2C19 gene.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to two amplification reactions (PCR). Pooled PCR amplicons are enzymatically fragmented, labeled with biotin, and hybridized to a microarray containing oligonucleotide probes. After staining with a streptavidin-conjugated fluorescent dye, the array is scanned to detect signal from the hybridized DNA fragments. The pathologist evaluates the allelic ratios and data supporting the recommended identification of specific CYP2C19 variants. The pathologist composes a report which specifies the patient's CYP2C19 allele status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 886320 (Work RVU = 0.37, 17 minutes). The survey respondents indicated code 81225 is

more intense and complex than 86320 with a median Work RVU = 0.50. The expert panel agreed that the median physician time of 13 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.37 appropriately values new CPT code 81225 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

CPT Descriptor: CYP2D6 (cytochrome P450, family 2, subfamily D, polypeptide 6) (eg, drug metabolism), gene analysis, common variants (eg, *2, *3, *4, *5, *6, *9, *10, *17, *19, *29, *35, *41, *1XN, *2XN, *4XN)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A pre-menopausal 47-year-old woman is seen by an oncologist for breast cancer. Her tumor was positive for estrogen and progesterone receptors. The oncologist is considering treatment with tamoxifen rather than an aromatase inhibitor. To aid in this decision, the oncologist desires to predict the patient's ability to metabolize tamoxifen to the more active drug, endoxifen. A sample of anticoagulated peripheral blood is submitted to the laboratory to test for common variants in the CYP2D6 gene.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to two amplification reactions (PCR). Pooled PCR amplicons are enzymatically fragmented, labeled with biotin, and hybridized to a microarray containing oligonucleotide probes. After staining with a streptavidin-conjugated fluorescent dye, the array is scanned to detect signal from the hybridized DNA fragments. The pathologist evaluates the allelic ratios and data supporting the recommended identification of specific CYP2D6 variants. The pathologist composes a report which specifies the patient's CYP2D6 allele status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81226 is more intense and complex than 88291, although the median Work RVU = 0.50. The expert panel agreed that the median physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.43 appropriately values new CPT code 81226 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to a multiplexed PCR reaction, using primers specific for the most common variants, CYP2C9(*2) and CYP2C9(*3). The amplified target DNA is hybridized to a ferrocene signal probe and to an allele-specific capture probe, which is immobilized on an oligoarray. The captured target DNA generates a specific electrochemical signal that identifies the target DNA sequence. The pathologist examines the data and analytic system controls, and determines whether CYP2C9 variants are present in the patient's sample. The pathologist composes a report which specifies the patient's genotype. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 86320 (Work RVU = 0.37, 17 minutes). The survey respondents indicated code 81227 is more intense and complex as 86320 and the median Work RVU = 0.50. The expert panel agreed that the median physician time of 14 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.38 appropriately values new CPT code 81227 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

SUMMARY OF RECOMMENDATION

CPT Code:81245 Tracking Number Z6 Original Specialty Recommended RVU: **0.37**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: FLT3 (fms-related tyrosine kinase 3) (eg, acute myeloid leukemia), gene analysis, internal tandem duplication (ITD) variants (ie, exons 14, 15)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55 year old man presents to his primary care physician complaining of fatigue, dyspnea on exertion, and easy bruising. The patient's hemogram demonstrates leukocytosis with 30% blasts, anemia and thrombocytopenia. The peripheral blood smear shows decreased platelets and red blood cells along with large blasts with prominent nucleoli and Auer rods. The bone marrow contains 80% blasts which demonstrate an aberrant immunophenotype (CD33/CD13-positive with some cells expressing CD34 and CD117). The karyotype of the malignant cells is normal. An anticoagulated bone marrow specimen is submitted to the laboratory for FLT3 internal tandem duplication (ITD) mutation analysis.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from the bone marrow sample and subjected to a single PCR amplification encompassing the region which normally contains FLT3 internal tandem duplications. The fluorescent PCR products are separated by capillary electrophoresis. The pathologist evaluates the electropherogram comparing the relative sizes of the PCR product(s) to a control peak to determine FLT3/ITD mutation status. The pathologist composes a report which specifies the FLT3 ITD mutation status of the patient's leukemic cells. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Intra-Service intensity/complexity	3.67	3.67
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81257 with that of new tier 2 service 81402 *Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon)* (Recommended Work RVU = 0.50, 20 minutes). CAP recommends a direct crosswalk of 81257 to the physician work and time of CPT code 81402, based on work described in the CPT descriptors. A physician Work RVU of 0.50 also represents the 25th percentile of the survey respondents.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81261 Tracking Number Z8 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: IGH@ (Immunoglobulin heavy chain locus) (eg, leukemias and lymphomas) gene rearrangement analysis to detect abnormal clonal population(s); amplification methodology (eg, polymerase chain reaction)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An enlarged supraclavicular lymph node is identified during physical examination of 62-year-old man at a routine physician visit. A biopsy of the supraclavicular node is taken; initial morphologic and immunologic studies demonstrate a B-cell population that is suspicious for malignancy. A lymph node sample is submitted for immunoglobulin heavy chain gene rearrangement analysis for further evidence of a clonal B-lymphoid population.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from the lymph node sample and subjected to five multiplex PCR amplification reactions using fluorescently-tagged primers directed at various framework, diversity and joining regions of the immunoglobulin heavy chain gene. Following amplification, the reaction products from each tube are separately subjected to capillary electrophoresis. The pathologist evaluates the electrophoretic tracings for one or two predominant fragments of discrete size against background polyclonal or oligoclonal peaks for evidence of clonality. The pathologist composes a report which specifies the clonality status of the B-cell population in the patient sample. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). All intensity and complexity measures indicated a high intensity and complexity. The expert panel agreed that the median physician time of 21 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.52 appropriately values 81261 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions:

Description of Pre-Service Work: None

Description of Intra-Service Work: A large quantity of high quality genomic DNA is isolated from the lymph node sample, and gel electrophoresis is performed to assess integrity of the extracted DNA. The DNA undergoes digestion with the 3 restriction enzymes. The genomic fragments are separated by gel electrophoresis, transferred to a nylon membrane by capillary action, and hybridized to radiolabeled probes directed toward sequences in the immunoglobulin heavy chain joining region. The pathologist evaluates the autoradiographically generated hybridization patterns of the digestion fragments in relation to marker and control lanes for evidence of clonal rearrangements or polymorphisms. The pathologist composes a report specifying the clonality status of the B-cell population. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88182 (Work RVU = 0.77, 20 minutes). All intensity and complexity measures indicated a high intensity and complexity. The expert panel agreed that the median physician time of 20 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.61 appropriately values 81262 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

CPT Code:81263 Tracking Number Z10 Original Specialty Recommended RVU: **0.74**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: IGH@ (Immunoglobulin heavy chain locus) (eg, leukemia and lymphoma) variable region somatic mutation analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old man presents to his primary care physician complaining of recent fatigue, early satiety, and a 5 – 10 lb. weight loss. The patient has generalized lymphadenopathy and a palpable spleen tip. The complete blood count demonstrates lymphocytosis with anemia and thrombocytopenia. The peripheral blood smear shows an excess of small lymphocytes, occasional prolymphocytes, and smudge cells. Flow cytometry confirms a diagnosis of chronic lymphocytic leukemia. A blood specimen is submitted for IgVH sequencing to assess for somatic hypermutation in the leukemic cells.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to two multiplex PCR reactions utilizing primers directed at the leader, framework 1 and junctional regions of the immunoglobulin heavy chain gene. PCR products are separated by gel electrophoresis. After purification, clonal PCR products are subjected to dideoxynucleotide sequencing. The pathologist evaluates the degree of divergence from an appropriately selected reference sequence in order to determine somatic hypermutation status. The pathologist composes a report which specifies the patient's IvGH mutation status. The report is edited, signed, and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88182 (Work RVU = 0.77, 20 minutes). All intensity and complexity measures indicated a high intensity and complexity. The committee also distinguished this service as a unique complex mutation analysis unlike others. The expert panel agreed that the median physician time of 23 minutes is typical and compared to the key reference service, and the median work RVU of 0.74 appropriately values 81263 within this family of services.

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from the lymph node sample and subjected to two multiplex PCR amplification reactions using fluorescently-tagged primers directed at various framework, intronic, joining and kappa-deletion regions of the immunoglobulin kappa light chain gene. Following amplification, the reaction products from each tube are separately subjected to capillary electrophoresis. The pathologist evaluates the electrophoretic tracings for one or two predominant fragments of discrete size against background polyclonal or oligoclonal peaks for evidence of clonality. The pathologist composes a report which specifies the rearrangement and clonality status of the B-cell population in the patient sample. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88182 (Work RVU = 0.77, 20 minutes). The committee agreed that this service is similar to 81261 however it is a more complex service. In addition, the survey respondents assimilated the work to that of 88182. The expert panel agreed that the median physician time of 22 minutes is typical and compared to the key reference service, and the median work RVU of 0.75 appropriately values 81264 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81265 Tracking Number Z12 Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: Comparative analysis using Short Tandem Repeat (STR) markers; patient and comparative specimen (eg, pre-transplant recipient and donor germline testing, post-transplant non-hematopoietic recipient germline [eg, buccal swab or other germline tissue sample] and donor testing, twin zygosity testing, or maternal cell contamination of fetal cells)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old man presents to his physician complaining of fatigue, dyspnea on exertion, and easy bruising. The patient's complete blood count, peripheral blood smear, flow cytometry analysis, and bone marrow examination support a diagnosis of acute myeloid leukemia. Normal cytogenetic findings and the presence of a FLT3 internal tandem duplication mutation place him at high risk for relapse following initial treatment. The patient achieves remission with induction chemotherapy, and he is referred for peripheral blood stem cell transplantation. A matched related donor is found. Stem cells are collected from the donor, and blood specimens from the patient and the donor are submitted for pre-transplant testing to identify informative short tandem repeat (STR) markers for post-transplant chimerism testing.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from the recipient and donor whole blood samples. The individual DNA isolates are each subjected to a single multiplex PCR amplification reaction that utilizes a combination of 16 primer sets directed toward 15 polymorphic STRs and the gender marker amelogenin. The donor and recipient fluorescent PCR products are separated by capillary electrophoresis. The pathologist compares the relative sizes of the PCR products from the respective electropherograms, and identifies informative alleles that can be used for post-transplant engraftment monitoring. The pathologist composes a report specifying the informative STRs for future chimerism testing. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 86320 (Work RVU = 0.37, 17 minutes). This service involves the analysis of more than one specimen and the expert panel agreed that the median physician time of 17 minutes is typical and compared to the key reference service, and the 25th percentile work RVU of 0.40 appropriately values 81265 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   ☐ Multiple codes are used to maintain consistency with similar codes.
   ☐ Historical precedents.
   ☒ Other reason (please explain) 81265 may be billed with add on code 81265. It may be also billed at or around the time as any HLA typing codes are billed.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from the recipient whole blood and both cord blood samples. The individual DNA isolates are each subjected to a single multiplex PCR amplification reaction that utilizes a combination of 16 primer sets directed toward 15 polymorphic STRs and the gender marker amelogenin. The fluorescent PCR products from the donors and recipient are separated by capillary electrophoresis. The pathologist compares the relative sizes of the PCR products from the respective electropherograms, and identifies informative alleles that can be used for post-transplant engraftment monitoring. The pathologist composes a report which specifies the informative STRs for future chimerism testing. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 86320 (Work RVU = 0.37, 17 minutes). The committee agreed that the work of 81266 more intense than 86320. In addition, the survey respondents assimilated the work to that of 88182. The expert panel agreed that the median physician time of 22 minutes is typical and compared to the key reference service, and the 25th percentile work RVU of 0.41 appropriately values 81266 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☒ Other reason (please explain) 81266 is an add on code and it may be billed at or around the same time as a HLA typing code.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The committee agreed that the work of 81267 more intense than 88291. In addition, 81267 is similar to 81265 (Work RVU recommended = 0.40, 17 minutes) but is much more work as it involves an intense and complex comparison of analyses. The expert panel agreed that the median physician time of 18 minutes is typical and compared to the key reference service, and the median work RVU of 0.52 appropriately values 81267 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: CD3-positive and CD33-positive cells are isolated using fluorescent antibody-based flow cytometry. High quality genomic DNA is isolated from each of these cellular fractions and subjected to a single multiplex PCR amplification reaction that utilizes a combination of 16 primer sets directed toward 15 polymorphic STRs and the gender marker amelogenin. The fluorescent PCR products are separated by capillary electrophoresis. The pathologist compares the electropherograms to the pretransplant recipient and donor electropherograms, and analyzes the informative alleles for the relative proportions of donor and recipient DNA for each cellular component. The pathologist composes a report that states the percentages of donor and recipient alleles present for each cellular component. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

The risk of significant complications, morbidity and/or mortality	3.71	3.71
Outcome depends on the skill and judgment of physician	4.14	4.00
Estimated risk of malpractice suit with poor outcome	3.29	3.71

