Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
<b>19295</b>	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
<b>19290</b>	Preoperative placement of needle localization wire, breast;
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
<b>76098</b>	Radiological examination, surgical specimen
<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1st lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

### Localization Device Placement Codes (19281-19288)

#### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways.

Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather, a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19282 (*Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including mammographic guidance (List separately in addition to code for primary procedure)*) describes image guided wire localization placement, each additional lesion utilizing mammographic imaging guidance including the placement of a breast localizing device(s) and imaging of the biopsy specimen, when performed. Currently, these are typically performed using multiple localization wires to "bracket" the lesion. Depending on lesion morphology, this procedure can involve placement of 1-4 wires, with 2 being most typical. This CPT code was designed to utilize a single CPT code, reported only once, regardless of the number or type of markers placed in or around a second separate lesion under mammographic guidance. This service is currently reported using the following codes:

Code	Descriptor	Work RVU
<b>19291</b>	Preoperative placement of needle localization wire, breast; each additional lesion (List separately in addition to code for primary procedure)	0.63

<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation	0.56
--------------	---	------

### Work RVU Recommendation

The expert panel recommends a work RVU of 1.00, which is half the recommended value of 19281, the base code with which add on code 19282 code will be reported. The intra-service time for these 2 codes is nearly identical (30 vs. 20 minutes) suggesting the application of the surgical MPPR to reach our recommendation is appropriate. Our recommendation is below the 25th percentile of our survey and below the existing value of the two codes currently used to describe this service.

#### Pre-Service Time

The respondents indicated 5 minutes of pre service time and 5 minutes of post service time for this ZZZ add-on code. The expert panel attributes this time to the following activities which occur after and in addition to similar activities involved in treating the 1<sup>st</sup> lesion

pre-service activities:

- Target second separate lesion. Obtain mammographic image. Determine coordinates for marker placement.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia at each marker insertion site.

and post-service activities:

- Cover area with sterile dressing.

#### Intra Service Times

We are recommending the median intra service time of 20 minutes which is slightly less than the 30 minutes of intra-service time for the base code, 19281, with which this ZZZ code is reported.

### Comparison to Key Reference Service

Our recommendation compares favorably to the most commonly chosen KRS, 76812 (*Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation plus detailed fetal anatomic examination, transabdominal approach; each additional gestation (List separately in addition to code for primary procedure)*), which has a higher RVU of 1.78 and slightly longer intra-service time of 25 minutes. Our surveyed code is an intervention whereas the KRS is an imaging study and our respondents found the localization clip placement more complex on 11 out of 11 complexity measures.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
76812	1.78					25		25	0.0712

### MPC Comparison

Our recommendation of 1.00 RVUs compares favorably to ZZZ MPC code 64484, which has less intra-service time than our surveyed code.

Code	RVU	Pre	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
------	-----	-----	-----------------	-----------	-----------	-------	------	-------	-------

		Eval							
64484	1.00					10		10	0.1000

### Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

### Conclusion

In summary, the panel recommends and RVU of 1.00, half the value of the base code with which this code will be reported. We believe this relative value is appropriate based on comparisons to the KRS, the MPC code provided and within the larger family of breast biopsy codes.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19291, 77032

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology                      How often? Commonly

Specialty    How often?

Specialty    How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We are unable to accurately estimate the number of times this service might be provided nationally in a one year period.

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 76812

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 19283      Tracking Number 09      Original Specialty Recommended RVU: **2.00**  
 Presented Recommended RVU: **2.00**  
 Global Period: 000      RUC Recommended RVU: **2.00**

CPT Descriptor: Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including stereotactic guidance

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 59-year-old female has recently been diagnosed with invasive ductal carcinoma in the inferior left breast. Wire/needle localization with stereotactic guidance is performed from an inferior approach prior to sending the patient to the operating room.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 1%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

**Description of Pre-Service Work:**

- Review medical records and previous imaging and decide on appropriate guidance method and initial approach based on prior imaging.
- Discuss procedure details, including alternatives and risks with the patient and family and obtain informed consent.
- Review set up in the procedure suite. Ensure accurate calibration of the equipment. Supervise positioning and preparation of the patient.
- Surgical time out performed.
- Supervise and review initial scout image and stereotactic pair of images. Target the lesion to be localized. Transmit coordinates to the stereotactic device. If the lesion is not adequately visualized, change patient position and repeat the localizing process.
- Move the needle into appropriate position on the machine.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia.

**Description of Intra-Service Work:**

- Advance needle to stereotactic coordinates. Confirm placement with stereotactic images.
- Deploy marker.
- Obtain stereotactic images after marker deployment.
- Review post-marker placement images for successful deployment.
- Repeat process as needed to place markers at additional locations around periphery of same lesion.
- Annotate images.
- Secure markers as needed.

Description of Post-Service Work:

- Cover area with sterile dressing. Confirm patient stability. Transfer patient and marked images to pre-surgical area.
- A formal report of the procedure is dictated into the permanent medical record.
- The results and further management are discussed with the patient and their family, as well as the requesting physician.
- Review and sign procedure report.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
<b>19295</b>	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
<b>19290</b>	Preoperative placement of needle localization wire, breast;
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
<b>76098</b>	Radiological examination, surgical specimen
<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1<sup>st</sup> lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

### Localization Device Placement Codes (19281-19288)

#### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways. Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19283 (*Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including stereotactic guidance*) describes image guided placement of a wire for localization of a tumor utilizing stereotactic imaging guidance. This new CPT code will be coded only once, no matter how many markers are placed in or around the lesion. This takes into account the evolution of practice and the use of more than one marker to better define the margins of a lesion. This code also addressed a coding shortcoming as no code existed for placement of a marker which was not preceded by a biopsy. It is now common to place a marker in a lesion without a biopsy on the same day, such as prior to initiating neo-adjuvant chemotherapy.

This service is currently reported using the following codes:

Code	Descriptor	Work RVU
<b>19499</b>	Unlisted procedure, breast	0.00

<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation	1.59
--------------	---	------

### Work RVU Recommendation

The expert panel recommends the 25<sup>th</sup> percentile value of 2.00 RVUs, higher than the existing value of 1.59.

#### Pre-Service Time

The expert panel recommends pre-service package 1a (Straightforward Patient/Straightforward Procedure (No sedation/anesthesia care)) with the following adjustments:

(1) Increase the total pre-service evaluation time by 5 minutes to 18 minutes total to accommodate an extra 3 minutes necessary for "history and exam (Performance and review of appropriate pre-tests) and an additional 2 minutes for "Communicate with patient and/or family (Discuss procedure / obtain consent)". Patients undergoing stereotactic guided clip placement typically have a large number of prior examinations which must be reviewed in detail including prior screening mammography, diagnostic mammography, diagnostic ultrasound, prior biopsies and clip placements. Moreover, a careful review of the prior pathology, previous medical and surgical treatment and planned therapy is performed. It is incumbent on the performing physician to review the entire breast imaging record prior to the biopsy being performed including imaging of the opposite breast. These patients are often well informed women appropriately requiring and expecting detailed discussion of the expected course and outcome. Unlike other biopsies performed elsewhere in the body, there is high anxiety, both because the biopsy is often unanticipated and because it involves the breast. For these reasons, breast biopsy patients have more anxiety, have more questions, and frequently bring multiple family members to the consent, which increases time to address all of their needs as well.

(2) Increase the positioning time by 2 minutes to 3 minutes to accommodate the additional time necessary to optimally position these patients on the stereotactic table and ensure that operator and imaging equipment are likewise well positioned relative to the patient. Further, it is reasonable to conclude that survey respondents would consider imaging to localize the mass and guide skin prep prior to biopsy to be considered pre-service work.

#### Intra and Post Service Times

We are recommending the median intra and post-service times of 20 and 15 minutes, respectively.

### Comparison to Key Reference Service

The panel would like to point out that many of our survey respondents practice nearly 100% breast imaging. Since the surveyed code family essentially includes all of the 0 global day services this survey population performs, respondents may have struggled to find a 0 day global reference service they commonly perform. Nonetheless, the most commonly chosen KRS is 36556 (*Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older*), which has a lower intra-service time of 15 minutes but higher RVUs of 2.50. While both of these procedures include imaging guidance, 19283 scored higher on 11 of 11 complexity measures. This reflects the unique nature of breast interventions. These procedures are associated with very high patient and family anxiety, which tends to increase the psychological stress of the physician performing the exam. Additionally, these types of exams have a higher frequency to be associated with malpractice suits, which adds to the stress as well.

Our recommendation yields an IWPUT of 0.0573, reflecting the intensity of this procedure in this subset of patients. Indeed, the patient is laying prone with her breast in compression throughout the intra service period of this procedure. The stereotactic table is inherently uncomfortable leading to frequent complaints of neck and shoulder pain during the procedure as time passes. Due to the need for the patient to remain fully aware and not move even a few millimeters, the atmosphere in the room can become quite tense. Calcifications which are readily visible on a high resolution digital mammogram are often poorly seen on the much lower resolution screen of the stereotactic machine. In addition, surrounding landmarks are often not visible in the much smaller field of view. This can lead to multiple changes of patient position which can be very unsettling for the patient and increase pressure on the physician thus increasing the intensity of the procedure.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
36556	2.50	15	5	5	25	15	10	50	0.1192

## MPC Comparison

Our recommendation is bracketed in RVUs and intra-service time by two MPC codes, 64483 (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level*) and 90937 (*Hemodialysis procedure requiring repeated evaluation(s) with or without substantial revision of dialysis prescription*).

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
64483	1.90	13	5	6	24	15	10	49	0.0816
90937	2.11	10			10	40	10	60	0.0415

## Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

## Conclusion

In summary, the panel recommends the 25<sup>th</sup> percentile value of 2.00 RVUs. We believe this relative value is appropriate based on comparisons to the KRS, the two MPC codes provided and within the larger family of breast localization device placement codes.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19499, 77031

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology                      How often? Commonly

Specialty General Surgery                              How often? Commonly

Specialty    How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We are unable to accurately estimate the number of times this service might be provided nationally in a one-year period

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 50387

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 19284      Tracking Number   O10

Original Specialty Recommended RVU: **1.00**Presented Recommended RVU: **1.00**

Global Period: ZZZ

RUC Recommended RVU: **1.00**

CPT Descriptor: Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including stereotactic guidance (List separately in addition to code for primary procedure)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 52-year-old female recently underwent stereotactic biopsy of two separate lesions within the inferior right breast. One region demonstrated ductal carcinoma in-situ (DCIS) and the second was diagnosed as invasive ductal carcinoma. Stereotactic-guided wire/needle localization of the focus of DCIS is performed after initial stereotactic-guided marker localization of the separate invasive ductal carcinoma. [Note: This is an add-on code. Marker placement(s) at the initial lesion reported separately using 19283.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

### Description of Pre-Service Work:

- Reposition patient back into the stereotactic biopsy system.
- Target second separate lesion. Supervise and review initial scout image and stereotactic pair of images. Target the lesion to be localized. Transmit coordinates to the stereotactic device. If the lesion is not adequately visualized, change patient position and repeat the localizing process.
- Move the needle into appropriate position on the machine.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia.

### Description of Intra-Service Work:

- Advance needle to stereotactic coordinates. Confirm placement with stereotactic images.
- Deploy marker.
- Obtain stereotactic images after marker deployment.
- Review post-marker placement images for successful deployment.
- Repeat process as needed to place markers at additional locations around periphery of same lesion.
- Annotate images.
- Secure markers as needed.

### Description of Post-Service Work:

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
19103	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
19295	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
19290	Preoperative placement of needle localization wire, breast;
77031	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
76098	Radiological examination, surgical specimen
77032	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1<sup>st</sup> lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

### Localization Device Placement Codes (19281-19288)

#### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways. Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19284 (*Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including stereotactic guidance (List separately in addition to code for primary procedure)*) describes image guided wire localization placement, each additional lesion utilizing stereotactic imaging guidance including the placement of a breast localizing device and imaging of the biopsy specimen, when performed. The panel would like to point out that. This new CPT code will be coded only once, no matter how many markers are placed in or around the lesion. This takes into account the evolution of practice and the use of more than one marker to better define the margins of a lesion. This code also addressed a coding shortcoming as no code existed for placement of a marker which was not preceded by a biopsy. It is now common to place a marker in a lesion without a biopsy on the same day, such as prior to initiating neo-adjuvant chemotherapy. This service is currently reported using the following codes:

Code	Descriptor	Work RVU
------	------------	-------------

<b>19499</b>	Unlisted procedure, breast	0.00
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation	1.59

### Work RVU Recommendation

The expert panel recommends a work RVU of 1.00, which is half the recommended value 19283, the base code with which add on code 19284 will be reported. The intra-service time for these 2 codes is identical (20 minutes), suggesting the application of the surgical MPPR to reach our recommendation is appropriate. Our recommendation is below the 25th percentile of our survey and below the existing value of the two codes currently used to describe this service.

#### Pre-Service Time

The respondents indicated 5 minutes of pre service time and 5 minutes of post service time for this ZZZ add-on code. The expert panel attributes this time to the following activities which occur after and in addition to similar activities involved in treating the 1<sup>st</sup> lesion.

pre-service activities:

- Target second separate lesion. Supervise and review initial scout image and stereotactic pair of images. Target the lesion to be localized. Transmit coordinates to the stereotactic device. If the lesion is not adequately visualized, change patient position and repeat the localizing process.
- Move the needle into appropriate position on the machine.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia.

and post-service activities:

- Cover area with sterile dressing.

#### Intra Service Times

We are recommending the median intra service times of 20 minutes which is the same as the intra-service time for the base code, 19283, with which this ZZZ code is reported.

### Comparison to Key Reference Service

Our recommendation compares favorably to the most commonly chosen KRS, 76812 (*Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation plus detailed fetal anatomic examination, transabdominal approach; each additional gestation (List separately in addition to code for primary procedure)*), which has a higher RVU of 1.78 and slightly longer intra-service time of 25 minutes. Our surveyed code is an intervention whereas the KRS is an imaging study and our respondents found the localization clip placement more complex on 11 out of 11 complexity measures.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
76812	1.78					25		25	0.0712

### MPC Comparison

Our recommendation of 1.00 RVU compares favorably to ZZZ MPC code 64484, which has less intra-service time than our surveyed code.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
64484	1.00					10		10	0.1000

## Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

## Conclusion

In summary, the panel recommends an RVU of 1.00, half the value of the base code with which this code will be reported. We believe this relative value is appropriate based on comparisons to the KRS, the MPC code provided, and within the larger family of breast biopsy codes.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

### Description of Pre-Service Work:

- Review medical records and previous imaging and decide on appropriate guidance method and initial approach based on prior imaging.
- Discuss procedure details, including alternatives and risks with the patient and family and obtain informed consent.
- Review set up in the procedure suite. Ensure accurate calibration of the equipment. Supervise positioning and preparation of the patient.
- Surgical time out performed.
- Position patient on the ultrasound table to best localize the lesion. Image sonographically to confirm adequate lesion visualization and approach to lesion.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia at each marker insertion site.

### Description of Intra-Service Work:

- Under ultrasound visualization, advance introducer(s) to edge(s) of lesion(s). Document position with ultrasound image(s).
- Deploy marker(s). Obtain post-deployment ultrasound images to confirm adequacy.
- Withdraw the introducer(s) and obtain hemostasis with manual compression over the procedure site.
- Repeat process as needed to place markers at additional locations around periphery of same lesion.
- Close wound(s)

### Description of Post-Service Work:

- Apply dressing.

- Monitor the patient's condition prior to discharge including wound check.
- A formal report of the procedure is dictated into the permanent medical record.
- The results and further management are discussed with the patient and their family, as well as the requesting physician.
- Review and sign procedure report.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
<b>19295</b>	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
<b>19290</b>	Preoperative placement of needle localization wire, breast;
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
<b>76098</b>	Radiological examination, surgical specimen
<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1<sup>st</sup> lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

### Localization Device Placement Codes (19281-19288)

#### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways. Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19285 (*Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including ultrasound guidance*) describes image guided placement of a wire for localization of a tumor utilizing ultrasound imaging guidance. This new CPT code will be coded only once, no matter how many markers are placed in or around the lesion. This takes into account the evolution of practice and the use of more than one marker to better define the margins of a lesion. This code also addressed a coding shortcoming as no code existed for placement of a marker which was not preceded by a biopsy. It is now common to place a marker in a lesion without a biopsy on the same day, such as prior to initiating neo-adjuvant chemotherapy.

This service is currently reported using the following codes:

Code	Descriptor	Work RVU
<b>19499</b>	Unlisted procedure, breast	0.00

<b>76942</b>	Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation	0.67
--------------	---	------

### Work RVU Recommendation

The expert panel recommends the 25<sup>th</sup> percentile RVU of 1.70, higher than the existing value of 0.67.

#### Pre-Service Time

The expert panel recommends pre-service package 1a (Straightforward Patient/Straightforward Procedure (No sedation/anesthesia care)) with the following adjustments:

(1) Increase the total pre-service evaluation time by 5 minutes to 18 minutes total to accommodate an extra 3 minutes necessary for "history and exam (Performance and review of appropriate pre-tests) and an additional 2 minutes for "Communicate with patient and/or family (Discuss procedure / obtain consent)". Patients undergoing ultrasound guided clip placement typically have a large number of prior examinations which must be reviewed in detail including prior screening mammography, diagnostic mammography, diagnostic ultrasound, prior biopsies and clip placements. Moreover, a careful review of the prior pathology, previous medical and surgical treatment and planned therapy is performed. It is incumbent on the performing physician to review the entire breast imaging record prior to the biopsy being performed including imaging of the opposite breast. These patients are often well informed women appropriately requiring and expecting detailed discussion of the expected course and outcome. Unlike other biopsies performed elsewhere in the body, there is high anxiety, both because the biopsy is often unanticipated and because it involves the breast. For these reasons, breast biopsy patients have more anxiety, have more questions, and frequently bring multiple family members to the consent, which increases time to address all of their needs as well.

(2) Increase the positioning time by 2 minutes to 3 minutes to accommodate the additional time necessary to optimally position these patients on the ultrasound table and ensure that operator and imaging equipment are likewise well positioned relative to the patient. Further, it is reasonable to conclude that survey respondents would consider imaging to localize the mass and guide skin prep prior to biopsy to be considered pre-service work.

#### Intra and Post Service Times

We are recommending the median intra and post-service times of 15 and 15 minutes, respectively.

### Comparison to Key Reference Service

The panel would like to point out that many of our survey respondents practice nearly 100% breast imaging. Since the surveyed code family essentially includes all of the 0 day global services this survey population performs, respondents may have struggled to find a 0 day global reference service they commonly perform. Nonetheless, the most commonly chosen KRS is 36556 (*Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older*), which has the same intra-service time of 15 minutes but higher RVUs of 2.50. While both of these procedures include imaging guidance, 19285 scored higher on all of the complexity measures. This reflects the unique nature of breast interventions. These procedures are associated with very high patient and family anxiety, which tends to increase the psychological stress of the physician performing the exam. Additionally, these types of exams have a higher frequency to be associated with malpractice suits, which adds to the stress as well.

Our recommendation yields an IWPUT of 0.0563, reflecting the intensity of this procedure in this subset of patients. Due to the need for the patient to remain fully aware and not move even a few millimeters, the atmosphere in the room can become quite intense. The patient is typically able to view the large biopsy device entering her breast which makes many patients very anxious. Some lesions can be quite mobile both initially and difficult to see after local anesthesia administration leading to difficulty localizing the lesion which can add to the anxiety.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
36556	2.50	15	5	5	25	15	10	50	0.1192

### MPC Comparison

Our MPC code is 64483 (*Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level*). 19285 has the same intra-service time as 64483 but a lower work RVU.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
64483	1.90	13	5	6	24	15	10	49	0.0816

### Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

### Conclusion

In summary, the panel recommends the median survey value of 1.70 RVUs. We believe this relative value is appropriate based on comparisons to the KRS, the MPC code provided, and within the larger family of breast localization device placement codes.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19499, 76942

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology                      How often? Commonly

Specialty General Surgery                      How often? Commonly

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We are unable to accurately estimate the number of times this service might be provided nationally in a one-year period.

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see work neutrality estimates.

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36569

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 19286      Tracking Number   O12

Original Specialty Recommended RVU: **0.85**Presented Recommended RVU: **0.85**

Global Period: ZZZ

RUC Recommended RVU: **0.85**

CPT Descriptor: Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including ultrasound guidance (List separately in addition to code for primary procedure)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 72-year-old female with recently diagnosed invasive ductal carcinoma in the left breast at 2 o'clock, 3 cm from the nipple, and a second carcinoma in the left breast at 1 o'clock, 8 cm from the nipple. Ultrasound-guided wire/needle localization of the lesion at 1 o'clock performed after initial ultrasound-guided wire/needle localization of the lesion at 2 o'clock. [Note: This is an add-on code. Marker placement(s) at the initial lesion reported separately using 19285.]

Percentage of Survey Respondents who found Vignette to be Typical: 96%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

### Description of Pre-Service Work:

- Reposition the patient as needed to optimally target second lesion.
- Target second separate lesion. Position patient on the ultrasound table to best localize the lesion. Image sonographically to confirm adequate lesion visualization and approach to lesion.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia at each marker insertion site.

### Description of Intra-Service Work:

- Under ultrasound visualization, advance introducer(s) to edge(s) of lesion(s). Document position with ultrasound image(s).
- Deploy marker(s). Obtain post-deployment ultrasound images to confirm adequacy.
- Withdraw the introducer(s) and obtain hemostasis with manual compression over the procedure site.
- Repeat process as needed to place markers at additional locations around periphery of same lesion.
- Close wound(s).

### Description of Post-Service Work:

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
<b>19295</b>	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
<b>19290</b>	Preoperative placement of needle localization wire, breast;
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
<b>76098</b>	Radiological examination, surgical specimen
<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1<sup>st</sup> lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

## Localization Device Placement Codes (19281-19288)

### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways. Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19286 (*Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including ultrasound guidance (List separately in addition to code for primary procedure)*) describes image guided wire localization placement, each additional lesion utilizing ultrasound imaging guidance including the placement of a breast localizing device and imaging of the biopsy specimen, when performed. The panel would like to point out that. This new CPT code will be coded only once, no matter how many markers are placed in or around the lesion. This takes into account the evolution of practice and the use of more than one marker to better define the margins of a lesion. This code also addressed a coding shortcoming as no code existed for placement of a marker which was not preceded by a biopsy. It is now common to place a marker in a lesion without a biopsy on the same day, such as prior to initiating neo-adjuvant chemotherapy. This service is currently reported using the following codes:

Code	Descriptor	Work
------	------------	------

		RVU
19499	Unlisted procedure, breast	0.00
76942	Ultrasonic guidance for needle placement (eg, biopsy, aspiration, injection, localization device), imaging supervision and interpretation	0.67

### Work RVU Recommendation

The expert panel recommends a work RVU of 0.85, which is half the recommended value of 19285, the base code with which add on code 19286 will be reported. The intra-service time for these 2 codes is nearly identical (15 vs. 19 minutes), suggesting the application of the surgical MPPR to reach our recommendation is appropriate. Our recommendation is below the 25th percentile of our survey and below the existing value of the two codes currently used to describe this service.

#### Pre-Service Time

The respondents indicated 5 minutes of pre service time and 5 minutes of post service time for this ZZZ add-on code. The expert panel attributes this time to the following which occur after and in addition to similar activities involved in treating the 1<sup>st</sup> lesion

pre-service activities:

- Target second separate lesion. Position patient on the ultrasound table to best localize the lesion. Image sonographically to confirm adequate lesion visualization and approach to lesion.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia at each marker insertion site.

and post-service activities:

- Apply dressing.

#### Intra Service Times

We are recommending the median intra service time of 19 minutes which is slightly more than the 15 minutes of intra-service time for the base code, 19285, with which this ZZZ code is reported.

### Comparison to Key Reference Service

Our recommendation compares favorably to the most commonly chosen KRS, 76812 (*Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation plus detailed fetal anatomic examination, transabdominal approach; each additional gestation (List separately in addition to code for primary procedure)*), which has a higher RVU of 1.78 and slightly longer intra-service time of 25 minutes. Our surveyed code is an intervention whereas the KRS is an imaging study and our respondents found the localization clip placement more complex on 11 out of 11 complexity measures.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
76812	1.78					25		25	0.0712

### MPC Comparison

Our recommendation is similar in RVU and intra-service time by two 000 MPC codes, 90945 (*Dialysis procedure other than hemodialysis (eg, peritoneal dialysis, hemofiltration, or other continuous renal replacement therapies), with single evaluation by a physician or other qualified health care professional*) and 55876 (*Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple*).

Code	RVU	Pre	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
------	-----	-----	-----------------	-----------	-----------	-------	------	-------	-------

		Eval							
90945	1.56	10			10	27	10	47	0.0412
55876	1.73	19	10		19	20	10	49	0.0428

### Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

### Conclusion

In summary, the panel recommends an RVU of 0.85, half the value of the base code with which this code will be reported. We believe this relative value is appropriate based on comparisons to the KRS, the MPC codes provided, and within the larger family of breast biopsy codes.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19499, 76942

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology                      How often? Commonly

Specialty General Surgery                              How often? Commonly

Specialty    How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We are unable to accurately estimate the number of times this service might be provided nationally in a one-year period.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see work neutrality estimates.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 76812

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 19287      Tracking Number   013

Original Specialty Recommended RVU: **3.02**Presented Recommended RVU: **3.02**

Global Period: 000

RUC Recommended RVU: **3.02**

CPT Descriptor: Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including magnetic resonance guidance

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 59-year-old female has a large invasive ductal carcinoma in the right breast and is a candidate for neoadjuvant chemotherapy prior to surgery. MRI guidance is used to place markers at the edges of the lesion prior to therapy to monitor response to treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 8%

**Description of Pre-Service Work:**

- Review medical records and previous imaging and decide on appropriate guidance method and initial approach based on prior imaging.
- Discuss procedure details, including alternatives and risks with the patient and family and obtain informed consent.
- Review set up in the procedure suite. Ensure accurate calibration of the equipment. Supervise positioning and preparation of the patient.
- Surgical time out performed.
- Supervise and review initial magnetic resonance sequences. Target the lesion to be localized. Transmit coordinates to the work station. Choose grid coordinates.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia.

**Description of Intra-Service Work:**

- Make a small incision with a scalpel.
- Move the trocar(s) into appropriate position(s). Confirm placement with MR imaging. Adjust as necessary.
- Advance introducer(s) through trocar(s). Deploy marker(s). Remove introducer(s).
- Obtain and review post-marker placement MRI images for successful deployment.
- Withdraw the trocar(s) and obtain hemostasis with manual compression over the procedure site.
- Repeat process as needed to place markers at additional locations around periphery of same lesion.
- Close wound(s).

**Description of Post-Service Work:**

- Apply dressing.
- Monitor the patient's condition prior to discharge including wound check.
- A formal report of the procedure is dictated into the permanent medical record.
- The results and further management are discussed with the patient and their family, as well as the requesting physician.
- Review and sign procedure report.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
<b>19295</b>	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
<b>19290</b>	Preoperative placement of needle localization wire, breast;
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
<b>76098</b>	Radiological examination, surgical specimen
<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1<sup>st</sup> lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

### Localization Device Placement Codes (19281-19288)

#### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways. Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19287 (*Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including magnetic resonance guidance*) describes image guided placement of a wire for localization of a tumor utilizing magnetic resonance imaging guidance. This new CPT code will be coded only once, no matter how many markers are placed in or around the lesion. This takes into account the evolution of practice and the use of more than one marker to better define the margins of a lesion. This code also addressed a coding shortcoming as no code existed for placement of a marker which was not preceded by a biopsy. It is now common to place a marker in a lesion without a biopsy on the same day, such as prior to initiating neo-adjuvant chemotherapy.

This service is currently reported using the following codes:

Code	Descriptor	Work RVU
<b>19499</b>	Unlisted procedure, breast	0.00

<b>77021</b>	Magnetic resonance guidance for needle placement (eg, for biopsy, needle aspiration, injection, or placement of localization device) radiological supervision and interpretation	1.50
--------------	--	------

## Work RVU Recommendation

The expert panel recommends the median RVU of 3.02.

### Pre-Service Time

The expert panel recommends pre-service package 1a (Straightforward Patient/Straightforward Procedure (No sedation/anesthesia care)) with the following adjustments:

(1) Increase the total pre-service evaluation time by 5 minutes to 18 minutes total to accommodate an extra 3 minutes necessary for "history and exam (Performance and review of appropriate pre-tests) and an additional 2 minutes for "Communicate with patient and/or family (Discuss procedure / obtain consent)". Patients undergoing MR guided clip placement typically have a large number of prior examinations which must be reviewed in detail including prior screening mammography, diagnostic mammography, diagnostic ultrasound, prior biopsies and clip placements. Moreover, a careful review of the prior pathology, previous medical and surgical treatment and planned therapy is performed. It is incumbent on the performing physician to review the entire breast imaging record prior to the biopsy being performed including imaging of the opposite breast. These patients are often well informed women appropriately requiring and expecting detailed discussion of the expected course and outcome. Unlike other biopsies performed elsewhere in the body, there is high anxiety, both because the biopsy is often unanticipated and because it involves the breast. For these reasons, breast biopsy patients have more anxiety, have more questions, and frequently bring multiple family members to the consent, which increases time to address all of their needs as well.

(2) Increase the positioning time by 2 minutes to 3 minutes to accommodate the additional time necessary to optimally position these patients on the MR table and ensure that operator and imaging equipment are likewise well positioned relative to the patient. Further, it is reasonable to conclude that survey respondents would consider imaging to localize the mass and guide skin prep prior to biopsy to be considered pre-service work.

### Intra and Post Service Times

We are recommending the median intra and post-service times of 37 and 15 minutes, respectively.

## Comparison to Key Reference Service

The panel would like to point out that many of our survey respondents practice nearly 100% breast imaging. Since the surveyed code family essentially includes all of the 0 day global services this survey population performs, respondents may have struggled to find a 0 day global reference service they commonly perform. Nonetheless, the most commonly chosen KRS is 36556 (*Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older*), which has a lower intra-service time of 15 minutes and lower RVUs of 2.50. While both of these procedures include imaging guidance, 19287 scored higher on 11 of 11 complexity measures. This reflects the unique nature of breast interventions. These procedures are associated with very high patient and family anxiety, which tends to increase the psychological stress of the physician performing the exam. Additionally, these types of exams have a higher frequency to be associated with malpractice suits, which adds to the stress as well.

Our recommendation yields an IWPUT of 0.0585, reflecting the intensity of this procedure in this subset of patients. Indeed, the patient is laying prone with her breast in compression throughout the intra service period of this procedure. The MR table is inherently uncomfortable leading to frequent complaints of neck and shoulder pain during the procedure as time passes. Due to the need for the patient to remain fully aware and not move even a few millimeters, the atmosphere in the room can become quite tense. The images for the biopsy are performed on a biopsy device rather than a dedicated breast coil and as such correlating the lesion to be marked to the initial lesion of concern can be challenging especially for very small lesions which are typically the ones for which MRI has to be performed since they cannot be visualized sonographically. Many patients have feelings of claustrophobia even if they are actually able to tolerate the machine which increases the anxiety level of the patient and the pressure on the physician thus increasing the intensity of the procedure.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
------	-----	----------	-----------------	-----------	-----------	-------	------	-------	-------

36556	2.50	15	5	5	25	15	10	50	0.1192
-------	------	----	---	---	----	----	----	----	--------

### MPC Comparison

Our recommendation has higher RVU than the MPC code, 31622 (*Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*), with 7 more minutes of intra-service time.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
31622	2.78	10	5	5	20	30	15	65	0.0688

### Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

### Conclusion

In summary, the panel recommends the median survey value of 3.02 RVUs. We believe this relative value is appropriate based on comparisons to the KRS, the MPC code provided, and within the larger family of breast localization device placement codes.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19499, 77021

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We are unable to accurately estimate the number of times this service might be provided nationally in a one-year period.

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see work neutrality estimates.

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 32551

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 19288      Tracking Number    O14

Original Specialty Recommended RVU: **1.51**Presented Recommended RVU: **1.51**

Global Period: ZZZ

RUC Recommended RVU: **1.51**

CPT Descriptor: Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including magnetic resonance guidance (List separately in addition to code for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 67-year-old female has two separate recently biopsied areas of invasive ductal carcinoma in the lower-outer quadrant of the left breast. She is a candidate for neoadjuvant therapy prior to surgery. MRI guidance is used to place markers at the edges of the second lesion after initial MRI-guided localization to place markers around the first lesion. [Note: This is an add-on code. Marker placement at the initial lesion reported separately using 19287.]

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 3%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

**Description of Pre-Service Work:**

- Reposition patient back into the MRI biopsy system.
- Target second separate lesion. Supervise and review initial magnetic resonance sequences. Transmit coordinates to the work station. Choose grid coordinates.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia.

**Description of Intra-Service Work:**

- Make a small incision with a scalpel.
- Move the trocar(s) into appropriate position(s). Confirm placement with MR imaging. Adjust as necessary.
- Advance introducer(s) through trocar(s). Deploy marker(s). Remove introducer(s).
- Obtain and review post-marker placement MRI images for successful deployment.
- Withdraw the trocar(s) and obtain hemostasis with manual compression over the procedure site.
- Repeat process as needed to place markers at additional locations around periphery of same lesion.
- Close wound(s).

**Description of Post-Service Work:**

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several breast intervention codes were identified by the 75% screen including the following:

Code	Descriptor
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance
<b>19295</b>	Image guided placement, metallic localization clip, percutaneous, during breast biopsy/aspiration (List separately in addition to code for primary procedure)
<b>19290</b>	Preoperative placement of needle localization wire, breast;
<b>77031</b>	Stereotactic localization guidance for breast biopsy or needle placement (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation
<b>76098</b>	Radiological examination, surgical specimen
<b>77032</b>	Mammographic guidance for needle placement, breast (eg, for wire localization or for injection), each lesion, radiological supervision and interpretation

To improve the reporting of breast interventions, the entire family of existing breast intervention codes was sent to the CPT Editorial Panel who created a new family of 14 bundled codes to describe image-guided breast interventions. This new family consists of two main groups: (1) 6 codes to describe breast biopsy (19081-19086) differentiated by the imaging modality used, either stereotactic, ultrasound, or MR guidance, with each guidance method then divided into a base code for the 1<sup>st</sup> lesion and an add-on code for each additional lesion biopsied; (2) 8 new codes (19281-19288) to describe the placement of breast localization device(s) also differentiated by the imaging guidance used with base and add-on codes created.

The American College of Radiology, American College of Surgeons, and the American Society of Breast Surgeons randomly surveyed their respective members, and an expert panel was convened to review the survey results. The MR guidance codes (19085, 19085, 19287, and 19288) and the mammo guided localization codes (19281 and 19282) were only surveyed by the ACR.

### Localization Device Placement Codes (19281-19288)

#### Compelling Evidence

We believe the localization device placement codes satisfy compelling evidence standards in a number of ways. Previously, placement of a marker into a breast was a relatively simple and straightforward procedure. This often consisted of using imaging guidance to place only a single marker at the lesion for subsequent localization at the time of excision, or placement of a single marker in the lesion at the time of percutaneous biopsy for future localization or mammographic follow-up. Currently, improvements in open breast surgical technique have made it necessary to not only mark a lesion, but often mark multiple edges of a lesion to better define the lesion's extent preoperatively. This allows closer surgical margins and improved cosmetic results. Additionally, in the era of neo-adjuvant chemotherapy, not all patients go immediately to surgery upon discovery of a breast tumor. Rather a subset of breast cancer patients is treated with chemotherapy prior to surgical excision. In those cases, it is necessary to mark the lesion along multiple margins to aid in subsequent evaluation of response to the neo-adjuvant chemotherapy.

CPT code 19288 (Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including magnetic resonance guidance (List separately in addition to code for primary procedure)) describes image guided wire localization placement, each additional lesion utilizing magnetic resonance imaging guidance including the placement of a breast localizing device and imaging of the biopsy specimen, when performed. The panel would like to point out that. This new CPT code will be coded only once, no matter how many markers are placed in or around the lesion. This takes into account the evolution of practice and the use of more than one marker to better define the margins of a lesion. This code also addressed a coding shortcoming as no code existed for placement of a marker which was not preceded by a biopsy. It is now common to place a marker in a lesion without a biopsy on the same day, such as prior to initiating neo-adjuvant chemotherapy. This service is currently reported using the following codes:

Code	Descriptor	Work RVU
<b>19499</b>	Unlisted procedure, breast	0.00
<b>77021</b>	Magnetic resonance guidance for needle placement (eg, for biopsy, needle aspiration, injection, or placement of localization device) radiological	1.50

supervision and interpretation

## Work RVU Recommendation

The expert panel recommends a work RVU of 1.51, which is half the recommended value of 19287, the base code with which add on code 19288 will be reported. The intra-service time for these 2 codes is nearly identical (37 vs. 30 minutes), suggesting the application of the surgical MPPR to reach our recommendation is appropriate. Our recommendation is below the 25th percentile of our survey and close to the existing value of the two codes currently used to describe this service.