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.86	3.71
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The committee agreed that the work of 81268 more intense than 88291 and more work. 81268 involves more work than 81267 whereas individual cell sorting is performed and compared to baseline analyses. The survey respondents agreed that the physician work was greater than the reference code and that of 81267. The intensity and complexity indicators agree there is more work as well. The expert panel agreed that the median physician time of 20 minutes is typical and compared to the key reference service, and the median work RVU of 0.75 appropriately values 81268 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

SUMMARY OF RECOMMENDATION

CPT Code:81292 Tracking Number Z16 Original Specialty Recommended RVU: **1.40**
Presented Recommended RVU: **1.40**
Global Period: XXX RUC Recommended RVU: **1.40**

CPT Descriptor: MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male patient presents with fatigue and weight loss. On physical examination, occult blood is discovered in the stool. The patient's family history is positive for colon cancer in several relatives. The patient undergoes a right hemicolectomy after a large, poorly differentiated adenocarcinoma with lymphocytic infiltration is found in the right colon. Microsatellite instability testing performed on the tumor demonstrates high level instability (MSI-H). Immunohistochemical staining reveals a loss of MLH1 protein expression. Mutation testing of the tumor for the BRAF V600E mutation and MLH1 hypermethylation are negative. An anticoagulated peripheral blood sample is submitted for MLH1 gene sequencing to assess the patient for the presence of an HNPCC-related mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 19 individual PCR amplification reactions whose products encompass the entire coding sequence, exon-intron boundaries and portions of 5'and 3'-untranslated regions of the MLH1 gene. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variants suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report which specifies the patient's mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81292 with that of new tier 2 service 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)* (Recommended Work RVU = 1.40, 60 minutes). CAP recommends a direct crosswalk of 81292 to the physician work and time of CPT code 81406, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old asymptomatic woman whose 45-year-old brother was recently diagnosed with colon cancer and Lynch Syndrome presents to her physician for genetic testing. The brother has a disease-associated mutation in the MLH1 gene. An anticoagulated peripheral blood sample from the asymptomatic woman is submitted for testing for this known familial mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to PCR amplification for the respective MLH1 exon that contains the known familial mutation. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for the known familial mutation and any other variants that may be present. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81293 with that of new tier 2 service 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (Recommended Work RVU = 0.52, 28 minutes). CAP recommends a direct crosswalk of 81293 to the physician work and time of CPT code 81403, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

SUMMARY OF RECOMMENDATION

CPT Code:81294 Tracking Number Z18 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: MLH1 (mutL homolog 1, colon cancer, nonpolyposis type 2) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; duplication/deletion variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old man with a family history of colon cancer undergoes a right hemicolectomy to remove a poorly differentiated colonic adenocarcinoma with lymphocytic infiltration. The tumor demonstrates high level microsatellite instability (MSI-H). Immunohistochemistry staining reveals a loss of MLH1 protein expression. Mutation testing on the tumor for the BRAF V600E mutation and MLH1 hypermethylation are negative. Prior MLH1 sequencing performed to assess the patient for the presence of an HNPCC-related mutation was negative. Deletion/duplication analysis of the MLH1 gene is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA previously isolated from whole blood is subjected to multiplex ligation probe ligation analysis (MLPA), which involves hybridization and ligation of multiple pairs of oligonucleotide probes specific for the 19 exons of the MLH1 gene to assess dosage of each exon. The pathologist examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the MLH1 gene. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81295 Tracking Number Z19 Original Specialty Recommended RVU: **1.40**
Presented Recommended RVU: **1.40**
Global Period: XXX RUC Recommended RVU: **1.40**

CPT Descriptor: MSH2 (mutS homolog 2, colon cancer, nonpolyposis type 1) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male patient presents with fatigue and weight loss. On physical examination, occult blood is discovered in the stool. The patient's family history is positive for colon cancer in several relatives. The patient undergoes a right hemicolectomy after a large, poorly differentiated adenocarcinoma with lymphocytic infiltration is found in the right colon. Microsatellite instability testing is performed on the tumor demonstrates high level instability (MSI-H). Immunohistochemical staining reveals a loss of MSH2 protein expression. An anticoagulated peripheral blood sample is submitted for MSH2 gene sequencing to assess the patient for the presence of an HNPCC-related mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 16 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report specifying the patient's mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.00	4.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81295 with that of new tier 2 service 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)* (Recommended Work RVU = 1.40, 60 minutes). CAP recommends a direct crosswalk of 81295 to the physician work and time of CPT code 81406, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 800
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States?

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81296 with that of new tier 2 service 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (Recommended Work RVU = 0.52, 28 minutes). CAP recommends a direct crosswalk of 81296 to the physician work and time of CPT code 81403, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88182

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81297 Tracking Number Z21 Original Specialty Recommended RVU: **0.80**
Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: MSH2 (mutS homolog 2, colon cancer, nonpolyposis type 1) (eg, hereditary non- polyposis colorectal cancer, Lynch syndrome) gene analysis; duplication/deletion variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old man with a family history of colon cancer undergoes a right hemicolectomy to remove a poorly differentiated colonic adenocarcinoma with lymphocytic infiltration. The tumor demonstrates high level microsatellite instability (MSI-H). Immunohistochemistry staining reveals a loss of MSH2 protein expression. Prior MLH2 sequencing performed to assess the patient for the presence of an HNPCC-related mutation was negative. Deletion/duplication analysis of the MSH2 gene is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA previously isolated from whole blood is subjected to multiplex ligation probe ligation analysis (MLPA), which involves hybridization and ligation of multiple pairs of oligonucleotide probes specific for the 16 exons of the MSH2 gene to assess dosage of each exon. The pathologist examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the MSH2 gene. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81297 with that of new tier 2 service 81405 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* (Recommended Work RVU = 0.80, 30 minutes). CAP recommends a direct crosswalk of 81297 to the physician work and time of CPT code 81405, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 800
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States?

Presented Recommended RVU: **0.80**
Global Period: XXX RUC Recommended RVU: **0.80**

CPT Descriptor: MSH6 (mutS homolog 6 [E. coli]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; full sequence analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male patient presents with fatigue and weight loss. On physical examination, occult blood is discovered in the stool. The patient's family history is positive for colon cancer in several relatives. The patient undergoes a right hemicolectomy after a large, poorly differentiated adenocarcinoma with lymphocytic infiltration is found in the right colon. Microsatellite instability testing is performed on the tumor demonstrates high level instability (MSI-H). Immunohistochemical staining reveals a loss of MSH6 protein expression. An anticoagulated peripheral blood sample is submitted for MSH6 gene sequencing to assess the patient for the presence of an HNPCC-related mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 10 individual PCR amplification reactions whose products encompass the entire coding sequence, exon-intron boundaries and portions of 5' and 3'-untranslated regions of the MSH6 gene. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report which specifies the patient's mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81299 Tracking Number Z23 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: MSH6 (mutS homolog 6 [E. coli]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old asymptomatic woman whose 45-year-old brother was recently diagnosed with colon cancer and Lynch Syndrome presents to her primary care physician for genetic testing. The brother was found to have a disease-associated mutation in the MSH6 gene. An anticoagulated peripheral blood sample from the asymptomatic woman is submitted to test for an MSH6 gene known familial mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: Upon receipt of the specimen, high quality genomic DNA is isolated from whole blood and subjected to PCR amplification for the respective MSH6 exon that contains the known familial mutation. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for the known familial mutation and any other variants that may be present. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Intra-Service intensity/complexity	3.00	3.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81299 with that of new tier 2 service 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (Recommended Work RVU = 0.52, 28 minutes). CAP recommends a direct crosswalk of 81299 to the physician work and time of CPT code 81403, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA previously isolated from whole blood is subjected to multiplex ligation probe ligation analysis (MLPA), which involves hybridization and ligation of multiple pairs of oligonucleotide probes specific for the 10 exons of the MSH6 gene to assess dosage of each exon. The pathologist examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the MSH6 gene. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81301 Tracking Number Z25 Original Specialty Recommended RVU: **0.50**
Presented Recommended RVU: **0.50**
Global Period: XXX RUC Recommended RVU: **0.50**

CPT Descriptor: Microsatellite instability analysis (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) of markers for mismatch repair deficiency (eg, BAT25, BAT26), includes comparison of neoplastic and normal tissue, if performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old male patient presents with fatigue and weight loss. On physical examination, occult blood is discovered in the stool. The patient's family history is positive for colon cancer in several relatives. The patient undergoes a right hemicolectomy after a large, poorly differentiated adenocarcinoma with lymphocytic infiltration is found in the right colon. Microsatellite instability (MSI) testing is performed on the tumor and adjacent normal tissue.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: Paraffin is removed, and DNA is isolated from the patient's tumor and normal tissue. Each DNA isolate is subjected to a multiplex PCR amplification reaction that utilizes a combination of 7 fluorescently-labeled primer sets directed toward 5 mononucleotide repeat markers (BAT-25, BAT-26, NR-21, NR-24, and MONO-27), and 2 pentanucleotide repeat markers (Penta C and Penta D). The fluorescent PCR products from the tumor and normal tissue are each separated by capillary electrophoresis. The pathologist determines the MSI status of the tumor by comparing the electrophoretic patterns generated by the PCR products from tumor and normal tissue DNA in relation to a sizing standard for each of the repeat markers, and assessing the proportion of unstable markers. The pathologist composes a report which specifies the MSI status of the tumor. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.50	3.50
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from 41 pathologists who perform the service and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81301 is less slightly intense and complex as 88291, although they indicated it was more overall work, with a median Work RVU = 0.70. The expert panel agreed that the median physician time of 20 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.50 appropriately values new CPT code 81301 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Presented Recommended RVU: **0.65**
Global Period: XXX RUC Recommended RVU: **0.65**

CPT Descriptor: MECP2 (methyl CpG binding protein 2) (eg, Rett syndrome) gene analysis; full sequence analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2 1/2 year-old girl born to a G2P2 mother following an unremarkable pregnancy presents to her pediatrician with regression in her language and motor skills over several months. On physical examination, the patient is small, with a head circumference in the 5th percentile. She has mildly decreased muscle tone in her limbs and slight truncal ataxia. She displays occasional abnormal limb posturing, as well as repetitive hand wringing. Rett syndrome is suspected. An anticoagulated peripheral blood sample is submitted for MECP2 sequencing to assess the patient's MECP2 mutation status.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 4 individual PCR amplification reactions, the products of which encompass the entire coding sequence, intron-exon boundaries and portions of 5' and 3'-untranslated regions of the MECP2 gene. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81302 with that of new tier 2 service 81404 *Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)* (Recommended Work RVU = 0.65, 30 minutes). CAP recommends a direct crosswalk of 81302 to the physician work and time of CPT code 81404, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81303 Tracking Number Z27 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: MECP2 (methyl CpG binding protein 2) (eg, Rett syndrome) gene analysis; known familial variant

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14 month-old girl born to a G2P2 mother who has a known MECP2 mutation presents to her pediatrician with developmental delay. The patient's older sister was diagnosed with Rett syndrome two years previously, and a mutation in the MECP2 gene was identified. At that time, the patient's mother was tested and was found to carry the identical MECP2 mutation. An anticoagulated peripheral blood sample is submitted for MECP2 sequencing to assess the patient for the known familial MECP2 mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to PCR amplification reaction of the exon that contains the known familial MECP2 mutation. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for the known familial mutation and any other variants that may be present. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81303 with that of new tier 2 service 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (Recommended Work RVU = 0.52, 28 minutes). CAP recommends a direct crosswalk of 81303 to the physician work and time of CPT code 81403, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: MECP2 (methyl CpG binding protein 2) (eg, Rett syndrome) gene analysis; duplication/deletion variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2 1/2 year-old girl born to a G2P2 mother following an unremarkable pregnancy presents to her pediatrician with regression in her language and motor skills over several months. On physical examination, the patient is small with a head circumference in the 5th percentile. She has mildly decreased muscle tone in her limbs and slight truncal ataxia. She displays occasional abnormal limb posturing, as well as repetitive hand wringing. Rett syndrome is suspected. An anticoagulated peripheral blood sample was submitted to the laboratory for MECP2 sequencing, and a mutation was not detected. Deletion/duplication analysis of the MECP2 gene is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA previously isolated from whole blood is subjected to multiplex ligation probe ligation analysis (MLPA), which involves hybridization and ligation of oligonucleotide probes specific for the 4 exons of the MECP2 gene to assess dosage of each exon. The pathologist examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the MECP2 gene. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.00	3.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81304 with that of new tier 2 service 81403 *Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)* (Recommended Work RVU = 0.52, 28 minutes). CAP recommends a direct crosswalk of 81304 to the physician work and time of CPT code 81403, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81310 Tracking Number N29 Original Specialty Recommended RVU: **0.39**
Presented Recommended RVU: **0.39**
Global Period: XXX RUC Recommended RVU: **0.39**

CPT Descriptor: NPM1 (nucleophosmin) (eg, acute myeloid leukemia) gene analysis, exon 12 variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old man presents to his primary care physician complaining of fatigue, dyspnea on exertion, and easy bruising. The patient's hemogram demonstrates leukocytosis with 30% blasts, anemia and thrombocytopenia. The peripheral blood smear shows decreased platelets and red blood cells along with large blasts with prominent nucleoli and Auer rods. The bone marrow contains 80% blasts which demonstrate an aberrant immunophenotype (CD33/CD13-positive with some cells expressing CD34 and CD117). The karyotype of the malignant cells is normal. A sample of anticoagulated bone marrow is submitted for NPM1 exon 12 tetranucleotide insertion mutation testing.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: Upon receipt of the specimen high quality genomic DNA is isolated. A single PCR amplification is performed encompassing the region which normally contains NPM1 tetranucleotide insertion mutations. The fluorescent PCR products are separated by capillary electrophoresis. The pathologist evaluates the electropherogram comparing the relative sizes of the PCR product(s) in relation to a control peak to determine the NPM1 exon 12 mutation status. The pathologist composes a report describing the NPM1 exon 12 mutation status of the patient's leukemic cells. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81310 is less intense and complex than 88291, and the median Work RVU = 0.51. The expert panel agreed that the survey respondents underestimated the time spent creating the report and communicating the results. The expert panel therefore recommends 19 total minutes of physician time similar to 88291 (20 minutes) as typical for this service. The expert panel also agreed that the 25th percentile work RVU of 0.39 appropriately values new CPT code 81310 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 15 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report which specifies the patient's mutation status to include information from a database and literature search regarding the significance of variants identified. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.00	3.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81317 with that of new tier 2 service 81406 *Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)* (Recommended Work RVU = 1.40, 60 minutes). CAP recommends a direct crosswalk of 81317 to the physician work and time of CPT code 81406, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 600
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88182

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81318 Tracking Number Z31 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: PMS2 (postmeiotic segregation increased 2 [S. cerevisiae]) (eg, hereditary non-polyposis colorectal cancer, Lynch syndrome) gene analysis; known familial variants

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 40-year-old asymptomatic woman whose 45-year-old brother was recently diagnosed with colon cancer and Lynch Syndrome presents to her primary care physician for genetic testing. The brother has a disease-associated mutation in the PMS2 gene. An anticoagulated peripheral blood sample from the asymptomatic woman is submitted for testing for this known familial mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to PCR amplification for the respective PMS2 gene exon that contains the known familial mutation. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for the known familial mutation and any other variants that may be present. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.00	3.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81319 with that of new tier 2 service 81405 *Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)* (Recommended Work RVU = 0.80, 30 minutes). CAP recommends a direct crosswalk of 81319 to the physician work and time of CPT code 881405, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81331 Tracking Number Z33 Original Specialty Recommended RVU: **0.39**
Presented Recommended RVU: **0.39**
Global Period: XXX RUC Recommended RVU: **0.39**

CPT Descriptor: SNRPN/UBE3A (small nuclear ribonucleoprotein polypeptide N and ubiquitin protein ligase E3A) (eg, Prader-Willi syndrome and/or Angelman syndrome), methylation analysis

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 2-year-old girl is brought to a pediatrician for evaluation. She has consistently been in the 5th to 10th percentile on growth charts, is somewhat developmentally delayed, and is a voracious eater. The pediatrician discusses the possibility of Prader-Willi syndrome with the parents. A sample of anticoagulated peripheral blood is submitted for SNRPN/UBE3A methylation analysis.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from the blood sample and undergoes bisulfite modification to convert unmethylated cystosine nucleotides to uracil. Following PCR amplification using primers specific for sequences on the maternal (methylated) and paternal (unmethylated) chromosomes, the PCR products are separated on agarose gels. The pathologist evaluates the electrophoretic patterns to determine whether normal biparental inheritance is demonstrated. The pathologist composes a report which specifies the patient's SNRPN/UBE3A mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81331 is slightly less overall work than 88291 with the median Work RVU = 0.48, but also indicated the work was more intense than the reference code in the intra-service period. The expert panel agreed that the median physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile Work RVU of 0.39 appropriately values new CPT code 81331 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81332 Tracking Number Z34 Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: SERPINA1 (serpin peptidase inhibitor, clade A, alpha-1 antiproteinase, antitrypsin, member 1) (eg, alpha-1-antitrypsin deficiency), gene analysis, common variants (eg, *S and *Z)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 53-year-old woman with an extensive smoking history complains to her family physician that she has been experiencing modest but increasing shortness of breath. Pulmonary function studies suggest mild airflow obstruction consistent with chronic obstructive pulmonary disease. Liver enzyme studies are normal. Alpha-1-antitrypsin deficiency is part of the differential diagnosis. An anticoagulated peripheral blood sample is submitted for SERPINA1 genotype determination of the 'Z' and 'S' alleles.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to two separate PCR amplification reactions encompassing the regions of the SERPIN1A gene which code for the 'Z' and 'S' alleles. PCR amplification products are digested with different restriction endonucleases, and the digestion products are visualized separately by ethidium bromide staining following agarose gel electrophoresis. The pathologist evaluates the patterns of restriction endonuclease digestion products on gel photographs to determine the patient's mutation status for the normal 'M" as well as mutant 'Z' and 'S' alleles. The pathologist composes a report which specifies the patient's SERPINA1 mutation status. The report is edited, signed and the results are communicated to the appropriate caregivers.

Description of Post-Service Work: None

CPT Descriptor Microscopic examination of hairs plucked or clipped by the examiner (excluding hair collected by the patient) to determine telogen and anagen counts, or structural hair shaft abnormality

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 2 **% of respondents:** 66.6 **%**

TIME ESTIMATES (Median)	**CPT Code: 81332**	**Key Reference CPT Code:** 88291	**Source of Time** **RUC Time**
Median Pre-Service Time	0.00	0.00	
Median Intra-Service Time	15.00	20.00	
Median Immediate Post-service Time	0.00	0.00	
Median Critical Care Time	0.0	0.00	
Median Other Hospital Visit Time	0.0	0.00	
Median Discharge Day Management Time	0.0	0.00	
Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**15.00**	**20.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	5.00	5.00
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	5.00	5.00
Urgency of medical decision making	3.00	2.00
Technical Skill/Physical Effort (Mean)		
Technical skill required	5.00	5.00
Physical effort required	1.00	1.00
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	2.00	2.00
Outcome depends on the skill and judgment of physician	3.00	3.00
Estimated risk of malpractice suit with poor outcome	2.00	2.00

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.00	4.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81332 with that of new tier 2 service 81401 *Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)* (Recommended Work RVU = 0.40, 15 minutes). CAP recommends a direct crosswalk of 81332 to the physician work and time of CPT code 81401, based on work described in the CPT descriptors.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81340 Tracking Number Z35 Original Specialty Recommended RVU: **0.63**
Presented Recommended RVU: **0.63**
Global Period: XXX RUC Recommended RVU: **0.63**

CPT Descriptor: TRB@ (T cell antigen receptor, beta) (eg, leukemia and lymphoma), gene rearrangement analysis to detect abnormal clonal population(s); using amplification methodology (eg, polymerase chain reaction)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male patient presents with fever, episodic night sweats, weight loss and lymphadenopathy. A biopsy of an enlarged supraclavicular node is taken; initial morphologic and immunologic studies demonstrate a T-cell population that is suspicious for malignancy. A frozen sample of the lymph node is submitted for T-cell antigen receptor gene, beta rearrangement studies as part of a pathologic evaluation for lymphoma.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is extracted from a lymph node sample. In order to detect a clonally rearranged population of T-cells against a background of polyclonal T-cells, 3 multiplex PCR reactions are performed using fluorescent-linked primers directed at the variable, joining, and diversity regions of the T-cell receptor beta chain genes. The resulting PCR products are separated using capillary electrophoresis. The pathologist evaluates the capillary tracing for a predominant fragment of discrete size and appropriate morphology against background polyclonal or oligoclonal peaks for evidence of clonality. The pathologist composes a report which specifies the clonality status of the T-cell population. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 88182 (Work RVU = 0.77, 20 minutes). The survey respondents indicated code 81340 is slightly less intense and complex than 88182. However, the respondents also equated the new code's overall work with that of 88182, with a median Work RVU = 0.77. The expert panel agreed that the median physician time of 25 minutes is typical and compared to the key reference service, the survey's 25th percentile work RVU of 0.63 appropriately values new CPT code 81210 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

Description of Pre-Service Work: None

Description of Intra-Service Work: A large quantity of high quality genomic DNA is isolated from the lymph node sample. Gel electrophoresis of the extracted DNA is performed to assess DNA integrity. The DNA undergoes digestion with 3 restriction enzymes. The genomic fragments are separated by gel electrophoresis, transferred to a nylon membrane by capillary action, and hybridized to radiolabeled probes directed toward the TCRB joining regions (Jβ1 and 2). The pathologist evaluates the autoradiographically generated hybridization patterns of the digestion fragments in relation to marker and control lanes to determine T-cell clonality status. The pathologist composes a report which specifies the clonality status of the T-cell population. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

MPC CPT Code 1	Global	Work RVU	Time Source	Most Recent Medicare Utilization
99212	XXX	0.48	**RUC Time**	19,291,310

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

MPC CPT Code 2	Global	Work RVU	Time Source	Most Recent Medicare Utilization
92250	XXX	0.44	**RUC Time**	2,186,775

CPT Descriptor 2 Fundus photography with interpretation and report

Other Reference CPT Code	Global	Work RVU	Time Source
88388	XXX	0.45	**RUC Time**

CPT Descriptor Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node) (List separately in addition to code for primary procedure)

RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):
Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 3 **% of respondents:** 37.5 **%**

TIME ESTIMATES (Median)	**CPT Code: 81341**	**Key Reference CPT Code:** 88291	**Source of Time RUC Time**

Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.00	4.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey results and agreed that the number of survey respondents was extremely low and that conclusions could not be drawn from the data. The expert panel assimilated the overall physician work of 81341 with that of CPT code 88388 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); in conjunction with a touch imprint, intraoperative consultation, or frozen section, each tissue preparation (eg, a single lymph node) (List separately in addition to code for primary procedure)* (Recommended Work RVU = 0.45, 12 minutes). However the expert panel agreed that the survey median time of 19 minutes accurately reflects the typical time required to perform this service. CAP recommends a direct crosswalk of 81341 to the physician Work RVU of 88388 at 0.45 RVUs and a total physician time of 19 minutes, based on time, physician work effort, and intensity and complexity of the service.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

SUMMARY OF RECOMMENDATION

CPT Code:81342 Tracking Number Z36 Original Specialty Recommended RVU: **0.57**
Presented Recommended RVU: **0.57**
Global Period: XXX RUC Recommended RVU: **0.57**

CPT Descriptor: TRG@ (T cell antigen receptor, gamma) (eg, leukemia and lymphoma), gene rearrangement analysis, evaluation to detect abnormal clonal population(s)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 55-year-old male patient presents with fever, episodic night sweats, weight loss and lymphadenopathy. A biopsy of an enlarged supraclavicular node is taken; initial morphologic and immunologic studies demonstrate a T-cell population that is suspicious for malignancy. A frozen sample of the lymph node is submitted for T-cell antigen receptor gene, gamma rearrangement studies as part of a pathologic evaluation for lymphoma.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is extracted from a lymph node sample. In order to detect a clonally rearranged population of T-cells against a background of polyclonal T-cells, 2 multiplex PCR reactions are performed using fluorescent linked primers directed toward the variable and joining regions of the T-cell receptor gamma genes. The resulting PCR products are separated using capillary electrophoresis. The pathologist evaluates the capillary tracing for a predominant fragment of discrete size and appropriate shape against background polyclonal or oligoclonal peaks for evidence of clonality. The pathologist composes a report which specifies the clonality status of the T-cell population. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from 50 pathologists who perform the service and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81342 takes more time

and work than 88291. The survey's median Work RVU=0.77, and median time = 25 minutes. The survey respondents also indicated overall that the intensity and complexity of the new code is greater than the key reference code. The expert panel agreed that the median physician time of 25 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.57 appropriately values new CPT code 81342 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data from pathologists who perform the service and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81350 takes 15 minutes

to provide with less overall work than the key reference service. (median Work RVU = 0.48) The expert panel agreed that the median physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.37 appropriately values new CPT code 81350 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

CPT Code:81355 Tracking Number Z5 Original Specialty Recommended RVU: **0.38**
Presented Recommended RVU: **0.38**
Global Period: XXX RUC Recommended RVU: **0.38**