### Pre-Service Time

The respondents indicated 5 minutes of pre service time and 5 minutes of post service time for this ZZZ add-on code. The expert panel attributes this time to the following activities which occur after and in addition to similar activities involved in treating the 1<sup>st</sup> lesion

pre-service activities:

- Target second separate lesion. Supervise and review initial magnetic resonance sequences. Transmit coordinates to the work station. Choose grid coordinates.
- Prepare the skin with an appropriate surgical antiseptic solution and administer local anesthesia.

and post-service activities:

- Apply dressing.

### Intra Service Times

We are recommending the median intra service time of 30 minutes which is slightly less than the 37 minutes of intra-service time for the base code, 19287, with which this ZZZ code is reported.

## Comparison to Key Reference Service

Our recommendation compares favorably to the most commonly chosen KRS, 76812 (*Ultrasound, pregnant uterus, real time with image documentation, fetal and maternal evaluation plus detailed fetal anatomic examination, transabdominal approach; each additional gestation (List separately in addition to code for primary procedure)*), which has a higher RVU of 1.78 and slightly longer intra-service time of 25 minutes. Our surveyed code is an intervention whereas the KRS is an imaging study and our respondents found the localization clip placement more complex on 11 out of 11 complexity measures.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
76812	1.78					25		25	0.0712

## MPC Comparison

Our recommendation of 1.51 RVUs compares favorably to ZZZ MPC code 99292 (*Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (List separately in addition to code for primary service)*), which has the same intra-service time and a higher RVU than our surveyed code.

Code	RVU	Pre Eval	Pre Positioning	Pre S/D/W	Total Pre	Intra	Post	Total	IWPUT
99292	2.25					30		30	0.750

### Comparison Within the Family

The recommendations maintain appropriate rank order across the entire family of localization device placement codes as summarized in the table below. As discussed above, the inherent level of patient discomfort throughout this examination and the variability of visualization of the biopsy target, procedures performed under stereotactic guidance are, by definition, more intense than other breast biopsies. The MRI guided biopsies have similar proposed RVU values yet significantly longer intra service times due to the much longer acquisition times to obtain MRI sequences to verify lesion location and needle placement than the acquisition times for stereotactic procedures. Similarly ultrasound guided procedures require less intra service time due to the use of real-time imaging.

### Conclusion

In summary, the panel recommends and RVU of 1.51, half the value of the base code with which this code will be reported. We believe this relative value is appropriate based on comparisons to the KRS, the MPC code provided, and within the larger family of breast biopsy codes.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 19499, 77021

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Diagnostic Radiology

How often? Commonly

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. We are unable to accurately estimate the number of times this service might be provided nationally in a one-year period.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. see work neutrality estimates.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 76812

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non Facility Direct Inputs**

CPT Long Descriptor:

<b>19281</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including mammographic guidance
<b>19282</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including mammographic guidance (List separately in addition to code for primary procedure)

Global Period: 000, ZZZ Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology convened a consensus panel to finalize the practice expense data for the codes listed above.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

For the mammographic guidance marker placement codes, the current mammo guidance code, 77032, and needle localization codes, 19290 and 19291, were used as a PE reference. 77032, 19290, and 19291 will be deleted and replaced by 19281 and 19282.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We have increased minutes over the PE Subcommittee standards for several activities to accommodate the complex nature of mammography guided breast biopsy.

- **Prepare room, equipment, supplies** – The extra minute is necessary since complex biopsy equipment is involved.
- **Prepare and position patient/ monitor patient/ set up IV** – Since the breast is a round structure, positioning can vary to assure operator, biopsy devices and imaging equipment are properly oriented.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We have increased the staff time, supplies and equipment to accommodate the evolution of mammography guided breast biopsy since the original PEAC review.

**Staff time**

- **Retrieve prior images for comparison** – Prior pathology is always reviewed prior to biopsy to help direct the current biopsy or prior to marker placement to decide on the type of marker placement and number of markers needed.
- **Monitor pt. following service/check tubes, monitors, drains** - Post procedure monitoring typically performed for 5-10 minutes after the procedure for pressure, hemostasis, and monitoring. We frequently do anticoagulated patients as well, which requires prolonged post procedure monitoring.

#### Supplies

- **Drape-towel, sterile OR blue (2 pk uou) (SB020)** – Used to create a sterile work surface.
- **Mask, surgical (SB033)** – Clinically required.
- **Needle-wire for localization (SC045)** - Practice has changed. In the past we put a single wire in the middle of the lesion. Now we are most typically asked to bracket the lesion with 2 wires or markers for excision.
- **Syringe 10-12ml (SC051)** - Rather than 20cc of lido as was used in the past, it is now typically 10 cc lido superficially and 10 cc lido with epi deep. That is why 2 syringes required.
- **Guide, needle for localization (SD087)** – Dual wires require dual guides.
- **Gauze, sterile 4in x 4in (10 pack uou) (SG056)** - These are used around the needles and wires when taping them down to send to the OR, and also used to blot blood drips during the procedure, as well as bandaging at the end.
- **Tape, elastic, 2in (Elastoplast, Elasticon) (5yd uou) (SG076)** - Used to tape down bandages and wires to send patients to OR.
- **Lidocaine 1% w-epi inj (Xylocaine w-epi) (SH046)** - Rather than 20cc of lido as was used in the past, it is now typically 10 cc lido superficially and 10 cc lido with epi deep.
- **Sodium chloride 0.9% inj (250-1000ml uou) (SH067)** - Placed into the lidocaine to buffer it and decrease the burn of the lido in the skin.
- **Cetacaine spray (56gm size bottle) (SJ012)** - Used to "pre-numb" the skin a bit for the lidocaine needle.
- **Povidone swabsticks (3 pack uou) (SJ043)** – Typically used instead of Betadine.
- **Swab-pad, alcohol (SJ053)** - 2 alcohol pads to clean tops of lido and lido with epi.

5. Please describe in detail the clinical activities of your staff:

#### Pre-Service Clinical Labor Activities:

- Retrieve prior images for comparison

#### Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Assist physician in performing procedure
- Monitor pt. following service/check tubes, monitors, drains
- Clean room/equipment by physician staff
- Review/read X-ray, lab, and pathology reports
- Check dressings & wound/ home care instructions /coordinate office visits /prescriptions
- Process images, complete data sheet, present images and data to the interpreting physician

#### Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non Facility Direct Inputs**

CPT Long Descriptor:

<b>19085</b>	Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed and imaging of the biopsy specimen, when performed, percutaneous; first lesion, including magnetic resonance guidance
<b>19086</b>	Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed and imaging of the biopsy specimen, when performed, percutaneous; each additional lesion, including magnetic resonance guidance (List separately in addition to code for primary procedure)
<b>19287</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including magnetic resonance guidance
<b>19288</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including magnetic resonance guidance (List separately in addition to code for primary procedure)

Global Period: 000, ZZZ Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology convened a consensus panel to finalize the practice expense data for the codes listed above.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

19103, 19295, and 77021 were used as the PE reference for the new MR guided breast biopsy and clip placement codes, 19085-19086 and 19287-19288. 19103 and 19295 will be deleted and replaced, by the new codes, which 77021 is the MR guidance code.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We have increased minutes over the PE Subcommittee standards for several activities to accommodate the complex nature of MRI guided breast biopsy.

- **Prepare room, equipment, supplies** – The extra minute is necessary since complex biopsy equipment is involved.
- **Prepare and position patient/ monitor patient/ set up IV** – Since the breast is a round structure, positioning can vary to assure operator, biopsy devices and imaging equipment are properly oriented.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We have increased the staff time, supplies and equipment for the following activities to accommodate the evolution of MRI guided breast biopsy since the original PEAC review.

#### **Staff time**

- **Retrieve prior images for comparison** – Prior pathology is always reviewed prior to biopsy to help direct the current biopsy or prior to marker placement to decide on the type of marker placement and number of markers needed.
- **Monitor pt. following service/check tubes, monitors, drains** - Post procedure monitoring typically performed for 5-10 minutes after the procedure for pressure, hemostasis, and monitoring. We frequently do anticoagulated patients as well, which requires prolonged post procedure monitoring.
- **Process images, complete data sheet, present images and data to the interpreting physician** – Since they are comparable services, we are recommending the same amount of time as the ultrasound guidance code, 76942.

#### **Supplies**

- **Gloves, non-sterile (SB022)** - For the biopsy codes, one pair of non-sterile gloves needed for the assistant in the procedure. The second pair is for handling the specimen to prepare for pathology. For the marker codes, only 1 set of non-sterile gloves is needed for the assistant.
- **Gown, patient (SB026)** – Clinically required.
- **Underpad 2ft x 3ft (Chux) (SB044)** - Blood from biopsy drips down and needs to be collected.
- **Scalpel, safety, surgical, with blade (#10-20) (SF047)** – Safety scalpel typically used.
- **Gauze, sterile 4in x 4in (10 pack uou) (SG056)** - These are used around the needles and wires when taping them down to send to the OR, and also used to blot blood drips during the procedure, as well as bandaging at the end.
- **Lidocaine 1% w-epi inj (Xylocaine w-epi) (SH046)** - Rather than 20cc of lido as was used in the past, it is now typically 10 cc lido superficially and 10 cc lido with epi deep.
- **Swab-pad, alcohol (SJ053)** - 2 alcohol pads to clean tops of lido and lido with epi.
- **Filter paper, qualitative, <15.0cm (SL064)** - To filter samples out of saline and place in formaldehyde.
- **20MM Handpiece –MR** – Needle used to collect the sample.
- **Vacuum line assembly** – Tubing connected to the needle.
- **Introducer localization set (trocar)** – An MR-compatible trocar is used to advance through the grid to the lesion to confirm placement before inserting the vacuum needle and obtaining the specimen.
- **Breast biopsy device (coil)** – the patient lays on top of the device during the procedure
- **Lateral Grid** - The grid is inserted into the coil and projects onto the patient. It is used to assist the radiologist with determining the location of the specimen sample.
- **Tissue filter** – basket that holds the specimen

5. Please describe in detail the clinical activities of your staff:

#### **Pre-Service Clinical Labor Activities:**

- Retrieve prior images for comparison

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Assist physician in performing procedure
- Monitor pt. following service/check tubes, monitors, drains
- Clean room/equipment by physician staff
- Review/read X-ray, lab, and pathology reports
- Check dressings & wound/ home care instructions /coordinate office visits /prescriptions
- Process images, complete data sheet, present images and data to the interpreting physician

Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non Facility Direct Inputs**

CPT Long Descriptor:

<b>19081</b>	Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed and imaging of the biopsy specimen, when performed, percutaneous; first lesion, including stereotactic guidance
<b>19082</b>	Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed and imaging of the biopsy specimen, when performed, percutaneous; each additional lesion, including stereotactic guidance (List separately in addition to code for primary procedure)
<b>19283</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including stereotactic guidance
<b>19284</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including stereotactic guidance (List separately in addition to code for primary procedure)

Global Period: 000, ZZZ Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology, American College of Surgeons, American Society of Breast Surgeons convened a consensus panel to finalize the practice expense data for the codes listed above.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

19103, 19295, 76098, and 77031 is being used as the PE reference for the new stereotactic guided breast biopsy and clip placement codes, 19081-19082 and 19283-19284. The current codes (except the specimen code, 76098, will be deleted and replaced, by the new codes.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We have increased minutes over the PE Subcommittee standards for several activities to accommodate the complex nature of stereotactic breast biopsy.

- **Prepare room, equipment, supplies** – The extra minute is necessary since complex biopsy equipment is involved.
- **Prepare and position patient/ monitor patient/ set up IV** – Since the breast is a round structure, positioning can vary to assure operator, biopsy devices and imaging equipment are properly oriented.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We have increased the staff time, supplies and equipment to accommodate the evolution of stereotactic breast biopsy since the original PEAC review.

**Staff time**

- **Retrieve prior images for comparison** – Prior pathology is always reviewed prior to biopsy to help direct the current biopsy or prior to marker placement to decide on the type of marker placement and number of markers needed.
- **Monitor pt. following service/check tubes, monitors, drains** - Post procedure monitoring typically performed for 5-10 minutes after the procedure for pressure, hemostasis, and monitoring. We frequently do anticoagulated patients as well, which requires prolonged post procedure monitoring.

- **Guide, needle for localization (SD087)** – Dual wires require dual guides.
- **Scalpel, safety, surgical, with blade (#10-20) (SF047)** – Safety scalpel typically used.
- **Gauze, sterile 4in x 4in (10 pack uou) (SG056)** - These are used around the needles and wires when taping them down to send to the OR, and also used to blot blood drips during the procedure, as well as bandaging at the end.
- **Lidocaine 1% w-epi inj (Xylocaine w-epi) (SH046)** - Rather than 20cc of lido as was used in the past, it is now typically 10 cc lido superficially and 10 cc lido with epi deep.
- **Cetacaine spray (56gm size bottle) (SJ012)** - Used to "pre-numb" the skin a bit for the lidocaine needle.
- **Swab-pad, alcohol (SJ053)** - 2 alcohol pads to clean tops of lido and lido with epi.
- **Filter paper, qualitative, <15.0cm (SL064)** - To filter samples out of saline and place in formaldehyde.

5. Please describe in detail the clinical activities of your staff:

**Pre-Service Clinical Labor Activities:**

- Retrieve prior images for comparison

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Assist physician in performing procedure
- Monitor pt. following service/check tubes, monitors, drains
- Clean room/equipment by physician staff
- Review/read X-ray, lab, and pathology reports
- Check dressings & wound/ home care instructions /coordinate office visits /prescriptions
- Process images, complete data sheet, present images and data to the interpreting physician

Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

<b>19083</b>	Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed and imaging of the biopsy specimen, when performed, percutaneous; first lesion, including ultrasound guidance
<b>19084</b>	Biopsy, breast, with placement of breast localization device(s) (eg, clip, metallic pellet), when performed and imaging of the biopsy specimen, when performed, percutaneous; each additional lesion, including ultrasound guidance (List separately in addition to code for primary procedure)
<b>19285</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; first lesion, including ultrasound guidance
<b>19286</b>	Placement of breast localization device(s) (eg clip, metallic pellet, wire/needle, radioactive seeds), percutaneous; each additional lesion, including ultrasound guidance (List separately in addition to code for primary procedure)

Global Period: 000, ZZZ Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The American College of Radiology, American College of Surgeons, and American Society of Breast Surgeons convened a consensus panel to finalize the practice expense data for the codes listed above.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

19103, 19295, and 76942 were used as the PE reference for the new ultrasound guided breast biopsy and clip placement codes, 19083-19084 and 19285-19286. The current codes, except for US guidance code 76942, will be deleted and replaced by the new codes.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We have increased minutes over the PE Subcommittee standards for several activities to accommodate the complex nature of ultrasound guided breast biopsy.

- **Prepare room, equipment, supplies** – The extra minute is necessary since complex biopsy equipment is involved.
- **Prepare and position patient/ monitor patient/ set up IV** – Since the breast is a round structure, positioning can vary to assure operator, biopsy devices and imaging equipment are properly oriented.

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We have increased the staff time, supplies and equipment to accommodate the evolution of ultrasound guided breast biopsy since the original PEAC review.

#### **Staff time**

- **Retrieve prior images for comparison** – Prior pathology is always reviewed prior to biopsy to help direct the current biopsy or prior to marker placement to decide on the type of marker placement and number of markers needed.
- **Monitor pt. following service/check tubes, monitors, drains** - Post procedure monitoring typically performed for 5-10 minutes after the procedure for pressure, hemostasis, and monitoring. We frequently do anticoagulated patients as well, which requires prolonged post procedure monitoring.

#### **Supplies**

- **Gloves, non-sterile (SB022)** – For the biopsy codes, one pair of non-sterile gloves needed for the assistant in the procedure. The second pair is for handling the specimen to prepare for pathology. For the marker codes, only 1 set of non-sterile gloves is needed for the assistant.
- **Gown, patient (SB026)** – Clinically required.
- **Paper, exam table (SB036)** – Clinically necessary.
- **Clip, tissue marker (SD037)** - For the marker codes, half the time we mark with 2 clips, and half the time we mark with 4 clips depending on morphology of lesion, with 3 clips being average.
- **Scalpel, safety, surgical, with blade (#10-20) (SF047)** – Safety scalpel typically used.
- **Gauze, sterile 4in x 4in (10 pack uou) (SG056)** - These are used around the needles and wires when taping them down to send to the OR, and also used to blot blood drips during the procedure, as well as bandaging at the end.
- **Lidocaine 1% w-epi inj (Xylocaine w-epi) (SH046)** - Rather than 20cc of lido as was used in the past, it is now typically 10 cc lido superficially and 10 cc lido with epi deep.
- **Cetacaine spray (56gm size bottle) (SJ012)** - Used to "pre-numb" the skin a bit for the lidocaine needle.
- **Lubricating jelly (Surgilube) (SJ033)** – 4 oz to go on the patient
- **Swab-pad, alcohol (SJ053)** - 2 alcohol pads to clean tops of lido and lido with epi.
- **Ultrasound transmission gel (SJ062)** - non-sterile gel to put between the transducer and condom cover.
- **Filter paper, qualitative, <15.0cm (SL064)** - To filter samples out of saline and place in formaldehyde.

#### **Equipment**

- **Table, exam (EF023)** – Ultrasound typically done on exam table, not a power table.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Retrieve prior images for comparison

Intra-Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Provide pre-service education/obtain consent
- Prepare room, equipment, supplies
- Prepare and position patient/ monitor patient/ set up IV
- Assist physician in performing procedure
- Monitor pt. following service/check tubes, monitors, drains
- Clean room/equipment by physician staff
- Review/read X-ray, lab, and pathology reports
- Check dressings & wound/ home care instructions /coordinate office visits /prescriptions
- Process images, complete data sheet, present images and data to the interpreting physician

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2013

### Shoulder Prosthesis Removal

At the April 2012 meeting, the RUC referred CPT codes 23331 *Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal)* and 23332 *Removal of foreign body, shoulder; complicated (eg, total shoulder)* to the CPT Editorial Panel to clearly distinguish between removal of prosthesis and other types of foreign bodies. At the October 2012 CPT meeting, the Editorial Panel approved three new codes, 23333 *Removal of foreign body, shoulder; deep (subfascial or intramuscular)*, 23334 *Removal of prosthesis, includes debridement and synovectomy when performed; humeral or glenoid component* and 23335 *Removal of prosthesis, includes debridement and synovectomy when performed; humeral and glenoid component(s) (eg, total shoulder)* to delineate between removal of foreign body and prosthesis.

Prior to valuing these procedures, the specialty societies presented compelling evidence to justify a change in the physician work value. The physician work and time components of CPT codes 23331 and 23332 were based on the Harvard studies. Since that time, the technique and technology has changed. In the past, humeral prostheses were straight and smooth and the humeral side was typically not cemented, therefore, more easily removed. Cementing techniques, which previously were hand mixed and finger packed, have changed and are now pressurized and vacuum mixed and include the use of devices, such as a centrifuge and distal restrictor. The new technique has made removal more difficult. For components that are not cemented, current design includes metaphyseal fill, which is difficult to remove. Porous coated bone in growth also makes removal difficult since the bone has attached to the stem. In addition, polyethylene wear with resultant osteolysis and bone loss makes prosthesis and cement removal more complicated due to the increased risk of fracture and/or bone attached to the prosthesis. In order to avoid bone loss or fracture, and allow complete removal of cement to avoid infection, specialized equipment such as special osteotomes, high-speed surgical drill and ultrasound are utilized. Given this information, the RUC accepted compelling evidence that the current work RVU of 7.63 for 23331 and 12.37 for 23332 are potentially misvalued.

#### **23333 Removal of foreign body, shoulder; deep (subfascial or intramuscular)**

The RUC reviewed the survey results from 33 orthopedic and hand surgeons and recommended the following physician time components: pre-service time of 60 minutes, intra-service time of 45 minutes and post-service time of 15 minutes. The RUC agreed that 9 minutes of additional pre-service positioning time from the standard pre-service package is warranted to place the patient in the lateral beach chair position.

After review of physician time, the RUC determined that a work RVU of 6.00, the survey 25<sup>th</sup> percentile, is appropriate. The RUC reviewed the key reference service, 20680 *Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate)* (work RVU=5.96) and determined that 23333 was more complex and requires more time. The RUC also reviewed CPT codes 25248 *Exploration with removal of deep foreign body, forearm or wrist* (work RVU=5.31) and 27372 *Removal of foreign body, deep, thigh region or knee area* and agreed that the

physician work and complexity of 23333 was greater and therefore should be valued higher. The RUC reviewed and discussed the appropriate number and level of post-operative visits and determined that one half discharge day, 99238, and two office visits, (1) 99212 and (1) 99213 were appropriate. The RUC agreed with the specialty societies that a level three office visit is necessary following this procedure to account for moderate to high complexity of medical decision making relating to wound care, suture removal, pain medication management, assessment of shoulder, elbow and hand function and coordination of rehabilitation. To support the number and level of post-operative visits, the RUC reviewed CPT code 23071 *Excision, tumor, soft tissue of shoulder area, subcutaneous; 3 cm or greater* (work RVU=5.91) which includes identical post-operative visits, and agreed that 23333 is a more complex procedure. **The RUC recommends a work RVU of 6.00 for CPT code 23333.**

***23334 Removal of prosthesis, includes debridement and synovectomy when performed; humeral or glenoid component***

The RUC reviewed survey results from 31 orthopedic and hand surgeons and determined that the survey respondents overestimated the work value at the median level (work RVU= 20.00). To determine an appropriate value, the RUC agreed that a work RVU of 18.89, a direct crosswalk to CPT code 27269 *Open treatment of femoral fracture, proximal end, head, includes internal fixation, when performed* (work RVU=18.89), is appropriate. The time and intensity components of these two services are similar. In addition, the RUC agreed that 12 minutes of additional pre-service positioning time from the standard pre-service package is warranted to either place the patient in the lateral beach chair position or on a radiolucent table for fluoroscopy. The RUC also reviewed CPT code 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* (work RVU=22.00) and determined that this code should be valued slightly higher due to the physician work and complexity. The RUC reviewed and discussed the appropriate number and level of post-operative visits and determined that two level two hospital visits (99232), one discharge day(99238) and four office visits, (1) 99212 and (3) 99213 were appropriate. The specialty society confirmed that the first hospital visit is done on the day of surgery. The survey data confirmed that it is typical for the physician to perform an Evaluation and Management (E/M) service later on the same day of surgery to evaluate wound, complete neuromuscular exam and monitor any potential respiratory issues. The RUC noted that the typical patient is older and presents with an infection, elevated white blood count and inflammatory markers. The surgeon is typically involved in intensive care coordination including managing PICC line and antibiotics with an infectious disease specialist, which can span 4-6 weeks and coordinating physical and occupational therapy. In addition, a musculoskeletal exam on the entire extremity as well as a neurovascular exam will be completed and determining gait pattern for these patients is essential since the extremity will be considered non-weight bearing post-surgery. **The RUC recommends a work RVU of 18.89 for CPT code 23334.**

***23335 Removal of prosthesis, includes debridement and synovectomy when performed; humeral and glenoid component(s) (eg, total shoulder)***

The RUC reviewed the survey results from 32 orthopedic and hand surgeons and determined that a work RVU of 22.13, a direct crosswalk to CPT code 23472 *Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder))* (work RVU=22.13) is appropriate. The intra service and total times are identical for these two services and thus substantiates an identical work RVU for both. In addition, the RUC agreed that 12 minutes of additional pre-service positioning time from the standard pre-service package is warranted to either place the patient in the lateral beach chair position or on a radiolucent table for fluoroscopy. The RUC also reviewed MPC code 37215 *Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection* (work RVU=19.68) and agreed that 23335 requires more physician work and complexity, and therefore, should be valued higher. The RUC reviewed and discussed the

appropriate number and level of post-operative visits and determined that two level two hospital visits(99232) one discharge day (99238) and four office visits, (1) 99212 and (3) 99213 were appropriate. The specialty society confirmed that the first hospital visit is done on the day of surgery. The survey data confirmed that it is typical for the physician to perform an E/M service later on the same day of surgery to evaluate wound, complete neuromuscular exam and monitor any potential respiratory issues. The typical patient is older and presents with pain and decreased motion. Although, white blood count is normal, inflammatory markers are elevated. The surgeon is typically involved in intensive care coordination including managing antibiotics and coordinating physical and occupational therapy. In addition, a musculoskeletal exam on the entire extremity and neurovascular exam will be completed as well as assessing motor function determining restrictions since the entire extremity will be considered non-weight bearing post-surgery. **The RUC recommends a work RVU of 22.13 for CPT code 23335.**

#### Practice Expense:

The RUC accepted the direct practice expense inputs with no modifications as approved by the Practice Expense Subcommittee.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 23333	Tracking Number P1	Original Specialty Recommended RVU: <b>7.00</b>
		Presented Recommended RVU: <b>6.00</b>
Global Period: 090		RUC Recommended RVU: <b>6.00</b>

CPT Descriptor: Removal of foreign body, shoulder; deep (subfascial or intramuscular)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 19-year-old male is involved in a motor vehicle collision. The windshield is shattered. A large piece of glass pierces the skin on the lateral aspect of the shoulder and is imbedded deep within the deltoid muscle. (Patient sustained no other injuries.) He undergoes removal of the foreign body.

Percentage of Survey Respondents who found Vignette to be Typical: 76%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 36% , In the ASC 64%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 75% , Overnight stay-less than 24 hours 100% , Overnight stay-more than 24 hours 8%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 3%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review labs, pathology reports and imaging studies. Meet with patient/family to review planned procedure and post-operative management. Review and have patient sign informed consent. Mark surgical site. Review length and type of anesthesia with anesthesiologist. Assure appropriate selection, timing, and administration of antibiotic. Verify that all required instruments and supplies are available. After induction of anesthesia in supine position, assist with lateral beach chair positioning, exposing the shoulder and stabilizing the patient's torso. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, the small puncture wound is extended proximally and distally. The defect in the deltoid fascia is exposed and opened further. The deltoid muscle is carefully split in line with its fibers, with care to avoid injury to the axillary nerve. The glass fragment is exposed and removed. The wound is irrigated and the deltoid fascia is closed, followed by layered closure of the wound.

Description of Post-Service Work: Hospital - through discharge: The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background – 23333, 23334, 23335**

At the April 2012 RUC meeting, codes 23331, *Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal)* and 23332, *Removal of foreign body, shoulder; complicated (eg, total shoulder)* were surveyed as family member codes in conjunction with the survey of new CPT codes 23473 and 23474 (revision shoulder arthroplasty). However, during facilitation, RUC members determined that the descriptor for 23331 at the time was problematic because it stated “foreign body removal” as opposed to “prosthetic removal.” It was believed that a surgeon removing any foreign body from the shoulder could have reported 23331. The RUC referred code 23331 to CPT for better delineation between the removal of a prosthesis and other types of foreign bodies.

In October 2012, the CPT Editorial Panel approved revised and renumbered code descriptors for 23331 and 23332 and added a new code for removal of a foreign body – other than hardware or prosthesis:

23333 Removal of foreign body, shoulder; deep (subfascial or intramuscular)

23334 Removal of prosthesis; humeral or glenoid component

23335 Removal of prosthesis; humeral and glenoid component

For removal of hardware other than prosthesis, new guidelines direct codes to use current codes 20670, *Removal of implant; superficial (eg, buried wire, pin or rod) (separate procedure)* and 20680, *Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate)*.

### 23333 – Discussion and Recommendation

The AAOS and ASSH conducted a RUC survey and received 33 responses; this is a low volume procedure. We do not believe 23331 was used to report removal of a foreign body other than prosthesis because of the inclusion of "eg, Neer hemiarthroplasty removal" in the descriptor. Orthopaedic surgeons would not equate removal of a foreign body with removal of prosthetic hardware. Therefore, we believe code 23333 is a new code.

**We recommend the survey median RVW of 7.00.** This value compares well with the key reference service and MPC codes.

We recommend Pre-Time Package 3 with the following modification, crosswalked from similar code 23076, *Excision, tumor, soft tissue of shoulder area, subfascial (eg, intramuscular); less than 5 cm*:

- Evaluation: no change
- Positioning: Add 9 minutes (total positioning time=12). After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder and stabilize the patient's torso.
- Scrub/Dress/Wait: no change

### Comparison to Key Reference Service (20680)

Code 20680, *Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate)* requires less total time and would require less intense/complex total physician work than 23333. Implants are not typically associated with contamination as is the case with removal of non-implant foreign body(s). The latter will typically be associated with trauma, where contamination is likely, resulting in additional post-op work. This is seen in the higher level and number of follow-up visits. Intra-operative work will also be more complex, requiring attention to removal of all fragments. Therefore, we believe these maintain a good rank order.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23331 or 23332

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery                      How often? Rarely

Specialty hand surgery                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe this will be rarely billed as it is an infrequently performed procedure, however, because it is a new code we have no historical data to reference.

Specialty orthopaedic surgery	Frequency 470	Percentage 94.00 %
-------------------------------	---------------	--------------------

Specialty hand surgery	Frequency 30	Percentage 6.00 %
------------------------	--------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 23472

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 23334      Tracking Number P2      Original Specialty Recommended RVU: **20.00**  
 Presented Recommended RVU: **18.89**  
 Global Period: 090      RUC Recommended RVU: **18.89**

CPT Descriptor: Removal of prosthesis; humeral or glenoid component

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 64-year-old female is 8 months following a cemented shoulder hemi-arthroplasty for a proximal humerus fracture. She has pain, decreased motion, and drainage from the wound. The WBC and inflammatory markers are elevated. Radiographs show minimal lucency at the bone cement interface. She undergoes removal of the humeral component, removal of all the cement in the medullary canal, with joint debridement and synovectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 13% , Overnight stay-more than 24 hours 87%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 71%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning - position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, the previous deltopectoral incision is opened from the mid-clavicle to the junction to the mid-third of the humerus. The deltopectoral interval is opened allowing identification of the conjoined tendon. Careful protection around neurovascular structures during the case including the axillary and musculocutaneous nerve is accomplished. The subscapularis tendon is divided, tagged and mobilized. A wide capsular release is performed for exposure and mobilization of the proximal humerus. Synovial fluid and soft tissue specimens are sent for gram stain, culture, and pathology. Dislocation of the shoulder is performed with intra-operative inspection and assessment of the humeral component and glenoid articular cartilage. Extensive scar tissue is excised. Extraction instruments are used to remove the humeral component. Meticulous preparation and cleaning of the humeral canal, including removal of the fibrous membrane and all of the cement is performed. Bone specimens are sent for culture and pathology. The joint is debrided and the hypertrophic synovium is excised. The wound is irrigated with liters of antibiotic fluid. The subscapularis is repaired. The deltopectoral groove is closed, followed by closure of the subcutaneous tissues and skin.

Description of Post-Service Work: Hospital - through discharge from recovery room: The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity to ensure that no brachial plexus injury has occurred during surgery. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise, indicating avoidance of passive stretching of the shoulder. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic shoulder. Write orders for progression to active exercise depending on the quality of the rotator cuff tissues and the adequacy of the rotator cuff repair. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status and check wounds. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

Post-Service intensity/complexity	3.75	3.63

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background – 23333, 23334, 23335**

At the April 2012 RUC meeting, codes 23331, Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal) and 23332, Removal of foreign body, shoulder; complicated (eg, total shoulder) were surveyed as family member codes in conjunction with the survey of new CPT codes 23473 and 23474 (revision shoulder arthroplasty). However, during facilitation, RUC members determined that the descriptor for 23331 at the time was problematic because it stated “foreign body removal” as opposed to “prosthetic removal.” It was believed that a surgeon removing any foreign body from the shoulder could have reported 23331. The RUC referred code 23331 to CPT for better delineation between the removal of a prosthesis and other types of foreign bodies.

In October 2012, the CPT Editorial Panel approved revised and renumbered code descriptors for 23331 and 23332 and added a new code for removal of a foreign body – other than hardware or prosthesis:

23333 Removal of foreign body, shoulder; deep (subfascial or intramuscular)

23334 Removal of prosthesis; humeral or glenoid component

23335 Removal of prosthesis; humeral and glenoid component

For removal of hardware other than prosthesis, new guidelines direct codes to use current codes 20670, Removal of implant; superficial (eg, buried wire, pin or rod) (separate procedure) and 20680, Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate).

### **23334 – Compelling Evidence for Change in Work RVU**

1. *Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey and/or crosswalk assumptions in a previous evaluation.*
  - Code 23334 is a new code that replaces the current code 23331 which, as drafted, was intended to be used for the removal of a single component shoulder prosthesis. Harvard data indicate that only the intra-service time was surveyed (n=11), using the code descriptor as written in 1988 "Removal of foreign body, shoulder; deep (eg, Neer prosthesis removal)" as the Harvard survey vignette. Medicare frequency in 1993 was 215. In 1988, both Medicare and national frequency for single shoulder arthroplasty component removal would have been extremely low. In addition, there would not have been many surgeons familiar with shoulder arthroplasty removal of one or both components. We believe that the 11 general orthopaedic surgeons who participated in the Harvard review of intra-service time may not have been familiar with this procedure. Further, the consensus panel surgeons that Harvard used to review families of codes within and across specialties, would also not likely have been familiar with this procedure. This question of "fitness to rate" is compelling evidence that the Harvard time and visit data may be flawed.
2. *Change in physician work due to more than one of the following: technique, knowledge/technology, patient population, site-of-service, length of hospital stay, physician time.*
  - Technique and technology
    - Older versions of humeral prostheses were straight and smooth. Also, the humeral side was often uncemented and more easily removed. For those prostheses that were cemented, the cement was finger packed and removal was not complicated. Current cementing is very different; using pressurized cementing techniques (ie, vacuum mixed, centrifuge, pressurized, distal restrictor) that make removal more difficult.
    - For un-cemented components, current prosthesis design (eg, curved, metaphyseal fill, porous coated bone in growth) makes prosthesis removal difficult since the bone has attached to the stem.
    - Polyethylene wear with resultant osteolysis and bone loss makes prosthesis and cement removal more complicated, due to the risk of fracture and/or bone attached to the prosthesis.
    - Technical aspects of prosthesis and/or cement removal are more complex with the intent to limit bone loss or fracture and allow complete removal of cement to avoid infection. Specialized equipment is typically required (eg, special osteotomes, MidasRex, ultrasound).
  - Physician time and length of hospital stay

- There has been a clear increase in physician time, including significant increases in the intra-service time, as well as increased post-procedure visits – both number and level. Harvard data for 23331 implies an overnight stay (0.5x99231, 1.0x99238), which is not true now, nor was this true in 1988. This incorrect estimation of post-op work by algorithm for a low volume code resulted in an under estimation of total physician work.

### 23334 – Discussion and Recommendation

The AAOS and ASSH conducted a RUC survey and received 31 responses.

**We recommend the survey median RVW of 20.00.** This value compares well with the key reference service and MPC and other similar codes.

We recommend Pre-Time Package 4 with the following modification, crosswalked from similar major open shoulder procedures (eg, 23410-23420, 23472-23474)

- Evaluation: no change
- Positioning: Add 12 minutes (total positioning time=15). After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder, stabilize the patient's torso, and be certain there is adequate access to imaging equipment and electric instruments.
- Scrub/Dress/Wait: no change

### Comparison to Key Reference Service (27269)

Code 27269, *Open treatment of femoral fracture, proximal end, head, includes internal fixation, when performed* requires similar intra-time and similar total time compared with 23334, although there are differences in numbers and levels of post-op visits. Both procedures require dissection to a major joint and dislocation of the joint for repair. Survey code 23334 requires the additional complexity of extraction of the implant prior to repair and closure. The patient undergoing 23334 is more likely to be older with osteoporosis, compared with the typical patient undergoing 27269 (ie, trauma in an otherwise healthy individual). Follow-up therapy and ROM issues will also be greater in the patient undergoing 23334. Pre-service work for 27269 will typically be less than for 23334 because the typical patient is trauma/urgent. In summary, the recommended RVW of 20.00 is correctly greater than 27269.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐  
☐

The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
 Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23331

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery                      How often? Rarely

Specialty hand surgery                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe this will be rarely billed as it is an infrequently performed procedure, however, because it is a new code we have no historical data to reference.

Specialty orthopaedic surgery                      Frequency 470                      Percentage 94.00 %

Specialty hand surgery                      Frequency 30                      Percentage 6.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 23472

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 23335      Tracking Number P3      Original Specialty Recommended RVU: **23.00**  
 Presented Recommended RVU: **22.13**  
 Global Period: 090      RUC Recommended RVU: **22.13**

CPT Descriptor: Removal of prosthesis; humeral and glenoid component

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 72-year-old male is 3 years following a total shoulder arthroplasty for osteoarthritis. She presents with pain and decreased motion. The WBC is normal and inflammatory markers are elevated. Radiographs show minimal lucency at the bone cement interface of the humeral component. He undergoes removal of the humeral and glenoid components, removal of all the cement, with joint debridement and synovectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 9% , Overnight stay-more than 24 hours 91%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 69%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning - position the patient on a radiolucent table for fluoroscopy or in the beach chair position with adequate room for portable x-ray. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a deltopectoral incision is made from the mid clavicle to the junction to the mid-third of the humerus. The deltopectoral interval is opened allowing identification of the conjoined tendon. Careful protection around neurovascular structures during the case including the axillary and musculocutaneous nerve is accomplished. The subscapularis tendon is divided, tagged and mobilized. A wide capsular release is performed for exposure and mobilization of the proximal humerus. Synovial fluid and soft tissue specimens and sent for gram stain, culture, and pathology. Dislocation of the shoulder components is performed with intraoperative inspection and assessment of the humeral and glenoid components. Extensive scar tissue is excised. Extraction instruments are used to remove the humeral and glenoid components. Meticulous preparation and cleaning of the humeral canal, including removal of the fibrous membrane and all of the cement is performed. Meticulous preparation and cleaning of the glenoid, including removal of the fibrous membrane and all of the cement is performed. Bone specimens are sent for culture and pathology. The joint is debrided and the hypertrophic synovium is excised. The wound is irrigated with liters of antibiotic fluid. The subscapularis is repaired. The deltopectoral groove is closed, followed by closure of the subcutaneous tissues and skin.