CPT Descriptor: VKORC1 (vitamin K epoxide reductase complex, subunit 1) (eg, warfarin metabolism), gene analysis, common variants (eg, -1639/3673)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 60-year-old man presents to his physician with complaints of fatigue, lightheadedness, and palpitations. A diagnostic workup revealed atrial fibrillation, for which the physician would like to prescribe warfarin. In order to facilitate rapid achievement of the proper dose, she orders warfarin sensitivity genotyping for common variants of the VKORC1 gene, which have been shown to significantly influence the dose of warfarin needed to achieve appropriate therapeutic levels. A sample of peripheral blood is submitted for genotypic analysis of the VKORC1 gene.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to a multiplexed PCR reaction, using primers specific for the most common variants, VKORC1 (-1639A). The amplified target DNA is hybridized to a ferrocene signal probe and to an allele-specific capture probe, which is immobilized on an oligoarray. The captured target DNA generates a specific electrochemical signal that identifies the target DNA sequence. The pathologist examines the patient's results and analytic system controls, and determines whether VKORC1 variants are present in the patient's sample. The pathologist composes a report which specifies the patient's genotype. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic regions containing the HLA-A, -B, -C, -DRB1/3/4/5 and -DQB1 loci are amplified by PCR using a series of 142 sequence specific primer sets. The amplicons produced are separated by size via gel electrophoresis. The pathologist examines a digitized image or photograph of the ethidium bromide stained gel to assess the presence or absence of amplicons produced for the allele group-specific reactions in comparison to positive and negative controls. Based on the manual analysis of amplicon patterns and with the assistance of computer software, the pathologist determines the HLA type for the HLA-A, -B, -C, DRB1/3/4/5, and –DQB1 loci. The pathologist composes a report which specifies the patient's HLA type at the low resolution level. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Pre-Service intensity/complexity		
Intra-Service intensity/complexity	3.40	3.30
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The 30 survey respondents indicated 813730 requires more physician work and is more complex or intense in 7 out of 9 measures compared to the key reference service. The expert panel agreed that the median physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.54 appropriately values 81370 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81371 Tracking Number Z40 Original Specialty Recommended RVU: **0.77**
Presented Recommended RVU: **0.60**
Global Period: XXX RUC Recommended RVU: **0.60**

CPT Descriptor: HLA Class I and II typing, low resolution (eg, antigen equivalents); HLA-A, -B, and -DRB1/3/4/5 (eg, verification typing)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old man with acute myelogenous leukemia with unfavorable cytogenetics is in his first remission. The patient will require a hematopoietic stem cell transplant. A potential HLA matched unrelated donor has been identified through the National Marrow Donor Program. Prior to final donor selection, a sample of anticoagulated peripheral blood is submitted to the laboratory for low resolution typing for HLA-A, -B, -DRB1/3/4/5 to confirm the recipient's typing and donor match.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic regions containing the HLA-A, -B, -DRB1/3/4/5 loci are amplified by PCR using a series of 95 sequence specific primer sets. The amplicons produced are separated by size via gel electrophoresis. The pathologist examines a digitized image or photograph of the ethidium bromide stained gel to assess the presence or absence of amplicons produced for the allele group-specific reactions in comparison to positive and negative controls. Based on the manual analysis of the amplicon patterns and with the assistance of computer software, the pathologist determines the HLA type for the HLA-A, -B, and -DRB1/3/4/5 loci, and compares the results to the original high resolution typing used for the donor search to verify the original typing result. The pathologist composes a report which specifies the patient's HLA type from both analyses. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Median Office Visit Time	0.0	0.00	
Prolonged Services Time	0.0	0.00	

Median Subsequent Observation Care Time	0.0	0.00
Median Total Time	**15.00**	**20.00**
Other time if appropriate		

INTENSITY/COMPLEXITY MEASURES (Mean)	**(of those that selected Key Reference code)**	
Mental Effort and Judgment (Mean)		
The number of possible diagnosis and/or the number of management options that must be considered	4.25	4.25
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.00	4.25
Urgency of medical decision making	3.75	3.75
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.50	4.50
Physical effort required	3.50	3.50
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	4.00	4.00
Outcome depends on the skill and judgment of physician	4.25	4.25
Estimated risk of malpractice suit with poor outcome	3.50	3.50

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.25	4.25
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88182 (Work RVU = 0.77, 20 minutes). The survey respondents indicated 81372 requires less physician work than the reference code yet this service has a high intensity and complexity within the HLA family. The expert panel agreed that the median physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.52 appropriately values 81372 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81373 Tracking Number Z42 Original Specialty Recommended RVU: **0.37**
Presented Recommended RVU: **0.37**
Global Period: XXX RUC Recommended RVU: **0.37**

CPT Descriptor: HLA Class I typing, low resolution (eg, antigen equivalents); one locus (eg, HLA-A, B, or -C), each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 32-year-old woman has a complex array of symptoms and signs that indicate the presence of an autoimmune disorder. Several disorders with HLA-B associations are considered. A sample of anticoagulated peripheral blood is submitted to the laboratory for HLA-B typing.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic region containing the HLA-B locus is amplified by PCR using 47 sequence-specific primers sets. The amplicons produced are separated by size via gel electrophoresis. The pathologist examines a digitized image or photograph of the ethidium bromide stained gel to assess the presence or absence of amplicons produced for the allele group-specific reactions in comparison to positive and negative controls. Based on the manual analysis of the amplicon patterns and with the assistance of computer software, the pathologist determines the HLA type for the HLA-B locus. The pathologist composes a report which specifies the patient's HLA-B type at the low resolution level. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 86320 (Work RVU = 0.37, 17 minutes). The survey respondents assimilated the physician work of 81373 to the key reference service. The expert panel agreed that the survey respondents underestimated the total time for the service. Specifically the CAP expert panel agreed that the interpretation and report time was underestimated. The expert panel agreed that a total physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.37 appropriately values 81373 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

Intra-Service intensity/complexity	2.00	2.33
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 86320 (Work RVU = 0.37, 17 minutes). The survey respondents indicated the physician work of 81374 was slightly greater than the key reference service however less intense and complex. The expert panel agreed that the survey respondents underestimated the total time for the service. Specifically the CAP expert panel agreed that the interpretation and report time was underestimated. The expert panel agreed that a total physician time of 13 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.34 appropriately values 81374 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Global Period: XXX RUC Recommended RVU: **0.60**

CPT Descriptor: HLA Class II typing, low resolution (eg, antigen equivalents); HLA-DRB1/3/4/5 and -DQB1

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 28-year-old man is being considered as a potential hematopoietic stem cell donor for his sister who has been diagnosed with acute myelogenous leukemia. He and the other asymptomatic siblings were initially typed for Class I HLA (HLA-A,-B,-C). He was found to be a full match for his sister at these loci. A sample of anticoagulated peripheral blood is submitted to the laboratory for low resolution HLA-DRB1/3/4/5 and -DQB1 typing.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic region containing the HLA-DRB1/3/4/5 and -DQB1 loci are amplified by PCR using 48 sequence-specific primer sets. The amplicons produced are separated by size via gel electrophoresis. The pathologist examines a digitized image or photograph of the ethidium bromide stained gel to assess the presence or absence of amplicons produced for the allele group-specific reactions in comparison to positive and negative controls. Based on the manual analysis of the amplicon patterns and with the assistance of computer software, the pathologist determines the HLA type for the HLA-DRB1/3/4/5, and –DQB1 loci. The pathologist composes a report which specifies the donor's HLA-DRB1/3/4/5 and –DQB1 type at the low resolution level and assesses the match with the recipient. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated the physician work of 81375 is much greater than the key reference service as the median Work RVU was 0.75. In addition all of the intensity and complexity measures indicated that 81375 is much more complex and intense than 88291. The expert panel agreed that a total physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile Work RVU of 0.60 appropriately values 81375 within this family of services.

Intra-Service intensity/complexity	4.00	3.75
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88182 (Work RVU = 0.77, 20 minutes). The survey respondents indicated the physician work of 81376 is less physician work than the key reference service as the median Work RVU was 0.62. However, the all intensity and complexity measures indicated that 81376 is similar in complexity and intensity as 88291. The expert panel agreed that a total physician time of 15 minutes is typical and compared to the key reference service, the median Work RVU of 0.62 appropriately values 81376 within this family of services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

SUMMARY OF RECOMMENDATION

CPT Code:81377 Tracking Number Z46 Original Specialty Recommended RVU: **0.43**
Presented Recommended RVU: **0.43**
Global Period: XXX RUC Recommended RVU: **0.43**

CPT Descriptor: HLA Class II typing, low resolution (eg, antigen equivalents); one antigen equivalent, each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 50-year-old woman presents to an ophthalmologist for ocular pain and photophobia. She has been suffering headaches and dizziness for several weeks. Upon examination, the doctor finds signs of posterior uveitis and observes vitiligo on her face and her arms. He suspects Vogt-Koyanagi-Harada (VKH), an autoimmune disease strongly associated with HLA-DR4. A sample of anti-coagulated peripheral blood is submitted to the laboratory for HLA-DR4 typing.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to PCR amplification using a set of primers specific for the HLA-DRB1*04 allele group. A series of negative and positive control DNA samples are run in parallel. The amplicons produced are separated by size via gel electrophoresis. The pathologist examines a digitized image or photograph of the ethidium bromide stained gel to assess the presence or absence of amplicons produced for the allele group-specific reactions in comparison to positive and negative controls. Based on the manual analysis of the amplicon patterns and with the assistance of computer software, the pathologist determines the HLA-DRB1*04 status. The pathologist composes a report which specifies the patient's HLA-DRB1*04 status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated the physician work of 81377 is less than the key reference service as the median Work RVU was 0.51. The expert panel also referenced CPT code 88388 (Work RVU = 0.45, 12 minutes total time) as a good comparison code. The expert panel agreed that a total physician time of 15 minutes is typical and compared to the key reference service, the 25th percentile Work RVU of 0.43 appropriately values 81377 within this family of services.

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DA is isolated from whole blood. The genomic regions containing the HLA-A, -B, -C and DRB1 genes are amplified by PCR using locus specific primers. For each locus, the PCR products are sequenced with a series of forward and reverse primers. The pathologist visually analyzes the DNA sequences obtained and assesses their alignment against a consensus sequence and comparison with a database of all known alleles with the assistance of software. Ambiguities are resolved using sequence specific primers. Based on these analyses, the pathologist assigns an HLA type for HLA-A, -B, -C and DRB1 at the allele level. The pathologist composes a report which specifies the patient's HLA type. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and agreed that the survey respondents overestimated the physician work, but not the time involved. The expert panel agreed with the survey respondent's median time of 20 minutes for this service, as the typical time required. The expert panel assimilated the overall physician work with that of recently RUC reviewed service 88388 (Work RVU = 0.45, 12 minutes). CAP recommends a direct crosswalk of 81378 to the physician work of 88388 (Work RVU = 0.45) and a total time of 20 minutes for CPT code 81378.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Global Period: XXX RUC Recommended RVU: **0.45**

CPT Descriptor: HLA Class I typing, high resolution (ie, alleles or allele groups); complete (ie, HLA-A, -B, and -C)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 45-year-old man with acute myelogenous leukemia is being considered for a hematopoietic stem cell transplant from an unrelated donor. The potential recipient has been previously typed by high resolution for HLA Class II and low resolution for HLA-A, -B, and –C in an unsuccessful attempt to identify a related donor. To select the best unrelated donor, high resolution typing of the patient is necessary. A sample of anticoagulated peripheral blood is submitted to the laboratory for high resolution HLA-A, -B, and -C allele identification.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic regions containing the HLA-A, -B, and -C genes are amplified by PCR using locus specific primers. For each locus, the PCR products are sequenced with a series of forward and reverse primers. The pathologist evaluates the DNA sequences obtained, assesses their alignment against a consensus sequence and compares results against a database of all known alleles with the assistance of computer software. Ambiguities are resolved using sequence specific primers. Based on these analyses, the pathologist assigns an HLA type for HLA-A, -B, and -C at the allele level. The pathologist composes a report which specifies the patient's HLA type. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Global Period: XXX RUC Recommended RVU: **0.45**

CPT Descriptor: HLA Class I typing, high resolution (ie, alleles or allele groups); one locus (eg, HLA-A, -B, or -C), each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 34 year old woman with acute myelogenous leukemia is being considered for a hematopoietic stem cell transplant from a related donor. Low resolution HLA typing of the patient and several family members identifies a brother who is a potential 2 haplotype match. However, four closely related HLA-B allele groups are segregating in the family, calling into question whether the patient and her brother have inherited identical HLA-B alleles. High resolution typing of the B locus of the patient and her brother is required to resolve this ambiguity. A sample of anticoagulated peripheral blood from the patient is submitted to the laboratory for high resolution HLA-B locus testing to assess her HLA-B allele type for comparison to her brother's type.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Site of Service (Complete for 010 and 090 Globals Only)