Description of Post-Service Work: Hospital - through discharge from recovery room: Apply sterile dressings. The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity to ensure that no brachial plexus injury has occurred during surgery. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise, indicating avoidance of passive stretching of the shoulder. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic shoulder. Write orders for progression to active exercise depending on the quality of the rotator cuff tissues and the adequacy of the rotator cuff repair. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background – 23333, 23334, 23335**

At the April 2012 RUC meeting, codes 23331, Removal of foreign body, shoulder; deep (eg, Neer hemiarthroplasty removal) and 23332, Removal of foreign body, shoulder; complicated (eg, total shoulder) were surveyed as family member codes in conjunction with the survey of new CPT codes 23473 and 23474 (revision shoulder arthroplasty). However, during facilitation, RUC members determined that the descriptor for 23331 at the time was problematic because it stated “foreign body removal” as opposed to “prosthetic removal.” It was believed that a surgeon removing any foreign body from the shoulder could have reported 23331. The RUC referred code 23331 to CPT for better delineation between the removal of a prosthesis and other types of foreign bodies.

In October 2012, the CPT Editorial Panel approved revised and renumbered code descriptors for 23331 and 23332 and added a new code for removal of a foreign body – other than hardware or prosthesis:

23333 Removal of foreign body, shoulder; deep (subfascial or intramuscular)

23334 Removal of prosthesis; humeral or glenoid component

23335 Removal of prosthesis; humeral and glenoid component

For removal of hardware other than prosthesis, new guidelines direct codes to use current codes 20670, Removal of implant; superficial (eg, buried wire, pin or rod) (separate procedure) and 20680, Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate).

### **23335 – Compelling Evidence for Change in Work RVU**

1. *Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey and/or crosswalk assumptions in a previous evaluation.*
  - Code 23335 is a new code that replaces the current code 23332 which, as drafted, was intended to be used for the removal of both components of a shoulder prosthesis. Harvard data indicate that only the intra-service time was surveyed (n=10), using the code descriptor as written in 1988 "Removal of foreign body, shoulder; complicated, including 'total shoulder'" as the Harvard survey vignette. Medicare frequency in 1993 was 149. In 1988, both Medicare and national frequency for total shoulder arthroplasty removal would have been extremely low. In addition, there would not have been many surgeons familiar with shoulder arthroplasty removal of one or both components. We believe that the 10 general orthopaedic surgeons who participated in the Harvard review of intra-service time may not have been familiar with this procedure. Further, the consensus panel surgeons that Harvard used to review families of codes within and across specialties, would also not likely have been familiar with this procedure. This question of "fitness to rate" is compelling evidence that the physician work from the Harvard study may be flawed. In addition, since 23335 was only surveyed for intra-time and post time was calculated by algorithm and then visits were imputed by Dunn for practice expense purposes based on the calculated times, we believe there is compelling evidence that the total work does not reflect correct post-op work.
2. *Change in physician work due to more than one of the following: technique, knowledge/technology, patient population, site-of-service, length of hospital stay, physician time.*
  - Technique and technology
    - Older versions of humeral prostheses were straight and smooth. Also, the humeral side was often uncemented and more easily removed. For those prostheses that were cemented, the cement was finger packed and removal was not complicated. Current cementing is very different; using pressurized cementing techniques (ie, vacuum mixed, centrifuge, pressurized, distal restrictor) that make removal more difficult.
    - For un-cemented components, current prosthesis design (eg, curved, metaphyseal fill, porous coated bone in growth) makes prosthesis removal difficult since the bone has attached to the stem.
    - Polyethylene wear with resultant osteolysis and bone loss makes prosthesis and cement removal more complicated, due to the risk of fracture and/or bone attached to the prosthesis.
    - Technical aspects of prosthesis and/or cement removal are more complex with the intent to limit bone loss or fracture and allow complete removal of cement to avoid infection. Specialized equipment is typically required (eg, special osteotomes, MidasRex, ultrasound).

--Physician time

- There has been an increase in physician intra-time and intensity of follow-up visits. Harvard estimation of post-op work by algorithm for a low volume code resulted in an incorrect estimation of total physician work.

### 23335 – Discussion and Recommendation

The AAOS and ASSH conducted a RUC survey and received 32 responses.

**We recommend the survey median RVW of 23.00.** This value compares well with the key reference service and MPC and other similar codes.

We recommend Pre-Time Package 4 with the following modification, crosswalked from similar major open shoulder procedures (eg, 23410-23420, 23472-23474)

- Evaluation: no change
- Positioning: Add 12 minutes (total positioning time=15). After induction of anesthesia in supine position, the patient will be repositioned in beach chair and slightly lateral to expose the shoulder, stabilize the patient's torso, and be certain there is adequate access to imaging equipment and electric instruments.
- Scrub/Dress/Wait: no change

### Comparison to Key Reference Service (23472)

Code 23472, *Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (eg, total shoulder))* requires the same intra-time and the same total time. The intra-operative complexity and intensity for 23335 will be greater than 23472 because significant attention is required to remove the prosthesis and all cement, but maintain as much bone as possible for subsequent reconstruction. Additional complexity is also performed related to altered surgical field and adhesions from the prior surgery, which may involve neurovascular structures. A recommendation of 23.00 places 23335 in correct rank order with 23472

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 23332

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery                      How often? Rarely

Specialty hand surgery                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We believe this will be rarely billed as it is an infrequently performed procedure, however, because it is a new code we have no historical data to reference.

Specialty orthopaedic surgery                      Frequency 470                      Percentage 94.00 %

Specialty hand surgery                      Frequency 30                      Percentage 6.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 23472

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor:

23333, Removal of foreign body, shoulder; deep (subfascial or intramuscular)

23334, Removal of prosthesis; humeral or glenoid component

23335, Removal of prosthesis; humeral and glenoid component

Global Period: 090

Meeting Date: 01/2013

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A consensus expert panel committee was convened and reviewed the procedures under review. The consensus panel recommends standard 090 facility inputs for the codes.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale: Consensus committee reviewed current PE details as comparison codes for both the existing and the new codes as these are the most relevant to the existing and new code descriptors.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Standard pre-service clinical labor activities for 090-day global facility codes

Intra-Service Clinical Labor Activities:

Standard intra-service clinical labor activities for 090-day global facility codes- half-day discharge for 23333 and full-day discharge for 23334 and 23335.

Post-Service Clinical Labor Activities:

Standard post-service clinical labor activities for 090-day global facility codes

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2013

### Elbow Prosthesis Removal

In April 2012, the RUC referred CPT Code 24160 *Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar components* to the CPT Editorial Panel to revise the descriptor to clearly indicate “prosthetic removal”. At the October 2012 CPT meeting, the Editorial Panel revised the code descriptor for 24160 and 24164 *Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar component; radial head* to describe “prosthesis” versus “implant”.

Prior to valuing these procedures, the specialty societies presented compelling evidence to justify a change in the physician work value. The physician work and time components of CPT codes 24160 and 24164 were valued in the Harvard studies. Since that time, the technique and technology has changed. In the past, humeral prostheses were straight and smooth and the humeral side was typically not cemented, therefore, more easily removed. Cementing techniques have changed and are now pressurized and vacuum mixed and include the use of devices, such as a centrifuge and distal restrictor as opposed to hand mixed and finger packed. The new technique has made removal more difficult. For components that are not cemented, current design which includes metaphyseal fill, porous coated bone in growth also makes removal difficult since the bone has attached to the stem. In addition, polyethylene wear with resultant osteolysis and bone loss makes prosthesis and cement removal more complicated due to the increased risk of fracture and/or bone attached to the prosthesis. In order to avoid bone loss or fracture and allow complete removal of cement to avoid infection, specialized equipment such as special osteotomes, high-speed surgical drill and ultrasound are utilized. In addition, older versions of radial head implants were typically silastic and a single unit with a tapered stem. The flexible prosthesis made removal from the lateral elbow fairly straightforward. Current radial head prostheses are modular titanium implants with longer, wider and cylindrical stems. They are not flexible, thus, removal is a more difficult, complex and longer procedure. Additional soft tissue release is necessary to permit subluxation of the radius relative to the capitellum to allow extraction of the implant. The capsule and tendon insertion are then repaired back to the bone. Given this information, the RUC accepted compelling evidence that the current work RVU of 8.00 for 24160 and 6.43 for 24164 are potentially misvalued.

#### ***24160 Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar components***

The RUC reviewed survey results from 30 orthopedic and hand surgeons and recommended the following physician time components: pre-service time of 72 minutes, intra-service time of 120 minutes and immediate post-service time of 30 minutes. The RUC agreed that 9 minutes of additional pre-service positioning time is warranted to either place the patient in the lateral decubitus position.

After review of the physician time, the RUC determined that a value of 18.63, the survey 25<sup>th</sup> percentile is appropriate. The RUC compared 24160 to key reference service 24363 *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* (work RVU=22.00) and determined that the reference code has an additional 40 minutes of total time, justifying the higher work RVU. The RUC also reviewed CPT codes 21242 *Arthroplasty, temporomandibular joint, with allograft* (work RVU=14.59), 24077 *Radical resection of tumor (eg, malignant neoplasm), soft tissue of upper arm or elbow area; less than 5 cm* (work RUV=15.72) and 23466 *Capsulorrhaphy, glenohumeral joint, any type multi-directional instability* (work RVU=15.80) and determined that 24160 is a more complex procedure. The typical patient is older and presents with pain and infection, typically resulting in cement removal and joint debridement. The RUC reviewed and discussed the appropriate number and level of post-operative visits and determined that two hospital visits, (1) 99231 and (1)99232, one discharge day (99238) and four office visits, (1) 99212 and (3) 99213 were appropriate. The specialty society confirmed that the first hospital visit is done on the day of surgery. The survey data confirmed that it is typical for the physician to perform an Evaluation and Management (E/M) service later on the same day of surgery to evaluate wound, complete neuromuscular exam and monitor any potential respiratory issues. The RUC noted that the typical patient is older and presents with pain, decreased motion and wound drainage. The surgeon is typically involved in intensive care coordination with the primary care provider and relating to physical and occupational therapy. In addition, the physician will complete a musculoskeletal exam on the entire extremity as well as a neurovascular exam. Determining a gait pattern for these patients is essential since the extremity will be considered non-weight bearing post-surgery. **The RUC recommends a work RVU of 18.63 for CPT code 24160.**

***24164 Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar component; radial head***

The RUC reviewed the survey results from orthopedic and hand surgeons and recommended the following physician time components: pre-service time of 60 minutes, intra-service time of 60 minutes and immediate post-service time of 20 minutes. The RUC agreed that 9 minutes of additional pre-service positioning time is warranted to either place the patient in the lateral decubitus position.

After review of the physician time, the RUC determined that a work RVU of 10.00, the survey 25<sup>th</sup> percentile, is appropriate. The RUC noted that this is a low volume procedure with 89 claims reported in 2011, which explains the low survey response. The RUC compared 24164 to key reference service 23430 *Tenodesis of long tendon of biceps* (work RVU=10.17) and determined that these two services should be valued similarly since the intra service time is the same with similar complexity. The RUC also reviewed MPC 60220 *Total thyroid lobectomy, unilateral; with or without isthmusectomy* (work RVU=11.19) and agreed that since this procedure requires more total time and complexity, it should be valued higher. The RUC reviewed and discussed the appropriate number and level of post-operative visits and determined that one half of a discharge day (99238) and three office visits (99213) were appropriate. The surgeon is typically involved in intensive care coordination with the primary care provider and relating to physical and occupational therapy. In addition, the physician will complete a musculoskeletal exam on the entire extremity as well as a neurovascular exam. Determining a gait pattern for these patients is essential since the extremity will be considered non-weight bearing post-surgery. The RUC also agreed that 9 minutes of additional pre-service positioning time is warranted to either place the patient in the lateral decubitus position. **The RUC recommends a work RVU of 10.00 for CPT code 24164.**

**Practice Expense:**

The direct practice expense inputs were accepted without modification as approved by the Practice Expense Subcommittee.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲24160	Q1	<p><del>Implant removal, elbow joint</del> Removal of prosthesis, includes debridement and synovectomy when performed; humeral and ulnar components</p> <p><u>(To report removal of foreign body, elbow, see 24200, 24201)</u></p> <p><u>(To report removal of hardware from the distal humerus or proximal ulna, other than humeral and ulnar prosthesis, use 20680)</u></p> <p>(Do not report 24160 in conjunction with 24370 or 24371 if a prosthesis [ie, humeral and/or ulnar component(s)] is being removed and replaced in the same elbow <u>during the same surgical session</u>)</p>	090	18.63

(Do not report 24370, 24371 in conjunction with 24160 if a prosthesis [ie, humeral and/or ulnar component(s)] is being removed and replaced in the same elbow)	

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 24160	Tracking Number Q1	Original Specialty Recommended RVU: <b>20.50</b>
		Presented Recommended RVU: <b>18.63</b>
Global Period: 090		RUC Recommended RVU: <b>18.63</b>

CPT Descriptor: Removal of prosthesis; humeral and ulnar components

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 73-year-old female is 8 months following a total elbow arthroplasty for rheumatoid arthritis. She presents with pain, decreased motion, and wound drainage. She undergoes removal of the humeral and ulnar components, removal of all the cement, with joint debridement and synovectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 83%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 10% , Overnight stay-more than 24 hours 90%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 57%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning in a lateral decubitus position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, a posterior elbow incision is made. The ulnar nerve is identified for protection throughout the dissection. The triceps and extensor mechanism are released from their insertion on the ulna and then displaced in a radial direction. The elbow joint is exposed and scar tissue is excised and contractures released from the humerus and ulna for exposure and soft tissue balancing. Extraction instruments are used to remove the loose humeral and ulnar components, along with the fibrous membrane and all the cement. The wound is irrigated with liters of antibiotic fluid. The tourniquet is released, hemostasis is obtained, and the triceps tendon is re-approximated to the proximal ulna. The remainder of the extensor mechanism is approximated, subcutaneous tissue approximated, and the skin is closed.

Description of Post-Service Work: Hospital - through discharge from recovery room: Apply sterile dressings and splint. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in

chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Call referring physician(s). Write orders for transferring to orthopaedic floor and discuss ongoing care with floor nurses.

Hospital visits: Review interval chart notes. Discuss ongoing care with floor nurses. Examine patient, assess neurologic status, check wounds, and change dressings. Monitor physiotherapy and assess range of motion progress. Assess opposite extremity for comparison. Write orders assistive exercise. Educate the patient regarding arm movements to prevent possible dislocation of the prosthetic elbow. Write orders for progression to active exercise. Assess pain scores and adequacy of analgesia. Review nursing/other staff patient chart notes. Write orders for films and continued antibiotic medications, as necessary. Chart patient progress notes. Answer patient and family questions. Answer nursing/other staff questions.

Hospital Discharge Management: Review interval chart notes. Examine patient, assess neurologic status, check wounds, and change dressings. Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples and sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background – 24160, 24164**

At the April 2012 RUC meeting, code 24160, Implant removal; elbow joint was surveyed as a family member code in conjunction with the survey of new CPT codes 24370 and 24371 (revision elbow arthroplasty). However, during facilitation, RUC members determined that the descriptor for 24160 at the time was problematic because it stated “implant removal” as opposed to “prosthetic removal.” It was believed that a surgeon removing any hardware or prosthetic component from the shoulder could have reported 24160. The RUC referred code 24160 to CPT for better delineation between the removal of a prosthesis and other types of implants. The AAOS and ASSH added 24164, Implant removal; radial head to the CPT proposal for revised descriptors.

In October 2012, the CPT Editorial Panel approved revised code descriptors for 24160 and 24164:

24160 Removal of prosthesis; humeral **and** ulnar components

24164 Removal of prosthesis; radial head

For removal of hardware other than prosthesis, new guidelines direct codes to use current codes 20670, Removal of implant; superficial (eg, buried wire, pin or rod) (separate procedure) and 20680, Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate).

### 24160 – Compelling Evidence for Change in Work RVU

1. *Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey and/or crosswalk assumptions in a previous evaluation.*
  - Code 24160, as drafted, was intended to be used for the removal of a total elbow prosthesis. Harvard data indicate that only the intra-service time was surveyed (n=12), using the code descriptor as written in 1988 "Implant removal, elbow joint" as the Harvard survey vignette. Medicare frequency in 1993 was 108. In 1988, both Medicare and national frequency for total elbow arthroplasty removal would have been extremely low. In addition, there would not have been many surgeons familiar with total elbow arthroplasty removal. We believe that the 12 general orthopaedic surgeons who participated in the Harvard review of intra-service time may not have been familiar with this procedure. Further, the consensus panel surgeons that Harvard used to review families of codes within and across specialties, would also not likely have been familiar with this procedure. This question of "fitness to rate" is compelling evidence that the Harvard time and visit data may be flawed.
2. *Change in physician work due to more than one of the following: technique, knowledge/technology, patient population, site-of-service, length of hospital stay, physician time.*
  - Technique and technology
    - Older versions of total elbow prostheses were most often straight and smooth. For those prostheses that were cemented, the cement was finger packed and removal was less complicated. Current cement fixation is different; pressurized cementing techniques (ie, vacuum mixed, centrifuge, pressurized, distal restrictor) make removal more difficult.
    - When cement fixation is not used, current prosthesis design (eg, curved, metaphyseal fill, porous coated bone in growth) makes prosthesis removal difficult since the bone has attached to the stem.
    - Polyethylene wear with resultant osteolysis and bone loss makes prosthesis and cement removal more complicated due to the risk of fracture and/or bone attached to the prosthesis.
    - Technical aspects of prosthesis and/or cement removal are more complex with the intent to limit bone loss or fracture and allow complete removal of cement to avoid infection. Specialized equipment is typically required (eg, special osteotomes, MidasRex, ultrasound).
  - Physician time and length of hospital stay
    - There has been a clear increase in physician time, including significant increases in the intra-service time, as well as additional post-procedure visits – both number and level. Harvard data for 24160 implies same day discharge with no additional hospital visits (1.0x99238), which is not true now, nor was this true in 1988. This

incorrect estimation of post-op work by algorithm for a very low volume code resulted in a incorrect value for total physician work.

### 24160 – Discussion and Recommendation

The AAOS and ASSH conducted a RUC survey and received 30 responses. We believe the Harvard review of 24160 intra-service time (Hvd N=12) and incorrect estimation of post-op work resulted in an underestimation of total physician work. The CMS website 2011 Medicare utilization file indicates 397 cases. Of this total, 175 cases or 44% included an assistant at surgery.

**We recommend the survey median RVW of 20.50.** This value compares well with the key reference service and MPC and other similar codes.

We recommend Pre-Time Package 4 with the following modification, crosswalked from similar major open elbow procedures (eg, 24363, 24370, 24371)

- Evaluation: no change
- Positioning: Add 9 minutes (total positioning time=12). After induction of anesthesia in supine position, the patient will be repositioned lateral and stabilized.
- Scrub/Dress/Wait: no change

### Comparison to Key Reference Service (24363)

Code 24363, *Arthroplasty, elbow; with distal humerus and proximal ulnar prosthetic replacement (eg, total elbow)* requires slightly more intra-time and slightly more total time compared with 24160. Although code 24363 requires more intra-operative time, survey code 24160 requires additional complexity related to extraction of the prosthesis with retention of as much bone as possible, plus the extra work related to scarring and adhesions from prior surgery. In summary, the recommended RVW of 20.50 is appropriately less than 24363.

CPT	RVW	IWPUT	total	eval	posit	sdw	intra	sd-post	99232	99231	99238	99213	99212

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24160

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery                      How often? Rarely

Specialty hand surgery                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 100

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CMS Website: 2011 Medicare final utilization for 24160 subtracting the total number of total elbow arthroplasty revision codes we are assuming, starting in FY 2013, will be performed which is roughly 160 (243X1 and 243X2) because those will no longer will be billed under 24160 leaving approximately 100 implant removals done stand-alone.

Specialty orthopaedic surgery                      Frequency 78                      Percentage 78.00 %

Specialty hand surgery                      Frequency 21                      Percentage 21.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 24363

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 24164	Tracking Number Q2	Original Specialty Recommended RVU: <b>10.00</b>
		Presented Recommended RVU: <b>10.00</b>
Global Period: 090		RUC Recommended RVU: <b>10.00</b>

CPT Descriptor: Removal of prosthesis; radial head

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 47-year-old male is 4 years following a radial head replacement for a radial head fracture and elbow dislocation. He presents with lateral elbow pain and slight decreased motion. Radiographs show loosening around the implant stem, with narrowing of the joint space between the implant and capitellum. He undergoes removal of the radial head prosthesis, joint debridement, and synovectomy.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 30% , In the ASC 70%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 50% , Overnight stay-less than 24 hours 33% , Overnight stay-more than 24 hours 17%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 5%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Write preadmission orders for preoperative medications. Review results of preadmission testing including labs, X-rays, CT scans, and/or MRIs. Reexamine patient to make sure that physical findings have not changed and update H&P. Meet with patient and family to review planned procedure and post-operative management. Review informed consent with patient. Verify that all required instruments and supplies are available, including intraoperative imaging/fluoroscopy for documentation. Ensure that an array of implants is available for possible use in the operating room. An estimate of the appropriate size component is determined by templating of the joint with radiographs. Monitor/assist with patient positioning in a lateral decubitus position. Indicate areas of skin to be prepped and mark surgical incisions. Scrub and gown. Perform surgical "time out" with operating surgical team.

Description of Intra-Service Work: Under anesthesia, an incision is made over the anterolateral aspect of the elbow. The dissection is brought through the subcutaneous tissue. The interval between the anconeus and extensors is divided. The capsule is incised over the lateral aspect of the elbow. Synovial fluid and soft tissue are sent for gram stain, culture and pathology. Dissection is made around the radial head implant and proximal radial shaft. The implant is removed. The medullary canal of the radius is debrided. The capitellum is exposed and the joint debrided; hypertrophic synovium is excised. The elbow is tested for stability. The joint is irrigated. The tourniquet is released and hemostasis obtained. The capsule, fascia, subcutaneous tissue and skin are closed.

Description of Post-Service Work: Hospital - through discharge: Apply sterile dressings. The shoulder is immobilized at the patient's side. Assist in transfer of patient from operating table to gurney. Monitor transport of patient from operating room to recovery room. Monitor patient stabilization in the recovery room, with a careful neurologic examination of the extremity. Discuss postoperative recovery care with anesthesia and nursing staff including need for patient controlled

analgesia. Discuss procedure and outcome with family in waiting area. Write brief operative note or complete final operative note and place in chart. Write postoperative note in the recovery room. Dictate operative report and copy referring physician(s). Write orders for follow-up, post-discharge labs, x-rays, home care, and physical therapy. Write prescriptions for medications needed post-discharge. Home restrictions and activity levels are discussed with the patient, family members and discharging nurse. All appropriate medical records are completed, including discharge summary and discharge instructions, and insurance forms.

Post-op Office Visits: Review interval chart notes. Examine and talk with patient. Assess surgical wound. Remove staples or sutures, when appropriate. Assess neurovascular status, ROM, circulation, sensation, and motor function of the operated extremity. Assess opposite extremity for comparison. Redress wound. Review activity and restrictions. Order occupational therapy. Supervise rehabilitation. Order radiographs, as necessary. Discuss progress with PCP (verbal and written). Assess pain scores and adequacy of analgesia. Dictate progress notes for medical chart.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background – 24160, 24164**

At the April 2012 RUC meeting, code 24160, *Implant removal; elbow joint* was surveyed as a family member code in conjunction with the survey of new CPT codes 24370 and 24371 (revision elbow arthroplasty). However, during

facilitation, RUC members determined that the descriptor for 24160 at the time was problematic because it stated “implant removal” as opposed to “prosthetic removal.” It was believed that a surgeon removing any hardware or prosthetic component from the shoulder could have reported 24160. The RUC referred code 24160 to CPT for better delineation between the removal of a prosthesis and other types of implants. The AAOS and ASSH added 24164, Implant removal; radial head to the CPT proposal for revised descriptors.

In October 2012, the CPT Editorial Panel approved revised code descriptors for 24160 and 24164:

24160 Removal of prosthesis; humeral **and** ulnar components

24164 Removal of prosthesis; radial head

For removal of hardware other than prosthesis, new guidelines direct codes to use current codes 20670, Removal of implant; superficial (eg, buried wire, pin or rod) (separate procedure) and 20680, Removal of implant; deep (eg, buried wire, pin, screw, metal band, nail, rod or plate).

### **24164 – Compelling Evidence for Change in Work RVU**

1. *Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey and/or crosswalk assumptions in a previous evaluation.*
  - Code 24164, as drafted, was intended to be used for the removal of a radial head prosthesis. Harvard data indicate that only the intra-service time was surveyed (n=14), using the code descriptor as written in 1988 "Implant removal, radial head" as the Harvard survey vignette. Medicare frequency in 1993 was 30. In 1988, both Medicare and national frequency for radial head prosthesis removal would have been extremely low. In addition, there would not have been many surgeons familiar with radial head prosthesis removal. We believe that the 14 general orthopaedic surgeons who participated in the Harvard review of intra-service time may not have been familiar with this procedure. Further, the consensus panel surgeons that Harvard used to review families of codes within and across specialties, would also not likely have been familiar with this procedure. This question of "fitness to rate" is compelling evidence that the Harvard time and visit data may be flawed.
2. *Change in physician work due to more than one of the following: technique, knowledge/technology, patient population, site-of-service, length of hospital stay, physician time.*

#### **--Technique and technology**

- Older versions of radial head implants were typically silastic and a single unit with a tapered stem; removal was fairly straightforward because the flexible prosthesis was easily removed from the lateral elbow.
- Current radial head prostheses are modular metallic (e.g. titanium) implants with longer, wider and cylindrical stems. They are not flexible. Thus removal of the prosthesis is more a difficult, complex and longer procedure; more extensive soft tissue release (capsule and extensor origin) is necessary to permit subluxation of the radius relative to the capitellum to allow extraction of the implant. The capsule and tendon insertion are then repaired back to the bone.

#### **--Physician time and length of hospital stay**

- There has been a clear increase in physician intra-time from the Harvard estimation. Harvard data for 24164 implies an overnight stay (0.5x99231, 1.0x99238), which is now described as "outpatient" and assigned 0.5x99238 per CMS policy. The incorrect estimation of post-op office work by algorithm along with incorrect estimation of intra-time for a very low volume code resulted in an incorrect estimation of total physician work.

### **24164 – Discussion and Recommendation**

The AAOS and ASSH conducted a RUC survey and received 20 responses. We believe the Harvard review of 24164 intra-service time (Hvd N=14) and misestimation of post-op work resulted in an underestimation of total physician work.

**We recommend the survey 25<sup>th</sup> percentile RVW of 10.00.** This value compares well with the key reference service and MPC and other similar codes.

We recommend Pre-Time Package 3 with the following modification, crosswalked from similar open elbow procedures (eg, 23430, 24071, 24152)

- Evaluation: no change
- Positioning: Add 9 minutes (total positioning time=12). After induction of anesthesia in supine position, the patient will be repositioned lateral and stabilized. A tourniquet is applied.
- Scrub/Dress/Wait: no change

### Comparison to Key Reference Service (23430)

Code 23430, *Tenodesis of long tendon of biceps* requires the same intra-time and similar total time compared with 24164. Both procedures are typically performed on non-elderly patients. Post-op work for the elbow procedure will include less visits, but at a higher level because the patient requires more attention to therapy and range of motion compared with the shoulder procedure. In summary, the recommended RVW of 10.00 is appropriately similar to 23430.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

---

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 24164

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty orthopaedic surgery                      How often? Rarely

Specialty hand surgery                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. national frequency unknown

Specialty                      Frequency 0                      Percentage 0.00 %

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor:

24160, Removal of prosthesis; humeral and ulnar components

24164, Removal of prosthesis; radial head

Global Period: 090

Meeting Date: 01/2013

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: A consensus expert panel committee was convened and reviewed the procedures under review. The consensus panel compared the current PE details for 24160, and 24164 and determined no changes beyond changes in post-operative service time where the level and/or number of post-operative office visits were warranted. Otherwise, standard 090 facility inputs were used.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale: Consensus committee reviewed current PE details as comparison codes for both the existing and the new codes as these are the most relevant to the existing and new code descriptors.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Standard pre-service clinical labor activities for 090-day global facility codes

Intra-Service Clinical Labor Activities:

Standard intra-service clinical labor activities for 090-day global facility codes- half-day discharge for 24164 and full-day discharge for 24160.

Post-Service Clinical Labor Activities:

Standard post-service clinical labor activities for 090-day global facility codes

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2013

### Transcatheter Aortic Valve Replacement

In February 2012, the CPT Editorial Panel deleted four Category III code (0256T-0259T) and approved nine codes to report transcatheter aortic valve replacement procedures.

In April 2012, the RUC thoroughly discussed the unique nature of these services to understand and assign the appropriate valuation. First, the members noted that these services require two physicians, an interventional cardiologist and a cardiothoracic surgeon, be actively working on the patient during these procedures. Each operator has distinctly required work, which are specific to the operator's skill set, and are not duplicative between the two. For these reasons, the CMS National Coverage Determination (NCD) mandates that two physicians be present for this procedure to be completed. Second, the RUC recognized the intense nature of these procedures. Patients eligible for these procedures have previously been turned down for aortic valve replacement surgery and are receiving these procedures as a last resort. The NCD further mandates this patient population and there are currently no indications that these procedures will be approved for otherwise operable patients in the future. Finally, the RUC noted that the recommendations made by the Committee will value the total work of the service. Physician time includes the clock time of the procedure and does not constitute the addition of each physician's time. Payment policy issues, related to the co-surgery modifier and resulting payment modifications, were not determined, as it is outside the purview of the RUC. The RUC understands that CMS will consider these issues when implementing the new code family.

Prior to surveying, the specialty societies obtained approval from the Research Subcommittee to conduct an alternative methodology for surveying these services. To ensure the complete work of both physicians was captured, each survey was conducted concurrently by a thoracic surgeon and an interventional cardiologist.

In April 2012 the RUC reviewed and recommended a work RVU of 40.00 for CPT code 33366 *Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)*. However, this service did not receive FDA approval prior to publication of CPT and it was carrier priced and published in CPT 2013 as Category III CPT code 0318T *Implantation of catheter-delivered prosthetic aortic heart valve, open thoracic approach, (eg, transapical, other transaortic)*. FDA approval was received in November 2012 as a result, the Society of Thoracic Surgeons (STS), the American College of Cardiology (ACC) and the Society for Cardiac Angiography and Interventions (SCAI) submitted a coding proposal to CPT to convert Category III code 0318T to a Category I code, 33366 for CPT 2014. CPT code 33366 has the same descriptor, vignette and work descriptions that were surveyed and reviewed by the RUC at the April 2012 meeting. **In April 2013, the RUC reaffirmed its April 2012 recommendation of 40.00 work RVUs for CPT code 33366.**

April 2012 RUC Recommendation:

**33366 Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)**

The RUC reviewed the survey data from 31 thoracic surgeons and cardiologists and agreed with the specialty that the appropriate physician time components for this procedure are as follows: pre-service time = 85 minutes, intra-service time = 195 minutes and post-service time = 45 minutes. This time represents the procedure time and does not duplicate the time spent by each physician. Agreed with the addition of 22 minutes of pre-service time to account for the time each physician spends separately obtaining consent and reviewing the procedure with the patient. Additionally, there is greater positioning time because the patient must be positioned for each contingency of the procedure. The RUC also assigned one critical care code (99291) to this 000 day global service as the patient is cared for in the inpatient setting. This critical care visit covers the time that both physicians spend with the patient directly related to the procedure.

The RUC reviewed the survey respondents' estimated physician work value for this procedure and agreed with the specialty that 40.00, the survey median, is an appropriate work RVU for this service. To justify this value, the RUC reviewed the key reference service code 33979 *Insertion of ventricular assist device, implantable intracorporeal, single ventricle* (work RVU= 37.50) and agreed that while 33979 has more intra-service time compared to the surveyed code, 0318T should be valued slightly higher due to greater intensity, as seen in the intensity complexity measures. The RUC also reviewed CPT code 33880 *Endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); involving coverage of left subclavian artery origin, initial endoprosthesis plus descending thoracic aortic extension(s), if required, to level of celiac artery origin* (work RVU= 27.28, valued as a 000 day global) and agreed that while the reference code has greater total physician time, 0318T is a much more intense procedure. In addition, 33366, as described above, is a unique procedure involving two physicians and is a much more complicated and involved procedure compared to the reference code. The RUC also reviewed 33366 in comparison to 33361 and agreed that the increase complexity was accurately reflected with the increase work RVU of 10.50 and increased time of 60 minutes. **The RUC recommends a work RVU of 40.00 for CPT code 33366.**

**Practice Expense**

The RUC reviewed and approved the practice expense at the April 2012 RUC meeting.

<b>Category I</b> <b>Surgery</b> <b>Cardiovascular System</b> <b>Cardiac Valves</b> <b>Aortic Valve</b>				
<p>Codes <del>33361-33365, 0318T</del>, 33366, 33362, 33363, 33364, 33365 are used to report transcatheter aortic valve replacement (TAVR)/ transcatheter aortic valve implantation (TAVI). TAVR/ TAVI requires two physician operators and all components of the procedure are reported using modifier 62.</p> <p>Codes <del>33361-33365, 0318T</del>, 33366, 33362, 33363, 33364, 33365 include the work, when performed, of percutaneous access, placing the access sheath, balloon aortic valvuloplasty, advancing the valve delivery system into position, repositioning the valve as needed, deploying the valve, temporary pacemaker insertion for rapid pacing (33210), and closure of the arteriotomy when performed. Codes <del>33361-33365, 0318T</del>, 33366, 33362, 33363, 33364, 33365 include open arterial or cardiac approach.</p> <p>Angiography, radiological supervision, and interpretation performed to guide TAVR/TAVI (eg, guiding valve placement, documenting completion of the intervention, assessing the vascular access site for closure) are included in these codes.</p> <p>Diagnostic left heart catheterization codes (93452, 93453, 93458-93461) and the supraaortic aortography code (93567) should <b>not</b> be used with TAVR/TAVI services (<del>33361-33365, 0318T</del>, 33366, 33362, 33363, 33364, 33365) to report:</p>				

1. Contrast injections, angiography, roadmapping, and/or fluoroscopic guidance for the TAVR/TAVI,
2. Aorta/left ventricular outflow tract measurement for the TAVR/TAVI, or
3. Post-TAVR/TAVI aortic or left ventricular angiography, as this work is captured in the TAVR/TAVI services codes (33361-~~33365~~, ~~0318T~~, 33366, 33362, 33363, 33364, 33365).

Diagnostic coronary angiography performed at the time of TAVR/TAVI may be separately reportable if:

1. No prior catheter-based coronary angiography study is available and a full diagnostic study is performed, or
2. A prior study is available, but as documented in the medical record:
  - a. The patient's condition with respect to the clinical indication has changed since the prior study, or
  - b. There is inadequate visualization of the anatomy and/or pathology, or
  - c. There is a clinical change during the procedure that requires new evaluation.
  - d. For same session/same day diagnostic coronary angiography services, report the appropriate diagnostic cardiac catheterization code(s) appended with modifier 59 indicating separate and distinct procedural service from TAVR/TAVI.

Diagnostic coronary angiography performed at a separate session from an interventional procedure may be separately reportable.

Other cardiac catheterization services may be reported separately when performed for diagnostic purposes not intrinsic to TAVR/TAVI.

Percutaneous coronary interventional procedures may be reported separately, when performed.

When transcatheter ventricular support is required in conjunction with TAVR/TAVI, the appropriate code should be reported with the appropriate ventricular assist device (VAD) procedure code (33990-33993, 33975, 33976, 33999) or balloon pump insertion code (33967, 33970, 33973).

The TAVR/TAVI cardiovascular access and delivery procedures are reported with 33361-~~33365~~, ~~0318T~~, 33366, 33362, 33363, 33364, 33365. When cardiopulmonary bypass is performed in conjunction with TAVR/TAVI, codes 33361-~~33365~~, ~~0318T~~, 33366, 33362, 33363, 33364, 33365 should be reported with the appropriate add-on code for percutaneous peripheral bypass (33367), open peripheral bypass (33368), or central bypass (33369).

33361	Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach
33362	open femoral artery approach

33363	open axillary artery approach			
33364	open iliac artery approach			
33365 transaortic approach (eg, median sternotomy, mediastinotomy)				
●33366	BB1	transapical exposure (eg, left thoracotomy)	000	40.00
<b>✚33367</b> cardiopulmonary bypass support with percutaneous peripheral arterial and venous cannulation (eg, femoral vessels) (List separately in addition to code for primary procedure) (Use 33367 in conjunction with 33361– <del>33365, 0318T</del> , <u>33366, 33362, 33363, 33364, 33365</u> ) (Do not report 33367 in conjunction with 33368, 33369)				
<b>✚33368</b> cardiopulmonary bypass support with open peripheral arterial and venous cannulation (eg, femoral, iliac, axillary vessels) (List separately in addition to code for primary procedure) (Use 33368 in conjunction with 33361– <del>33365, 0318T</del> , <u>33366, 33362, 33363, 33364, 33365</u> ) (Do not report 33368 in conjunction with 33367, 33369)				
<b>✚33369</b> cardiopulmonary bypass support with central arterial and venous cannulation (eg, aorta, right atrium, pulmonary artery) (List separately in addition to code for primary procedure) (Use 33369 in conjunction with 33361– <del>33365, 0318T</del> , <u>33366, 33362, 33363, 33364, 33365</u> ) (Do not report 33369 in conjunction with 33367, 33368)				
<b>Category III</b>				
0254T	Endovascular repair of iliac artery bifurcation (eg, aneurysm, pseudoaneurysm, arteriovenous malformation, trauma) using bifurcated endoprosthesis from the common iliac artery into both the external and internal iliac artery, unilateral;			
0255T	radiological supervision and interpretation (0256T has been deleted. To report, see 33361, <u>33362, 33363, 33364</u> ) (0257T has been deleted. To report, see <del>33365, 0318T</del> , <u>33366</u> )			

<p>(0258T has been deleted. To report, see 33365, <del>33366</del><u>33366</u>)</p> <p>(0259T has been deleted. To report, see 33365-,<u>33367</u>, <u>33368</u>, 33369)</p>

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 33366      Tracking Number   GG6

Original Specialty Recommended RVU: **40.00**Presented Recommended RVU: **40.00**

Global Period: 000

RUC Recommended RVU: **40.00**

CPT Descriptor: Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; transapical approach (eg, left thoracotomy)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: An 83 y/o male with aortic stenosis, coronary artery disease, and Class III-IV heart failure. The aortic stenosis is life-limiting and severely symptomatic, and is characterized as critical with a documented aortic valve orifice area of 0.6 cm<sup>2</sup>. He has multiple additional co-morbidities that make his risk of mortality with conventional open heart aortic valve replacement greater than 10% by objective predictive criteria. He is evaluated by the valve-team comprised of a cardiac surgeon and an interventional cardiologist who agree that the operative risks outweigh the benefit. The team therefore recommends transcatheter aortic valve replacement. Because of severe peripheral vascular disease, including severe aortoiliac, femoral axillary artery disease, and the presence of a porcelain aorta, a transapical approach is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 100%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 100%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 6%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests, including CT angiogram, coronary and ilio-femoral contrast angiogram, transthoracic echocardiogram, transesophageal echocardiogram are reviewed. This includes review of the primary CT and angiographic images from prior studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate antiplatelet and other pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. Hair is removed from the potential access sites. Instruments and supplies for the procedure are pulled. The patient is transported to the procedure suite, positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. General anesthesia is induced by the anesthesiology team. External defibrillator pads are placed on the anterior and posterior chest. A sterile table is prepared. All cardiopulmonary bypass equipment and specialized instruments/supplies are assembled on

the operative field. Critical personnel, including surgeons, interventional cardiologists, nurses, technicians, and perfusionists are also positioned at the operative field. In addition, all other personnel including anesthesiologists, circulating nurses, respiratory therapists, echocardiologists and echo technicians are in place, performing their specialized duties. The patient is prepped and draped for all possible alternative access sites and possible open surgical approaches. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study.

A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, signed consent, availability of proper equipment, and any unusual circumstances which might influence the procedure.

**Description of Intra-Service Work:** A temporary transvenous pacemaker electrode is advanced into apex of the right ventricle and tested for proper electrical capture.

Arterial access (eg, femoral, radial, or brachial) for the reference pigtail catheter is obtained by needle puncture (Seldinger technique), followed by passage of a standard guide wire and pigtail angiographic catheter. The catheter is positioned within the aortic root using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve.

The heart is exposed through a left anterior thoracotomy in the fifth or sixth intercostal space. Single lung ventilation is initiated and the left lung is collapsed. A pericardiotomy is performed, and pacing wires are affixed to the ventricular muscle. Two circumferential pledgeted pursestring sutures are placed in the apex of the left ventricle. Anticoagulant therapy is administered to achieve therapeutic anticoagulation levels. A sheath is introduced into the left ventricle, and a pigtail catheter advanced over a guidewire into the ascending aorta using fluoroscopy. A root aortogram(s) is/are obtained using power contrast injection and cine angiography to determine the optimal angiographic angle relative to the native aortic valve. Typically, several aortograms in different angles are required

Under fluoroscopic guidance, access across the native aortic valve is obtained using a guidewire and catheter of the physician's choice. This typically requires multiple attempts and multiple angiographic views due to the severe aortic valve stenosis. Once the guidewire is across the aortic valve and positioned in the aorta, a small catheter is advanced over the wire and the wire is exchanged for a stiff guide wire. A large balloon catheter is passed over the guide wire and positioned within the native aortic valve. Rapid pacing is initiated to minimize balloon movement and balloon aortic valvuloplasty is performed: the balloon is inflated by one physician while another physician continuously adjusts the balloon catheter position to minimize any potential movement and resultant left ventricular trauma/perforation. Typically, this results in hypotension and ventricular ectopy. The balloon is then rapidly deflated and the patient is monitored for hemodynamic recovery. Supravalvular aortography is performed to assess the aorta and ventricle for trauma and to assess for aortic insufficiency. Concurrently, the prosthetic valve is loaded into or onto the delivery catheter. Correct orientation of the valve on the delivery catheter is confirmed by the physician, before inserting the valve-delivery catheter system into the introducer sheath. The valvuloplasty catheter is exchanged for the prosthetic delivery catheter over the previously positioned stiff guidewire while maintaining access across the native aortic valve. The delivery catheter is advanced across the native aortic valve annulus to the aortic root and positioned under fluoroscopic guidance. In addition, transesophageal echocardiography may be used to position the prosthesis within the aortic annulus (if performed, TEE is separately reported). Multiple supravalvular aortograms may be performed to facilitate placement before a satisfactory valve position is chosen. The prosthesis is then deployed within the native aortic valve, typically during rapid ventricular pacing.

After confirming satisfactory position and function of the valve, as well as assessing the degree of any paravalvular regurgitation or presence of mechanical complications that might require open, urgent surgical intervention or coronary compromise requiring percutaneous coronary intervention, the delivery catheter and guide wire are removed from the patient.

The LV apical sheath is removed and the pursestring sutures are tied. Hemostasis is assured. Protamine is given to reverse the heparin. Chest tube(s) are placed. Double lung ventilation is resumed. The incision is closed in layers and dressings are placed.

**Description of Post-Service Work:** The physicians confirm the patient hemodynamic status, including systemic arterial pressure, pulmonary artery pressure and the patient's heart rhythm, prior to removing the patient from the operating room and committing the patient to ICU transfer. A focused vascular examination of the at-risk extremities is performed

assessing for adequate limb perfusion. Post operative orders are written. A detailed “hand-off” process is initiated in which procedure results are reviewed with the accepting nursing staff and other physicians, as well as with other members of the health care team. The patient’s fluoroscopic exposure time and total contrast volume administered are reviewed and recorded. Procedure notes are dictated, reviewed, revised as necessary to provide an accurate accounting of the procedure performed as well as any possible complications or events that would require special attention by the post operative care givers. The dictated summary is signed. Data relating to the patient and the procedure performed are immediately entered into the mandatory TAVR registry by the two procedural physicians.

**SURVEY DATA**

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An Expert Panel with representatives from the American College of Cardiology, Society of Thoracic Surgeons and the Society for Cardiac Angiography and Interventions was convened to review the survey results and finalize the recommendations. The survey response rate was excellent and the results were internally consistent. All survey respondents were members of teams of co-operators who participated in clinical trials of these new devices.

#### JOINT OPERATORS FOR THE PROCEDURES

There are nine codes included in the transcatheter aortic valve replacement (TAVR) procedures. Six codes represent the various approaches and insertion of the TAVR. Each of the six insertion codes were surveyed jointly by the cardiologist and the cardiac surgeon from institutions that were/are involved with clinical trials for the TAVR procedures. The survey was distributed to 70 institutions and over 140 physicians. There are three add-on codes to report when cardiopulmonary bypass is employed to support the patient during the procedure.

For the TAVR insertion procedures there are always two physicians (a cardiologist and a cardiac surgeon) that participate in the case and both physicians utilize their specialty specific expertise and collaborate for the entire procedure.

Medicare's proposed National Coverage Decision, and the joint statements of the American College of Cardiology and the Society of Thoracic Surgeons mandate the performance of these procedures by two physicians. The relevant section is as follows:

4. The procedure is performed by physicians with the following qualifications and experience:

a. Surgeon requirements:

- i. Board Certified/Eligible in Cardiovascular Surgery;
- ii. Professional experience with:
  1.  $\geq 100$  AVR/career including 10 high risk patients; OR
  2.  $\geq 25$  AVR/year or 50 AVR in 2 years; AND
  3.  $\geq 20$  in the last year prior to TAVR.

b. Interventionalist requirements:

- . Operators must be Board Certified/Eligible in Interventional Cardiology
- i. Professional experience with 50 structural heart disease procedures

This will result in the **required use of the -62 modifier** for 33361-33366 and result in each physician being allocated 62.5% of the physician work (and therefore total physician payment) described in the codes. Based upon this, the following describes the individual IWPUT for the proposed work values:

---------------	-----	--------	----------

These intensities are well within the typical range for similar procedures provided by these and other specialties. A separate file has been provided for comparative review, including many codes from the current MPC list.

#### PRE-TIME CHANGES

The Expert Panel selected pre-service time package 4 representing a difficult patient and difficult procedure done in a facility under anesthesia. The Expert Panel is recommending increases in time for the evaluation of the patient and for the positioning of the patient for all nine TAVR procedure codes.

#### ADDITIONAL EVALUATION TIME

For the evaluation the Expert Panel is recommending a 10-minute increase in time over the package for a total evaluation time of 50 minutes. This is supported by the survey data for four of the six codes. The total evaluation time accounts for the combined review of the patient by the physicians and the collaborative efforts that go into each case. The additional evaluation time of 10 minutes accounts for the time each physician would spend separately with the patient obtaining consent, reviewing the procedure and explaining the various aspects of the procedure from their specialty specific aspect. The Expert Panel felt that adding 10 minutes of evaluation time to package 4 was reasonable and would cover all aspects of the same day pre-service work involved with the procedure by both physicians. In addition, the Expert Panel feels that a uniform pre-time representation for each of the various approaches is reasonable. This change is further supported by the survey, where evaluation times ranged from 45-60 minutes.

RUC reviewed codes that were valued after the implantation of the pre-service time package that have additional evaluation time above the 40 minutes represented in pre-service time package 4 include the following:

Code	Descriptor	pre-time package	pre-evaluation time	global
33977	Removal of ventricular assist device; extracorporeal, single ventricle	4	60 mins	XXX
33978	Removal of ventricular assist device; extracorporeal, biventricular	4	60 mins	XXX
33980	Removal of ventricular assist device, implantable intracorporeal, single ventricle	4	60 mins	XXX

#### ADDITIONAL POSITIONING TIME

For the positioning, an additional 12 minutes was added to each case. The codes represent hybrid procedures each with the possibility of emergency bypass. The positioning for these procedures is unique in that there is more equipment involved and that the surgeons need to plan and position for each contingency on the procedures. In addition, the patient has to be positioned for all of the approaches plus the induction of bypass for each of the bypass procedures.

#### SAME DAY IMMEDIATE POST TIME

The survey supported 45 minutes of immediate post time. There are numerous examples in the RUC database supporting this time.

**SAME DAY POST PROCEDURE VISIT**

For the six TAVR 000 day procedure codes the survey respondents replied 100% that the procedure was performed in the hospital, that the patient stayed overnight for more than 24 hours, and that a visit was provided the same day of surgery.

The survey respondents indicated that they spent over 40 minutes providing critical care services to the patient postop on the same day as the procedure once the patient is in the ICU. The critical care visit covers that time that both physicians spend with the patient directly related to the procedure providing critical care services. The survey supported a single critical care visit and the Expert Panel agreed.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0257 T Implantation of catheter-delivered prosthetic aortic heart valve; open thoracic approach (eg, transapical, transventricular) and 0258T Transthoracic cardiac exposure (eg, sternotomy, thoracotomy, subxiphoid) for catheter-delivered aortic valve replacement; without cardiopulmonary bypass

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Cardiology and Cardiovascular Surgery

How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1190

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 5000 minimally invasive aortic valve implantation procedures will be performed per year, with approximately 2/3 (3300) of these procedures believed to be from an endovascular approach (codes 33361- 33364 and 1/3 (1700) from an open thoracic approach (33365 -33366). The estimated percentage breakdown for each approach from the trials is as follows: Endovascular approaches (3300) 33361 ercutaneous 30%, 33362

femoral 52%, 33363 axillary 10%, 33364 iliac 8%; Open approach (1700 total) 33365 transaortic 30%, 33366 transapical 70%

Specialty Cardiology and Cardiovascular Surgery	Frequency 1190	Percentage 100.00 %
---	----------------	---------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,130

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It is estimated that 95% of the procedures will be performed on Medicare patients.

Specialty Cardiology and Cardiovascular Surgery	Frequency 1130	Percentage 100.00 %
---	----------------	---------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 33979

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Facility Direct Inputs**

CPT Long Descriptor:

- 33361 - Transcatheter aortic valve replacement (TAVR/TAVI) with prosthetic valve; percutaneous femoral artery approach
- 33362 - open femoral artery approach
- 33363 - open axillary artery approach
- 33364 - open iliac artery approach
- 33365 - transaortic approach (eg, median sternotomy, mediastinotomy)
- 33366 - transapical approach (eg, left thoracotomy)

Global Period: 000 Meeting Date: April 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Codes 33980 - Removal of ventricular assist device, implantable intracorporeal, single ventricle  
This code represents an XXX global procedure that was reviewed by the RUC and the Practice Expense Subcommittee at the February of 2011 RUC meeting. 33980 is a procedure that is performed in the facility setting 100% of the time and requires office staff time that would be typical of a 90-day global procedure performed in the facility setting. This code has an approved pre-facility clinical staff time of 60 minutes. Since cardiothoracic offices typically employ PAs, the cardiothoracic codes are typically assigned CMS code L051A and staff type RN.

The TAVR codes also represent procedures that will be performed in the facility 100% of the time and will require office staff time that would be typical for a 90-day global procedure performed in the facility setting. The main difference between the TAVR codes and the reference code is that the TAVR codes will be done jointly with the cardiologist and cardiovascular surgeon and requires additional scheduling and coordination of services because the cardiology office and the cardiovascular surgery office must both coordinate with the other specialists involved in the procedure which at a minimum include radiology, perfusionist and a specialized anesthesiologist. In addition the procedure requires a hybrid OR room requiring special equipment for the catheter-based, surgical, and imaging aspects of the procedure and the cardiopulmonary bypass equipment. Since the codes were jointly surveyed involving cardiology and cardiac surgeons, the specialty societies are recommending CMS Code L037D with a blended staff type of RN/ LP/ MTA rather than the RN staff type typical to the cardiothoracic surgery codes.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The clinical staff from both offices fill out the pre-service diagnostic and referral forms. They call the hospital

to schedule space and equipment needed in the facility. They will also coordinate with specialized anesthesiologist, the perfusionist, radiology and any other physician offices to set up the case. The clinical staff will also coordinate with the hospital to schedule the OR and the specialized equipment for the procedure. The operating room coordinating requires ensuring the needed hybrid equipment including the catheter-based equipment for the valve deployment, any instrumentation needed for an open approach or conversion to an open approach and cardiopulmonary bypass equipment as well as supporting imaging equipment for the procedure. The clinical staff will educate the patient on what they need to do to prepare for surgery. The staff ensures the patient and family fully understands the procedure and the recovery afterwards and obtains the operative consent. They make follow-up phone calls to the patient and the office of referring physicians and call in needed prescriptions.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2013

### **Fenestrated Endovascular Repair (FEVAR)**

In February 2013, the CPT Editorial Panel converted four Category III codes and created eight Category I codes to report fenestrated endovascular repair of the visceral aorta bundled with radiological supervision and interpretation, as well as revised the introductory language for these services.

The Society for Vascular Surgery (SVS) indicated that the RUC survey data revealed extensive pre-service time (120-195 minutes) for these procedures. SVS confirmed that these procedures do require extensive pre-service work that is not otherwise reportable and some of the most intensive work occurs days to weeks before the defined 090-day global period. SVS indicated that each of the currently FDA-approved main aortic endograft bodies are custom made by the vendor because every patient has a different arrangement and relative orientation of the renal and visceral artery origins. Each fenestrated endograft is anatomically specific for each patient. Additionally, the physician must spend a minimum of two hours reviewing CT angiograms and 3D reconstructions, constructing procedure planning models and completing sizing sheets. Ultimately, the appropriate fenestrated device is ordered. The physician work is conducted over the course of several days or weeks prior to the date of surgery and is outside the guidelines for the 090-day global period.

**The RUC agreed with the specialty societies concerns and recommends that these services be carrier priced for CPT 2014 and that the specialty societies submit a coding proposal to describe the physician work provided prior to the 090-global period associated with these services.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation

**Category I****Surgery****Cardiovascular System****Arteries and Veins****Fenestrated Endovascular Repair of the Visceral and Infrarenal Aorta**

The upper abdominal aorta that contains the celiac, superior mesenteric, and renal arteries is termed the visceral aorta. For reporting purposes, the thoracic aorta extends from the aortic valve to the aortic segment just proximal to the celiac artery. Codes 34841-34848 are used to report placement of a fenestrated endovascular graft in the visceral aorta, either alone or in combination with the infrarenal aorta for aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption. The fenestrated main body endoprosthesis is deployed within the visceral aorta. Fenestrations within the fabric allow for selective catheterization of the visceral and/or renal arteries and subsequent placement of an endoprosthesis (ie, bare metal or covered stent) to maintain flow to the visceral artery.

Fenestrated aortic repair is reported based on the extent of aorta treated. Codes 34841-34844 describe repair using proximal endoprostheses that span from the visceral aortic component to one, two, three or four visceral artery origins and distal extent limited to the infrarenal aorta. These devices do not extend into the common iliac arteries. Codes 34845-34848 are used to report deployment of a fenestrated endoprosthesis that spans from the visceral aorta (including one, two, three, or four visceral artery origins) through the infrarenal aorta into the common iliac arteries. The infrarenal component may be a bifurcated unibody device, a modular bifurcated docking system with docking limb(s), or an aorto-uniliac or aorta-unifemoral device.-Codes 34845-34848 include placement of unilateral or bilateral docking limbs (depending on the device). Any additional stent graft extensions that terminate in the common iliac arteries are included in the work described by 34845-34848. Codes 34825 and 34826 may not be separately reported for proximal abdominal aortic extension prosthesis(s) or for distal extension prosthesis(s) that terminate in the aorta or the common iliac arteries. However, codes 34825 and 34826 may be reported for distal extension prosthesis(s) that terminate in the internal iliac, external iliac, or common femoral artery(s).

Codes 34841-34844 and 34845-34848 define the total number of visceral and/or renal arteries (ie, celiac, superior mesenteric, and/or unilateral or bilateral renal artery[s]) requiring placement of an endoprosthesis (ie, bare metal or covered stent) through an aortic endograft fenestration.

Introduction of guidewires and catheters in the aorta and visceral and/or renal arteries is included in the work of 34841-34848 and is not separately reportable. However, catheterization of the hypogastric artery(s) and/or arterial families outside the treatment zone of the graft may be separately reported. Balloon angioplasty within the target treatment zone of the endograft, either before or after endograft deployment, is not separately reportable. Fluoroscopic guidance and radiologic supervision and interpretation in conjunction with fenestrated endovascular aortic repair is not separately reportable and includes angiographic diagnostic imaging of the aorta and its branches prior to deployment of the fenestrated endovascular device, fluoroscopic guidance in the delivery of the fenestrated endovascular components, and intraoperative arterial angiography (eg, confirm position, detect endoleak, evaluate runoff) done at the time of the endovascular aortic repair.

Exposure of the access vessels (eg, 34812) may be reported separately. Extensive repair of an artery (eg, 35226, 35286) may be reported separately. For concomitant endovascular treatment of the descending thoracic aorta, report 33880-33886 and 75955-75959 with 34841-34848. Do not report descending thoracic aortic aneurysm repair extension placement for an extension that includes the visceral aorta. For isolated endovascular infrarenal abdominal aortic aneurysm repair that does not require placement of a fenestrated graft to preserve flow to the visceral branch(es), see 34800-34805.

Other interventional procedures performed at the time of fenestrated endovascular abdominal aortic aneurysm repair may be reported separately (eg, arterial embolization, intravascular ultrasound, balloon angioplasty or stenting of native artery[s] outside the endoprosthesis target zone, when done before or after deployment of endoprosthesis).

●34841	CC1	Endovascular repair of visceral aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption) by deployment of a fenestrated visceral aortic endograft and all associated radiological supervision and interpretation, including target zone angioplasty, when performed; including one visceral artery endoprosthesis (superior mesenteric, celiac or renal artery)	090	Carrier Price and Refer to CPT

Re: Tab 6 Fenestrated Endografting (FEVAR)

Dear Dr. Levy;

At their February 2013 meeting, the CPT Editorial Panel created eight new Category I codes to report fenestrated endograft repair of the upper abdominal aorta (FEVAR). The new codes 348XX1-348XX8 will be used to report placement of an endovascular graft in this visceral segment of the aorta, a procedure considered unimaginable just a few years ago. This endograft is different from all prior aortic endoprostheses in that there are pre-planned holes (fenestrations) in the fabric through which additional endograft limbs will extend into the origins of the renal and mesenteric arteries. Once the main body graft is placed, selective catheterization through the fenestrations is performed to bridge the gap between the main graft body and the renal arteries, superior mesenteric artery and/or celiac artery. With successful entry of wire and catheter through the fenestrations and into the main visceral arteries, covered stent grafts are advanced over the wire through the fenestrations, and into the native visceral arteries. When perfectly positioned, these additional covered endografts are deployed, thereby bridging the gap between main aortic endograft body and the visceral arteries. Thus, the new blood flow pathway is down the aorta, into the main body portion of the endograft, through the newly placed endograft branches and into the visceral arteries. This just-described deployment is performed either alone or in combination with repair of the entire infrarenal aorta, for arterial disorders including aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption. For the past several years these procedures have been reported by Category III codes (0078T, 0079T, 0080T, and 0081T). The application to convert to Category I codes was initiated by FDA-approval of the first such fenestrated aortic endograft. The Category I codes are substantially different than their Category III predecessors based on evolution of the investigational devices and procedures.

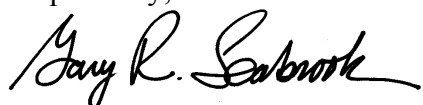

The task of recommending values for these eight new codes has been complicated by unanticipated hurdles as outlined below. As a result, we will be unable to submit RVU recommendations for these codes in April. We are recommending carrier pricing until several novel and complex issues are resolved.

RUC survey data revealed extensive pre-service time (120-195) for these procedures. The expert

consensus panel confirmed that these procedures do require extensive pre-service work that is not otherwise reportable, and in fact, some of the most intensive work occurs days to weeks before the defined 90-day global period begins (ie, the day before the procedure). Each of the currently FDA-approved main aortic endograft bodies are custom made by the vendor because every patient has a different arrangement and relative orientation of the renal and visceral artery origins. Thus, while the left and right renal arteries emanate from their respective sides of the aorta, one side may originate higher on the aorta than the other. In addition, the renal origins do not commonly exit from the normal 3 and 9 o'clock positions we envision on anatomic models. Finally, there is wide variation in how close the renal arteries are to the superior mesenteric origin. Each fenestrated endograft is anatomically specific for a patient depending on his or her anatomy. We now have learned that the physician must spend a minimum of 2 hours reviewing CT angiograms and 3D reconstructions, constructing procedure planning models and completing sizing sheets. Ultimately, the appropriate fenestrated device is ordered. This work is done over the course of several days or weeks prior to the date of surgery and is outside the guidelines for the 90-day global period. Additionally, this pre-service work is highly intense. If the surgeon errs in planning construction of the device, the intraoperative complications can be catastrophic, resulting in acute unresolvable renal failure, or acute and potentially fatal mesenteric ischemia should the fenestrations in the graft not align perfectly with the origins of the renal, superior mesenteric and celiac arteries. There is currently no means in RUC or CMS process to account for the degree, intensity and timing of two to three hours of physician work that occurs prior to initiation of the global period. This pre-service work is highly intense, and even if there were a means to artificially roll it forward into the 24 hours prior to surgery, the intensity is well beyond the standard 0.0224 IWP/UT used in CMS and RUC methodology.

We feel that it is crucial to correctly value these codes, but the limitations outlined above prevent us from making accurate recommendations. As such, SVS requests this Tab and these issues be referred to the Research Subcommittee to discuss specifically how to account for pre-service time and work that is 1) far in excess of any pre-service package, 2) vastly more intense than currently valued during pre-service, and 3) performed days to weeks prior to initiation of the traditional 90-day global period. We recommend that these eight new Category I CPT codes be Carrier priced until the Research Subcommittee and RUC formulate methodological recommendations.

Respectfully,

Gary Seabrook, MD  
The Society for Vascular Surgery (SVS)

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2013

### **Retrograde Treatment Open Carotid Stent**

In February 2013, the CPT Editorial Panel established a new code, 37217 *Transcatheter placement of an intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, via open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation* to allow for reporting of open stent insertion. This procedure is currently reported using an unlisted code.

The RUC reviewed survey results from 32 vascular surgeons and neurosurgeons and agreed that a work RVU of 22.00, the survey median, appropriately accounts for the physician work. There was consensus among the RUC that the following physician time components are appropriate: pre-time of 74 minutes, intra service time of 120 minutes and post service time of 30 minutes. The RUC also agreed that an additional 11 minutes is appropriate to position the patient on the table in a beach chair position with the neck fully extended and rotated away from the operative side. In addition, the RUC agreed that time must be added to account for the placement of fluoroscopy compatible arm boards and safety restraints. To justify the work RVU, the RUC reviewed key reference code 37215 *Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection* (work RVU=19.68, intra service time=103 minutes) and agreed that 37217 is a more intense procedure requiring additional physician work. Specifically, CPT code 37217 includes surgical exploration of the neck, dissection of the carotid sheath, dissection of the common artery and closure of the wound, in addition to the work of stent placement and angiography. Therefore, 37217 should be valued higher. The RUC also reviewed CPT code 35606 *Bypass graft, with other than vein; carotid-subclavian* (work RVU=22.46, intra service time=145 minutes) and concluded that these two services should be valued similarly since they require analogous physician work and intensity. However, since 35606 requires slightly more time, it is appropriately valued higher. Further, the RUC compared 37217 to CPT code 33883 *Placement of proximal extension prosthesis for endovascular repair of descending thoracic aorta (eg, aneurysm, pseudoaneurysm, dissection, penetrating ulcer, intramural hematoma, or traumatic disruption); initial extension* (work RVU=21.09, intra service time=120 minutes) and noted that although these two require the same physician time, 37217 describes a slightly more intense procedure. **The RUC recommends a work RVU of 22.00 for CPT code 37217.**

### **Practice Expense**

The RUC recommends the direct practice expense inputs as submitted by the specialty societies and approved by the Practice Expense Subcommittee.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Category I</b> <b>Surgery</b> <b>Cardiovascular System</b> <b>Arteries and Veins</b> <b>Transcatheter procedures</b>				
◎37215		Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection		
◎37216		without distal embolic protection		
<p>(37215 and 37216 include all ipsilateral selective carotid catheterization, all diagnostic imaging for ipsilateral, cervical and cerebral carotid arteriography, and all related radiological supervision and interpretation. When ipsilateral carotid arteriogram (including imaging and selective catheterization) confirms the need for carotid stenting, 37215 and 37216 are inclusive of these services. If carotid stenting is not indicated, then the appropriate codes for carotid catheterization and imaging should be reported in lieu of 37215 and 37216)</p> <p>(Do not report 37215, 37216 in conjunction with 36222-36224 for the treated carotid artery)</p> <p>(For <u>percutaneous</u> transcatheter placement of extracranial vertebral or intrathoracic carotid artery stent(s), see Category III codes 0075T, 0076T)</p> <p>(For <del>percutaneous transcatheter placement of intravascular stents other than coronary, carotid, or vertebral, see 37205, 37206</del>)</p>

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 37217	Tracking Number Y1	Original Specialty Recommended RVU: <b>22.00</b>
		Presented Recommended RVU: <b>22.00</b>
Global Period: 090		RUC Recommended RVU: <b>22.00</b>

CPT Descriptor: Transcatheter placement of an intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, via open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 66-year-old male has recurrent episodes of transient left hemiparesis while on aspirin. Neurologic evaluation reveals no fixed neurological deficit. Diagnostic imaging demonstrates an irregular severe left common carotid origin stenosis and a widely patent carotid bifurcation. A common carotid stent is placed through an open retrograde approach.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 100% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 16% , Overnight stay-more than 24 hours 84%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 53%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Pre-service work begins after the decision to operate is made, from the day before surgery until the time of the procedure. This includes review of the hospital admission workup with special attention to cardiac comorbidity and development of any new embolic symptoms. Review results of preadmission testing, with special attention to anticoagulant or antiplatelet therapy, contrast allergy, CT scans, duplex ultrasound studies, arteriograms electrolytes, BUN, creatinine, and CBC to assure patient suitability for planned procedure; communication with referring physician, cardiologist, anesthesiologist and other health care professionals as necessary; review of indications, risks and benefits of surgery with patient and family; signature of informed consent; and preview of expected hospital course, pain management, discharge plans etc. with patient and family. Other pre-operative services including dressing, scrubbing, and waiting for surgery; supervision of patient positioning and skin preparation, and ensuring that necessary surgical instruments and supplies are available. Check OR or hybrid endovascular operating suite to ensure proper function and configuration of imaging equipment including compliance with radiation safety issues. The physician estimates the range of guiding catheters, selective catheters, sheaths, guidewires, balloons, and stents that may be required, and ensure availability. Ensure all technical personnel have been familiarized with the upcoming procedure and techniques and that they are fully familiar with all required devices. Ensure the patient is appropriately positioned on the table in a beach chair position with the neck extended and rotated to the right. Don radiation protection gear and ensure that all who will be in the suite do likewise. Supervise sterile prep of access site(s) and subsequent draping. Perform pre-procedural "time-out." Surgical presence is also required as the anesthesiology team proceeds with induction of general endotracheal anesthesia and insertion of an arterial pressure line.

Description of Intra-Service Work: Under anesthesia, the neck is incised along the anterior border of the sternocleidomastoid muscle and the soft tissue is dissected away from the carotid sheath. The common carotid artery is exposed, mobilized, and encircled taking care not to injure the vagus nerve or internal jugular vein. Systemic anticoagulation is administered and the distal artery is occluded. The common carotid artery is then punctured for retrograde catheter and guidewire manipulation through the occlusive disease into the aortic arch using fluoroscopic guidance. Roadmapping images are obtained for vessel sizing and to document anatomy. The area of stenosis/occlusion in the intrathoracic common carotid artery is crossed with a guidewire, and a sheath is advanced to or through the stenosis/occlusion. The lesion may be initially treated with balloon angioplasty for pre-dilatation to allow passage of the stent delivery system. An appropriately sized stent is selected and introduced to the lesion through the sheath. Using fluoroscopic guidance and appropriate road-mapping, the stent is positioned across the intended treatment zone, and is deployed. The stent may be seated or fully opened with additional balloon dilation. The stent delivery system and balloon are removed or pulled back over the wire, and follow-up images are obtained with contrast injection to determine if the stenosis has been adequately treated. Multiple balloon inflations may be required, or additional balloons with larger diameters may be used. If there are multiple segments of disease within the same vessel, these are also treated with appropriate-sized stent(s). Once a satisfactory result has been documented in the absence of extravasation, the sheath is removed, and hemostasis obtained with standard surgical closure of the arteriotomy. Vascular clamps are released with reinitiation of blood flow, and hemostasis of the suture line is achieved. The incision is closed in layers.

Description of Post-Service Work: Post-service work begins after skin closure in the operating room and includes application of sterile bandages, waiting for emergence from anesthesia, and confirmation that the patient has an intact neurologic status. Once this is assured, the patient is transferred to the recovery room where postoperative orders are written. The surgeon reviews ECG, blood gas, and other blood test results, and monitors neurologic status. The family, referring physician, and consultant physicians are contacted. In hospital post-service time includes all subsequent hospital visits, continued regulation of blood pressure, monitoring and care of the incision; monitoring, care and removal of all tubes and drains; and pain medication management. Discharge day management includes the surgeon's final examination of the patient, discussion of the likely post-hospital events, instructions for continuing care, and preparation of discharge records. Additionally, all post-discharge office visits for 90 days are part of the post-operative work. This includes removal of sutures, evaluation of periodic imaging studies and laboratory reports, and pain medication adjustments if necessary.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## **Why is this code being reviewed?**

CPT Code 37217 is a new code presented to and accepted by CPT to describe this procedure with no other code to appropriately describe this work. This procedure is currently being reported with 37799, unlisted procedure, vascular surgery.

## **Methodology**

An invitation to participate in a standard RUC survey for 37217 was sent to all active members of the Society of Vascular Surgery (SVS) and to 400 members of the AANS/CNS Cerebrovascular group through an email list-service. There were 32 respondents out of 1800 survey requests for a response rate of 1.7%. There was a high degree of concordance among the survey respondents with a tight distribution of recommendations. 88% of the respondents thought the vignette described the typical patient. All respondents had experience with this procedure and the median performance rate was 2 cases over the past 12 months.

## **Work RVU Recommendation**

We are recommending the median survey value of 22.00 RVU for 37217.

## **Pre-time**

Our expert panel recommends that Pre-time package 4 (facility- difficult patient/difficult procedure) is appropriate, with 11 additional minutes for positioning:

Evaluation: Survey respondents indicated a median evaluation time of 110 minutes to review multiple pre-operative tests, consultations and images for responsible pre-operative planning. The society expert panel recommends accepting the package 4 evaluation time of 40 minutes.

Positioning: Package 4 positioning time is 3 minutes. An additional 11 minutes (total=14) of pre-service positioning time for 37217 is necessary to accomplish special positioning. The patient must be positioned with the neck extended and rotated away from the operative side. This request is consistent with the 12 minutes of positioning approved for CPT code 60240. In that case 9 minutes (total=12) were added to account for “induction of anesthesia in supine position, assist with patient positioning with shoulder roll, head extended and stabilized. Assist with adjusting the OR table and anesthesia lines so that the operative site is assessable. Re-assess position of the extremities and head, adjust as needed. An additional 2 minutes of positioning time is recommended to account for placement of fluoro compatible arm boards and safety restraints to prevent patient from falling off narrow angiography table, and due to the need for orientation and test imaging of the angiographic field of interest. Radio-opaque material in the field must be repositioned prior to sterile draping. The society feels that these additional steps in positioning more than justify the additional minutes to the standard package. [Summary: 3 + 9 + 2 = 14]

Scrub, dress & wait: The survey respondents confirmed 20 minutes for pre-service scrub, dress, and wait time.

## **Comparison to Key Reference Code and MPC code**

### **Clinical Comparison**

The key reference code 37215 was chosen by the survey respondents 47% of the time with the next most frequent code being chosen by only 16% of the respondents. The key reference service, 37215(*Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection*), is on the MPC list and was reviewed by the RUC in April 2004. Key reference 37215 is similar to 37217 in the sense that they are both vascular operations on the carotid system. Both codes describe placement of a stent in the left carotid system with the risk of emboli to the brain and stroke. Survey code 37217 includes surgical exploration of the neck, dissection of the carotid sheath, dissection of the common carotid artery, and closure of the wound in addition to the work of stent placement and angiography.