Pre-Service intensity/complexity		
Intra-Service intensity/complexity	4.00	4.33
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and agreed that the survey respondents overestimated the physician work, but not the time involved. The expert panel agreed with the survey respondent's median time of 15 minutes for this service, as the typical time required. The expert panel assimilated the overall physician work with that of recently RUC reviewed service 88388 (Work RVU = 0.45, 12 minutes). CAP recommends a direct crosswalk of 81380 to the physician work of 88388 (Work RVU = 0.45) and a total time of 15 minutes for CPT code 81380.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Presented Recommended RVU: **0.45**
Global Period: XXX RUC Recommended RVU: **0.45**

CPT Descriptor: HLA Class I typing, high resolution (ie, alleles or allele groups); one allele or allele group (eg, B*57:01P), each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: An antiretroviral regimen including the drug abacavir is planned for a 35-year-old man with a diagnosis of HIV-1. Prior to beginning abacavir treatment, a sample of anticoagulated peripheral blood is submitted to the laboratory for HLA-B*57:01 allele testing.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic region containing the HLA-B locus is amplified by PCR, and the amplicons are interrogated in hybridization reactions with 100 oligonucleotide probes immobilized on fluorescent microscopic beads. Fluorescence is then assessed in a fluorescent bead array assay. The pathologist examines the fluorescent intensities seen with each probe and determines the status of the HLA-B*57 allele group with the assistance of computer software. Testing with additional probes to distinguish HLA-B*57:01 from other B*57 alleles is performed if necessary. Based on these analyses, the pathologist determines the status of the HLA-B*57:01 allele. The pathologist composes a report which specifies the patient's HLA-B*57:01 allele status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic region containing the HLA Class II gene is amplified by PCR using locus specific primers. The PCR products are sequenced with a series of forward and reverse primers. The pathologist evaluates the DNA sequences obtained, assesses their alignment against a consensus sequence and compares results against a database of all known alleles with the assistance of computer software. Ambiguities are resolved using sequence specific primers.. Based on these analyses, the pathologist assigns an HLA type at the allele level. The pathologist composes a report which specifies the patient's HLA-DQB1 alleles. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity		
Intra-Service intensity/complexity	47.80	5.00
Post-Service intensity/complexity		

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and agreed that the survey respondents overestimated the physician work but not the time required. The expert panel agrees with the median survey time of 15 minutes as the typical time required to provide this service. The expert panel assimilated the overall physician work with that of recently RUC reviewed service 88388 (Work RVU = 0.45, 12 minutes). CAP recommends a direct crosswalk of 81382 to the physician work of 88388 of 0.45 Work RVUs and total time of 15 minutes for CPT code 81382.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88291

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81383 Tracking Number Z52 Original Specialty Recommended RVU: **0.45**
Presented Recommended RVU: **0.45**
Global Period: XXX RUC Recommended RVU: **0.45**

CPT Descriptor: HLA Class II typing, high resolution (ie, alleles or allele groups); one allele or allele group (eg, HLA-DQB1*06:02P), each

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old woman describes excessive daytime sleepiness over the past two months and a recent single episode of transient weakness resulting in her collapse to the floor while discussing a family member's recent death. The results of a polysomnogram and a multiple sleep latency test are indeterminate in helping reach a diagnosis of narcolepsy. A sample of anticoagulated peripheral blood is submitted to the laboratory for HLA-DQB1*06:02 allele identification.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood. The genomic region containing the HLA-DQB1 locus is PCR amplified using sets of sequence specific primers to detect HLA-DQB1*06 group alleles and to distinguish among DQB1*06 alleles. The amplicons produced are separated by size via gel electrophoresis. The pathologist examines the digitized images or photographs of the ethidium bromide stained gels to assess the presence or absence of amplicons produced for the specific reactions in comparison to positive and negative controls. Based on the manual analysis of the amplicon patterns and with the assistance of computer software, the pathologist determines whether the HLA–DQB1*06:02 allele is present. The pathologist composes a report which specifies the patient's HLA-DQB1*06:02 allele status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

AMA/Specialty Society Update Process
Practice Expense Summary of Recommendation
Non Facility Direct Inputs

59 New Molecular Pathology Services

Global Period:_XXX Meeting Date: _September 2011

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

TAB 5 – All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011), except for the HLA code set where CAP surveyed several large and small labs throughout the United States. Survey responses were compiled; questions and clarifications were followed up with lab managers and directors. CAP's expert panel reviewed compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment for all codes.

TAB 9 – All practice expenses were cross-walked to already reviewed Tier 2 codes (April 2011).

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Molecular DNA analyses based on specific code.

Intra-Service Clinical Labor Activities:

NONE

Post-Service Clinical Labor Activities:
Clean up, document filing, and other activities, see spreadsheet

	A	B	C	D

2	**Meeting Date: September 2011** **Specialty: Pathology** **Cross walk from 88XX8 and 88XX23 (DNA extraction from parriffin)** *Typical Batch Size - 2*			*BRAF (v-raf murine sarcoma viral oncogene homolog B1) (eg, colon cancer), gene analysis, V600E variant*
3		**CMS Code**	**Staff Type**	**Total Minutes**
4	**Global Period**			**XXX**
5	**TOTAL CLINICAL LABOR TIME**			**111**
6	*Lab Tech*			*18*
7	*Cytotechnologist*			*93*
8	**TOTAL PRE-SERV CLINICAL LABOR TIME**			**100**
9	**TOTAL SERVICE PERIOD CLINICAL LABOR TIME**			
10	**TOTAL POST-SERV CLINICAL LABOR TIME**			**11**
11	**PRE-SERVICE**			
12	**Start: When preparing containers/requisitions for physician begins**			
13	**Confirm** orders	L033A	Lab Tech	1
14	**Accession** specimen, label and prepare specimen for storage until scheduled processing date	L033A	Lab Tech	6
15	**DNA Extraction**	L045A	Cytotechnologist	6
16	Cutting sections from specimen block using microtome			
17	Removal of paraffin			
18	DNA extraction using extraction instrument			
19	Dilution of DNA extraction 1:5 or 1:10			
20	Discard DNA extraction waste (liquids and solids)			
21	**PCR Set Up**	L045A	Cytotechnologist	13
22	Assemble PCR Primers, buffer, etc… into plates			
23	Combine reagents for PCR master mix			
24	Place tips, PCR reagents and PCR reaction plate on liquid handling instrument 2			
25	Remove extracted DNA from DNA extraction instrument and place on liquid handling system 2			
26	Allow instrument to set up PCR reaction			
27	Cover plate with sealing mat			
28	Place PCR reaction plate in thermal cycler, enter PCR program, and allow instrument to perform PCR			
29	Discard liquid handling system 2 tips from PCR set up			
30	**Check gel**	L045A	Cytotechnologist	13
31	Spin down PCR plate			
32	Mix, heat, cool and pour ethidium bromide containing agarose gel			
33	Combine 8uL of PCR product with 2uL of loading buffer			
34	Add samples, controls and ladder to agarose gel			
35	Photograph gel			
36	Save image and annotate			
37	**PCR Post Processing 1**	L045A	Cytotechnologist	17
38	Prepare EXO/SAP mix			
39	Add mix to PCR products on plate			
40	Place on thermal cycler			
41	**Dye Term Cycle**	L045A	Cytotechnologist	13
42	Prepare sequencing plates			
43	Prepare sequencing Big Dye master mix			
44	Aliquot Big Dye master mix			
45	Add template			
46	Seal, vortex, spin			
47	Place on thermal cycler			
48	**Dye Term Purification**	L045A	Cytotechnologist	24
49	Make fresh Sodium Acetate/ETOH			
50	Add to sequencing samples			
51	Spin down for 20 min			
52	Invert plate on towels			
53	Quick spin plate			
54	Make fresh 70% ETOH			
55	Add ETOH to wells			
56	Spin for 5 min			
57	Add formamide and sequencing standard			
58	Cover with septa and quick spin			

	A	B	C	D
1	**TAB 5 - Final Recommendation**			**81210**

AMA/Specialty Society RVS Update Committee Summary of Recommendations

September 2011

Molecular Pathology Test-Tier 2

In response to payer requests, the CPT Editorial Panel developed a new coding structure to describe molecular pathology services, based on the efforts and recommendations of the Molecular Pathology Coding Workgroup convened beginning in October 2009. In October 2010, the Panel accepted 9 Tier 2 codes, which are a list of codes to be reported when the service is not listed in the Tier 1 codes. The Tier 2 codes are arranged by the level of technical resources and interpretive professional work required. The RUC understands that these services will be rarely reported and represent tests that are established and well developed, however their low volume does not warrant characterization as Tier 1 and unlikely to be automated at this time. If increases, the RUC understands that the test will be assigned a Tier 1 code. These services were previously reported with a series of "stacking codes." The RUC understands that payment for these services is currently based on a mixture of payment methodologies, including the physician fee schedule and the clinical lab fee schedule. CMS has requested that the RUC review data provided by the College of American Pathologists to provide the agency with more information as a policy is developed to determine which payment schedule is appropriate for these services.

In April 2011, the RUC found it difficult to appropriately assign a physician work valuation to these services. The number of survey respondents for each code ranged from 11 to 26, all below the RUC's required minimum of thirty respondents. The recommendations submitted by the specialty did not reflect appropriate valuation given the corresponding time recommendations. The RUC proposed interim recommendations and the specialty society re-surveyed for the September 2011 RUC Meeting. For the September 2011 RUC meeting, the specialty society was able to garner a significantly higher response rate and thus the RUC has considerable confidence in their survey data for the following Molecular Pathology Tier 2 Tests.

81400 Molecular pathology procedure, Level 1 (eg, identification of single germline variant [eg, SNP] by techniques such as restriction enzyme digestion or melt curve analysis)

The RUC reviewed the specialty's survey data from 94 molecular pathologists who provide these services.The survey results indicated a median physician time for 81400 of 10 minutes and a work value of 0.37. The RUC agreed that the median time accurately reflects the amount of time required to perform the service. The RUC compared 81400 to the key reference code 86320 *Immunoelectrophoresis; serum* (work RVU = 0.37) and agreed that the reference code requires more time to perform than the surveyed code, 17 minutes and 10 minutes, respectively The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), and noted that the

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

surveyed code requires less time to perform than this reference code. **Based on these comparisons, the RUC recommends a work RVU of 0.32, the survey's 25th percentile, for CPT code 81400**.

81401 Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)

The RUC reviewed the specialty society's survey data from 59 molecular pathologists who provide these services. The survey data resulted in amedian physician time for 81401 of 15 minutes and a work RVU of 0.50.. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81401 to the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (work RVU = 0.52) and agreed that the reference code requires more time to perform than the surveyed code, 20 minutes and 15 minutes, respectively. Further, the RUC noted that the key reference code is a more intense service to perform as compared to the reference code. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), and noted that the surveyed code requires similar physician time to perform as compared to this reference code. **Based on these comparisons, the RUC recommends a work RVU of 0.40, the survey's 25th percentile, for CPT code 81401**.

81402 Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon)
The RUC reviewed the specialty society's survey data from 61 molecular pathologists who provide these services.that the survey data resulted in a median physician time for 81402 was 20 minutes and a work RVU of 0.52. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81402 to the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (work RVU = 0.52) and agreed that the reference code requires the same time to provide as compared to the surveyed code, 20 minutes. The RUC also compared this service to 93784 *Ambulatory blood pressure monitoring, utilizing a system such as magnetic tape and/or computer disk, for 24 hours or longer; including recording, scanning analysis, interpretation and report* (intra-time=15 minutes, work RVU=0.38), and noted that the surveyed code requires more time to perform as compared to this reference code. **Based on these comparisons, the RUC recommends a work RVU of 0.50, the survey's 25th percentile, for CPT code 81402**.

81403 Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)

The RUC reviewed the specialty's society's survey data from 47 molecular pathologists who provide these services, The survey data indicated a median time for 81403 of 28 minutes with a median physician work RVU of 0.77. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81403 to the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (work RVU = 0.52) and agreed that the reference code requires less time to perform as compared to the surveyed code, 20 minutes and 28 minutes, respectively. However, the specialty acknowledged, and the RUC agreed, that although the surveyed code requires

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

more time to perform as compared to the reference code, they are similarly intense services. The RUC also compared this service to 95251 *Ambulatory continuous glucose monitoring of interstitial tissue fluid via a subcutaneous sensor for a minimum of 72 hours; interpretation and report* (intra-time=30 minutes, work RVU=0.85), and noted that the surveyed code requires less time and is a less intense service to perform as compared to this reference code. **Based on these comparisons, the RUC recommends a work RVU of 0.52, the survey's 25th percentile, for CPT code 81403**.