### **Work Comparison with Key Reference/MPC Code**

Key reference code 37215 (*Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection*) involves percutaneous remote access to the carotid system, placement of an embolic protection device and delivery of a stent to the affected area. This percutaneous approach results in a shorter intra service procedure time and shorter hospitalization due to the absence of a neck wound and the pain and risk associated

with the surgical exposure required for 37217. The high risk of thromboembolic complications associated with both codes account for the similar range IWPUT. The shorter intraservice time, shorter hospitalization and higher risk of perioperative stroke account for the higher intensity of work seen in the key reference service code. Pre and Post service times are the similar between the two codes. The added time for surgical exposure, dissection and closure of the wound are reflected in the longer intra-service time seen in 37217. The post service times and office visit patterns are the same between the codes. The hospital visits reflect an additional day of hospitalization compared to the key reference service due to pain control, blood pressure control and recovery from open exploration required for 37217 which is not seen in the key reference code.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	office
37217	22.00	0.111	403	40	14	20	120	30	33,32,38	13,13
37215	19.68	0.122	347	60	15	15	103	30	32,38	13,13

## **Additional Comparison Code 35606**

### **Clinical Comparison**

The additional comparison code 35606 (*Bypass graft, with other than vein; carotid-subclavian*) reflects somewhat similar vascular surgery work in the same anatomic region as the survey code and was chosen by the respondents as the second most common key reference code with 16% of the respondents selecting it as the reference code. CPT Code 35606 (*Bypass graft, with other than vein; carotid-subclavian*) was reviewed by the RUC in September 2005. The comparison code 35606 is similar to 37217 in the sense that they are both vascular operations on the carotid artery system. Both codes describe surgical exploration of the neck, dissection of the carotid sheath, dissection of the common carotid artery, and closure of the wound. In addition the comparison code 35606 includes bypass of the common carotid artery to the subclavian artery with non autogenous conduit.

### **Work Comparison with Additional Comparison Code 35606**

The comparison code 35606 (*Bypass graft, with other than vein; carotid-subclavian*) involves bypass with a non autogenous conduit and two anastomoses which take longer than the closure of the single arteriotomy performed in 37217. The surgical incision and exposure are similar between the two procedures as is postoperative recovery and care. There is a high risk of thromboembolic complications associated with both codes. Pre time is slightly longer in 37217 due to the added preparation necessary for performance of a procedure involving angiography and operative interventions. The added time for performance of a second anastomosis is reflected in the longer intra-service time seen in 35606. The post service times, office visit, and hospital visit patterns are the same between the codes. While both services are very intense, the accurate intra-thoracic placement of a stent requires steep LAO imaging to achieve precise remote placement. It is entirely appropriate that the IWPUT of the new retrograde carotid stent of 0.111 is higher than the bypass graft 35606 (0.097), but lower than that of the percutaneous cervical carotid stent (0.122).

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	Post	Hosp	office
37217	22.00	0.111	403	40	14	20	120	30	33,32,38	13,13
35606	22.46	0.097	414	30	15	15	145	30	33,32,38	13,13

## **Summary**

Based on comparisons to the key reference service / MPC code and the additional comparison code, we believe that our recommendation for the median survey value of 22.00 is appropriate for 37217.

## **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37799 Unlisted procedure, vascular surgery

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Sometimes

Specialty Neuro Surgery                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available.

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is an uncommon procedure. The specialty expert panel estimates 1000 cases per year.

Specialty Vascular Surgery	Frequency 950	Percentage 95.00 %
----------------------------	---------------	--------------------

Specialty Neuro Surgery	Frequency 50	Percentage 5.00 %
-------------------------	--------------	-------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37660

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

**Global Period:** 090

**Meeting Date:** 04/2013

**CPT Long Descriptor:** *Transcatheter placement of an intravascular stent(s), intrathoracic common carotid artery or innominate artery by retrograde treatment, via open ipsilateral cervical carotid artery exposure, including angioplasty, when performed, and radiological supervision and interpretation*

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

A standard RUC survey was conducted for physician work. An expert panel reviewed the recommendations for physician work and makes the following practice expense recommendations.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

CPT Code 37215 *Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection* was included as the reference code for these practice expense recommendations. CPT code 37215 was the key reference service code for the physician work survey and has the same direct practice expense inputs.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

Staple removal pack added for the surveyed code with is “open” compared with the reference code, which is percutaneous through groin.

**5. Please describe in detail the clinical activities of your staff:**

**Pre-Service Clinical Labor Activities:**

The standard inputs for 090-day codes have been recommended for this procedure.

**Intra-Service Clinical Labor Activities:**

The standard time for discharge day management has been recommended for this procedure.

**Post-Service Clinical Labor Activities:**

Standard times to ready patient/records and assist physician at each post-op office visit have been applied.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*High Volume Growth / Codes Reported Together 75% or More*

April 2013

**Transcatheter Placement of Intravascular Stent**

In February 2010, the CPT Editorial Panel revised CPT codes 37208-37028 as part of the larger Endovascular Revascularization issue. Initially, the RUC requested review of these codes in tandem with the new lower extremity revascularization codes, but subsequently deferred review because it would be difficult to describe the typical patient given the removal of the lower extremity revascularization services. In April 2010, CPT code 37205 *Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; initial vessel* was identified through the High Volume and Codes Reported Together 75% or More screens and the specialties were encouraged to create new bundled codes. In February 2013, the CPT Editorial Panel deleted four intravascular stent placement codes: 37205 *Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; initial vessel*, 37206 *Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; each additional vessel*, 37207 *Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; initial vessel* and 37208 *Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; each additional vessel (List separately in addition to code for primary procedure)* and one radiological supervision and interpretation code, 75960 *Transcatheter introduction of intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity artery), percutaneous and/or open, radiological supervision and interpretation, each vessel* and established four new bundled codes to describe transcatheter placement of intravascular stent.

***37236 Transcatheter placement of an intravascular stent(s) (except lower extremity, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery***

The RUC reviewed the survey results from 77 vascular surgeons, radiologists and cardiologists and determined that a work RVU of 9.00, the survey median, appropriately accounts for the physician work of this procedure. The RUC noted that 37236 will be reported with a catheter placement code, 36200 *Introduction of catheter, aorta* (work RVU=3.02), 36215 *Selective catheter placement, arterial system; each first order thoracic or brachiocephalic branch, within a vascular family* (work RVU=4.67), 36216 *Selective catheter placement, arterial system; initial second order thoracic or brachiocephalic branch, within a vascular family* (work RVU=5.27), 36217 *Selective catheter placement, arterial system; initial third order or more selective thoracic or brachiocephalic branch, within a vascular family* (work RVU=6.29), 36245 *Selective catheter placement, arterial system; each first order abdominal, pelvic, or lower extremity artery branch, within a vascular family* (work RVU=4.67), 36246 *Selective catheter placement, arterial system; initial second order abdominal, pelvic, or lower extremity artery branch, within a vascular family* (work RVU=5.27) or 36247 *Selective catheter placement, arterial system; initial third order or more selective abdominal,*

*pelvic, or lower extremity artery branch, within a vascular family* (work RVU=6.29), and the catheter code will be subject to the multiple procedure payment reduction. The retention of the catheter codes was necessary to account for variation in anatomical sites. To ensure the recommended value is relative to similar stenting procedures, the RUC reviewed several newly bundled services in the lower extremity revascularization family of services. Prior to comparing, the RUC noted that these codes have catheterization bundled in and appropriately applied the multiple procedure reduction in order to provide a useful comparison to 37236. The RUC reviewed the following CPT codes: 37221 *Iliac stent* (work RVU= 10.00) and removed the work of catheterization code 36245 (work RVU=  $4.67/2 = 2.33$ ) for a comparison value of 7.67; 37226 *Femoral stent* (work RVU= 10.49) and removed the work of catheterization code 36247 (work RVU=  $6.29/2 = 3.15$ ) for a comparison value of 7.34 and 37230 *Tibial stent* (work RVU= 13.80) and removed the work of catheterization code 36247 (work RVU=  $6.29/2 = 3.15$ ) for a comparison value of 10.65. The surveyed code describes intravascular stenting of any vessel other than lower extremity, coronary or carotid. The remaining vessels represent a wide variety of sizes, anatomies and locations; all of which are now described in 37236. Given this, the RUC agreed that the recommended value of 9.00 for 37236 is appropriately aligned between these three comparison codes.

For further comparison, the RUC compared 37236 to key reference code 37184 *Primary percutaneous transluminal mechanical thrombectomy, noncoronary, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injection(s); initial vessel* (work RVU=8.66) and noted that although these two codes have exact intra service time (90 minutes), and similar total time, (161 versus 160 minutes), the survey respondents indicated that 37236 is more intense and complex compared to the key reference code, 37184. The RUC agreed that the survey 25<sup>th</sup> percentile work RVU of 8.00 would create a rank order anomaly. The RUC also reviewed CPT code 52355 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with resection of ureteral or renal pelvic tumor* (work RVU=9.00) and agreed that the physician work and complexity of these two procedures is similar. **The RUC recommends a work RVU of 9.00 for CPT code 37236.**

***37237 Transcatheter placement of an intravascular stent(s) (except lower extremity, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results from 61 vascular surgeons, radiologists and cardiologists and determined that a work RVU of 4.25, the survey 25<sup>th</sup> percentile is appropriate. The RUC also agreed with the specialty society that 1 minute of pre and 1 minute of post time is appropriate for this add-on code to account for the additional evaluation time above the base code to assess placement of an additional stent in a separate vessel. This additional time is consistent with other ZZZ global codes in the vascular family (e.g. 37222, 37223 and 37232). To ensure relativity, the RUC reviewed two add-on codes: 35685 *Placement of vein patch or cuff at distal anastomosis of bypass graft, synthetic conduit* (work RVU= 4.04) and 60512 *Parathyroid autotransplantation (List separately in addition to code for primary procedure)* (work RVU= 4.44) and noted that both have identical intra times as 37237, 45 minutes, and provide appropriate brackets to validate the recommended work RVU. **The RUC recommends a work RVU of 4.25 for CPT code 37237.**

***37238 Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; initial vein***

The RUC reviewed survey results from 75 vascular surgeons, radiologists and cardiologists and determined that a direct crosswalk to CPT code 36247 *Selective catheter placement, arterial system; initial third order or more selective abdominal, pelvic, or lower extremity artery branch, within a vascular family* (work RVU= 6.29, and intra-service time of 60 minutes), is appropriate. A work value of 6.29 for 37238 is slightly higher than the survey 25<sup>th</sup> percentile. The RUC reviewed CPT code 35460 *Transluminal balloon angioplasty, open; venous* (work RVU= 6.03) and agreed that a work RVU lower than 6.29 would create a rank order anomaly since 37238 includes the physician work of an angioplasty and placement of a stent. To further support this value, the RUC reviewed CPT code 37197 *Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed* (work RVU=6.29, intra-service time=60 minutes) and agreed that both codes have the same intra-service time and similar complexity and should be valued the same. **The RUC recommends a work RVU of 6.29 for CPT code 37238.**

***37239 Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including angioplasty within the same vessel, when performed; each additional vein (List separately in addition to code for primary procedure)***

The RUC reviewed the survey results of 61 vascular surgeons, radiologists and cardiologists and determined that a direct crosswalk to CPT code 35686 *Creation of distal arteriovenous fistula during lower extremity bypass surgery (non-hemodialysis) (List separately in addition to code for primary procedure)* (work RVU= 3.34 and intra-service time of 35 minutes) accurately accounts for the work involved in this service. The RUC also agreed with the specialty societies that 1 minute of pre-service and 1 minute of post-service time is appropriate to account for the additional evaluation time above the base code to assess placement of an additional stent in a separate vessel. The RUC also compared the work RVU of 3.34 to 37237 and agreed that since 37239 has 15 minutes less intra time, it is appropriately valued lower than 37237. To support this value, the RUC reviewed key reference code 37185 *Primary percutaneous transluminal mechanical thrombectomy, noncoronary, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injection(s); second and all subsequent vessel(s) within the same vascular family (List separately in addition to code for primary mechanical thrombectomy procedure)* (work RVU=3.28, intra-service time=40 minutes) and determined that the physician work and intensity of 37239 is higher, justifying the higher work value. **The RUC recommends 3.34 work RVUs for CPT code 37239.**

**Practice Expense:**

The RUC accepted the direct PE inputs with minor modifications as recommended by the PE Subcommittee.

**Work Neutrality**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Category I</b> <b>Surgery</b> <b>Cardiovascular System</b> <b>Heart and Pericardium</b> <b>Single Ventricle and Other Complex</b> <b>Cardiac Anomalies</b>				
33621		Transthoracic insertion of catheter for stent placement with catheter removal and closure (eg, hybrid approach stage 1)  (For placement of stent, use <del>37207</del> <u>37236</u> )  (Report both 33620, 33621 if performed in same session)		
<b>Vascular Injection Procedures</b> <b>Intra-Arterial—Intra-Aortic</b> <b>Interventions for Arteriovenous (AV) Shunts Created for Dialysis (AV Grafts and AV Fistulae):</b> For the purposes of coding interventional procedures in arteriovenous (AV) shunts created for dialysis (both arteriovenous fistulae [AVF] and arteriovenous grafts [AVG]), the AV shunt is artificially divided into two vessel segments. The first segment is peripheral and extends from the peri-arterial anastomosis through the axillary vein (or entire cephalic vein in the case of cephalic venous outflow). The second segment includes the veins central to the axillary and cephalic veins, including the subclavian and innominate veins through the vena cava. Interventions performed in a single segment, regardless of the number of lesions treated, are coded as a single intervention.  The AV shunt is considered to be venous and most interventions are coded with the venous intervention codes (ie, angioplasty is reported with venous angioplasty codes <u>35476</u> , <u>75978</u> ). Codes <u>35476</u> and <u>75978</u> would be reported once to describe all angioplasty work performed in one segment of the AV dialysis shunt, regardless of the number of distinct lesions treated within that segment, the number of times the balloon is inflated, or the number of balloon catheters required to open all lesions.				

There is an exception to the use of venous interventional codes. When there is a stenosis at the arterial anastomosis, it typically extends across the anastomosis and involves the artery just proximal to and at the anastomosis as well as the outflow vessel or graft. This segment is called the peri-anastomotic (or juxta-anastomotic) region, and even though the stenosis can involve multiple vessels, it is typically a single lesion with a single etiology crossing the anastomosis, and treatment to open this lesion crosses from the artery into the vein or venous graft. An intervention treated in this peri-anastomotic segment is coded as an arterial intervention (35475, 75962). Since the entire segment of the AV shunt from the peri-arterial anastomosis through the axillary vein is considered a single vessel for coding of interventions, the arterial angioplasty codes include the work of opening the peri-anastomotic stenosis, as well as all other stenoses treated within this segment of the vessel. Codes 35475 and 75962 are reported once to describe all work done to angioplasty any lesion from the peri-arterial anastomosis through the axillary vein in procedures that involve angioplasty of the peri-arterial anastomosis of the AV shunt. In these special instances, venous angioplasty codes would not be reported additionally for this first or most peripheral shunt segment, even if balloon angioplasty is performed on segments of the AV dialysis shunt that are purely venous anatomy within this specific vessel segment.

It is never appropriate to report removal of the arterial plug during a declot/thrombectomy procedure as an arterial or venous angioplasty (35475, 35476). Removal of the arterial plug is included in the work of a fistula thrombectomy (36870), even if a balloon catheter is used to mechanically dislodge the resistant thrombus.

The central veins (eg, subclavian, innominate, and cava) are considered an additional, separate venous vessel segment for purposes of interventional coding for AV dialysis shunt interventions. If one or more central venous stenoses are treated with angioplasty, this is reported as a single venous angioplasty (35476, 75978), regardless of the number of discrete lesions treated within this segment, and also independent of the number of balloon inflations or number of balloon catheters or sizes required. This additional work should be clearly documented in the patient record and in the recorded images.

~~The codes for stents placed in AV dialysis accesses are generic for intravascular work and not specific for arterial or venous anatomy. However,~~ The same rules used for angioplasty apply to stent placements for AV dialysis shunts with respect to the number of interventions reported for each patient. ~~Stent codes (37205, 75960) are~~ Either code 37236 or 37238 is reported once to describe all work of stenting lesions within the defined AV dialysis shunt segment from the peri-arterial anastomosis through the axillary and cephalic veins, regardless of the number of stents placed or the number of discrete lesions treated within that vessel segment. Code 37238 is reported for placement of AV access stent unless the treated lesion includes the peri-anastomotic region. This peri-anastomotic region is considered an artery and therefore code 37236 is reported instead of code 37238. If additional stenting is required for central venous stenosis, this may be reported as an additional stent placement (~~37206, 75960-37239~~), describing all the work of stent placement within the central venous segment .

The work of catheterizing all the veins in the dialysis AV shunt is included in 36147 (and, if appropriate, 36148). Selective catheterization of the inferior/superior vena cava and central veins cannot be separately reported when performed from a direct puncture of the AVF/AVG.

However, if additional venous side branches off of the conduit, known as accessory veins, are separately catheterized for intervention such as embolization of a large competing accessory vein, this additional work may be separately reported using the appropriate selective venous catheterization codes (36011 and 36012). The embolization may be reported using 37204, 75894.

<p>●37215</p> <p>Transcatheter placement of intravascular stent(s), cervical carotid artery, percutaneous; with distal embolic protection</p>				

◎37216

without distal embolic protection

(37215 and 37216 include all ipsilateral selective carotid catheterization, all diagnostic imaging for ipsilateral, cervical and cerebral carotid arteriography, and all related radiological supervision and interpretation. When ipsilateral carotid arteriogram (including imaging and selective catheterization) confirms the need for carotid stenting, 37215 and 37216 are inclusive of these services. If carotid stenting is not indicated, then the appropriate codes for carotid catheterization and imaging should be reported in lieu of 37215 and 37216)

(Do not report 37215, 37216 in conjunction with 36222- 36224 for the treated carotid artery)

(For transcatheter placement of extracranial vertebral or intrathoracic carotid artery stent(s), see Category III codes 0075T, 0076T)

(For percutaneous transcatheter placement of intravascular stents other than coronary, carotid, or vertebral, see 37205, 37206)

**Endovascular Revascularization (Open or Percutaneous, Transcatheter)**

◎✚37235 Revascularization, endovascular, open or percutaneous with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)

(Use 37235 in conjunction with 37231)

Codes 37236-37239 are used to report endovascular revascularization for vessels other than lower extremity (ie, 37221, 37223, 37226-37227, 37230-37231, 37234-37235), cervical carotid (ie, 37215-37216), intracranial (ie, 61635), intracoronary (ie, 92928-92929, 92933-92934, 92937-92938, 92941, 92943-92944), extracranial vertebral or intrathoracic carotid (ie, 0075T-0076T) performed percutaneously and/or through an open surgical exposure, or open retrograde intrathoracic common carotid or innominate (3741).

Codes 37236-37237 describe transluminal intravascular stent insertion in an artery while codes 37238-37239 describe transluminal intravascular stent insertion in a vein. Multiple stents placed in a single vessel may only be reported with a single code. If a lesion extends across the margins of one vessel into another, but can be treated with a single therapy, the intervention should be reported only once. When additional, different vessels are treated in the same session, report 37237 and/or 37239 as appropriate. Each code in this family (37236-37239) includes any and all balloon angioplasty(s) performed in the treated vessel, including any pre-dilation (whether performed as a primary or secondary angioplasty), post-dilation following stent placement, treatment of a lesion outside the stented segment but in the same vessel, or use of larger/smaller balloon to achieve therapeutic result. Angioplasty in a separate and distinct vessel may be reported separately. Non-selective and/or selective catheterization(s) (eg, 36005, 36010-36015, 36200, 36215-36218, 36245-36248) is reported separately.

Codes 37236-37239 include radiological supervision and interpretation directly related to the intervention(s) performed, closure of the arteriotomy by pressure, application of an arterial closure device or standard closure of the puncture by suture, and imaging performed to document completion of the intervention in addition to the intervention(s) performed. Extensive repair or replacement of an artery may be reported separately (eg, 35226 or 35286). Report 76937 for ultrasound guidance for vascular access, when performed in conjunction with 37236-37239. Intravascular ultrasound may be reported separately (ie, 37250-37251). For mechanical thrombectomy and/or thrombolytic therapy, when performed, see 37184-37188, 37211-37214.

Intravascular stents, both covered and uncovered, are a class of devices that may be used as part of an embolization procedure. As such, there is the potential for overlap among codes used for placement of vascular stents and those used for embolization. When a stent is placed for the purpose of providing a latticework for deployment of embolization coils, such as for embolization of an aneurysm, the embolization code is reported and not the stent code. If a covered stent is deployed as the sole management of an aneurysm, pseudoaneurysm, or vascular extravasation then the stent deployment code should be reported and not the embolization code.

D+0079T		Placement of visceral extension prosthesis for endovascular repair of abdominal aortic aneurysm involving visceral vessels, each visceral branch (List separately in addition to code for primary procedure) (Use 0079T in conjunction with 0078T)	ZZZ	N/A
D0080T		Endovascular repair using prosthesis of abdominal aortic aneurysm, pseudoaneurysm or dissection, abdominal aorta involving visceral vessels (superior mesenteric, celiac and/or renal artery[s]), radiological supervision and interpretation (Do not report 008T in conjunction with 34800-34805, 35801, 35102, 35452, 35472) (Report 008T in conjunction with 37205-37208, 37220-37223, only when these procedures are performed outside the target zone of the endoprosthesis)	XXX	N/A
D+0081T		Placement of visceral extension prosthesis for endovascular repair of abdominal aortic aneurysm involving visceral vessels, each visceral branch, radiological supervision and interpretation (List separately in addition to code for primary procedure) (Use 0081T in conjunction with 0080T) (0078T-0081T have been deleted. To report, see 34841-34848)	ZZZ	N/A
0262T                      Implantation of catheter-delivered prosthetic pulmonary valve, endovascular approach (0262T includes all congenital cardiac catheterization[s], intraprocedural contrast injection[s], fluoroscopic radiological supervision and interpretation, and imaging guidance performed to complete the pulmonary valve procedure. Do not report 0262T in conjunction with 76000, 76001, 93530, 93563, 93566- 93568 )				

(0262T includes percutaneous balloon angioplasty/valvuloplasty of the pulmonary valve/conduit. Do not report 0262T in conjunction with 92990)

(0262T includes stent deployment within the pulmonary conduit. Do not report ~~37205, 37206, 75960~~ 37236-37239 for stent placement within the pulmonary conduit. Report ~~37236-37239~~ 37205, 37206, 92928-92944, ~~75960~~ separately when cardiovascular stent placement is performed at a site separate from the prosthetic valve delivery site. Report 92997, 92998 separately when pulmonary artery angioplasty is performed at a site separate from the prosthetic valve delivery site unless stenting also performed at that site)

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 37236	Tracking Number X1	Original Specialty Recommended RVU: <b>9.00</b>
		Presented Recommended RVU: <b>9.00</b>
Global Period: 000		RUC Recommended RVU: <b>9.00</b>

CPT Descriptor: Transcatheter placement of an intravascular stent(s) (except lower extremity, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial artery

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female smoker presents with a 6-month history of post-prandial abdominal pain, fear of food, and 30 pound weight loss. Diagnostic imaging demonstrates severe stenoses of the mesenteric vessels. A superior mesenteric artery stent(s) is placed.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 86%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 81%

#### Description of Pre-Service Work:

- The patient's history and pertinent non-invasive diagnostic studies are reviewed, with special attention to associated symptoms as well as co-morbidities that would place the patient at higher risk for open surgical reconstruction.
- Physical exam is reviewed to ensure that the patient has suitable access vessels for percutaneous access including femoral, brachial, and radial pulses.
- Medications are reviewed including antiplatelet and anticoagulant agents that the patient is or needs to be taking.
- Preprocedural laboratory evaluation is reviewed with a focus on coagulation and renal function studies. If renal insufficiency is present, attention is given to whether the patient needs and/or has received appropriate renal protective agents and periprocedural hydration.
- Based on this review, the physician estimates the range of equipment including guiding catheters/sheaths, guidewires, selective catheters, balloons, stents, and embolic protection devices that may be required and ensures that all are available for use.
- The imaging suite/hybrid operating room is checked to ensure proper function and configuration of the imaging equipment including compliance with all radiation safety issues as well as proper function of all patient monitoring equipment including ECG and hemodynamic monitors
- The physician ensures that all technical personnel have been familiarized with the procedure and are familiar with the devices to be used.

- Procedure details, including alternatives and risks, are discussed with the patient and the family. Informed consent is reviewed with the patient and the family.
- Confirm patient positioning and supervise sterile prep of access site(s) and subsequent draping
- Perform preprocedural “time out”
- Intravenous access is started and moderate sedation is administered

#### Description of Intra-Service Work:

Arterial access is separately reported and the vessel in question has a catheter in place when the work of this service begins.

#### Angiographic procedure:

- \* All steps are performed under fluoroscopic guidance
- \* Conscious sedation is ongoing and adequate monitoring is verified
- \* IV heparin is administered to achieve therapeutic anticoagulation and levels adjusted as needed thereafter
- \* Inject contrast to localize stenosis and allow measurements for appropriate device
- \* Depending on required device, guiding sheath may need to be switched out for a larger caliber
- \* Cross lesion with hydrophilic guidewire and advance low profile catheter across lesion.
- \* Exchange hydrophilic guidewire for more rigid guidewire needed to support balloons and stents, as required
- \* Predilate stenosis with a low profile angioplasty balloon if required (not separately reportable)
- \* Inject contrast to confirm positioning within the SMA beyond the stenosis
- \* Advance sheath or guiding catheter across lesion as required by type of lesion and stent to be deployed
- \* Advance appropriately sized stent across intended treatment zone
- \* Withdraw sheath and deploy balloon-expandable or self- expanding stent
- \* Retract stent delivery system and balloon
- \* Insert appropriately sized balloon and inflate for post-dilation (not separately reportable)
- \* Reimage and repeat post-deployment balloon angioplasty as often as required to fully seat and expand stent
- \* Remove balloon catheter and reimage vessel to assess postprocedural success and to exclude distal embolism
- \* Capture final completion images
- \* Remove all delivery catheters and secure hemostasis with manual pressure or with closure device
- \* Ensure adequate circulation distal to arterial access site prior to transfer to recovery area

#### Radiologic Supervision and Interpretation is included in this procedure:

- Direct technical personnel throughout the procedure
- Interpretation of imaging of vessel being treated as well as vessels accessed en route (e.g. iliac, brachial, axillary, subclavian arteries, aorta) including all imaging to manipulate the wires, catheters, and devices into position, as well as to correctly position and deploy all balloons and stents
- Ensure accurate radiologic views, exposures, shielding, image size, injection sequences, radiation protection and management for patient and staff
- Real-time interpretation of imaging to assess post-procedural success and complications as well as removal of all catheters and devices

#### Description of Post-Service Work:

- Apply sterile dressings
- Assist team in moving patient to stretcher and transporting to recovery area
- Ensure blood pressure and heart rate are normal and stable upon arrival to recovery area and discuss post-procedure care with recovery area staff
- Write postop orders
- Communicate with family and referring physicians
- Review results of procedure with patient once sedation wears off
- Review and interpret all images
- Post-process radiologic images and archive for permanent record
- Review and record patient fluoroscopic exposure time and contrast volume
- Dictate procedure note including interpretation of diagnostic and therapeutic imaging
- Review, revise, and sign final report
- Send final report to PCP and any other referring providers

- Discharge day management includes communication with PCP and family, writing orders for follow-up labs, x-rays and patient care, as well as assurance that discharge criteria are met including evaluation of procedural success and assessment for access site complications

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## **Why is this code being reviewed?**

Four interventional codes (37205-8) and one radiological supervision and interpretation code (75960) were identified in a screen for codes reported >75% together because they form a logical component coding pairs (37205+75960, 37206+75960, 37207+75960 and 37208+75960). Each code pair includes one vascular stent deployment and one radiological S&I code. All five of these codes will be deleted in 2014. In their place, four new CPT codes will be created that bundle the procedure with the S&I.

Codes to be deleted relevant to this SoR include percutaneous approach to an initial artery or vein (37205), open approach to an initial artery or vein (37207); and the S&I (75960). Because current interventionalists believe there is a difference in work depending on whether the procedure is done in an artery or a vein, the new codes are broken out with a code representing arterial stenting and another representing venous stenting. In each case, the radiological S&I is bundled into the procedure code.

For 37236, the three relevant to-be-deleted codes are 37205 (percutaneous transcatheter stent placement, initial vessel), 37207 (open transcatheter stent placement, initial vessel) and 75960 (radiologic supervision and interpretation code for vascular stent). Since the new code recommendations reflect different RVWs for arterial vs. venous work, a work neutrality analysis is presented at the end of this section.

In considering the work RVU of this service it is also important to note that this code will be co-reported with a catheter placement code (36200, 36215-7, or 36245-7), and the catheter code will be subject to multiple procedure payment reduction. Retaining the separate catheterization code is necessary because these new stent codes will be reported for all remaining arteries and veins in the body after anatomic site-specific codes have been created to specifically report coronary stents, lower extremity stents, extracranial cervical carotid stents, and intracranial stents. Thus, the significant variation in work to reach many different target zones has to be represented by the catheterization code.

## **Methodology**

An invitation to participate in a standard RUC survey for 37236 was sent to random sample of members of the Society for Vascular Surgery (SVS), the Society for Interventional Radiology (SIR), the American College of Radiology (ACR), the American College of Cardiology (ACC) and the Society for Cardiovascular Angiography and Interventions (SCAI) through an email list-service. There were 77 respondents out of 3404 survey requests for a response rate of 2.2%. There was a high degree of concordance among the survey respondents with a very tight distribution of recommendations. 87% of the respondents thought the vignette described the typical patient.

## **Work RVU Recommendation**

We recommend the median survey value of 9.00 RVU for 37236.

## **Pre-time**

Our expert panel recommends that pre-time package 2b (facility- difficult patient/straightforward procedure with sedation / anesthesia) is appropriate, with 2 additional minutes for positioning:

Evaluation: Survey respondents indicated a median evaluation time of 65 minutes to review multiple pre-operative tests, consultations and images for responsible pre-operative planning. The society expert panel recommends accepting the package 2b evaluation time of 33 minutes.

Positioning: Package 2b positioning time is 1 minute. An additional 2 minutes (total=3) of pre-service positioning time for 37236 is recommended to assist with adjusting the imaging table and anesthesia lines for appropriate positioning in order to be able to obtain all appropriately necessary views required for the intervention.

Scrub, dress & wait: The society expert panel recommends accepting the pre-time 2b package evaluation time of 5 minutes.

## **Comparison to Key Reference Code**

### **Clinical Comparison with Key Reference Code**

The reference code chosen by majority of the survey respondents was 37184 (*Primary percutaneous transluminal mechanical thrombectomy, noncoronary, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injection(s); initial vessel*). The key reference 37184 has a 000 day global, and is similar to 37236 in they are both endovascular procedures performed on similar arteries for occlusive disease. 37184 was evaluated by the RUC in April 2005.

### **Work Comparison with Key References**

Both 37236 and 37184 have 90 minutes of intra time and nearly identical total times for physician work. Survey respondents rated 37236 as more intense and complex for both pre-service and intra-service work, with identical ratings for post-service work. The

reference service has an RVW of 8.66. The recommended value for 37236 is 0.34 RVUs greater, at 9.00. The 0.34 increment is justified by the higher intensity and complexity ratings during 90 minutes of intra-service time. This works out to a miniscule additional 0.0038 RVUs per minute during the intra-service portion of the procedure. This comparison justifies our recommendation for the median survey value of 9.00 for 37236.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37236</b>	9.00	0.083	161	33	3	5	90	30
<b>37184</b>	8.66	0.080	160	20	10	10	90	30

### **Comparison to CPT Code from Another Specialty**

CPT Code 52355 (*Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with resection of ureteral or renal pelvic tumor*) is a minimally invasive interventional code from another specialty with a 000 day global evaluated by the RUC in September 2011, with identical RVW's and pre-service evaluations times, and nearly identical total times and IWPUT's. This comparison justifies our recommendation for the median survey value of 9.00 for 37236.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37236</b>	9.00	0.083	161	33	3	5	90	30
<b>52355</b>	9.00	0.084	155	33	5	15	90	20

### **Comparison to MPC Code**

CPT Code 15004 (*Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet and/or multiple digits; first 100 sq cm or 1% of body area of infants and children*) is the closest valued MPC code with a 000 day global. There is no clinical similarity between 37236 and 15004. There is no way to perform a valid pre-service comparison between 37236 and 15004 because 15004 was evaluated by the RUC in 2006, and that was before implementation of the RUC pre-service time packages. The only way to compare pre-time between these codes is to look at survey times, and in that analysis our new code has a total of 95 minutes of pre-service survey time which would compare to 75 minutes of survey time for 15004. This analysis favors 37236 in terms of pre-service work.

More importantly, intra-service time for 37236 is twice that of 15004, and the recommended RVW for 37236 is twice that of the MPC code 15004. Since there is no possible clinical comparison, this primarily intra-time comparison to an MPC service justifies our recommendation for the median survey value of 9.00 for 37236.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37236</b>	9.00	0.083	161	33	3	5	90	30
<b>15004</b>	4.58	0.054	150	45*	15*	15*	45	30

Please note that pre-times for 15004 are asterisked\* because they were assigned prior to implementation of RUC pre-time packages.

### **Work Neutrality Considerations**

Since there are two daughter codes (37236 and 37238) it is important to perform an analysis of work neutrality. The parent codes (37205 or 37207 plus 75960) have a combined current work RVU of 8.27 + 0.82 for a total of 9.09. Our recommendations for the daughter codes are 9.00 work RVUs for the arterial stent (37236 – this SoR) and 6.29 work RVUs for the vein stent (37238). Thus, the artery stent code recommendation is 0.09 RVUs less than current value, while the vein stent code recommendation is 2.80 RVUs less than current value, and the net change will inevitably result in a reduction in work RVUs for this family.

Based on review of the diagnosis codes used to report the current code pair of 37205/37207 & 75960 as well as understanding of current day practice, our expert panel estimates that this service is performed 75% of the time in arteries and 25% of the time in veins. Thus, for every 100 procedures with the new codes, 37236 will be reported 75 times, while 37238 will be reported 25 times.

Current work value of 100 services 37205/37207 + 75960 = 100 x (8.27 + 0.82) = 909 RVUs

Proposed work value for 100 daughter services:

Artery stent code 37236 projected frequency 75 x 9.00 RVUs =	675 RVUs
Vein stent code 37238 projected frequency 25 x 6.29 RVUs =	157 RVUs
Total add-on work for combination of two daughter codes =	832 RVUs

Net Reduction in work RVUs for this frequency distribution	-77.00 RVUs for each 100 procedures reported
Percentage reduction in RVUs for this frequency distribution	-8.5%

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code bundles the existing surgical procedure and radiological supervision and interpretation codes into one code as requested by the RUC, based on the 75% screen. Stent insertion can occur in any vessel, both arterial and venous. The work required for endovascular stent insertion will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more vascular catheterization codes in addition to the arterial or venous stent code. This reflects current coding practice and appropriately represents the highly variable work required for stenting of different vessels.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37205 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; initial vessel OR 37207 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; initial vessel

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery	How often? Commonly
----------------------------	---------------------

Specialty Radiology	How often? Commonly
---------------------	---------------------

Specialty Cardiology	How often? Commonly
----------------------	---------------------

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
39,810 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
Please explain the rationale for this estimate. Combining 37205 (51,400) and 37207 (1,640) adds up to 53,080 which will crosswalk to the total number of claims adding 37236 and 37238. It is estimated that 75% of the 53,080 will be captured with 37236 and 25% with 37238.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States? Yes

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36247

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 37237      Tracking Number   X2      Original Specialty Recommended RVU: **4.25**  
 Presented Recommended RVU: **4.25**  
 Global Period: ZZZ      RUC Recommended RVU: **4.25**

CPT Descriptor: Transcatheter placement of an intravascular stent(s) (except lower extremity, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional artery

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 65-year-old female smoker presents with a 6-month history of post-prandial abdominal pain, fear of food, and 30 pound weight loss. Diagnostic imaging demonstrates severe stenoses of the mesenteric vessels. After deployment of a superior mesenteric artery stent (reported separately), a stent(s) is placed in the celiac artery.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 91%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 57%

#### Description of Pre-Service Work:

- Patients who require interventional treatment at more than one site will obligatorily require an increment of additional pre-service evaluation work by the physician for completion of a thorough preprocedural assessment
- The physician needs to consider the additional site of treatment, diameter and length of necessary stent(s) for the second site, availability of those devices, the order in which to proceed, and what approach to use

#### Description of Intra-Service Work:

Arterial access is separately reported and the target vessel has a catheter in place when the work of this service begins.

- \* All steps are performed under fluoroscopic guidance
- \* Conscious sedation is ongoing and adequate monitoring is verified
- \* Adequacy of heparinization is assessed with additional doses administered as required
- \* Inject contrast to localize stenosis and allow measurements for appropriate stent diameter and length
- \* Depending on required stent, guiding sheath may need to be exchanged for a larger caliber
- \* Cross lesion with hydrophilic guidewire and advance low profile catheter through the stenosis
- \* Exchange hydrophilic guidewire for more rigid guidewire needed to support balloons and stents, as required
- \* Pre-dilate stenosis with a low profile angioplasty balloon if required (not separately reportable)
- \* Remove balloon and advance balloon-expandable or self-expanding stent across the target stenosis

- \* Recheck position and deploy stent
- \* Remove stent catheter
- \* Inject contrast to image lesion and determine if post dilation is necessary
- \* Post-dilate as indicated with an appropriately sized angioplasty balloon (not separately reportable)
- \* Exchange balloon catheter for larger diameter balloon if required (not separately reportable)
- \* Re-image and re-dilate as many times as necessary to fully seat and expand stent (not separately reportable)
- \* Remove balloon catheter & perform final contrast injections to assess success and exclude extravasation or embolization
- \* Remove all delivery catheters and secure hemostasis with manual compression or a closure device
- \* Ensure adequate circulation distal to arterial access site prior to transfer to recovery area

Description of Post-Service Work:

- Additional postservice work over and above that already provided for the primary procedure includes time to review extra films as well as dictate extra procedural details into the interpretation
- Patients with more than one treatment site require longer discussion and explanation with the patient and family
- In patients with multiple treatment areas and multiple access sites, more attention needs to be paid to evaluation of procedural success and assessment for access site complications

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Why is this code being reviewed?**

Four interventional codes (37205-8) and one radiological supervision and interpretation code (75960) were identified in a screen for codes reported >75% together because they form a logical component coding pairs (37205+75960, 37206+75960, 37207+75960 and 37208+75960). Each code pair includes one vascular stent deployment and one radiological S&I code. All five of these codes will be deleted in 2014. In their place, four new CPT codes will be created that bundle the procedure with the S&I.