81404 Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)

The RUC reviewed the specialty society's survey data from 49 molecular pathologist who provide these services. The survey data indicated a median time for 81404 of 30 minutes with a median physician work RVU of 0.83. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81404 to the key reference code 88291 *Cytogenetics and molecular cytogenetics, interpretation and report* (work RVU = 0.52) and agreed that the reference code requires less time to perform as compared to the surveyed code, 20 minutes and 30 minutes, respectively. Further, the specialty acknowledged ,and the RUC agreed, that the surveyed code is a more intense service to perform in comparison to the reference code. The RUC also compared this service to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Work RVU=0.94) and noted that the reference code requires more time to perform in comparison to the surveyed code, 40 minutes and 30 minutes, respectively. **Based on these comparisons, the RUC recommends a work RVU of 0.65, the survey's 25th percentile, for CPT code 81404**.

81405 Molecular pathology procedure, Level 6 (eg, analysis of 6-10 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 11-25 exons)

The RUC reviewed the specialty's survey data from 31 molecular pathologists who provide these services, The survey data indicated a median time for 81405 of 30 minutes with a median physician work RVU of 0.94.. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81403 to the key reference code 88112 *Cytopathology, selective cellular enhancement technique with interpretation (eg, liquid based slide preparation method), except cervical or vaginal* (work RVU = 1.18) and agreed that the reference code requires more time to perform as compared to the surveyed code, 43 minutes and 30 minutes, respectively. The RUC also compared this service to 86077 *Blood bank physician services; difficult cross match and/or evaluation of irregular antibody(s), interpretation and written report* (Work RVU=0.94) and noted that the reference code requires more time to perform in comparison to the surveyed code, 40 minutes and 30 minutes, respectively. **Based on these comparisons, the RUC recommends a work RVU of 0.80, the survey's 25th percentile, for CPT code 81405**.

81406 Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81406 was 60 minutes, with a median work RVU of 1.40. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

compared 81406 to the key reference code 88323 *Consultation and report on referred material requiring preparation of slides* (work RVU = 1.83) and agreed that the reference code requires similar time to perform as compared to the surveyed code, 56 minutes and 60 minutes, respectively. However, the specialty acknowledged and the RUC agreed that although the surveyed code requires similar time to perform as compared to the reference code, the reference code is a more intense service to perform in comparison to the surveyed code. The RUC also compared this service to 92626 *Evaluation of auditory rehabilitation status; first hour* (intra-time=60 minutes, work RVU=1.40), and noted that the surveyed code requires the same time and is a similarly intense service to perform as compared to this reference code. **Based on these comparisons, the RUC recommends a work RVU of 1.40, the survey's median, for CPT code 81406**.

81407 Molecular pathology procedure, Level 8 (eg, analysis of 26-50 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of >50 exons, sequence analysis of multiple genes on one platform)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81406 was 60 minutes, with a median work RVU of 1.85. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81407 to the key reference code 88309 *Level VI - Surgical pathology, gross and microscopic examination* (work RVU = 2.80) and agreed that the reference code requires more time to perform as compared to the surveyed code, 90 minutes and 60 minutes, respectively. The RUC also compared this service to 96118 *Neuropsychological testing (eg, Halstead-Reitan Neuropsychological Battery, Wechsler Memory Scales and Wisconsin Card Sorting Test), per hour of the psychologist's or physician's time, both face-to-face time administering tests to the patient and time interpreting these test results and preparing the report* (Work RVU=1.86) and noted that this reference code requires the same time to perform in comparison to the surveyed code, 60 minutes. **Based on these comparisons, the RUC recommends a work RVU of 1.85, the survey's median percentile, for CPT code 81407**.

81408 Molecular pathology procedure, Level 9 (eg, analysis of >50 exons in a single gene by DNA sequence analysis)

The RUC reviewed the survey data as presented by the specialty society which indicated that the median time for 81408 was 80 minutes, with a median work RVU of 2.80. The RUC agreed that this time accurately reflects the amount of time required to perform the service. The RUC compared 81408 to the key reference code 88309 *Level VI - Surgical pathology, gross and microscopic examination* (work RVU = 2.80) and agreed that the reference code requires more time to perform as compared to the surveyed code, 90 minutes and 80 minutes, respectively. The RUC also compared this service to 88325 *Consultation, comprehensive, with review of records and specimens, with report on referred material* (Work RVU=2.50) and noted that this reference code requires the same time to perform in comparison to the surveyed code, 80 minutes. **Based on these comparisons, the RUC recommends a work RVU of 2.35, the survey's 25th percentile, for CPT code 81408**.

Practice Expense

The practice expense inputs for these services were approved at the April 2011 RUC meeting and forwarded to CMS in May 2011.

Work Neutrality

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Reviewing the Medicare utilization data for 83912 *Molecular diagnostics; interpretation and report* (work RVU = 0.37) and the specialty's estimate of utilization of these individual services, the RUC understands that these recommendations will be work neutral to the family.

New Technology

The entire set of molecular pathology codes should be re-reviewed after claims data are available and there is experience with the new coding system. The time, work valuation, and practice expense inputs should all be reviewed again in the future as these estimates are based on a good faith effort using available information in 2011.

CPT Code (•New)	Track-ing Num-ber	CPT Descriptor	Global Period	Work RVU Recom-mendation
Pathology and Laboratory **Molecular Pathology** The following Molecular Pathology Procedure (Tier 2) codes are used to report procedures not listed in the Tier 1 molecular pathology codes (AXXX1-UXXX1). They represent medically useful procedures that are generally performed in lower volumes than Tier 1 procedures (eg, the incidence of the disease being tested is rare). They are arranged by level of technical resources and interpretive work by the physician.. The individual analyses listed under each code (ie, level of procedure) utilize the definitions and coding principles as described in the introduction preceding the Tier 1 molecular pathology codes. The parenthetical examples of methodologies presented near the beginning of each code provide general guidelines used to group procedures for a given level and are not all-inclusive. Use the appropriate molecular pathology procedure level code that includes the specific analyte listed after the code descriptor. If the analyte tested is not listed under one of the Tier 2 codes or is not represented by a Tier 1 code, use the appropriate methodology codes in the 83890-83914 and 88384-88386 series.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81401 Tracking Number AA2 Original Specialty Recommended RVU: **0.40**
Presented Recommended RVU: **0.40**
Global Period: XXX RUC Recommended RVU: **0.40**

CPT Descriptor: Molecular pathology procedure, Level 2 (eg, 2-10 SNPs, 1 methylated variant, or 1 somatic variant [typically using nonsequencing target variant analysis], or detection of a dynamic mutation disorder/triplet repeat)
CCND1/ IGH (BCL1/ IGH, t[(11;14]d) (eg, mantle cell lymphoma) translocation analysis, major breakpoint, qualitative, and quantitative, if performed

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old asymptomatic man with a family history of Huntington disease presents to his physician for predictive genetic testing for Huntington disease. A sample of anticoagulated peripheral blood is submitted for HTT mutation testing.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work:

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to PCR amplification for the CACNA1C gene exon which contains the known familial mutation. The PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using capillary electrophoresis. The pathologist evaluates the sequencing electropherograms for the known familial mutation and any other variants that may be present. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work:

SURVEY DATA

RUC Meeting Date (mm/yyyy)	09/2011		
Presenter(s):	Jonathan L. Myles, MD, FCAP, Roger D. Klein, MD, JD, FCAP, Aaron D. Bossler, MD, PhD, and Thomas M. Williams, MD

Estimated risk of malpractice suit with poor outcome	4.19	4.10

INTENSITY/COMPLEXITY MEASURES	CPT Code	Reference Service 1
Time Segments (Mean)		
Pre-Service intensity/complexity	0.00	0.00
Intra-Service intensity/complexity	3.86	3.90
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert panel reviewed the survey data and compared the physician work of the new code to the key reference code 88291 (Work RVU = 0.52, 20 minutes total time). The expert panel agreed that considering the robust survey results, the median physician time of 15 minutes was typical, and the 25th percentile work RVU of 0.40 appropriately values 81401.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of code 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0
If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88291

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality genomic DNA is isolated. The genomic region containing the site of the K304E variant is amplified by PCR using primers that in the presence of the K304E variant, introduce an additional restriction endonuclease site into the amplicon. The PCR products undergo digestion with a restriction endonuclease, and the resulting fragments are separated using gel electrophoresis. The pathologist evaluates the patterns of the digestion fragments in relation to marker and control lanes to determine the patient's mutation and zygosity status. The pathologist composes a report which specifies the patient's mutation and zygosity status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) Stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81402 Tracking Number AA3 Original Specialty Recommended RVU: **0.50**
Presented Recommended RVU: **0.50**
Global Period: XXX RUC Recommended RVU: **0.50**

CPT Descriptor: Molecular pathology procedure, Level 3 (eg, >10 SNPs, 2-10 methylated variants, or 2-10 somatic variants [typically using non-sequencing target variant analysis], immunoglobulin and T-cell receptor gene rearrangements, duplication/deletion variants 1 exon)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 14-year-old girl of Turkish descent is seen by her physician for her third episode of fever accompanied by pleuritic chest pain, abdominal discomfort, and pain in the lower extremity joints. Her physical examination demonstrates a temperature of 38.5°C and dullness to percussion at the left lung base. Her abdomen is rigid with apparent rebound tenderness and diminished bowel sounds, and her left knee is warm and swollen with pain upon passive motion. Her white blood count, erythrocyte sedimentation rate and fibrinogen level are elevated. Familial Mediterranean fever is suspected, and a sample of anticoagulated peripheral blood is submitted for genetic testing for common variants in the MEFV gene.

Percentage of Survey Respondents who found Vignette to be Typical: 66%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality genomic DNA is isolated and subjected to multiplex PCR. Following exonuclease I and shrimp alkaline phosphatase treatment, a second reaction using allele specific primer extension (ASPE) amplifies either the normal or mutant allele sequences for 11 common MEFV variants. The fluorescently-tagged PCR products are separated by capillary electrophoresis. The pathologist evaluates the electropherogram comparing the relative sizes and peak heights of the PCR products to determine mutation and zygosity status. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The expert panel agreed that the median physician time of 20 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.50 appropriately values 81402.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

CPT Code:81403 Tracking Number AA4 Original Specialty Recommended RVU: **0.52**
Presented Recommended RVU: **0.52**
Global Period: XXX RUC Recommended RVU: **0.52**

CPT Descriptor: Molecular pathology procedure, Level 4 (eg, analysis of single exon by DNA sequence analysis, analysis of >10 amplicons using multiplex PCR in 2 or more independent reactions, mutation scanning or duplication/deletion variants of 2-5 exons)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old man with chronic myelogenous leukemia (CML) of several years duration on maintenance therapy with imatinib mesylate, experiences a greater than 1 log increase in his BCR/ABL1 transcript levels on repeat measurements. He reports adherence to his therapeutic regimen, and his imatinib level was found to be within the therapeutic range. Because of an apparent loss of response to imatinib, a sample of anticoagulated peripheral blood is submitted for ABL1 tyrosine kinase domain sequencing to assess for imatinib resistance mutations.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality total cellular RNA is isolated and stored under RNase-free conditions. Reverse transcriptase is used to convert RNA to cDNA. PCR amplification using primers for the BCR/ABL1 major breakpoint translocation is performed, followed by nested PCR amplification using internal primers flanking the tyrosine kinase domain region. The nested PCR products undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report specifying the patient's ABL1 kinase domain mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81403 was less intense and complex than 88291 however it typically took more time. The overall work effort was therefore similar to 88291. The expert panel agreed that the median physician time of 28 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.52 appropriately values 81403.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81404 Tracking Number AA5 Original Specialty Recommended RVU: **0.65**
Presented Recommended RVU: **0.65**
Global Period: XXX RUC Recommended RVU: **0.65**

CPT Descriptor: Molecular pathology procedure, Level 5 (eg, analysis of 2-5 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 6-10 exons, or characterization of a dynamic mutation disorder/triplet repeat by Southern blot analysis)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 30-year-old woman who has relatives with head and neck paragangliomas presents to her physician complaining of an enlarging, otherwise asymptomatic right-sided neck mass. Imaging studies suggest a carotid body paraganglioma. The patient is referred to a surgeon, who suspects a hereditary paraganglioma-pheochromocytoma syndrome. An anticoagulated peripheral blood sample is submitted for SDHD gene sequencing.

Percentage of Survey Respondents who found Vignette to be Typical: 69%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 4 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report specifying the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*
Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88291 (Work RVU = 0.52, 20 minutes). The survey respondents indicated code 81404 is greater or as intense and complex as

88291 and it typically takes more time. Therefore, it was clear that there is more overall work in 81404 than in 88291. The expert panel agreed that the median physician time of 30 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.65 appropriately values 81404.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	0.00	0.00
Intra-Service intensity/complexity	4.20	4.00
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88112 (Work RVU = 1.18, 43 minutes). The survey respondents indicated code 81405 is greater, or as intense and complex, as 88112 and it typically takes more time. The expert panel agreed with the survey respondents based on the fact that there are 11-25 exons to be reviewed. The expert panel agreed that the median physician time of 30 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 0.80 appropriately values 81405.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians <u>in your specialty</u> perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period?
If the recommendation is from multiple specialties, please provide the frequency and <u>percentage</u> for each specialty. Please explain the rationale for this estimate.

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Specialty Frequency Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,000
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81406 Tracking Number AA7 Original Specialty Recommended RVU: **1.40**
Presented Recommended RVU: **1.40**
Global Period: XXX RUC Recommended RVU: **1.40**

CPT Descriptor: Molecular pathology procedure, Level 7 (eg, analysis of 11-25 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of 26-50 exons, cytogenomic array analysis for neoplasia)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 10-month-old infant of mixed Ashkenazi Jewish ancestry experiences progressive muscle weakness with a loss of motor skills, decreased attentiveness, and an increased startle response. His pediatrician suspects a diagnosis of Tay-Sachs disease, and the patient is tested for the common Ashkenazi Jewish HEXA gene variants. The patient is found to be heterozygous for the +TATC1278 variant, but no additional common mutations are detected. An anticoagulated peripheral blood sample is submitted for HEXA sequencing to assess the patient for the presence of a second HEXA mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 14 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report specifying the patient's HEXA mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88323 (Work RVU = 1.83, 56 minutes). The survey respondents indicated code 81406 is greater, or as intense and complex, as 88323 and it typically takes more time. All intensity and complexity measures indicated a high intensity and complexity. The expert panel agreed with the survey respondents based on the fact that there are 26-50 exons to be reviewed. The expert panel agreed that the median physician time of 60 minutes is typical and compared to the key reference service, the median work RVU of 1.40 appropriately values 81406.

Urgency of medical decision making	4.33	4.83
Technical Skill/Physical Effort (Mean)		
Technical skill required	4.83	5.00
Physical effort required	4.33	4.50
Psychological Stress (Mean)		
The risk of significant complications, morbidity and/or mortality	5.00	5.00
Outcome depends on the skill and judgment of physician	5.00	5.00
Estimated risk of malpractice suit with poor outcome	4.83	4.83

INTENSITY/COMPLEXITY MEASURES	**CPT Code**	**Reference Service 1**
Time Segments (Mean)		
Pre-Service intensity/complexity	0.00	0.00
Intra-Service intensity/complexity	4.83	4.50
Post-Service intensity/complexity	0.00	0.00

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88309 (Work RVU = 2.80, 90 minutes). The survey respondents indicated code 81407 is greater, or as intense and complex as 88309 in 5 out of 9 measures. All intensity and complexity measures indicated a high intensity and complexity. The expert panel agreed with the survey respondents that 81407 is complex and intense. The expert panel agreed that the median physician time of 60 minutes is typical and compared to the key reference service, the median work RVU of 1.85 appropriately values 81407 within this family of Tier 2 services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty College of American Pathologists How often? Sometimes

Specialty How often?

AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS
SUMMARY OF RECOMMENDATION

CPT Code:81408 Tracking Number AA9 Original Specialty Recommended RVU: **2.35**
Presented Recommended RVU: **2.35**
Global Period: XXX RUC Recommended RVU: **2.35**

CPT Descriptor: Molecular pathology procedure, Level 9 (eg, analysis of >50 exons in a single gene by DNA sequence analysis)

CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 16-month-old girl is found by her pediatrician to have mild axillary freckling and 2 large café-au-lait macules on routine physical examination. The history and physical examination is otherwise within normal limits. A diagnosis of neurofibromatosis is suspected. An anticoagulated peripheral blood sample is submitted for NF1 sequencing to assess the patient for the presence of a neurofibromatosis-related mutation.

Percentage of Survey Respondents who found Vignette to be Typical: 67%

Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?
Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?
Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Is moderate sedation inherent in your reference code (Office setting)?
Is moderate sedation inherent in your reference code (Hospital/ASC setting)?

Description of Pre-Service Work: n/a

Description of Intra-Service Work: High quality genomic DNA is isolated from whole blood and subjected to 58 individual PCR amplification reactions. The PCR products from each reaction undergo bidirectional dideoxynucleotide chain termination sequencing using a capillary electrophoresis instrument. The pathologist evaluates the sequencing electropherograms for potential nucleotide sequence variants, insertions, deletions or other changes. The pathologist compares this evaluation with possible variations suggested by computer software to ensure that all abnormalities are identified. The pathologist composes a report specifying the patient's NF1 mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: n/a

Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Following the survey, the data were reviewed by an expert panel that included CAP's relative value workgroup, CAP's RUC advisor, the American Society of Cytopathology (ASC) RUC advisor, molecular pathology experts (MDs) and representatives from the general and academic pathology practice settings.

The expert committee reviewed the survey data and compared it to the key reference code 88309 (Work RVU = 2.80, 90 minutes). The survey respondents indicated code 81408 is greater, or as intense and complex as 88309 in 8 out of 9 measures. All intensity and complexity measures indicated a high intensity and complexity. The expert panel agreed with the survey respondents that 81408 is complex and intense. The expert panel agreed that the median physician time of 80 minutes is typical and compared to the key reference service, the 25th percentile work RVU of 2.35 appropriately values 81408 within this family of Tier 2 services.

SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

   Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

   - ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
   - ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
   - ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
   - ☐ Multiple codes are used to maintain consistency with similar codes.
   - ☐ Historical precedents.
   - ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will fall in the 350,000 range for the Medicare population based on the current volume of 83912.

Subject: HCPAC Recommendations

Dear Mr. Blum:

The RUC Health Care Professionals Advisory Committee (HCPAC) Review Board submits the enclosed recommendation to the Centers for Medicare and Medicaid Services (CMS). The HCPAC reviewed CPT code 90863 *Pharmacologic management, including prescription and review of medication, when performed with psychotherapy services* identified through the Fourth Five-Year Review process, at its April 26, 2012 meeting.

The RUC and HCPAC are fully committed to this ongoing effort to improve relativity in the work, practice expense, and professional liability insurance values. The HCPAC appreciates the opportunity to provide recommendations related to the 2013 Medicare Physician Payment Schedule. If you have any questions regarding this submission, please contact Susan Clark via (202) 789-7495 or Susan.Clark@ama-assn.org at the AMA for clarification regarding these recommendations.

Sincerely,

Arthur Traugott, MD
HCPAC Chair

Health Care Professionals Advisory Committee (HCPAC) Summary of Recommendations
Fourth Five-Year Review

April 2012

Pharmacologic Management with Psychotherapy

In February 2012, as part of the new psychotherapy coding framework, the CPT Editorial Panel created code 90863 *Pharmacologic management, including prescription and review of medication, when performed with psychotherapy services (List separately in addition to the code for primary procedure)* to allow psychologists who perform pharmacologic management services for their patients as an add-on to psychotherapy to report these services.

The American Psychological Association recommended that code 90863 be carrier priced as this service is being reported by approximately 100 individuals in two states and it would be difficult to survey at this time. **The HCPAC agreed and recommends that CPT code 90863 be carrier priced.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
Psychiatry				
Psychiatry services include diagnostic services, psychotherapy, and other services to an individual, family, or group. Patient condition, characteristics, or situational factors may require services described as being with interactive complexity. Services may be provided to a patient in crisis. Services are provided in all settings of care and psychiatry services codes are reported without regard to setting. Services may be provided by a physician or other qualified health care professional. Some psychiatry services may be reported with **Evaluation and Management Services** (99201-99255, 99281-99285, 99304-99337, 99341-99350) or other services when performed. **Evaluation and Management Services** (99201-99285, 99304-99337, 99341-99350) may be reported for treatment of psychiatric conditions, rather than using **Psychiatry Services** codes, when appropriate.				

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Hospital care ~~by the attending physician~~ in treating a psychiatric inpatient or partial hospitalization may be initial or subsequent in nature (see 99221-99233)~~ and may include exchanges with nursing and ancillary personnel. Hospital care services involve a variety of responsibilities unique to the medical management of inpatients, such as physician hospital orders, interpretation of laboratory or other medical diagnostic studies and observations~~.

Some patients receive hospital evaluation and management services only and others receive hospital evaluation and management services and other procedures. If other procedures such as electroconvulsive therapy or psychotherapy are rendered in addition to hospital evaluation and management services, these ~~should~~may be listed separately (~~ie~~eg, hospital care services (99221-99223, 99231-99233) plus electroconvulsive therapy (90870), or when psychotherapy is done, ~~an~~with appropriate code(s) defining psychotherapy ~~with medical evaluation and management~~ services~~). Modifier 22 may be used to indicate a more extensive service. Modifier 52 may be used to signify a service that is reduced or less extensive than the usual procedure~~.

~~Other evaluation and management services, such as office medical service or other patient encounters, may be described as listed in the section on **Evaluation and Management,** if appropriate.~~

~~The evaluation and management services should not be reported separately, when reporting codes 90805, 90807, 90809, 90811, 90813, 90815, 90817, 90819, 90822, 90824, 90827, 90829.~~

Consultation for psychiatric evaluation of a patient includes examination of a patient and exchange of information with the primary physician and other informants such as nurses or family members, and preparation of a report. These ~~consultation~~ services ~~(99241-99255) are limited to initial evaluation and do not involve psychiatric treatment. Follow-up visits in the consultant's office or other outpatient facility that are initiated by the physician consultant or patient are~~may be reported using ~~the appropriate codes for established patients, office visits (99211-99215), domiciliary, rest home (99334-99337), or home (99347-99350). If an additional request for an opinion or advice regarding the same or a new problem is received from another physician or other appropriate source and documented in the medical record, the office~~ consultation codes ~~may be used again. Services that constitute transfer of care (ie, are provided for the management of the patient's entire care or for the care of a specific condition or problem~~see **Consultations**~~) are reported with the appropriate new or established patient codes for office or other outpatient visits, domiciliary, rest home services, or home services~~.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

Interactive Complexity

Code 90785 is an add-on code for interactive complexity to be reported in conjunction with codes for diagnostic psychiatric evaluation (90791, 90792), psychotherapy (90832, 90834, 90837), psychotherapy when performed with an Evaluation and Management service (90833, 90836, 90838, 99201-99255, 99304-99337, 99341-99350), and group psychotherapy (90853).

Interactive complexity refers to specific communication factors that complicate the delivery of a psychiatric procedure. Common factors include more difficult communication with discordant or emotional family members and engagement of young and verbally undeveloped or impaired patients. Typical patients are those who have third parties, such as parents, guardians, other family members, interpreters, language translators, agencies, court officers, or schools involved in their psychiatric care.

These factors are typically present with patients who:

- Have other individuals legally responsible for their care, such as minors or adults with guardians, or
- Request others to be involved in their care during the visit, such as adults accompanied by one or more participating family members or interpreter or language translator, or
- Require the involvement of other third parties, such as child welfare agencies, parole or probation officers, or schools.

Psychiatric procedures may be reported "with interactive complexity" when at least one of the following is present:

1. The need to manage maladaptive communication (related to, eg, high anxiety, high reactivity, repeated questions, or disagreement) among participants that complicates delivery of care.
2. Caregiver emotions or behavior that interferes with the caregiver's understanding and ability to assist in the implementation of the treatment plan.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

3. Evidence or disclosure of a sentinel event and mandated report to third party (e.g., abuse or neglect with report to state agency) with initiation of discussion of the sentinel event and/or report with patient and other visit participants.
4. Use of play equipment, other physical devices, interpreter or translator to communicate with the patient to overcome barriers to therapeutic or diagnostic interaction between the physician or other qualified health care professional and a patient who:

- Is not fluent in the same language as the physician or other qualified health care professional, or
- Has not developed, or has lost, either the expressive language communication skills to explain his/her symptoms and response to treatment, or the receptive communication skills to understand the physician or other qualified health care professional if he/she were to use typical language for communication.

When provided in conjunction with the psychotherapy codes 90832-90838, the amount of time spent by a physician or other qualified health care professional providing interactive complexity services should be reflected in the timed service code for psychotherapy (90832, 90834, 90837) or the psychotherapy add-on code performed with an Evaluation and Management service (90833, 90836, 90838, 99201-99255, 99304-99337, 99341-99350) and must relate to the psychotherapy service only. Interactive complexity is not a factor for Evaluation and Management Services selection (99201-99255, 99281-99285, 99304-99337, 99341-99350), except as it directly affects key components as defined in Evaluation and Management Services Guidelines (ie, history, examination and medical decision making).

+●90785	LL1	Interactive Complexity (List separately in addition to the code for primary procedure) (Use 90785 is conjunction with codes for diagnostic psychiatric evaluation (90791, 90792), psychotherapy (90832, 90834, 90837), psychotherapy when performed with an Evaluation and Management service (90833, 90836, 90838, 99201-99255, 99304-99337, 99341-99350), and group psychotherapy (90853)) (Do not use 90785 in conjunction with 90839, 90840 or in conjunction with E/M services when no psychotherapy service is also reported)	ZZZ	Carrier Price (RUC Recommendation)

Psychiatric Diagnostic ~~or Evaluative Interview~~ Procedures

Psychiatric diagnostic ~~interview examination includes a~~evaluation is an integrated biopsychosocial assessment, including history, mental status, and ~~a disposition, and~~recommendations. The evaluation may include communication with family or other sources~~, ordering~~ and review and ~~medical interpretation~~ordering of ~~laboratory or other medical~~ diagnostic studies~~. In certain circumstances other informants will be seen in lieu of the patient~~.