Codes to be deleted relevant to this SoR include percutaneous approach to an additional artery or vein (37206), open approach to an additional artery or vein (37208); and the S&I (75960). Because current interventionalists believe there is a difference in work depending on whether the procedure is done in an artery or a vein, the new codes are broken out with a code representing arterial stenting and another representing venous stenting. In each case, the radiological S&I is bundled into the procedure code.

For 37237, the three relevant to-be-deleted codes are 37206 (percutaneous transcatheter stent placement, additional vessel), 37208 (open transcatheter stent placement, additional vessel) and 75960 (radiologic supervision and interpretation code for vascular stent). Since the new code recommendations reflect different RVWs for arterial vs. venous work, a work neutrality analysis is presented at the end of this section.

In considering the work RVU of this service it is also important to note that this code will be co-reported with a catheter placement code (36200, 36215-7, or 36245-7), and the catheter code will be subject to multiple procedure payment reduction. Retaining the separate catheterization code is necessary because these new stent codes will be reported for all remaining arteries and veins in the body after anatomic site-specific codes have been created to specifically report coronary stents, lower extremity stents, extracranial cervical carotid stents, and intracranial stents. Thus, the significant variation in work to reach many different target zones has to be represented by the catheterization code.

### **Methodology**

An invitation to participate in a standard RUC survey for 37237 was sent to random sample of members of the Society for Vascular Surgery (SVS), the Society for Interventional Radiology (SIR), the American College of Radiology (ACR), the American College of Cardiology (ACC) and the Society for Cardiovascular Angiography and Interventions (SCAI) through an email list-service. There were 61 respondents out of 3404 survey requests for a response rate of 1.7%. There was a high degree of concordance among the survey respondents with a very tight distribution of recommendations. 89% of the respondents thought the vignette described the typical patient.

### **Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey value of 4.25 RVU for 37237 which is a ZZZ Global Code.

### **Pre-time**

Our expert panel recommends that 10 minutes of pre-time be added to the ZZZ global package because unlike other stent codes or other ZZZ codes, the patient in 37237 is undergoing additional stent placement in a totally different vessel. In the typical vignette, the initial stent is placed in the patient's superior mesenteric artery, and this requires certain pre-service work. However, additional pre-service work is required for consideration of stenting the celiac, and this is all evaluation time. The celiac must be studied intensively on all pre-operative imaging such as CT scans and MRAs. The length and diameter must be assessed to ensure appropriate balloons and stents are on site. Liver function blood tests must be considered as well as the anatomy of the common hepatic and splenic arteries. There is no denying the fact that this takes a minimum of 10 minutes.

### **Post-time**

Again, unlike an additional stent in a lower extremity artery, stenting a different vessel requires additional post-service consideration. Physical exam must be done to exclude liver or splenic tenderness. Post-procedure liver function blood tests should be assessed if there is any question about adequacy of liver perfusion. The median time estimate for this work was 10 minutes by our survey respondents, and the expert panel cut that in half to 5 minutes.

### **Comparison to Key Reference Code**

#### **Clinical Comparison with Key Reference Code**

The reference code chosen by majority of the survey respondents was 37186 (*Secondary percutaneous transluminal thrombectomy (eg, nonprimary mechanical, snare basket, suction technique), noncoronary, arterial or arterial bypass graft, including fluoroscopic guidance and intraprocedural pharmacological thrombolytic injections, provided in conjunction with another percutaneous intervention other than primary mechanical thrombectomy (List separately in addition to code for primary procedure)*). The key

reference 37186 is a ZZZ global and is similar to 37237 in they are both endovascular procedures performed on various arteries in the body. 37186 was evaluated by the RUC in April 2005.

### Work Comparison with Key References

37237 has a survey median time of 45 minutes compared to 60 minutes for the key reference 37186. Survey respondents rated the intra-service work of 37237 as more intense than the key reference service. The 15 minute difference in intra time x the IWPUT of 0.082 = -1.23 RVUs. 37237 has 15 minutes of combined pre and immediate post-work compared to zero for the key reference. Valued at 0.0224 rvu/min, this represents 0.34 RVUs in the new code above and beyond that in the reference. Thus, to relate the new code to the reference, start with the value of 4.92 for the reference, subtract 1.23 for difference in work and add 0.34 for difference in pre/post. The value comes out to 4.03. Then an additional adjustment must be made for the greater intra-service intensity of the new code over the reference. 45 minutes of intra-time is multiplied by the difference in IWPUT of 0.005, which equals 0.225. When this is added to the previous sum of 4.03, the final relative value is 4.26. This comparison serves to justify our recommendation for the 25<sup>th</sup> percentile survey value of 4.25 for 37236.

	RVW	IWPUT	Total Time	Eval	INTRA	IM-post
<b>37237</b>	4.25	0.087	60	10	45	5
<b>37186</b>	4.92	0.082	60	0	60	0

### Comparison to MPC Code

CPT Code 57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*) is the closest valued MPC code with a ZZZ global. There is no clinical similarity between 37237 and 57267. 37237 has 10 minutes of pre-service evaluation time compared to zero for 57267. This is logical because insertion of mesh during an open surgery case does not require evaluation time, while consideration of stenting a completely different artery such as the celiac absolutely does require pre-service evaluation time. Thus, pre-service comparison favors 37237 in terms of work.

Importantly, intra-service time for 37237 is exactly that of 57267, yet the recommended RVW for 37237 is substantially less than that of the MPC code. Thus, a comparison of 37237 to the closest valued ZZZ MPC service clearly justifies our recommendation for the 25<sup>th</sup> percentile survey value of 4.25 for 37237.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37237</b>	4.25	0.087	60	10	0	0	45	5
<b>57267</b>	4.88	0.108	45	0	0	0	45	0

### Comparison to Another Vascular CPT Code

CPT Code 37223 (*Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*) is another minimally invasive interventional code with a ZZZ global evaluated by the RUC in April 2010, with identical RVWs and intra-service times and nearly identical total times and IWPUT's. This comparison justifies our recommendation for the 25<sup>th</sup> percentile survey value of 4.25 for 37237.

	RVW	IWPUT	Total Time	INTRA
<b>37237</b>	4.25	0.087	60	45
<b>37223</b>	4.25	0.093	47	45

### Work Neutrality Considerations

Since there are two daughter codes (37237 and 37239) it is important to perform an analysis of work neutrality. The parent codes (37206 or 37208 plus 75960) have a combined current work RVU of 4.12 + 0.82 for a total of 4.94. Our recommendations for the daughter codes are 4.25 work RVUs for the additional vessel arterial stent (37237, this SoR) and 3.50 work RVUs for the vein stent

(37239). Thus, the additional vessel artery stent code recommendation is 0.69 RVUs less than current value, while the additional vessel vein stent code recommendation is 1.44 RVUs less than current value, and the net change will inevitably result in a reduction in work RVUs for this family.

Based on review of the diagnosis codes used to report the current code pair of 37206/37208 & 75960 as well as understanding of current day practice, our expert panel estimates that this service is performed 75% of the time in arteries and 25% of the time in veins. Thus, for every 100 procedures with the new codes, 37237 will be reported 75 times, while 37239 will be reported 25 times.

Current work value of 100 services 37206/37208 + 75960 =  $100 \times (4.12 + 0.82) = 494$  RVUs

Proposed work value for 100 daughter services:

Additional Artery stent code 37237 projected frequency  $75 \times 4.25$  RVUs = 318.75 RVUs

Additional Vein stent code 37239 projected frequency  $25 \times 3.50$  RVUs = 87.50 RVUs

Total add-on work for combination of two daughter codes = 406.25 RVUs

Net Reduction in work RVUs for this frequency distribution: -87.75 RVUs for each 100 procedures reported

Percentage reduction in RVUs for this frequency distribution: -17.8%

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code bundles the existing surgical procedure and radiological supervision and interpretation codes into one code as requested by the RUC, based on the 75% screen. Stent insertion can occur in any vessel, both arterial and venous. The work required for endovascular stent insertion will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more vascular catheterization codes in addition to the arterial or venous stent code. This reflects current coding practice and appropriately represents the highly variable work required for stenting of different vessels.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37206 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; each additional vessel (List separately in addition to code for primary procedure) OR 37208 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; each additional vessel (List separately in addition to code for primary procedure)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery

How often? Commonly

Specialty Radiology                      How often? Commonly

Specialty Cardiology                      How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data is not available.

Specialty	Frequency	Percentage	%

-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,217

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Combining 37206 (5,416) and 37208 (207) adds up to 5,623 which will crosswalk to the total number of claims adding 37237 and 37239. It is estimated that 75% of the 5,623 will be captured with 37236.

Specialty	Frequency	Percentage	%

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37223

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 37238      Tracking Number X3      Original Specialty Recommended RVU: **6.29**  
 Presented Recommended RVU: **6.29**  
 Global Period: 000      RUC Recommended RVU: **6.29**

CPT Descriptor: Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed; initial vein

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 64-year-old female on dialysis through a left upper arm brachio-cephalic fistula develops high venous pressures and excessive bleeding after needle removal. Diagnostic imaging demonstrates a stenosis in the left subclavian vein central to the fistula. A subclavian vein stent(s) is placed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 84%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 72%

**Description of Pre-Service Work:**

- The patient's history and pertinent non-invasive diagnostic studies are reviewed, with special attention to associated symptoms as well as co-morbidities that would place the patient at higher risk for open surgical reconstruction.
- Physical exam is reviewed to ensure that the patient has suitable access vessels including relevant arteries, veins or fistula, depending on the required route.
- Medications are reviewed including antiplatelet and anticoagulant agents that the patient is or needs to be taking.
- Pre-procedural laboratory evaluation is reviewed with a focus on coagulation and renal function studies. In a non-ESRD patient with renal insufficiency, attention is given to whether the patient needs and/or has received appropriate renal protective agents and periprocedural hydration.
- Based on this review, the physician estimates the range of equipment including guiding catheters/sheaths, guidewires, selective catheters, balloons, stents, and embolic protection devices that may be required and ensures that all are available for use.
- The imaging suite/hybrid operating room is checked to ensure proper function and configuration of the imaging equipment including compliance with all radiation safety issues as well as proper function of all patient monitoring equipment including ECG and hemodynamic monitors.
- Intravenous access is started and moderate sedation is administered.

**Description of Intra-Service Work:**

Venous access is separately reportable, and the vessel in question has a catheter in place when the work of this service begins.

- \* All steps are performed under fluoroscopic guidance
- \* Moderate sedation is ongoing and adequate monitoring is verified.
- \* Roadmapping images are obtained for vessel sizing, to document anatomy, and assess exact location of stenosis.
- \* Area of stenosis/occlusion is crossed with a guidewire, and a sheath is advanced to or through the lesion.
- \* IV heparin is administered
- \* IV antibiotics are administered as indicated
- \* Sheath exchange if needed for appropriately sized stent
- \* Pre-treat lesion with balloon angioplasty if needed to allow passage of stent delivery system (not separately reportable)
- \* Appropriately sized stent is selected and introduced to the through the sheath
- \* Fluoroscopic guidance and appropriate roadmapping to position stent exactly across the intended treatment zone
- \* Deploy self-expanding or balloon-expandable stent
- \* Seat or fully expand stent with additional ballooning (not separately reportable).
- \* Remove or retract stent delivery system and balloon
- \* Inject contrast to assess adequacy of treatment
- \* Repeat balloon inflations as required, or additional larger diameter balloons as needed for adequate stent expansion.
- \* Multiple segments of disease within the same vessel are treated with appropriate-sized stents (not separately reportable).
- \* Inject contrast for completion images, document absence of extravasation or embolization
- \* Remove sheath
- \* Achieve hemostasis with manual compression, closure device, or standard surgical closure of the venotomy

#### Description of Post-Service Work:

- Apply sterile dressings
- Assist team in moving patient to stretcher and transporting to recovery area
- Ensure BP and heart rate are normal & stable upon arrival to recovery area
- \* Discuss post-procedure care with recovery area staff
- Write postop orders
- Communicate with family and referring physicians
- Review results of procedure with patient once sedation wears off
- Review and interpret all images
- Post-process radiologic images and archive for permanent record
- Review and record patient fluoroscopic exposure time and contrast volume
- Dictate procedure note including interpretation of diagnostic and therapeutic imaging
- Review, revise, and sign final report
- Send final report to PCP and any other referring providers

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Why is this code being reviewed?**

Four interventional codes (37205-8) and one radiological supervision and interpretation code (75960) were identified in a screen for codes reported >75% together because they form a logical component coding pairs (37205+75960, 37206+75960, 37207+75960 and 37208+75960). Each code pair includes one vascular stent deployment and one radiological S&I code. All five of these codes will be deleted in 2014. In their place, four new CPT codes will be created that bundle the procedure with the S&I.

Codes to be deleted relevant to this SoR include percutaneous approach to an initial artery or vein (37205), open approach to an initial artery or vein (37207); and the S&I (75960). Because current interventionalists believe there is a difference in work depending on whether the procedure is done in an artery or a vein, the new codes are broken out with one code representing arterial stenting and another representing vein stenting. In each case, the radiological S&I is bundled into the procedure code.

For 37238, the three relevant to-be-deleted codes are 37205 (percutaneous transcatheter stent placement, initial vessel), 37207 (open transcatheter stent placement, initial vessel) and 75960 (radiologic supervision and interpretation code for vascular stent). Since the new code recommendations reflect different RVWs for arterial vs. venous work, a work neutrality analysis is presented at the end of this section.

In considering the work RVU of this service it is also important to note that this code will be co-reported with a catheter placement code (36010-36012). These code pairs will be subject to multiple procedure payment reduction. Retaining the separate catheterization code is necessary because these new stent codes will be reported for all remaining arteries and veins in the body after anatomic site-specific codes have been created to specifically report coronary stents, lower extremity stents, extracranial cervical carotid stents, and intracranial stents. Thus, the significant variation in work to reach many different target zones has to be represented by the catheterization code.

### **Methodology**

An invitation to participate in a standard RUC survey for 37238 was sent to random sample of members of the Society for Vascular Surgery (SVS), the Society for Interventional Radiology (SIR), the American College of Radiology (ACR), the American College of Cardiology (ACC) and the Society for Cardiovascular Angiography and Interventions (SCAI) through an email list-service. There were 75 respondents out of 3404 survey requests for a response rate of 2.2%. There was a high degree of concordance among the survey respondents with a very tight distribution of recommendations. 88% of the respondents thought the vignette described the typical patient.

### **Work RVU Recommendation**

We are recommending the value of 6.29 RVU for 37238 based on a direct crosswalk to CPT Code 36247. We make this recommendation because compared to other recommended RVWs in this family of codes, we believe the median value of 8.00 would create rank order anomaly on the high side, while the 25<sup>th</sup> percentile value of 6.00 would create a rank order anomaly on the low side. The RUC-assessed code 36247 has the exact time inputs and accurate intensity inputs to serve as a crosswalk for 37238.

	RVW	IWP/UT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37238</b>	6.29	0.080	131	33	3	5	60	30
<b>36247</b>	6.29	0.080	131	33	3	5	60	30

### **Pre-time**

Our expert panel recommends that pre-time package 2b (facility- difficult patient/straightforward procedure with sedation / anesthesia) is appropriate, with 2 additional minutes for positioning:

Evaluation: Survey respondents indicated a median evaluation time of 60 minutes to review multiple pre-operative tests, consultations and images for responsible pre-operative planning. The society expert panel recommends accepting the package 2b evaluation time of 33 minutes.

Positioning: Package 2b positioning time is 1 minute. An additional 2 minutes (total=3) of pre-service positioning time for 37238 is recommended to assist with adjusting the imaging table and anesthesia lines for appropriate positioning in order to be able to obtain all appropriately necessary views required for the intervention.

Scrub, dress & wait: The society expert panel recommends accepting the pre-time 2b package evaluation time of 5 minutes.

## **Comparison to Key Reference Code**

### **Clinical Comparison with Key Reference Code**

The reference code chosen by majority of the survey respondents was 37187 (*Percutaneous transluminal mechanical thrombectomy, vein(s), including intraprocedural pharmacological thrombolytic injections and fluoroscopic guidance*). The key reference 37187 has a 000 day global, and is similar to 37238 in they are both endovascular procedures performed on similar veins. 37187 was evaluated by the RUC in April 2005.

### **Work Comparison with Key References**

37238 has 7 more minutes of pre-service evaluation time, 2 less minutes of positioning time, 4 less minutes of scrub, dress, and wait time, and 10 more minutes of immediate post-service time. This difference can be accounted for by adding a net 15 minutes at 0.0224 RVUs (Eval, posit, post) and subtracting 4 minutes at 0.0081 RVUs (SDW) or 0.34 – 0.03 for a total increment of 0.31 RVUs more than the reference service. The new code has an intra-service survey time of 60 minutes while 37187 has 85 minutes of intra time. Both codes have the identical IWPUT. The 25 minute difference in intra time x the IWPUT of 0.080 = 2.00 RVUs less than the Key Reference. Thus, starting with the Key Reference RVW of 8.03 and adding 0.31 for the pre and post difference, while subtracting 2.00 for the intra-service difference results in an estimated work value of 6.34. This comparison strongly justifies our recommendation for the value of 6.29 for 37238.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37238</b>	6.29	0.080	131	33	3	5	60	30
<b>37187</b>	8.03	0.080	145	26	5	9	85	20

## **Comparison to MPC Code**

CPT Code 15004 (*Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet and/or multiple digits; first 100 sq cm or 1% of body area of infants and children*) is the closest valued MPC code with a 000 day global. There is no clinical similarity between 37238 and 15004. There is no way to perform a valid pre-service comparison between 37238 and 15004 because 15004 was evaluated by the RUC in 2006, and that was before implementation of the RUC pre-service time packages. The only way to compare pre-time between these codes is to look at survey times, and in that analysis our new code has a total of 90 minutes of pre-service survey time which would compare to 75 minutes surveyed for 15004. This analysis favors 37238 in terms of pre-service work.

More importantly, intra-service time for 37238 is 33% greater than 15004, and the recommended RVW for 37238 is 37% greater than the MPC code. Given more pre and post work for 37238, this primarily time-based comparison to the closest valued MPC service justifies our recommendation of 6.29 work RVUs for 37238.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37238</b>	6.29	0.080	131	33	3	5	60	30
<b>15004</b>	4.58	0.054	150	45*	15*	15*	45	30

Please note that pre-times for 15004 are asterisked\* because they were assigned prior to implementation of RUC pre-time packages.

## **Comparison to two vascular CPT Codes Representing Similar Work**

CPT Code 36247 (*Selective catheter placement, arterial system; initial third order or more selective abdominal, pelvic, or lower extremity artery branch, within a vascular family*) is an endovascular code with a 000 day global evaluated by the RUC in February 2011, and is presented as a cross walk to recommend the value of 6.29 for 37238.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37238</b>	6.29	0.080	131	33	3	5	60	30
<b>36247</b>	6.29	0.080	131	33	3	5	60	30

CPT Code 37197 (*Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed*) is another endovascular code with a 000 day global, evaluated by the RUC in September 2011, with intra time identical to 36247. These comparisons also justify our recommendation of 6.29 work RVUs for 37238.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37238</b>	6.29	0.080	131	33	3	5	60	30
<b>37197</b>	6.29	0.083	140	40	10	10	60	20

### Work Neutrality Considerations

Since there are two daughter codes (37236 and 37238) it is important to perform an analysis of work neutrality. The parent codes (37205 or 37207 plus 75960) have a combined current work RVU of  $8.27 + 0.82$  for a total of 9.09. Our recommendations for the daughter codes are 9.00 work RVUs for the arterial stent (37236) and 6.29 work RVUs for the vein stent (37238-this SoR). Thus, the artery stent code recommendation is 0.09 RVUs less than current value, while the vein stent code recommendation is 2.80 RVUs less than current value, and the net change will inevitably result in a work RVU reduction for this family.

Based on review of the diagnosis codes used to report the current code pair of 37205/37207 & 75960 as well as understanding of current day practice, our expert panel estimates that this service is performed 75% of the time in arteries and 25% of the time in veins. Thus, for every 100 procedures with the new codes, 37236 will be reported 75 times, while 37238 will be reported 25 times.

Current work value of 100 services  $37205/37207 + 75960 = 100 \times (8.27 + 0.82) = 909$  RVUs

Proposed work value for 100 daughter services:

Artery stent code 37236 projected frequency  $75 \times 9.00$  RVUs = 675 RVUs  
 Vein stent code 37238 projected frequency  $25 \times 6.29$  RVUs = 157 RVUs  
 Total add-on work for combination of two daughter codes = 832 RVUs

Net Reduction in work RVUs for this frequency distribution -77.00 RVUs for each 100 procedures reported  
 Percentage reduction in RVUs for this frequency distribution -8.5%

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code bundles the existing surgical procedure and radiological supervision and interpretation codes into one code as requested by the RUC, based on the 75% screen. Stent insertion can occur in any vessel, both arterial and venous. The work required for endovascular stent insertion will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more

vascular catheterization codes in addition to the arterial or venous stent code. This reflects current coding practice and appropriately represents the highly variable work required for stenting of different vessels.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37205 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; initial vessel OR 37207 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; initial vessel

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Vascular Surgery                      How often? Commonly

Specialty Radiology                              How often? Commonly

Specialty Cardiology                            How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National data not available

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

13,270 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Combining 37205 (51,400) and 37207 (1,640) adds up to 53,080 which will crosswalk to the total number of claims adding 37236 and 37238. It is estimated that 75% of the 53,080 will be captured with 37236 and 25% with 37238.

Specialty	Frequency	Percentage	%

Do many physicians perform this service across the United States?

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 36247

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 37239      Tracking Number   X4      Original Specialty Recommended RVU: **3.50**  
 Presented Recommended RVU: **3.34**  
 Global Period: ZZZ      RUC Recommended RVU: **3.34**

CPT Descriptor: Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological and supervision and interpretation and including all angioplasty within the same vessel, when performed; each additional vein

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 64-year-old female on dialysis through a left upper arm brachio-cephalic fistula develops high venous pressures and excessive bleeding after needle removal. Diagnostic imaging demonstrates a stenosis in the both the outflow brachial vein and the innominate vein central to the fistula. After deployment of a brachial vein stent (reported separately), an additional stent(s) is placed in the innominate vein.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 94%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work: This is a zzz add-on code, so much of the pre-service work lies with the primary service code. Nevertheless, the typical patient for this service has two vessels that are stenotic compared to only one stenotic vessel in the patient who does not require this add-on service. The pre-service work includes pre-operative estimate of stent diameter and length of the second site to ensure appropriately sized stents and balloons are on site. Additional technical considerations also focus on whether a larger diameter or longer introducer sheath will be required to deploy a stent in the second site. This is certainly the case with the vignette patient in whom a larger diameter central vein deep in the chest will be treated. Finally, technical considerations of patient positioning and imaging angles must be considered during the pre-service period as there are clearly additional challenges to setting up the table and imaging equipment to adequately visualize a secondary vein that may lie deep in the chest when the initially treated vein lies in the arm, leg or different part of the body.

### Description of Intra-Service Work:

Venous access is separately reported and the target vessel has a catheter in place when the work of this service begins.

- \* All steps are performed under fluoroscopic guidance
- \* Conscious sedation is ongoing and adequate monitoring is verified
- \* Adequacy of heparinization is assessed with additional doses administered as required
- \* Inject contrast to localize stenosis and allow measurements for appropriate stent diameter and length
- \* Depending on required stent, guiding sheath may need to be exchanged for a larger caliber
- \* Cross lesion with hydrophilic guidewire and advance low profile catheter through the stenosis

- \* Exchange hydrophilic guidewire for more rigid guidewire needed to support balloons and stents, as required
- \* Pre-dilate stenosis with a low profile angioplasty balloon if required (not separately reportable)
- \* Remove balloon and advance balloon-expandable or self-expanding stent across the target stenosis
- \* Recheck position and deploy stent
- \* Remove stent catheter
- \* Inject contrast to image lesion and determine if post dilation is necessary
- \* Post-dilate as indicated with an appropriately sized angioplasty balloon (not separately reportable)
- \* Exchange balloon catheter for larger diameter balloon if required (not separately reportable)
- \* Re-image and re-dilate as many times as necessary to fully seat and expand stent (not separately reportable)
- \* Remove balloon catheter & perform final contrast injections to assess success and exclude extravasation
- \* Remove all delivery catheters and secure hemostasis with manual compression

Description of Post-Service Work:

- Additional postservice work over and above that already provided for the primary procedure includes time to review extra films as well as dictate extra procedural details into the interpretation
- Patients with more than one treatment site require longer discussion and explanation with the patient and family
- In patients with multiple treatment areas and multiple access sites, more attention needs to be paid to evaluation of procedural success and assessment for access site complications.

## **Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Why is this code being reviewed?**

Four interventional codes (37205-8) and one radiological supervision and interpretation code (75960) were identified in a screen for codes reported >75% together because they form a logical component coding pairs (37205+75960, 37206+75960, 37207+75960 and 37208+75960). Each code pair includes one vascular stent deployment and one radiological S&I code. All five of these codes will be deleted in 2014. In their place, four new CPT codes will be created that bundle the procedure with the S&I.

Codes to be deleted relevant to this SoR include percutaneous approach to an additional artery or vein (37206), open approach to an additional artery or vein (37208); and the S&I (75960). Because current interventionalists believe there is a difference in work depending on whether the procedure is done in an artery or a vein, the new codes are broken out with a code representing arterial stenting and another representing vein stenting. In each case, the radiological S&I is bundled into the procedure code.

For 37239, the three relevant to-be-deleted codes are 37206 (percutaneous transcatheter stent placement, additional vessel), 37208 (open transcatheter stent placement, additional vessel) and 75960 (radiologic supervision and interpretation code for vascular stent). Since the new code recommendations reflect different RVWs for arterial vs. venous work, a work neutrality analysis is presented at the end of this section.

In considering the work RVU of this service it is also important to note that this code will be co-reported with a catheter placement code (36010-36012), and the catheter code will be subject to multiple procedure payment reduction. Retaining the separate catheterization code is necessary because these new stent codes will be reported for all remaining arteries and veins in the body after anatomic site-specific codes have been created to specifically report coronary stents, lower extremity stents, extracranial cervical carotid stents, and intracranial stents. Thus, the significant variation in work to reach many different target zones has to be represented by the catheterization code.

### **Methodology**

An invitation to participate in a standard RUC survey for 37239 was sent to random sample of members of the Society for Vascular Surgery (SVS), the Society for Interventional Radiology (SIR), the American College of Radiology (ACR), the American College of Cardiology (ACC) and the Society for Cardiovascular Angiography and Interventions (SCAI) through an email list-service. There were 61 respondents out of 3404 survey requests for a response rate of 1.7%. There was a high degree of concordance among the survey respondents with a very tight distribution of recommendations. 92% of the respondents thought the vignette described the typical patient.

### **Work RVU Recommendation**

We are recommending the 25<sup>th</sup> percentile survey value of 3.50 RVU for 37239 which is a ZZZ Global Code.

### **Pre-time**

Our expert panel recommends that 10 minutes of pre-time be added to the ZZZ global package because unlike other stent codes or other ZZZ codes, the patient in 37239 is undergoing additional stent placement in a totally different vessel. In the typical vignette, the initial stent is placed in the patient's brachial vein, and this requires certain pre-service work. However, additional pre-service work is required for consideration of stenting the innominate vein, which is the additional vessel, and this is all evaluation time. The innominate must be studied intensively on all pre-operative imaging such as CT scans and MRVs. The length and diameter of the stenosis must be assessed pre-operatively to ensure appropriate balloons and stents are on site. Planning must be undertaken to ensure the imaging equipment will be adjustable to the correct cranial-caudal and laterally oblique angles required for the innominate. There is no denying the fact that this takes a minimum of 10 minutes.

### **Post-time**

Again, unlike an additional stent in a lower extremity artery or elsewhere, stenting a different venous vessel requires additional post-service consideration. Physical exam must be done to exclude post-operative problems. The median time estimate for this work was 10 minutes by our survey respondents, and the expert panel cut that in half to 5 minutes.

## **Comparison to Key Reference Code**

### **Comparison with Key Reference Code**

37239 has a survey median total time of 45 minutes and 37185 has 40 minutes of total time. Survey respondents rated the intra-service work of 37239 as slightly less intense than the key reference service. This comparison justifies our recommendation for the 25<sup>th</sup> percentile survey value of 3.50 for 37239.

	RVW	IWPUT	Total Time	INTRA
<b>37239</b>	3.50	0.105	45	30
<b>37185</b>	3.28	0.082	40	40

### **Comparison to Another Vascular CPT Code**

CPT Code 37223 (*Revascularization, endovascular, open or percutaneous, iliac artery, each additional ipsilateral iliac vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed (List separately in addition to code for primary procedure)*) is another minimally invasive interventional code with a zzz day global evaluated by the RUC in April 2010, with a slightly higher RVW but similar total-service time. This comparison justifies our recommendation for the 25<sup>th</sup> percentile survey value of 3.50 for 37239.

	RVW	IWPUT	Total Time	INTRA
<b>37239</b>	3.50	0.105	45	30
<b>37223</b>	4.25	0.093	47	45

### **Comparison to MPC Code**

CPT Code 57267 (*Insertion of mesh or other prosthesis for repair of pelvic floor defect, each site (anterior, posterior compartment), vaginal approach (List separately in addition to code for primary procedure)*) is the closest valued MPC code with a ZZZ global. There is no clinical similarity between 37239 and 57267. 37239 has 10 minutes of pre-service evaluation time compared to zero for 57267. This is logical because insertion of mesh during an open surgery case does not require evaluation time, while consideration of stenting a completely different artery such as the celiac absolutely does require pre-service evaluation time. Thus, pre-service comparison favors 37239 in terms of work.

Importantly, IWPUT for 37239 is almost exactly that of 57267, yet the recommended RVW for 37239 is substantially less than that of the MPC code. A potential RVW for 37239 can be estimated from 57267 by subtracting 15 minutes of intra-time at an IWPUT of 0.108 ( $15 \times 0.108 = 1.62$ ) and adding 15 minutes of pre and post time ( $15 \times 0.0224 = 0.34$ ) resulting in a RVW of 3.6 ( $4.88 - 1.62 + 0.34$ ). Thus, a comparison of 37239 to the closest valued ZZZ MPC service clearly justifies our recommendation for the 25<sup>th</sup> percentile survey value of 3.5 for 37239.

	RVW	IWPUT	Total Time	Eval	Posit	SDW	INTRA	IM-post
<b>37239</b>	3.50	0.105	45	10	0	0	30	5
<b>57267</b>	4.88	0.108	45	0	0	0	45	0

### **Work Neutrality Considerations**

Since there are two daughter codes (37237 and 37239) it is important to perform an analysis of work neutrality. The parent codes (37206 or 37208 plus 75960) have a combined current work RVU of  $4.12 + 0.82$  for a total of 4.94. Our recommendations for the daughter codes are 4.25 work RVUs for the additional vessel arterial stent (37237) and 3.50 work RVUs for the vein stent (37239, this SoR). Thus, the additional vessel artery stent code recommendation is 0.69 RVUs less than current value, while the additional vessel vein stent code recommendation is 1.44 RVUs less than current value, and the net change will inevitably result in a reduction in work RVUs for this family.

Based on review of the diagnosis codes used to report the current code pair of 37206/37208 & 75960 as well as understanding of current day practice, our expert panel estimates that this service is performed 75% of the time in arteries and 25% of the time in veins. Thus, for every 100 procedures with the new codes, 372X6 will be reported 75 times, while 37239 will be reported 25 times.

Current work value of 100 services  $37206/37208 + 75960 = 100 \times (4.12 + 0.82) = 494$  RVUs

Proposed work value for 100 daughter services:

Additional Artery stent code 37237 projected frequency  $75 \times 4.25$  RVUs = 318.75 RVUs

Additional Vein stent code 37239 projected frequency  $25 \times 3.50$  RVUs = 87.50 RVUs

Total add-on work for combination of two daughter codes =

406.25 RVUs

Net Reduction in work RVUs for this frequency distribution:

-87.75 RVUs for each 100 procedures reported

Percentage reduction in RVUs for this frequency distribution:

-17.8%

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This code bundles the existing surgical procedure and radiological supervision and interpretation codes into one code as requested by the RUC, based on the 75% screen. Stent insertion can occur in any vessel, both arterial and venous. The work required for endovascular stent insertion will depend on the specific vessel that needs to be catheterized. Therefore, it is expected that coding for the procedure will include one or more vascular catheterization codes in addition to the arterial or venous stent code. This reflects current coding practice and appropriately represents the highly variable work required for stenting of different vessels.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 37206 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac, and lower extremity arteries), percutaneous; each additional vessel (List separately in addition to code for primary procedure) OR 37208 Transcatheter placement of an intravascular stent(s) (except coronary, carotid, vertebral, iliac and lower extremity arteries), open; each additional vessel (List separately in addition to code for primary procedure)

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

**Meeting Date:** April 2013

**CPT Long Descriptor:**

*Transcatheter placement of an intravascular stent(s) (except lower extremity, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed;*

37236 initial artery (000)

+37237 each additional artery (ZZZ)

(List separately in addition to code for primary procedure)

*Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed;*

37238 initial vein (000)

+37239 each additional vein (ZZZ)

(List separately in addition to code for primary procedure)

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The multispecialty organizations (SIR, ACR, SVS, ACC and SCAI) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this procedure. The panel made recommendations based on existing inputs and the new coding conventions.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

The new surveyed codes are the result of a bundling screen. As such, we have included columns with the existing inputs for reference. In addition to including the exiting inputs for 37205-8 and 75960, we included the inputs for CPT code 37224. This procedure has a similar process of care and was recently reviewed by the PE Subcommittee. It is typical that a needle/catheter code would be performed along with these new CPT codes. There is no particular needle/catheter code that appears in the billed together data as 'typical'. Therefore, we have included the direct practice expense inputs for CPT Code 36147, which has the highest billed together frequency.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

Pre Service Period

We are requesting pre service clinical time for these 000 services. The physician typically uses his/her own clinical staff to complete pre-service diagnostic/referral forms and to work with the insurance companies/radiation oncology benefits manager. They ensure all pre authorization forms are completed and forward approved forms to the appropriate personnel. Their clinical staff works with the facility to ensure that the facility is available as well as all the necessary supplies.

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

We are requesting pre service clinical time for these 000 service. (See Question #3)

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

A clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. The clinical staff contacts the facility to make sure appropriate time for the room is available as well as all the supplies, which will be required for the scheduled procedure.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

N/A.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**Meeting Date:** April 2013

**CPT Long Descriptor:**

*Transcatheter placement of an intravascular stent(s) (except lower extremity, cervical carotid, extracranial vertebral or intrathoracic carotid, intracranial, or coronary), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed;*

37236 initial artery (000)

+37237 each additional artery (ZZZ)

(List separately in addition to code for primary procedure)

*Transcatheter placement of an intravascular stent(s), open or percutaneous, including radiological supervision and interpretation and including all angioplasty within the same vessel, when performed;*

37238 initial vein (000)

+37239 each additional vein (ZZZ)

(List separately in addition to code for primary procedure)

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The multispecialty organizations (SIR, ACR, SVS, ACC and SCAI) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this procedure. The panel made recommendations based on existing inputs and the new coding conventions.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

The new surveyed codes are the result of a bundling screen. As such, we have included columns with the existing inputs for reference. In addition to including the exiting inputs for 37205-8 and 75960, we included the inputs for CPT code 37224. This procedure has a similar process of care and was recently reviewed by the PE Subcommittee. It is typical that a needle/catheter code would be performed along with these new CPT codes. There is no particular needle/catheter code that appears in the billed together data as 'typical'. Therefore, we have included the direct practice expense inputs for CPT Code 36147, which has the highest billed together frequency.

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

Pre Service Period

*Complete pre-service diagnostic and referral forms:*

A clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure.

*Coordinate pre-surgery services:*

Clinical staff member ensures that all appropriate labs (CBC, CHEM7, etc.) are drawn and results are acceptable.

*Follow-up phone calls and prescriptions:*

Clinical staff will contact the patient prior to the procedure to ensure that they will be NPO, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed, such as medication for contrast allergy or poor renal function.

Service Period

*Prepare Room, Equipment, Supplies*

Interventional technologist checks imaging equipment to make sure that it is turned on, warmed up, functioning properly, enters the patient demographics, opens the sterile tray and sets it up, goes to the storage room to pull all the supplies that will be used for the procedure, and brings them to the procedure room. The standard for prepare room is 2 minutes and the standard for prepare scope is 5 minutes. We are essentially accepting two standards on one line. We are 'preparing imaging equipment' as the second part of the prepare room, equipment and supplies line.

*Prepare and Position Patient*

Once the patient is brought into the procedure room, time is taken to ensure appropriate position of the patient on the procedure table. Care is taken to ensure the patient's comfort as they will be required to remain still for a long period of time. As well as time is taken to ensure an unobstructed the field of view over the targeted areas of interest; this involves making sure that nursing monitoring and other equipment that could obstruct the images is clear. The area around the angiographic imaging equipment is clear to allow for manipulation of the equipment throughout the procedure. These activities take more than the standard of 2 minutes.

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

The procedures described by the new coding convention were previously reported with CPT codes 37205-8. CPT codes 37205 & 6 are currently priced in the office setting. CPT codes 37207 & 8 are not currently priced in the office setting. We are requesting that all four of these new codes be priced in the office.

Upon review of the existing direct practice expense inputs we determined that many of the standard clinical activities did not have time included. As this code will be the 'base' code when performed, it is essential that this procedure include all typical clinical activities. The needle/catheter code will be subject to the multiple surgical reductions.

In addition, we are recommending adding conscious sedation inputs to these procedures.

#### Increase In Current Clinical Staff Time

##### *Vitals*

Blood pressure, heart rate, respiratory rate, temperature, rhythm strip and pulse oximetry, are all obtained.

##### *Pre service Education*

The clinical staff educates the patient regarding the procedure, what to expect in the procedure room, reviews the risk of contrast and radiation, and obtains consent for the above.

##### *Sedate*

*The RN administers moderate sedation.*

##### *Addition of Clinical Staff*

The existing inputs currently have a scrubbed in angio tech to assist the physician at 100% of the physician work time. We are recommending conscious sedation for these procedures as such we are recommending the addition of an RN for 100% of the physician work time. Finally we are requesting an additional individual who is not scrubbed will assist with the imaging equipment and opening supplies. This is the current standard for endovascular procedures performed in an angio suite. This is the blended person, which per prior discussions has been 75% angio tech, 25% of other clinical staff (therefore there are 3 FTEs present during the entire procedure.)

##### *Monitor*

We are recommending four hours of post procedure monitoring for 37236 (artery) and three hours of post procedure monitoring for 37238 (vein).

##### *Check Dressing/Wound Care Instructions/Coordinate Office Visits/Prescriptions*

In addition to checking the dressings and reviewing at home instructions the clinical staff will also obtain pain prescriptions for the patients and review the medications with them.

##### *Post Procedure Image Processing*

The angiography tech post procedure annotates the images, processes them, and then either hangs the films for interpretation or sends digital images to PACS and ensures they are received.

Increase In Current Supplies

We are making recommendations to modify the clinical supplies for these new codes. Many of the supplies included in the existing inputs remain unchanged (Lines 88-99). We have deleted some of the existing inputs (Lines 102-103).

We are recommending **adding** the following items (Line 68-85):

- Expandable Stent (***Invoice Included***)  
Balloon expandable rigid stent is required to restore patency to the firm plaque filled vessel.
- Micro Catheter  
Small diameter catheter is used to cross the lesion with a soft wire. The soft wire is then exchanged through the micro catheter for a stiffer support wire. (37236)
- PTA Balloon & Inflation Device
  - An additional non-complaint balloon is required to fully dilate the stent at the site of the narrowing.
  - An inflation device is required to inflate the balloons at high pressure to fully deploy or post
- Guidewires
  - The hydrophilic wire is necessary to select the origin of the target vessel (37236 and 37238)
  - A stiffer small vessel wire is required to support the rigid stent as it crosses the tight stenosis.
- Introducer Sheath  
A longer, supporting sheath is required maintain stability of the working system while carefully passing the stent into the artery.
- Sterile Radio-opaque ruler  
A sterile ruler is required to accurately determine size of the target vessel so that correct size stents, PTA balloons, (or embolic) are chosen.
- Moderate Sedation  
We are recommending the standard conscious sedation supply inputs.

Upon review of the existing supplies we determined that many of the necessary supplies were not included in CPT code 37205. As this code will be the 'base' code when performed, it is essential that this procedure include all typical/necessary supplies. The access code will be subject to the multiple surgical reductions and account for any possible overlap:

- Minimum multi-specialty visit pack
- Tray, shave prep
- Drapes
- Closed flush system
- Syringe w-needle

- Blade
- Sponge tipped applicator
- Gauze
- Steri-strip
- Tape
- Lidocaine & Betadine
- XRay ID card and envelope
- AccuStick system
- Gowns, masks, caps and shoe covers
- Disinfectant and sodium chloride
- Underpad

#### Increase In Equipment

We are recommending adding the standard conscious sedation equipment items.

We are also including time for patient recovery on a stretcher. We recognize that a ‘stretcher’ is not an approved conscious sedation standard. However, the patient needs a stretcher/table in the recovery period. We are looking for feedback from the PE subcommittee and/or CMS regarding patient recovery stretchers/tables.

#### **5. Please describe in detail the clinical activities of your staff:**

##### Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms: a clinically trained individual (RN/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. Coordinate pre-surgery services: Clinical staff member ensures that all appropriate labs (CBC, CHEM7, etc.) are drawn and results are acceptable. Follow-up phone calls and prescriptions: Clinical staff will contact the patient prior to the procedure to ensure that they will be NPO, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed, such as medication for contrast allergy or poor renal function. Other clinical activities: The angiography technologist prior to the patient’s arrival will retrieve any prior imaging exams, hang or display these exams for the physician to review, verify orders, review the chart to incorporate any relative clinical information and confirm contrast protocol.

##### Intra-Service Clinical Labor Activities:

Greet patient, provide gowning, and ensure appropriate medical records are available: Patient is greeted by the clinical staff, escorted to the intake area, provided with gowning and given assistance with changing into the gown if needed. Obtain vital signs: blood pressure, heart rate, respiratory rate, temperature, rhythm strip and pulse oximetry, are all obtained. Provide pre-service education/obtain consent: the clinical staff educates the patient regarding the procedure, what to expect in the procedure room, reviews the risk of contrast and radiation, and obtains consent for the above. Prepare room, equipment, supplies: Interventional technologist checks imaging equipment to make sure that it is turned on, warmed up, functioning properly, enters the patient demographics, opens the sterile tray and sets it up, goes to the storage room to pull all the supplies that will be used for the procedure,

and brings them to the procedure room. Prepare and position patient/Monitor patient/Setup IV. Intra-service Time of varying clinical personnel: there is a RN that is present with the patient the entire time to monitoring for sedation, an angio tech is scrubbed next to the physician the entire case, an additional 3<sup>rd</sup> individual who is not scrubbed will assist with the imaging equipment and opening supplies. Monitor patient following service/Check tubes, monitors, drains. The standard recommendation of CMS is that patients are recovered at a ratio of 1 nurse for 4 patients. Check dressings and wound/home care instructions/coordinated office visits/prescriptions. In addition to checking the dressings and reviewing at home instructions the clinical staff will also discuss pain prescriptions for the patients and review the medications with them. Other clinical activities: The angiography tech post procedure annotates the images, processes them, and then either hangs the films for interpretation or sends digital images to PACS and ensures they are received.

Post-Service Clinical Labor Activities:

Conducts phone calls/call in prescription: the clinical staff calls the patient the day after the procedure to make sure that there are no complications, answers any questions, ensures that pain control is adequate, and calls in additional prescriptions if needed.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*Codes Reported Together 75% or More Screen*

April 2013

**Embolization and Occlusion Procedures**

CPT code 37204 *Transcatheter occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method, non-central nervous system, non-head or neck* was identified through the Codes Reported Together 75% or More screen. In April 2010, the RUC accepted the specialties' recommendation to submit a code change proposal that would address any duplication when these services are reported together on the same date by the same physician. In February 2013, the CPT Editorial Panel deleted 37204 *Transcatheter occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method, non-central nervous system, non head or neck* and 37210 *Uterine fibroid embolization (UFE, embolization of the uterine arteries to treat uterine fibroids, leiomyomata), percutaneous approach inclusive of vascular access, vessel selection, embolization, and all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the procedure* and established four bundled codes to report embolization and occlusion procedures.

**37241 *Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; venous, other than hemorrhage (eg, congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)*** The RUC reviewed the survey results from 75 vascular surgeons and radiologists and agreed that a work RVU of 9.00, the survey 25<sup>th</sup> percentile is appropriate, setting a proper base for this family of services. There was consensus among the RUC that the following physician time components are appropriate: pre-time of 27 minutes, intra service time of 90 minutes and post service time of 30 minutes. Furthermore, the RUC agreed that an additional 2 minutes of pre-time is appropriate to account for positioning of the patient on the angiographic table, as well as optimizing EKG monitoring lead placement to avoid obscuring imaging during embolization. The RUC compared 37241 to key reference code 37182 *Insertion of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract formation/dilatation, stent placement and all associated imaging guidance and documentation)*(work RVU=16.97) and agreed that the time and intensity of 37182 is greater. The RUC also reviewed CPT code 37211 *Transcatheter therapy, arterial infusion for thrombolysis other than coronary, any method, including radiological supervision and interpretation, initial treatment day* (work RVU=8.00) and determined that since 37241 requires more physician work and intensity it should be valued higher. **The RUC recommends a work RVU of 9.00 for CPT code 37241.**

***37242 Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms)***

The RUC reviewed the survey results from 59 vascular surgeons and radiologists for CPT code 37242 and agreed that a direct crosswalk to CPT code 34833 *Open iliac artery exposure with creation of conduit for delivery of aortic or iliac endovascular prosthesis, by abdominal or retroperitoneal incision, unilateral* (work RVU= 11.98 and 100 minutes intra-service time) is appropriate. Both services have identical intra times and should have identical values. There was consensus among the RUC that the following physician time components are appropriate: pre-time of 41 minutes, intra service time of 100 minutes and post service time of 30 minutes. Furthermore, the RUC agreed that an additional 2 minutes of pre-time is appropriate to account for positioning of the patient on the angiographic table, as well as optimizing EKG monitoring lead placement to avoid obscuring imaging during embolization. To validate this value, the Committee reviewed CPT codes 61640 *Balloon dilatation of intracranial vasospasm, percutaneous; initial vessel* (work RVU= 12.32, and 90 minutes intra-service time/) and 37228 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with transluminal angioplasty* (work RVU= 11.00, and 90 minutes intra-service time) and noted that while catheterization is included in both these reference codes, the resulting values provide an adequate level of relativity across similar services. **The RUC recommends a work RVU of 11.98 for CPT code 37242.**

***37243 Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for tumors, organ ischemia, or infarction***

The RUC reviewed survey results from 62 vascular surgeons and radiologists and compared the intra-service times from 37243, 120 minutes, to 37244, 90 minutes. The RUC noted that 37244 is a more intense procedure. CPT code 37244 typically describes a hemorrhaging patient after trauma, in which the patient must be treated expeditiously to prevent exsanguination. Therefore, the intra-service time is less, but the service is much more intense. Therefore, a work RVU of 14.00 is appropriate for CPT code 37243, given the intensity difference. There was consensus among the RUC that the following physician time components are appropriate: pre-time of 41 minutes, intra service time of 120 minutes and post service time of 45 minutes. Furthermore, the RUC agreed that an additional 2 minutes of pre-time is appropriate to account for positioning of the patient on the angiographic table, as well as optimizing EKG monitoring lead placement to avoid obscuring imaging during embolization. To validate a work RVU of 14.00, the RUC reviewed CPT code 11005 *Debridement of skin, subcutaneous tissue, muscle and fascia for necrotizing soft tissue infection; abdominal wall, with or without fascial closure* (work RVU= 14.24 and intra-service time of 120 minutes) and agreed that the recommendation is relative to other services. **The RUC recommends a work RVU of 14.00 for CPT code 37243.**

***37244 Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for arterial or venous hemorrhage or lymphatic extravasation***

The Committee reviewed the survey data for CPT code 37244 and agreed that the survey 25<sup>th</sup> percentile work RVU of 14.00 accurately values this service. While the intra-service time of 90 minutes, is lower than some of the other codes in this family, this is the most intense procedure in the family. CPT code 37244 typically describes a hemorrhaging patient after trauma, in which the patient must be treated expeditiously to prevent exsanguination. Therefore, the intra-service time is less, but the service is much more intense. There was consensus among the RUC that the following physician time components are appropriate: pre-time of 41 minutes, intra service time of 90 minutes and post service time of 45 minutes. Furthermore, the RUC agreed that an additional 2 minutes of pre-time is appropriate to account for positioning of the patient on the angiographic table, as well as optimizing EKG monitoring lead placement to avoid obscuring imaging during embolization. To validate this value, the Committee reviewed CPT code 37229 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU= 14.05 and 120 minutes intra-service time) and agreed that while the reference code has more intra time, the service includes catheterization and is therefore a less intense service compared to the surveyed code. **The RUC recommends a work RVU of 14.00 for CPT code 37244.**

**Practice Expense:**

The RUC accepted the direct PE inputs with minor modifications as recommended by the PE Subcommittee.

**Work Neutrality**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Category I</b> <b>Surgery</b> <b>Cardiovascular System</b> <b>Arteries and Veins</b> <b>Vascular Injection Procedures</b> <b>Intra-Arterial – Intra-Aortic</b>				
<p><i><b>Diagnostic Studies of Arteriovenous (AV) Shunts for Dialysis:</b></i> For diagnostic studies, the arteriovenous (AV) dialysis shunt (AV shunt) is defined as beginning with the arterial anastomosis and extending to the right atrium. This definition includes all upper and lower extremity AV shunts (arteriovenous fistulae [AVF] and arteriovenous grafts [AVG]). Code 36147 includes the work of directly accessing and imaging the entire AV shunt. Antegrade and/or retrograde punctures of the AV shunt are typically used for imaging, and contrast may be injected directly through a needle or through a catheter placed into the AV shunt.</p>				

Occasionally the catheter needs to be advanced further into the shunt to adequately visualize the arterial anastomosis or the central veins, and all manipulation of the catheter for diagnostic imaging of the AV shunt is included in 36147. Advancement of the catheter to the vena cava to adequately image that segment of the AV shunt is included in 36147 and is not separately reported. Advancement of the catheter tip through the arterial anastomosis to adequately visualize the anastomosis is also considered integral to the work of 36147 and is not separately reported.

Ultrasound guidance for puncture of the AV shunt is not included in 36147. Particularly in the case of new or failing AVF, ultrasound may be necessary to safely and effectively puncture the AV access for evaluation, and this may be reported separately with 76937 if all the appropriate elements for reporting 76937 are performed.

Evaluation of the peri-anastomotic portion of the inflow is considered an integral part of the dialysis fistulagram and is included in the work of 36147. The peri-anastomotic portion of the vessel at the arterial anastomosis includes the short segment of the artery immediately adjacent to the anastomosis, the anastomosis itself, and the portion of the vessel or graft immediately distal to the anastomosis.

The arterial inflow to the AV access is considered a separate vessel. If a more proximal inflow problem separate from the peri-anastomotic segment is suspected and additional catheter work and imaging must be done for adequate evaluation, this work is not included in 36147. If a catheter is selectively advanced from the AV shunt puncture into the inflow artery, an additional catheterization code may be reported. In the typical case of an upper extremity AV shunt, 36215 is used to report this work, and includes placement of the catheter retrograde into the inflow artery and into the aorta if necessary (ie, 36200 may not be also reported since that work is included in the work defined by 36215).

***Interventions for Arteriovenous (AV) Shunts Created for Dialysis (AV Grafts and AV Fistulae):*** For the purposes of coding interventional procedures in arteriovenous (AV) shunts created for dialysis (both arteriovenous fistulae [AVF] and arteriovenous grafts [AVG]), the AV shunt is artificially divided into two vessel segments. The first segment is peripheral and extends from the peri-arterial anastomosis through the axillary vein (or entire cephalic vein in the case of cephalic venous outflow). The second segment includes the veins central to the axillary and cephalic veins, including the subclavian and innominate veins through the vena cava. Interventions performed in a single segment, regardless of the number of lesions treated, are coded as a single intervention.

The AV shunt is considered to be venous and most interventions are coded with the venous intervention codes (ie, angioplasty is reported with venous angioplasty codes 35476, 75978). Codes 35476 and 75978 would be reported once to describe all angioplasty work performed in one segment of the AV dialysis shunt, regardless of the number of distinct lesions treated within that segment, the number of times the balloon is inflated, or the number of balloon catheters required to open all lesions.

There is an exception to the use of venous interventional codes. When there is a stenosis at the arterial anastomosis, it typically extends across the anastomosis and involves the artery just proximal to and at the anastomosis as well as the outflow vessel or graft. This segment is called the peri-anastomotic (or juxta-anastomotic) region, and even though the stenosis can involve multiple vessels, it is typically a single lesion with a single etiology crossing the anastomosis, and treatment to open this lesion crosses from the artery into the vein or venous graft. An intervention treated in this peri-anastomotic segment is coded as an arterial intervention (35475, 75962). Since the entire segment of the AV shunt from the peri-arterial anastomosis through the axillary vein is considered a single vessel for coding of interventions, the arterial angioplasty codes include the work of opening the peri-anastomotic stenosis, as well as all other stenoses treated within this segment of the vessel. Codes 35475 and 75962 are reported once to describe all work done to angioplasty any lesion from the peri-arterial anastomosis through the axillary vein in procedures that involve angioplasty of the peri-arterial anastomosis of the AV shunt. In these special instances, venous angioplasty codes would not be reported additionally for this first or most peripheral shunt segment, even if balloon angioplasty is performed on segments of the AV dialysis shunt that are purely venous anatomy within this specific vessel segment.

It is never appropriate to report removal of the arterial plug during a declot/thrombectomy procedure as an arterial or venous angioplasty (35475, 35476). Removal of the arterial plug is included in the work of a fistula thrombectomy (36870), even if a balloon catheter is used to mechanically dislodge the resistant thrombus.

The central veins (eg, subclavian, innominate, and cava) are considered an additional, separate venous vessel segment for purposes of interventional coding for AV dialysis shunt interventions. If one or more central venous stenoses are treated with angioplasty, this is reported as a single venous angioplasty ( 35476, 75978), regardless of the number of discrete lesions treated within this segment, and also independent of the number of balloon inflations or number of balloon catheters or sizes required. This additional work should be clearly documented in the patient record and in the recorded images.

The codes for stents placed in AV dialysis accesses are generic for intravascular work and not specific for arterial or venous anatomy. However, the same rules used for angioplasty apply to stent placements for AV dialysis shunts with respect to the number of interventions reported for each patient. Stent codes (37205, 75960) are reported once to describe all work of stenting lesions within the defined AV dialysis shunt segment from the peri-arterial anastomosis through the axillary and cephalic veins, regardless of the number of stents placed or the number of discrete lesions treated within that vessel segment. If additional stenting is required for central venous stenosis, this may be reported as an additional stent placement (37206, 75960), describing all the work of stent placement within the central venous segment.

The work of catheterizing all the veins in the dialysis AV shunt is included in 36147 (and, if appropriate, 36148). Selective catheterization of the inferior/superior vena cava and central veins cannot be separately reported when performed from a direct puncture of the AVF/AVG.

However, if additional venous side branches off of the conduit, known as accessory veins, are separately catheterized for diagnosis or intervention such as embolization of a large competing accessory vein, this additional work may be separately reported using the appropriate selective venous catheterization codes (36011 and 36012). The embolization may be reported using 37241 once, irrespective of the number of branches embolized. ~~37204, 75894.~~

36215            Selective catheter placement, arterial system; each first order thoracic or brachiocephalic branch, within a vascular family  
(For catheter placement for coronary angiography, see 93454- 93461)

36217            initial third order or more selective thoracic or brachiocephalic branch, within a vascular family

+36218            additional second order, third order, and beyond, thoracic or brachiocephalic branch, within a vascular family (List in addition to code for initial second or third order vessel as appropriate)

(Use 36218 in conjunction with 32616, 36217)

(For angiography, see 36147, 36222-36228, 75600-75774, 75791)

(For angioplasty, see 35471, 35472, 35475)

(For transcatheter therapies, see 37200-~~37208~~ 37204, 37241-37244, 61624, 61626)

(When coronary artery, arterial conduit [eg, internal mammary, inferior epigastric or free radical artery] or venous bypass graft angiography is performed in conjunction with cardiac catheterization, see the appropriate cardiac catheterization, injection procedure, and imaging supervision code[s] [93455, 93457, 93459, 93461, 93530-93533, 93564] in the **Medicine** section. When internal mammary artery angiography only is performed without a concomitant cardiac catheterization, use 36216 or 36217 as appropriate)

36470            Injection of sclerosing solution; single vein

36471            multiple veins, same leg

(For vascular embolization and occlusion procedures, see 37241-37244)

36475            Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, radiofrequency; first vein treated

<b>Category I</b> <b>Surgery</b> <b>Cardiovascular System</b> <b>Arteries and Veins</b> <b><u>Embolization</u></b> <b><u>Vascular Embolization and Occlusion Procedures</u></b>				
<p><u>Codes 37241-37244 are used to describe the work of vascular embolization and occlusion procedures, excluding the central nervous system and the head and neck, which are reported using codes 61624, 61626, 61710 and 75894, and excluding the ablation/sclerotherapy/sclerosis procedures for venous insufficiency/telangiectasia of the extremities/skin, which are reported using codes 36468, 36470, 36471.</u></p> <p><u>Embolization and occlusion procedures are performed for a wide variety of clinical indications and in a range of vascular territories. Arteries, veins, and lymphatics may all be the target of embolization.</u></p> <p><u>The embolization codes include all associated radiological supervision and interpretation, intra-procedural guidance and roadmapping, imaging necessary to document completion of the procedure, and moderate sedation. Code(s) for catheter placement(s) and diagnostic studies may be separately reportable using the appropriate diagnostic angiography codes with an appropriate modifier (eg, modifier 59). Please see</u></p>				

the guidelines on reporting of diagnostic angiography preceding CPT code 75600 in the *Radiology Guidelines, Vascular Procedures, Aorta and Arteries* section.

37241 is used to report vascular embolization or occlusion procedures performed for venous conditions other than hemorrhage. Examples include embolization of venous malformations, capillary hemangiomas, varicoceles, and visceral varices. Embolization of side branch(es) of an outflow vein from a hemodialysis access would be reported using 37241.

37242 is used to report vascular embolization or occlusion performed for arterial conditions other than hemorrhage or tumor such as arteriovenous malformations and arteriovenous fistulas whether congenital or acquired. Embolization of aneurysm and pseudoaneurysms are also reported with 37242. Tumor embolization is reported with 37243. Note that injection to treat an extremity pseudoaneurysm is correctly reported with code 36002. Sometimes, embolization and occlusion of an artery are performed prior to another planned interventional procedure; an example is embolization of the left gastric artery prior to planned implantation of an hepatic artery chemotherapy port. The artery embolization is reported with 37242.

37243 is used to report embolization for the purpose of tissue ablation and organ infarction or ischemia. This can be performed in many clinical circumstances, including embolization of benign or malignant tumors of the liver, kidney, uterus or other organs. When chemotherapy is given as part of an embolization procedure, additional codes (eg, 96420) may be separately reported. When a radioisotope (eg, Yttrium-90) is injected as part of an embolization, then additional codes (eg, 79445) may be separately reported. Uterine fibroid embolization is reported with 37243.

37244 is used to report embolization for treatment of hemorrhage or vascular or lymphatic extravasation. Examples include embolization for management of gastrointestinal bleed, trauma-induced hemorrhage of the viscera or pelvis, embolization of the thoracic duct for chylous effusion and bronchial artery embolization for hemoptysis. Embolization of the uterine arteries for management of hemorrhage (eg, post-partum hemorrhage) is also reported with 37244.

Intravascular stents, both covered and uncovered, are a class of devices that may be used as part of an embolization procedure. As such, there is the potential for overlap among codes used for placement of vascular stents and those used for embolization. When a stent is placed for the purpose of providing a latticework for deployment of embolization coils, such as for embolization of an aneurysm, the embolization code is reported and not the stent code. If a stent is deployed as the sole management of an aneurysm, pseudoaneurysm, or vascular extravasation then the stent deployment code should be reported and not the embolization code.

Only one embolization code should be reported for each surgical field (ie, the area immediately surrounding and directly involved in a treatment/procedure). For example, embolization of one or more venous side branches in a single arm for a patient with a dialysis arteriovenous fistula is reported with 37241 only once per session. Embolization procedures performed at a single setting and including multiple surgical fields (eg a patient with multiple trauma and bleeding from the pelvis and the spleen) may be reported with multiple embolization codes with the appropriate modifier (eg, modifier 59).

There may be overlapping indications for an embolization procedure. The code for the immediate indication for the embolization should be used. For instance, if the immediate cause for embolization is bleeding in a patient with an aneurysm, report code 37244.

☉●37241	W1	Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; venous, other than hemorrhage (eg, congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)  <u>(For sclerosis of veins or endovenous ablation of incompetent extremity veins, see 36468-36479)</u>	000	9.00
☉●37242	W2	arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms)	000	11.98
☉●37243	W3	for tumors, organ ischemia, or infarction	000	14.00
☉●37244	W4	for arterial or venous hemorrhage or lymphatic extravasation <u>(For percutaneous treatment of extremity pseudoaneurysm, use 36002)</u> <u>(Do not report 37241-37244 in conjunction with 36468, 36470, 36471, 36475-36479, 75894, 75898)</u> <u>(For embolization procedures of the central nervous system or head and neck, see 61624, 61626, 61710)</u>	000	14.00
<b>Category I</b> <b>Surgery</b> <b>Nervous System</b> <b>Endovascular Therapy</b>				

61624	<p>Transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method; central nervous system (intracranial, spinal-cord)</p> <p><del>(See also 37204)</del></p> <p><u>(For noncentral nervous system and nonhead or neck embolization, see 37241-37244)</u></p> <p>(For radiological supervision and interpretation, use 75894)</p>

<b>Radiology</b> <b>Diagnostic Radiology (Diagnostic Imaging)</b> <b>Vascular Procedures</b> <b>Transcatheter Procedures</b>	
<p>Therapeutic transcatheter radiological supervision and interpretation code(s) include the following services associated with that intervention:</p> <ol style="list-style-type: none"> <li>1. Contrast injections, angiography/venography, roadmapping, and fluoroscopic guidance for the intervention,</li> <li>2. Vessel measurement, and</li> <li>3. Completion angiography/venography (except for those uses permitted by 75898).</li> </ol> <p>Unless specifically included in the code descriptor, diagnostic angiography/venography performed at the time of transcatheter therapeutic radiological and interpretation service(s) is separately reportable (eg, no prior catheter-based diagnostic angiography/venography study of the target vessel is available, prior diagnostic study is inadequate, patient's condition with respect to the clinical indication has changed since the prior study or during the intervention). See 75600- 75893.</p> <p><u>Do not report 75894, 75898 in conjunction with 37241-37244.</u></p>	

Codes 75956 and 75957 include all angiography of the thoracic aorta and its branches for diagnostic imaging prior to deployment of the primary endovascular devices (including all routine components of modular devices), fluoroscopic guidance in the delivery of the endovascular components, and intraprocedural arterial angiography (eg, confirm position, detect endoleak, evaluate runoff).

Code 75958 includes the analogous services for placement of each proximal thoracic endovascular extension. Code 75959 includes the analogous services for placement of a distal thoracic endovascular extension(s) placed during a procedure after the primary repair.

75894 Transcatheter therapy, embolization, any method, radiological supervision and interpretation

(Do not report 75894 in conjunction with 37241-37244)

~~(For uterine fibroid embolization, [uterine artery embolization performed to treat uterine fibroids], use 37210)~~

~~(For obstetrical and gynecological embolization procedures other than uterine fibroid embolization [eg, embolization to treat obstetrical or postpartum hemorrhage, use 37204])~~

75898 Angiography through existing catheter for follow-up study for transcatheter therapy, embolization or infusion, other than for thrombolysis.

(For thrombolysis infusion management other than coronary, see 37211-37214)

(Do not report 75898 in conjunction with 37211-37214, 37241-37244)

(75900 has been deleted. For exchange of a previously placed intravascular catheter during thrombolytic therapy with contrast monitoring, radiological supervision and interpretation, see 37211-37214)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 37241	Tracking Number W1	Original Specialty Recommended RVU: <b>11.50</b>
		Presented Recommended RVU: <b>11.50</b>
Global Period: 000		RUC Recommended RVU: <b>9.00</b>

CPT Descriptor: Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; venous, other than hemorrhage (eg, congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 17-year-old male presents with left scrotal pain. Ultrasound demonstrates a left varicocele. The patient is referred for embolization.

Percentage of Survey Respondents who found Vignette to be Typical: 87%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 93%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

**Description of Pre-Service Work:**

**DESCRIPTION OF WORK – Separately Reportable**

The right common femoral vein is accessed and a sheath placed. A guiding catheter is advanced into the origin of the left gonadal vein (Separately coded)

Gonadal venography is performed from the guiding catheter in order to assess the degree of reflux and identify venous anatomy and number of branches to be embolized. (Separately coded)

**Description of Pre-Service Work**

- A targeted H&P is performed obtaining relevant clinical information including indications, physical exam findings, and important laboratory findings. Careful review of axial imaging studies and multiplanar reformatted images is performed to assess access vessel, variants of anatomy, post-surgical changes, vessel diameter, and target tissue to be embolized.
  - The proposed procedure is discussed with the patient and family. Formal consent is obtained.
- The exam, procedural plans and consent are documented in the medical record.

**Description of Intra-Service Work:**

- Supporting base catheter, embolization catheter, and wire combinations are selected and assembled on the sterile table. In comparison to and in addition to diagnostic venography, Tri-axial systems are typically required to support embolization in the target vessel. Embolic material (coils, Sotradecol) is selected.
- The embolization system is advanced to the level of the distal gonadal vein.
- A microcatheter is guided through the base catheter deep into the target branches of the gonadal vein at or near the inguinal ligament using a steerable guidewire, fluoroscopy, and roadmapping including contrast material injection as needed.
- Embolic material is prepared and then serially loaded into the catheter system. Coils are carefully delivered to the end of the microcatheter and deployed. The microcatheter and coils may need to be repositioned to achieve a tight coil pack and avoid non-target embolization.
- Intermittent control follow-up venography is performed to document evidence of stasis, presence of collaterals, and need for additional treatment. The catheter is pulled back under fluoroscopic control and coils and Sotradecol are deployed at multiple levels typically along the entire course of the gonadal vein, corresponding to the position of side and parallel branches.
- Final coil deployment is performed through the base catheter at the upper end of the gonadal vein near the junction with the left renal vein.
- Completion venography of the left renal vein is performed to confirm elimination of reflux and occlusion of the left gonadal vein. When embolization is complete, the catheter system is removed.

#### Description of Post-Service Work:

- Appropriate care orders for post-embolization syndrome (pain, pyrexia, nausea, inflammatory response) specific to embolization are entered in the electronic medical record.
- The procedure is documented in the chart using a short post procedure note.
- The patient is transferred from the procedure table to the recovery area and monitored for 4 hours.
- The procedure outcome is discussed with the patient and family. Post procedure care instructions and plans for follow-up are also discussed.
- Recovery care and targeted exam findings are documented in a progress/discharge note. Discharge orders are written, including new medication prescriptions, and the patient is discharged to home.
- The procedure is formally documented in the medical record by dictating an operative report. The report is subsequently reviewed and authenticated after transcription is completed.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why are we here?**

Embolization therapy, CPT codes 37204 and 75894 *Transcatheter therapy, embolization, any method, radiological supervision and interpretation*, were identified as reported together greater than 75% of the time and, as a result, were sent to CPT. A code change proposal was created after extensive multi-disciplinary discussion. Among the options considered were complete procedures where work of embolization and all catheterization were included and partially bundled codes.

Major concerns that ultimately led to a less comprehensive bundling of only the embolization surgical and S&I codes included:

1. Embolization therapy is performed for tumors, bleeding, arterial, venous, lymphatic malformations and aneurysms.
2. There is no standard patient. The procedural approach, complexity, and intensity are disparate.
3. Embolization therapy is performed in the viscera, solid organs, and vasculature both above and below the diaphragm.
4. There was concern that the number of vascular beds, varied catheterization combinations, and variants of anatomy would result in a prohibitively large number of codes.

These issues were vetted and the CPT panel approved four new bundled embolization therapy codes (37237241-4). Additionally, in conjunction with the new family of four codes, CPT code 37210 (Uterine fibroid embolization) was deleted as part of the multi-specialty Code Change Proposal presented at the CPT Panel. The procedure described by 37210 falls within the clinical parameters of the new 37243 code, and the specialties maintained that having an “outlier” embolization code separate from the new family would not only create coding confusion, but also represented a detraction from the logical integrity of the new family.

A multi-disciplinary workgroup including ACR, SIR, and SVS was convened. A survey was distributed randomly to the members of the workgroup and a robust number of completed surveys were received. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved. Appropriate rank order appears to be reflected between the four codes. The survey results and recommendations are as follows

**Pre-Service Time**

For all four codes, the group is recommending pre service package 2B with 2 additional minutes of positioning time to account for positioning patient on the angiographic table, as well as optimizing EKG and monitoring lead placement to avoid obscuring imaging during embolization.

This additional positioning time is consistent with multiple recently valued procedures brought before the RUC in the last several cycles including thrombolysis (37211), foreign body retrieval (37197), selective catheterization (36245, 36246, 36200), and IVC filters (37191-3).

**Post-Service Time**

Survey respondents recommended a median post service time of 30 minutes for 37241, and 37242 which the expert panel felt appropriate given these patients are complex, but typically do not have significant post-embolization syndrome (pain, pyrexia, anorexia, nausea, vomiting). For 37243, respondents felt that 45 minutes of post-service time was required for management of patients after tumor embolization given the potential for post-embolization syndrome (PES), and tumor lysis syndrome. Survey respondents recommended 45 minutes for 37244 given severity of patients injuries and the need to follow-up frequently during the course of the day to assess, and reassess for signs of ongoing bleeding, ischemia, and the typical arterial sheaths left in place.

**Work Recommendations**

It is the multi-disciplinary panel’s expert opinion that in the family of recently valued endovascular procedures, embolization therapy ranks at the top for intensity, risk, and difficulty.

These procedures are more difficult and risky than thrombolysis catheter placement, foreign body retrieval, and the less complex recently valued lower extremity (LE) revascularization codes e.g iliac angioplasty, stent placement 37221-2. Embolizations are similar in difficulty and intensity to carotid stent placement (37215), TIPS placement (37182), and the more complex LE revascularizations e.g. tibial interventions (37226-8).

**How Does This Compare?**

CPT Code	Descriptor	RVU	Pre	Intra	Post	90	Total	IWPUT
37230	LE tibial	13.80	48	120	30		198	0.101
37227	LE fem pop	14.50	48	125	30		203	0.1026
37229	LE tibial	14.05	48	120	30		198	0.1031
37228	LE tibial	11.00	48	90	30		168	0.1036
37182	TIPS	16.97	30	150	30		210	0.1042
37211	Thrombolysis	8.00	48	60	30		138	0.1054
<b>37241</b>	<b>Embo venous</b>	<b>11.50</b>	<b>41</b>	<b>90</b>	<b>30</b>		<b>161</b>	<b>0.111</b>
37215	Carotid Stents	19.68	90	103	30	124	347	0.1223
<b>37243</b>	<b>Embo tumors</b>	<b>17.00</b>	<b>41</b>	<b>120</b>	<b>45</b>		206	<b>0.126</b>
<b>37242</b>	<b>Embo arterial</b>	<b>16.00</b>	<b>41</b>	<b>100</b>	<b>30</b>		171	<b>0.145</b>
<b>37244</b>	<b>Embo hemorrhage</b>	<b>17.00</b>	<b>41</b>	<b>90</b>	<b>45</b>		176	<b>0.168</b>

**37241**

CPT Code 37241 describes the permanent occlusion/embolization of a venous varicocity, venous aneurysm, venous malformation, or venous tributary. The vignette was considered typical by greater than 87% of respondents. Our key reference service code (KRS) was CPT code 37182 *insertion of TIPS*.

The median intra service time of **90 minutes** was felt to be accurate by the expert panel and we are recommending the median **RVW of 11.50** yielding an IWPUT of 0.111, which is consistent with other highly intense endovascular procedures (see table). Of the four codes, 37237241 is the least intense in the family given it is performed in the venous circulation, however the risk of coil migration to the heart or pulmonary arterial circulation is real and explains the procedure's intensity.

**37242**

37237242 describes the permanent occlusion/embolization of an arterial aneurysm, malformation, or potential feeding artery in aneurysm therapy. Embolization therapy in the arterial circulation is inherently more risky than in the venous system. Arterial rupture, unintended ischemia, or non-target embolization are risks the operator must avoid. The vignette was considered typical by greater than 98% of respondents. Our KRS was CPT code 37184 *mechanical thrombectomy*.