Psychiatric diagnostic evaluation with medical services is an integrated biopsychosocial and medical assessment, including history, mental status, other physical examination elements as indicated, and recommendations. The evaluation may include communication with family or other sources, prescription of medications, and review and ordering of laboratory or other diagnostic studies.

In certain circumstances one or more other informants (family members, guardians, or significant others) may be seen in lieu of the patient. Codes 90791, 90792 may be reported more than once for the patient when separate diagnostic evaluations are conducted with the patient and other informants. Report services as being provided to the patient and not the informant or other party in such circumstances. Codes 90791, 90792 may be reported once per day and not on the same day as an Evaluation and Management service performed by the same individual for the same patient.

~~Interactive psychiatric diagnostic interview examination is typically furnished to children. It involves the use of physical aids and non-verbal communication to overcome barriers to therapeutic interaction between the clinician and a patient who has not yet developed, or has lost, either the expressive language communication skills to explain his/her symptoms and response to treatment, or the receptive communication skills to understand the clinician if he/she were to use ordinary adult language for communication.~~

The psychiatric diagnostic evaluation may include interactive complexity services when factors exist that complicate the delivery of the psychiatric procedure. These services should be reported with add-on code 90785 used in conjunction with the diagnostic psychiatric evaluation codes 90791, 90792.

Codes 90791, 90792 are used for the diagnostic assessment(s) or reassessment(s), if required, and do not include psychotherapeutic services. Psychotherapy services, including for crisis, may not be reported on the same day.

Psychiatric Therapeutic Procedures

Psychotherapy is the treatment for mental illness and behavioral disturbances in which the clinician establishes a professional contract with the patient and, through definitive therapeutic communication, attempts to alleviate the emotional disturbances, reverse or change maladaptive patterns of behavior, and encourage personality growth and development. The codes for reporting psychotherapy are divided into two broad categories: Interactive Psychotherapy; and Insight Oriented, Behavior Modifying and/or Supportive Psychotherapy.
Interactive psychotherapy is typically furnished to children. It involves the use of physical aids and nonverbal communication to overcome barriers to therapeutic interaction between the clinician and a patient who has not yet developed, or has lost, either the expressive language communication skills to explain his/her symptoms and response to treatment, or the receptive communication skills to understand the clinician if he/she were to use ordinary adult language for communication.

Insight oriented, behavior modifying and/or supportive psychotherapy refers to the development of insight or affective understanding, the use of behavior modification techniques, the use of supportive interactions, the use of cognitive discussion of reality, or any combination of the above to provide therapeutic change.

Some patients receive psychotherapy only and others receive psychotherapy and medical evaluation and management services. These evaluation and management services involve a variety of responsibilities unique to the medical management of psychiatric patients, such as medical diagnostic evaluation (eg, evaluation of comorbid medical conditions, drug interactions, and physical examinations), drug management when indicated, physician orders, interpretation of laboratory or other medical diagnostic studies and observations.

In reporting psychotherapy, the appropriate code is chosen on the basis of the type of psychotherapy (interactive using non-verbal techniques versus insight oriented, behavior modifying and/or supportive using verbal techniques), the place of service (office versus inpatient), the face-to-face time spent with the patient during psychotherapy, and whether evaluation and management services are furnished on the same date of service as psychotherapy. Face-to-face time when providing psychotherapy with medical evaluation and management services includes time spent providing both psychotherapy and evaluation and management services (ie, 90809, 90811, 90813, 90815, 90817, 90819, 90822, 90824, 90827, 90829).
To report medical evaluation and management services furnished on a day when psychotherapy is not provided, select the appropriate code from the **Evaluation and Management Services Guidelines.**

Office or Other Outpatient Facility Insight Oriented, Behavior Modifying and/or Supportive Psychotherapy

Psychotherapy

Psychotherapy is the treatment of mental illness and behavioral disturbances in which the physician or other qualified health care professional, through definitive therapeutic communication, attempts to alleviate the emotional disturbances, reverse or change maladaptive patterns of behavior, and encourage personality growth and development.

The psychotherapy service codes 90832–90838 include ongoing assessment and adjustment of psychotherapeutic interventions, and may include involvement of family member(s) or others in the treatment process.

Psychotherapy times are for face-to-face services with patient and/or family member. The patient must be present for all or some of the service. For family psychotherapy without the patient present, use 90846. In reporting, choose the code closest to the actual time (ie, 16-37 minutes for 90832 and 90833, 38-52 minutes for 90834 and 90836, and 53 or more minutes for 90837 and 90838). Do not report psychotherapy of less than 16 minutes duration. (See instructions for the usage of Time in the Introduction of the CPT code set).

Psychotherapy provided to a patient in a crisis state is reported with codes 90839 and 90840 and cannot be reported in addition to the psychotherapy codes 90832-90838. For psychotherapy for crisis, see "Other Psychotherapy".

Code 90785 is an add-on code to report interactive complexity services when provided in conjunction with the psychotherapy codes 90832-90838. The amount of time spent by a physician or other qualified health care professional providing interactive complexity services should be reflected in the timed service code for psychotherapy (90832, 90834, 90837) or the psychotherapy add-on code performed with an Evaluation and Management service (90833, 90836, 90838).

Some psychiatric patients receive a medical evaluation and management (E/M) service on the same day as a psychotherapy service by the same physician or other qualified health care professional. To report both E/M and psychotherapy, the two services must be significant and separately identifiable. These services are reported by using codes specific for psychotherapy when performed with Evaluation and Management services (90833, 90836, and 90838) as add-on codes to the Evaluation and Management service.

Medical symptoms and disorders inform treatment choices of psychotherapeutic interventions, and data from therapeutic communication are used to evaluate the presence, type, and severity of medical symptoms and disorders. For the purposes of reporting, the medical and psychotherapeutic components of the service may be separately identified as follows:

1. The type and level of E/M service is selected first based upon the key components of history, examination, and medical decision-making.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

a. Time associated with activities used to meet criteria for the E/M service is not included in the time used for reporting the psychotherapy service (ie, time spent on history, examination and medical decision making **when used for the E/M service** is not psychotherapy time). Time may not be used as the basis of E/M code selection and Prolonged Services may not be reported when psychotherapy with E/M (90833, 90836, 90838) are reported. b. A separate diagnosis is not required for the reporting of E/M and psychotherapy on the same date of service.

Other Psychotherapy
Psychotherapy for Crisis

Psychotherapy for crisis is an urgent assessment and history of a crisis state, a mental status exam, and a disposition. The treatment includes psychotherapy, mobilization of resources to defuse the crisis and restore safety, and implementation of psychotherapeutic interventions to minimize the potential for psychological trauma. The presenting problem is typically life threatening or complex and requires immediate attention to a patient in high distress.

Codes 90839, 90840 are used to report the total duration of time face-to-face with the patient and/or family spent by the physician or other qualified health care professional providing psychotherapy for crisis, even if the time spent on that date is not continuous. For any given period of time spent providing psychotherapy for crisis state, the physician or other qualified health care professional must devote his or her full attention to the patient and, therefore, cannot provide services to any other patient during the same time period. The patient must be present for all or some of the service. Do not report with 90791 or 90792.

Code 90839 is used to report the first 30-74 minutes of psychotherapy for crisis on a given date. It should be used only once per date even if the time spent by the physician or other health care professional is not continuous on that date. Psychotherapy for crisis of less than 30 minutes total duration on a given date should be reported with 90832 or 90833 (when provided with Evaluation and Management services).

(90840 is used to report additional block(s) of time, of up to 30 minutes each beyond the first 74 minutes)

Practice Expense Subcommittee
Staff Note

Migration of Radiologic Images from Film to Digital Workgroup

In September 2011, the American College of Radiology (ACR) agreed to continue to collect data and review the typical Picture Archiving and Communication Systems (PACS) environment across specialty. The specialty requested the AMA's assistance in collecting additional data on this topic. A survey was developed collaboratively and deployed by the AMA in December 2011. The survey was sent to over 100,000 practicing patient care AMA physician members with an n=700. The report focuses on the top 7 specialties with 30 or more respondents. The survey results indicate that PACS ownership is now or soon will be typical in 6 of the top 7 specialties. Obstetrics and Gynecology is the only specialty where PACS is not yet typical.

Given this more robust data, indicating that PACS are typical, the ACR agreed to propose a timeline/workplan to develop appropriate practice expense inputs for PACS to replace practice expense inputs related to film for the appropriate codes. The ACR will provide a verbal update at the April meeting. The Practice Expense Subcommittee should discuss next steps, including the establishment of a workgroup, to address this concern. The workgroup should include representation from ACR and other appropriate specialty societies.

The workgroup will be charged with the following tasks:

- Develop appropriate practice expense inputs for PACS to replace practice expense inputs related to film for the appropriate codes.
- Identify which codes are appropriate to be migrated from film to PACS
- Reevaluate the need for a laser printer for all codes that will transition to reporting PACS rather than film.
- Reevaluate the need for equipment codes SK030, SK058, SK065 once the transition from film to digital is complete. These inputs are not part of the PACS system, but should be considered by the workgroup as related equipment.

Practice Expense Subcommittee
Staff Note

Migration of Radiologic Images from Film to Digital Workgroup

In April 2011, the American College of Radiology provided the PE Subcommittee with an update on their work in evaluating the migration of film acquisition to Picture Archiving and Communication Systems (PACS) through an internal ACR Workgroup. To further their evaluation, the ACR provided the PE Subcommittee with survey results from a survey conducted to determine the typical usage of PACS. The survey received 64 respondents from the AAOS, 15 respondents from the ACC and 3 respondents from the ACP. Of the 82 total respondents, 84% stated that they use PACS. The specialty also provided the typical scenario per modality. For CT, MR and interventional the use of PACS are typical. For x-ray and ultrasound PACS are not currently typical. The specialty noted, that while radiologists were not surveyed, the ACR confirmed that the above typical scenarios are accurate for the radiology community as well. The specialty and the Workgroup agreed that the ACR should continue to collect data and review the typical PACS environment across specialty and report back to the PE Subcommittee in February 2012. Staff also noted that the AMA could provide assistance to survey physicians about current PACS usage. AMA staff will work with the ACR regarding additional data collection.

PACS Survey

The AMA and the ACR worked together to collect additional data on this topic. A survey was developed collaboratively and deployed by the AMA in December, 2011. The survey was sent out on December 12th to all practicing patient care physicians on AMA's email opt-in list (118,139 physicians). The survey closed on December 20th. The subject line of the email was designed to encourage participation from physicians most likely to be interested in imaging systems (Use of Imaging Across Medicine). 1,498 physicians accessed the survey and 62% of those who accessed the survey perform and/or review/interpret imaging services (n=934). The results of the survey are included in the attached table entitled *PACS Survey Results*. Based on physicians self-reporting of their primary practice in Q9, the hospital based physicians (n=234) have been filtered out resulting in a new total of n=700. The report focuses on the top 7 specialties with 30 or more respondents. The survey results indicate that PACS ownership is now or soon will be typical in 6 of the top 7 specialties. Obstetrics and Gynecology is the only specialty with 30 or more respondents where PACS is not yet typical. Family Medicine reported 46% currently own PACS, however if you consider those that plan to obtain PACS within 2012 it puts the specialty to nearly 60%. The results of the survey have been shared with ACR for further comment by the January 26 PE Subcommittee meeting.

Practice Expense Subcommittee
Staff Note

Endoscope Cleaning and Disinfecting Pack, SA042

In January 2012, the PE Subcommittee noted that the pack included in supplies for cleaning the endoscope, CMS supply item SA042, includes gluteraldehyde (disinfecting/sanitizing agent) and does not contain a basin for the glueraldehyde. American Society for Gastrointestinal Endoscopy recommends that the irrigation basin, CMS code SJ009, be added to the pack below.

DESCRIPTION	Code	Unit	Item Qty	Unit price
pack, cleaning and disinfecting, endoscope	**SA042**	**pack**		**15.520**
gloves, non-sterile		pair	4	0.084
gown, staff, impervious		item	1	1.186
face shield, splash protection		item	1	1.706
biohazard bag		item	1	0.062
gauze, sterile 4in x 4in (10 pack uou)		item	1	0.798
alcohol isopropyl 70%		ml	60	0.002
cleaning brush, endoscope		item	1	4.992
glutaraldehyde 3.4% (Cidex, Maxicide, Wavicide)		oz	32	0.165
glutaraldehyde test strips (Cidex, Metrex)		item	1	1.012