The median intra service time was **100 minutes** which was felt to be accurate, and in rank order compared to 37241 and 37243. The expert panel is recommending the median RVW of 16.00 yielding an IWPUT of 0.145 which is higher than most endovascular procedures, but supported by the intensity, risk, and difficulty of the therapy.

**37243**

37237243 describes the pre-operative or definitive embolization therapy for benign and malignant tumors. The vignette describes treatment of a patient with carcinoid mets to the liver and 92% of survey respondents considered this typical. The KRS was CPT Code 37182.

The median intra service time was **120 minutes**, which was felt to be accurate. The expert panel is recommending the median RVW of 17.00 in line with other highly intense endovascular procedures like carotid stent (37215) and TIPS creation (37182). The IWPUT of 0.126 is lower reflecting a longer, more detailed, slightly less intense procedure when compared to 37242 and 37244. Tumor embolization requires precise catheter location beyond that required for diagnostic angiography. Catheter position must be chosen to avoid vasospasm and ensure precise tumor treatment while limiting non-target normal organ damage. Embolic solution must be of correct density and specific gravity to support suspension of beads/particles for uniform delivery to the tumor bed. Cautious intermittent delivery of small aliquots of embolic material is required to achieve effective tumor infarction. The process is slow and deliberate in the setting of tumor therapy.

**37244**

37237244 describes a nearly opposite embolization scenario. This vignette describes the hemorrhaging patient after extensive pelvic trauma which 98 % respondents considered typical. This patient must be treated as expeditiously as possible to prevent exsanguination. The operator is working as quickly as humanly possible under extreme conditions and intensity. This explains the decrease in intra service time to **90 minutes**. The KRS 37182 was again chosen.

The expert panel recommends the median **RVW of 17.00** despite the lower intra service time. It is the expert panel's assertion that 37237244 likely represents one of the most challenging, stressful therapies in the endovascular family warranting a high RVW and IWPOT (0.168).

**Reference Service Codes**

Further, the most common and key reference service chosen for all four codes was CPT Code 61624 *transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method, any method; central nervous system (intracranial, spinal cord)*. We included this code on our RSL. The RUC database has the source as "RUC", there are updated times and RUC meeting dates. However, there is a note that says "Do Not Use to Validate for Physician Work". As such, we included the 2<sup>nd</sup> most selected reference code as our key reference code.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. These four new CPT codes bundle 37204/37210 and the corresponding radiological supervision and interpretation codes into new bundled procedures. Access will be gained by using one of the existing catheterization codes, which are separately reportable.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT codes 37204, 75894 and 75898

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Radiology

How often? Commonly

Specialty Diagnostic Radiology

How often? Commonly

Specialty Vascular Surgery

How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National Frequency Data is Not Available

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,148

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The new codes will represent 100% of the instances where 37204 is now used (30,764) and 100% of the instances where 37210 is now used (357). We estimate that uses of 75894 (36,341) will decline sharply, but that code will still be used with CPT codes 61624 & 61626.

Specialty Vascular Surgery	Frequency 473	Percentage 15.02 %
----------------------------	---------------	--------------------

Specialty Radiology	Frequency 2675	Percentage 84.97 %
---------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37204

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 37242	Tracking Number W2	Original Specialty Recommended RVU: <b>16.00</b>
		Presented Recommended RVU: <b>11.98</b>
Global Period: 000		RUC Recommended RVU: <b>11.98</b>

CPT Descriptor: Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 35-year-old woman presents with intermittent abdominal and back pain. A CT scan shows a 3 cm splenic artery aneurysm. The patient is referred for embolization.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 91%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 89%

**Description of Pre-Service Work:**

**DESCRIPTION OF WORK – Separately Reportable**

Via right common femoral access, a base guiding catheter is advanced into the celiac artery (Separately coded).

Diagnostic planning angiography of the celiac artery is performed to delineate vascular anatomy and identify the principal target of embolization and routes of approach. (Separately coded)

**Description of Pre-service work**

- A targeted H&P is performed obtaining relevant clinical information including indications, physical exam findings, and important laboratory findings. Careful review of previously acquired imaging studies including multiplanar reformatted images is performed to assess access vessel, variants of anatomy, post-surgical changes, vessel diameter, and target vessel to be embolized.

- The proposed procedure is discussed with the patient and family. Consent is obtained.

- The exam, procedural plans and consent are documented in the medical record.

Diagnostic images are reviewed to determine appropriate catheter selection, placement, and embolization.

**Description of Intra-Service Work:**

- Supporting base catheter, embolization catheter, and wire combinations are selected and assembled on the sterile table. In comparison to and in addition diagnostic arteriography Tri-axial systems are typically required to support embolization in the target vessel. Appropriate sized coils are selected.
  - Using fluoroscopic guidance and roadmapping technique, the embolization system is advanced over a steerable guidewire to the midportion of the tortuous splenic artery.
  - The embolization microcatheter is advanced to and beyond the aneurysm.
  - Coils are prepared and then serially loaded into the catheter system. Coils are carefully delivered to the end of the catheter and deployed. The microcatheter and coils may need to be retracted and redeployed to achieve a tight coil pack and to avoid non-target embolization.
  - Embolization of the aneurysm is performed using coils placed downstream to, within, and proximal to the aneurysm.
  - Intermittent control arteriograms are performed to assess progress toward vessel stasis, presence of collaterals, interval vascular complication such as spasm/dissection, and need for additional treatment.
  - Completion angiography is performed demonstrating exclusion of the aneurysm from the arterial circulation.
- When embolization is complete, the catheter system is removed.

#### Description of Post-Service Work:

- Appropriate care orders for post-embolization syndrome (pain, pyrexia, nausea, inflammatory response) specific to embolization are entered in the electronic medical record. The patient is evaluated for non-target embolization.
- The procedure is documented in the chart using a short post procedure note.
- The patient is transferred from the procedure table to the recovery area and monitored for 4 hours.
- The procedure outcome is discussed with the patient and family. Post procedure care instructions and plans for follow-up are also discussed.
- Recovery care and targeted exam findings are documented in a progress/discharge note. Discharge orders are written, including new medication prescriptions, and the patient is transferred to the inpatient/observational status or discharged to home as appropriate.
- The procedure is formally documented in the medical record by dictating an operative report. The report is subsequently reviewed and authenticated after transcription is completed.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why are we here?**

Embolization therapy, CPT codes 37204 and 75894 *Transcatheter therapy, embolization, any method, radiological supervision and interpretation*, were identified as reported together greater than 75% of the time and, as a result, were sent to CPT. A code change proposal was created after extensive multi-disciplinary discussion. Among the options considered were complete procedures where work of embolization and all catheterization were included and partially bundled codes.

Major concerns that ultimately led to a less comprehensive bundling of only the embolization surgical and S&I codes included:

1. Embolization therapy is performed for tumors, bleeding, arterial, venous, lymphatic malformations and aneurysms.
2. There is no standard patient. The procedural approach, complexity, and intensity are disparate.
3. Embolization therapy is performed in the viscera, solid organs, and vasculature both above and below the diaphragm.
4. There was concern that the number of vascular beds, varied catheterization combinations, and variants of anatomy would result in a prohibitively large number of codes.

These issues were vetted and the CPT panel approved four new bundled embolization therapy codes (37237241-4). Additionally, in conjunction with the new family of four codes, CPT code 37210 (Uterine fibroid embolization) was deleted as part of the multi-specialty Code Change Proposal presented at the CPT Panel. The procedure described by 37210 falls within the clinical parameters of the new 37243 code, and the specialties maintained that having an “outlier” embolization code separate from the new family would not only create coding confusion, but also represented a detraction from the logical integrity of the new family.

A multi-disciplinary workgroup including ACR, SIR, and SVS was convened. A survey was distributed randomly to the members of the workgroup and a robust number of completed surveys were received. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved. Appropriate rank order appears to be reflected between the four codes. The survey results and recommendations are as follows

**Pre-Service Time**

For all four codes, the group is recommending pre service package 2B with 2 additional minutes of positioning time to account for positioning patient on the angiographic table, as well as optimizing EKG and monitoring lead placement to avoid obscuring imaging during embolization.

This additional positioning time is consistent with multiple recently valued procedures brought before the RUC in the last several cycles including thrombolysis (37211), foreign body retrieval (37197), selective catheterization (36245, 36246, 36200), and IVC filters (37191-3).

**Post-Service Time**

Survey respondents recommended a median post service time of 30 minutes for 37241, and 37242 which the expert panel felt appropriate given these patients are complex, but typically do not have significant post-embolization syndrome (pain, pyrexia, anorexia, nausea, vomiting). For 37243, respondents felt that 45 minutes of post-service time was required for management of patients after tumor embolization given the potential for post-embolization syndrome (PES), and tumor lysis syndrome. Survey respondents recommended 45 minutes for 37244 given severity of patients injuries and the need to follow-up frequently during the course of the day to assess, and reassess for signs of ongoing bleeding, ischemia, and the typical arterial sheaths left in place.

**Work Recommendations**

It is the multi-disciplinary panel’s expert opinion that in the family of recently valued endovascular procedures, embolization therapy ranks at the top for intensity, risk, and difficulty.

These procedures are more difficult and risky than thrombolysis catheter placement, foreign body retrieval, and the less complex recently valued lower extremity (LE) revascularization codes e.g iliac angioplasty, stent placement 37221-2. Embolizations are similar in difficulty and intensity to carotid stent placement (37215), TIPS placement (37182), and the more complex LE revascularizations e.g. tibial interventions (37226-8).

**How Does This Compare?**

<b>CPT Code</b>	<b>Descriptor</b>	<b>RVU</b>	<b>Pre</b>	<b>Intra</b>	<b>Post</b>	<b>90</b>	<b>Total</b>	<b>IWPUT</b>
37230	LE tibial	13.80	48	120	30		198	0.101

37182	TIPS	16.97	30	150	30		210	0.1042
37211	Thrombolysis	8.00	48	60	30		138	0.1054
<b>37241</b>	<b>Embo venous</b>	<b>11.50</b>	<b>41</b>	<b>90</b>	<b>30</b>		<b>161</b>	<b>0.111</b>
37215	Carotid Stents	19.68	90	103	30	124	347	0.1223
<b>37243</b>	<b>Embo tumors</b>	<b>17.00</b>	<b>41</b>	<b>120</b>	<b>45</b>		206	<b>0.126</b>
<b>37242</b>	<b>Embo arterial</b>	<b>16.00</b>	<b>41</b>	<b>100</b>	<b>30</b>		171	<b>0.145</b>
<b>37244</b>	<b>Embo hemorrhage</b>	<b>17.00</b>	<b>41</b>	<b>90</b>	<b>45</b>		176	<b>0.168</b>

**37241**

CPT Code 37241 describes the permanent occlusion/embolization of a venous varicocyt, venous aneurysm, venous malformation, or venous tributary. The vignette was considered typical by greater than 87% of respondents. Our key reference service code (KRS) was CPT code 37182 *insertion of TIPS*.

The median intra service time of **90 minutes** was felt to be accurate by the expert panel and we are recommending the median **RVW of 11.50** yielding an IWPUT of 0.111, which is consistent with other highly intense endovascular procedures (see table). Of the four codes, 37237241 is the least intense in the family given it is performed in the venous circulation, however the risk of coil migration to the heart or pulmonary arterial circulation is real and explains the procedure's intensity.

**37242**

37237242 describes the permanent occlusion/embolization of an arterial aneurysm, malformation, or potential feeding artery in aneurysm therapy. Embolization therapy in the arterial circulation is inherently more risky than in the venous system. Arterial rupture, unintended ischemia, or non-target embolization are risks the operator must avoid. The vignette was considered typical by greater than 98% of respondents. Our KRS was CPT code 37184 *mechanical thrombectomy*.

The median intra service time was **100 minutes** which was felt to be accurate, and in rank order compared to 37241 and 37243. The expert panel is recommending the median RVW of 16.00 yielding an IWPUT of 0.145 which is higher than most endovascular procedures, but supported by the intensity, risk, and difficulty of the therapy.

**37243**

37237243 describes the pre-operative or definitive embolization therapy for benign and malignant tumors. The vignette describes treatment of a patient with carcinoid mets to the liver and 92% of survey respondents considered this typical. The KRS was CPT Code 37182.

The median intra service time was **120 minutes**, which was felt to be accurate. The expert panel is recommending the median RVW of 17.00 in line with other highly intense endovascular procedures like carotid stent (37215) and TIPS creation (37182). The IWPUT of 0.126 is lower reflecting a longer, more detailed, slightly less intense procedure when compared to 37242 and 37244. Tumor embolization requires precise catheter location beyond that required for diagnostic angiography. Catheter position must be chosen to avoid vasospasm and ensure precise tumor treatment while limiting non-target normal organ damage. Embolic solution must be of correct density and specific gravity to support suspension of beads/particles for uniform delivery to the tumor bed. Cautious intermittent delivery of small aliquots of embolic material is required to achieve effective tumor infarction. The process is slow and deliberate in the setting of tumor therapy.

**37244**

37237244 describes a nearly opposite embolization scenario. This vignette describes the hemorrhaging patient after extensive pelvic trauma which 98 % respondents considered typical. This patient must be treated as expeditiously as possible to prevent exsanguination. The operator is working as quickly as humanly possible under extreme conditions and intensity. This explains the decrease in intra service time to **90 minutes**. The KRS 37182 was again chosen.

The expert panel recommends the median **RVW of 17.00** despite the lower intra service time. It is the expert panel's assertion that 37237244 likely represents one of the most challenging, stressful therapies in the endovascular family warranting a high RVW and IWPUT (0.168).

**Reference Service Codes**

Further, the most common and key reference service chosen for all four codes was CPT Code 61624 *transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method, any method; central nervous system (intracranial, spinal cord)*. We included this code on our RSL. The RUC database has the source as "RUC", there are updated times and RUC meeting dates. However, there is a note that says "Do Not Use to Validate for Physician Work". As such, we included the 2<sup>nd</sup> most selected reference code as our key reference code.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. These four new CPT codes bundle 37204/37210 and the corresponding radiological supervision and interpretation codes into new bundled procedures. Access will be gained by using one of the existing catheterization codes, which are separately reportable.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT codes 37204, 75894 and 75898

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Radiology

How often? Commonly

Specialty Diagnostic Radiology

How often? Commonly

Specialty Vascular Surgery

How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National Frequency Data is Not Available

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,870

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The new codes will represent 100% of the instances where 37204 is now used (30,764) and 100% of the instances where 37210 is now used (357). We estimate that uses of 75894 (36,341) will decline sharply, but that code will still be used with CPT codes 61624 & 61626.

Specialty Vascular Surgery	Frequency 1181	Percentage 15.00 %

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37204

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 37243	Tracking Number W3	Original Specialty Recommended RVU: <b>17.00</b>
		Presented Recommended RVU: <b>14.00</b>
Global Period: 000		RUC Recommended RVU: <b>14.00</b>

CPT Descriptor: Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for tumors, organ ischemia, or infarction

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 72-year-old woman with metastatic carcinoid tumor has enlarging metastatic disease in the liver despite chemotherapy. The patient is referred for embolization.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 91%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 88%

**Description of Pre-Service Work:**

**DESCRIPTION OF WORK – Separately Reportable**

Via right common femoral access, a base guiding catheter is advanced into the celiac artery (Separately coded)

Diagnostic planning angiography of the celiac artery is performed to delineate vascular anatomy and identify the principal targets of embolization and routes of approach and mapping arteriography of the liver is performed in multiple projections to identify the number and location of tumor feeding vessels to be embolized (Separately coded)

**Description of Pre-service work**

- A targeted H&P is performed obtaining relevant clinical information including indications, physical exam findings, and important laboratory findings. Careful review of previously acquired imaging studies including multiplanar reformatted images is performed to assess access vessel, variants of anatomy, post-surgical changes, vessel diameter, and target vessel to be embolized.
- The proposed procedure is discussed with the patient and family. Consent is obtained.
- The exam, procedural plans and consent are documented in the medical record
- Diagnostic images are reviewed to determine appropriate catheter selection, placement, and embolization.

**Description of Intra-Service Work:**

- Supporting base catheter, embolization catheter, and wire combinations are selected and assembled on the sterile table. In comparison to and in addition to diagnostic arteriography, Tri-axial systems are typically required to support embolization in the target vessel. Appropriate sized coils are selected.
- Using fluoroscopic guidance and roadmapping, the embolization microcatheter and micro-steerable guidewire are advanced into the more selective target vessels supplying the tumor.
- Embolic material is delivered onto the sterile field and prepared in a suspension of contrast and saline. Concentration and suspension are titrated to the vascularity of the tumor accounting for arterio-venous shunting and vasospasm.
- Embolization is performed using small aliquots of embolic material mixed with contrast. Aliquots are slowly delivered to the target tumor tissue under fluoroscopic guidance until adequate flow arrest in the targeted vessel is achieved
- Intermittent control arteriograms are performed to assess continued flow in the parent artery.
- Subsequent tumors are targeted and embolized with control angiograms performed to assess progress and need for further treatment. Coil embolization of non-target vessels may be required.
- Completion arteriography is performed demonstrating cessation of flow to the metastases and absence of iatrogenic vessel injury.
- When embolization is complete, the catheter system is removed.

#### Description of Post-Service Work:

- Appropriate care orders for post-embolization syndrome (pain, pyrexia, nausea, inflammatory response) specific to embolization are entered in the electronic medical record. The patient is evaluated for non-target embolization.
- The procedure is documented in the chart using a short post procedure note.
- The patient is transferred from the procedure table to the recovery area and monitored for 4 hours.
- The procedure outcome is discussed with the patient and family. Post procedure care instructions and plans for follow-up are also discussed.
- Recovery care and targeted exam findings are documented in a progress/discharge note. Admission orders are written.
- The procedure is formally documented in the medical record by dictating an operative report. The report is subsequently reviewed and authenticated after transcription is completed.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why are we here?**

Embolization therapy, CPT codes 37204 and 75894 *Transcatheter therapy, embolization, any method, radiological supervision and interpretation*, were identified as reported together greater than 75% of the time and, as a result, were sent to CPT. A code change proposal was created after extensive multi-disciplinary discussion. Among the options considered were complete procedures where work of embolization and all catheterization were included and partially bundled codes.

Major concerns that ultimately led to a less comprehensive bundling of only the embolization surgical and S&I codes included:

1. Embolization therapy is performed for tumors, bleeding, arterial, venous, lymphatic malformations and aneurysms.
2. There is no standard patient. The procedural approach, complexity, and intensity are disparate.
3. Embolization therapy is performed in the viscera, solid organs, and vasculature both above and below the diaphragm.
4. There was concern that the number of vascular beds, varied catheterization combinations, and variants of anatomy would result in a prohibitively large number of codes.

These issues were vetted and the CPT panel approved four new bundled embolization therapy codes (37237241-4). Additionally, in conjunction with the new family of four codes, CPT code 37210 (Uterine fibroid embolization) was deleted as part of the multi-specialty Code Change Proposal presented at the CPT Panel. The procedure described by 37210 falls within the clinical parameters of the new 37243 code, and the specialties maintained that having an “outlier” embolization code separate from the new family would not only create coding confusion, but also represented a detraction from the logical integrity of the new family.

A multi-disciplinary workgroup including ACR, SIR, and SVS was convened. A survey was distributed randomly to the members of the workgroup and a robust number of completed surveys were received. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved. Appropriate rank order appears to be reflected between the four codes. The survey results and recommendations are as follows

**Pre-Service Time**

For all four codes, the group is recommending pre service package 2B with 2 additional minutes of positioning time to account for positioning patient on the angiographic table, as well as optimizing EKG and monitoring lead placement to avoid obscuring imaging during embolization.

This additional positioning time is consistent with multiple recently valued procedures brought before the RUC in the last several cycles including thrombolysis (37211), foreign body retrieval (37197), selective catheterization (36245, 36246, 36200), and IVC filters (37191-3).

**Post-Service Time**

Survey respondents recommended a median post service time of 30 minutes for 37241, and 37242 which the expert panel felt appropriate given these patients are complex, but typically do not have significant post-embolization syndrome (pain, pyrexia, anorexia, nausea, vomiting). For 37243, respondents felt that 45 minutes of post-service time was required for management of patients after tumor embolization given the potential for post-embolization syndrome (PES), and tumor lysis syndrome. Survey respondents recommended 45 minutes for 37244 given severity of patients injuries and the need to follow-up frequently during the course of the day to assess, and reassess for signs of ongoing bleeding, ischemia, and the typical arterial sheaths left in place.

**Work Recommendations**

It is the multi-disciplinary panel’s expert opinion that in the family of recently valued endovascular procedures, embolization therapy ranks at the top for intensity, risk, and difficulty.

These procedures are more difficult and risky than thrombolysis catheter placement, foreign body retrieval, and the less complex recently valued lower extremity (LE) revascularization codes e.g iliac angioplasty, stent placement 37221-2. Embolizations are similar in difficulty and intensity to carotid stent placement (37215), TIPS placement (37182), and the more complex LE revascularizations e.g. tibial interventions (37226-8).

**How Does This Compare?**

<b>CPT Code</b>	<b>Descriptor</b>	<b>RVU</b>	<b>Pre</b>	<b>Intra</b>	<b>Post</b>	<b>90</b>	<b>Total</b>	<b>IWPUT</b>
37230	LE tibial	13.80	48	120	30		198	0.101
37227	LE fem pop	14.50	48	125	30		203	0.1026

37228	LE tibial	11.00	48	90	30		168	0.1036
37182	TIPS	16.97	30	150	30		210	0.1042
37211	Thrombolysis	8.00	48	60	30		138	0.1054
<b>37241</b>	<b>Embo venous</b>	<b>11.50</b>	<b>41</b>	<b>90</b>	<b>30</b>		<b>161</b>	<b>0.111</b>
37215	Carotid Stents	19.68	90	103	30	124	347	0.1223
<b>37243</b>	<b>Embo tumors</b>	<b>17.00</b>	<b>41</b>	<b>120</b>	<b>45</b>		206	<b>0.126</b>
<b>37242</b>	<b>Embo arterial</b>	<b>16.00</b>	<b>41</b>	<b>100</b>	<b>30</b>		171	<b>0.145</b>
<b>37244</b>	<b>Embo hemorrhage</b>	<b>17.00</b>	<b>41</b>	<b>90</b>	<b>45</b>		176	<b>0.168</b>

**37241**

CPT Code 37241 describes the permanent occlusion/embolization of a venous varicocity, venous aneurysm, venous malformation, or venous tributary. The vignette was considered typical by greater than 87% of respondents. Our key reference service code (KRS) was CPT code 37182 *insertion of TIPS*.

The median intra service time of **90 minutes** was felt to be accurate by the expert panel and we are recommending the median **RVW of 11.50** yielding an IWPUT of 0.111, which is consistent with other highly intense endovascular procedures (see table). Of the four codes, 37237241 is the least intense in the family given it is performed in the venous circulation, however the risk of coil migration to the heart or pulmonary arterial circulation is real and explains the procedure's intensity.

**37242**

37237242 describes the permanent occlusion/embolization of an arterial aneurysm, malformation, or potential feeding artery in aneurysm therapy. Embolization therapy in the arterial circulation is inherently more risky than in the venous system. Arterial rupture, unintended ischemia, or non-target embolization are risks the operator must avoid. The vignette was considered typical by greater than 98% of respondents. Our KRS was CPT code 37184 *mechanical thrombectomy*.

The median intra service time was **100 minutes** which was felt to be accurate, and in rank order compared to 37241 and 37243. The expert panel is recommending the median RVW of 16.00 yielding an IWPUT of 0.145 which is higher than most endovascular procedures, but supported by the intensity, risk, and difficulty of the therapy.

**37243**

37237243 describes the pre-operative or definitive embolization therapy for benign and malignant tumors. The vignette describes treatment of a patient with carcinoid mets to the liver and 92% of survey respondents considered this typical. The KRS was CPT Code 37182.

The median intra service time was **120 minutes**, which was felt to be accurate. The expert panel is recommending the median RVW of 17.00 in line with other highly intense endovascular procedures like carotid stent (37215) and TIPS creation (37182). The IWPUT of 0.126 is lower reflecting a longer, more detailed, slightly less intense procedure when compared to 37242 and 37244. Tumor embolization requires precise catheter location beyond that required for diagnostic angiography. Catheter position must be chosen to avoid vasospasm and ensure precise tumor treatment while limiting non-target normal organ damage. Embolic solution must be of correct density and specific gravity to support suspension of beads/particles for uniform delivery to the tumor bed. Cautious intermittent delivery of small aliquots of embolic material is required to achieve effective tumor infarction. The process is slow and deliberate in the setting of tumor therapy.

**37244**

37237244 describes a nearly opposite embolization scenario. This vignette describes the hemorrhaging patient after extensive pelvic trauma which 98 % respondents considered typical. This patient must be treated as expeditiously as possible to prevent exsanguination. The operator is working as quickly as humanly possible under extreme conditions and intensity. This explains the decrease in intra service time to **90 minutes**. The KRS 37182 was again chosen.

The expert panel recommends the median **RVW of 17.00** despite the lower intra service time. It is the expert panel's assertion that 37237244 likely represents one of the most challenging, stressful therapies in the endovascular family warranting a high RVW and IWPUT (0.168).

**Reference Service Codes**

Further, the most common and key reference service chosen for all four codes was CPT Code 61624 *transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method, any method; central nervous system (intracranial, spinal cord)*. We included this code on our RSL. The RUC database has the source as "RUC", there are updated times and RUC meeting dates. However, there is a note that says "Do Not Use to Validate for Physician Work". As such, we included the 2<sup>nd</sup> most selected reference code as our key reference code.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. These four new CPT codes bundle 37204/37210 and the corresponding radiological supervision and interpretation codes into new bundled procedures. Access will be gained by using one of the existing catheterization codes, which are separately reportable.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT codes 37204, 75894 and 75898 OR CPT codes 37210

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Radiology

How often? Commonly

Specialty Diagnostic Radiology

How often? Commonly

Specialty Vascular Surgery

How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National Frequency Data is Not Available

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

14,523 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The new codes will represent 100% of the instances where 37204 is now used (30,764) and 100% of the instances where 37210 is now used (357). We estimate that uses of 75894 (36,341) will decline sharply, but that code will still be used with CPT codes 61624 & 61626.

Specialty Vascular Surgery	Frequency 2179	Percentage 15.00 %
----------------------------	----------------	--------------------

Specialty Radiology	Frequency 12345	Percentage 85.00 %
---------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

**Description of Pre-Service Work:**

**DESCRIPTION OF WORK – Separately Reportable**

Catheterization of the right common femoral artery is performed and a pigtail catheter is advanced to the aortic bifurcation.

A Selective catheter is subsequently advanced into the iliac arterial system (Separately coded)

Diagnostic arteriography of the pelvis is performed to identify, characterize and target sites of active hemorrhage. (Separately coded)

**Description of Pre-service work**

- A targeted H&P is performed obtaining relevant clinical information including indications, physical exam findings, and important laboratory findings. Careful review of previously acquired imaging studies including multiplanar reformatted images is performed to assess access vessel, variants of anatomy, post-surgical changes, vessel diameter, and target vessel to be embolized.

- The proposed procedure is discussed with the patient and/or family. Consent is obtained.

- The exam, procedural plans and consent are documented in the medical record.

Diagnostic images are reviewed to determine appropriate catheter selection, placement, and embolization.

**Description of Intra-Service Work:**

- Supporting base catheter, embolization catheter, and wire combinations are selected and assembled on the sterile table. In comparison to and in addition to diagnostic arteriography Tri-axial systems are typically required to support embolization in the target vessel. Appropriate sized coils are selected.
- A microcatheter and microwire is advanced into the bleeding vessel(s) under roadmapping and fluoroscopic control.
- Embolization is performed using a combination of Gelfoam and coils.
- The embolic agents are slowly delivered to the target tumor tissue under fluoroscopic guidance until adequate flow arrest in the targeted vessel is achieved.
- Intermittent control angiograms are performed to assess progress in promoting arterial occlusion and to judge whether there is ongoing hemorrhage and collateral supply.
- Additional bleeding branches are targeted and embolized using Gelfoam and coils with intermittent control arteriography to assess progress.
- Completion angiography is performed demonstrating cessation of extravasation from the left pelvis and absence of iatrogenic vessel injury or non-target embolization.
- When embolization is complete, the catheter system is removed.

#### Description of Post-Service Work:

- Appropriate care orders for post-embolization syndrome (pain, pyrexia, nausea, inflammatory response) specific to embolization are entered in the electronic medical record. Signs of non-target embolization are evaluated.
- The procedure is documented in the chart using a short post procedure note.
- The patient is transferred from the procedure table to the recovery area and monitored for 4 hours.
- The procedure outcome is discussed with the patient and family. Post procedure care instructions and plans for follow-up are also discussed.
- Recovery care and targeted exam findings are documented in a progress/discharge note. Admission orders are written.
- The procedure is formally documented in the medical record by dictating an operative report. The report is subsequently reviewed and authenticated after transcription is completed.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why are we here?**

Embolization therapy, CPT codes 37204 and 75894 *Transcatheter therapy, embolization, any method, radiological supervision and interpretation*, were identified as reported together greater than 75% of the time and, as a result, were sent to CPT. A code change proposal was created after extensive multi-disciplinary discussion. Among the options considered were complete procedures where work of embolization and all catheterization were included and partially bundled codes.

Major concerns that ultimately led to a less comprehensive bundling of only the embolization surgical and S&I codes included:

1. Embolization therapy is performed for tumors, bleeding, arterial, venous, lymphatic malformations and aneurysms.
2. There is no standard patient. The procedural approach, complexity, and intensity are disparate.
3. Embolization therapy is performed in the viscera, solid organs, and vasculature both above and below the diaphragm.
4. There was concern that the number of vascular beds, varied catheterization combinations, and variants of anatomy would result in a prohibitively large number of codes.

These issues were vetted and the CPT panel approved four new bundled embolization therapy codes (37237241-4). Additionally, in conjunction with the new family of four codes, CPT code 37210 (Uterine fibroid embolization) was deleted as part of the multi-specialty Code Change Proposal presented at the CPT Panel. The procedure described by 37210 falls within the clinical parameters of the new 37243 code, and the specialties maintained that having an “outlier” embolization code separate from the new family would not only create coding confusion, but also represented a detraction from the logical integrity of the new family.

A multi-disciplinary workgroup including ACR, SIR, and SVS was convened. A survey was distributed randomly to the members of the workgroup and a robust number of completed surveys were received. The surveys were reviewed by the multi-specialty group and determined to be valid and reflective of the work and intensity involved. Appropriate rank order appears to be reflected between the four codes. The survey results and recommendations are as follows

**Pre-Service Time**

For all four codes, the group is recommending pre service package 2B with 2 additional minutes of positioning time to account for positioning patient on the angiographic table, as well as optimizing EKG and monitoring lead placement to avoid obscuring imaging during embolization.

This additional positioning time is consistent with multiple recently valued procedures brought before the RUC in the last several cycles including thrombolysis (37211), foreign body retrieval (37197), selective catheterization (36245, 36246, 36200), and IVC filters (37191-3).

**Post-Service Time**

Survey respondents recommended a median post service time of 30 minutes for 37241, and 37242 which the expert panel felt appropriate given these patients are complex, but typically do not have significant post-embolization syndrome (pain, pyrexia, anorexia, nausea, vomiting). For 37243, respondents felt that 45 minutes of post-service time was required for management of patients after tumor embolization given the potential for post-embolization syndrome (PES), and tumor lysis syndrome. Survey respondents recommended 45 minutes for 37244 given severity of patients injuries and the need to follow-up frequently during the course of the day to assess, and reassess for signs of ongoing bleeding, ischemia, and the typical arterial sheaths left in place.

**Work Recommendations**

It is the multi-disciplinary panel’s expert opinion that in the family of recently valued endovascular procedures, embolization therapy ranks at the top for intensity, risk, and difficulty.

These procedures are more difficult and risky than thrombolysis catheter placement, foreign body retrieval, and the less complex recently valued lower extremity (LE) revascularization codes e.g iliac angioplasty, stent placement 37221-2. Embolizations are similar in difficulty and intensity to carotid stent placement (37215), TIPS placement (37182), and the more complex LE revascularizations e.g. tibial interventions (37226-8).

**How Does This Compare?**

CPT Code	Descriptor	RVU	Pre	Intra	Post	90	Total	IWPUT
37230	LE tibial	13.80	48	120	30		198	0.101
37227	LE fem pop	14.50	48	125	30		203	0.1026
37229	LE tibial	14.05	48	120	30		198	0.1031
37228	LE tibial	11.00	48	90	30		168	0.1036
37182	TIPS	16.97	30	150	30		210	0.1042
37211	Thrombolysis	8.00	48	60	30		138	0.1054
<b>37241</b>	<b>Embo venous</b>	<b>11.50</b>	<b>41</b>	<b>90</b>	<b>30</b>		<b>161</b>	<b>0.111</b>
37215	Carotid Stents	19.68	90	103	30	124	347	0.1223
<b>37243</b>	<b>Embo tumors</b>	<b>17.00</b>	<b>41</b>	<b>120</b>	<b>45</b>		206	<b>0.126</b>
<b>37242</b>	<b>Embo arterial</b>	<b>16.00</b>	<b>41</b>	<b>100</b>	<b>30</b>		171	<b>0.145</b>
<b>37244</b>	<b>Embo hemorrhage</b>	<b>17.00</b>	<b>41</b>	<b>90</b>	<b>45</b>		176	<b>0.168</b>

**37241**

CPT Code 37241 describes the permanent occlusion/embolization of a venous varicocyt, venous aneurysm, venous malformation, or venous tributary. The vignette was considered typical by greater than 87% of respondents. Our key reference service code (KRS) was CPT code 37182 *insertion of TIPS*.

The median intra service time of **90 minutes** was felt to be accurate by the expert panel and we are recommending the median **RVW of 11.50** yielding an IWPUT of 0.111, which is consistent with other highly intense endovascular procedures (see table). Of the four codes, 37237241 is the least intense in the family given it is performed in the venous circulation, however the risk of coil migration to the heart or pulmonary arterial circulation is real and explains the procedure's intensity.

**37242**

37237242 describes the permanent occlusion/embolization of an arterial aneurysm, malformation, or potential feeding artery in aneurysm therapy. Embolization therapy in the arterial circulation is inherently more risky than in the venous system. Arterial rupture, unintended ischemia, or non-target embolization are risks the operator must avoid. The vignette was considered typical by greater than 98% of respondents. Our KRS was CPT code 37184 *mechanical thrombectomy*.

The median intra service time was **100 minutes** which was felt to be accurate, and in rank order compared to 37241 and 37243. The expert panel is recommending the median RVW of 16.00 yielding an IWPUT of 0.145 which is higher than most endovascular procedures, but supported by the intensity, risk, and difficulty of the therapy.

**37243**

37237243 describes the pre-operative or definitive embolization therapy for benign and malignant tumors. The vignette describes treatment of a patient with carcinoid mets to the liver and 92% of survey respondents considered this typical. The KRS was CPT Code 37182.

The median intra service time was **120 minutes**, which was felt to be accurate. The expert panel is recommending the median RVW of 17.00 in line with other highly intense endovascular procedures like carotid stent (37215) and TIPS creation (37182). The IWPUT of 0.126 is lower reflecting a longer, more detailed, slightly less intense procedure when compared to 37242 and 37244. Tumor embolization requires precise catheter location beyond that required for diagnostic angiography. Catheter position must be chosen to avoid vasospasm and ensure precise tumor treatment while limiting non-target normal organ damage. Embolic solution must be of correct density and specific gravity to support suspension of beads/particles for uniform delivery to the tumor bed. Cautious intermittent delivery of small aliquots of embolic material is required to achieve effective tumor infarction. The process is slow and deliberate in the setting of tumor therapy.

**37244**

37237244 describes a nearly opposite embolization scenario. This vignette describes the hemorrhaging patient after extensive pelvic trauma which 98 % respondents considered typical. This patient must be treated as expeditiously as possible to prevent exsanguination. The operator is working as quickly as humanly possible under extreme conditions and intensity. This explains the decrease in intra service time to **90 minutes**. The KRS 37182 was again chosen.

The expert panel recommends the median **RVW of 17.00** despite the lower intra service time. It is the expert panel's assertion that 37237244 likely represents one of the most challenging, stressful therapies in the endovascular family warranting a high RVW and IWPUT (0.168).

**Reference Service Codes**

Further, the most common and key reference service chosen for all four codes was CPT Code 61624 *transcatheter permanent occlusion or embolization (eg, for tumor destruction, to achieve hemostasis, to occlude a vascular malformation), percutaneous, any method, any method; central nervous system (intracranial, spinal cord)*. We included this code on our RSL. The RUC database has the source as "RUC", there are updated times and RUC meeting dates. However, there is a note that says "Do Not Use to Validate for Physician Work". As such, we included the 2<sup>nd</sup> most selected reference code as our key reference code.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. These four new CPT codes bundle 37204/37210 and the corresponding radiological supervision and interpretation codes into new bundled procedures. Access will be gained by using one of the existing catheterization codes, which are separately reportable.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) CPT codes 37204, 75894 and 75898

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Interventional Radiology	How often? Commonly
Specialty Diagnostic Radiology	How often? Commonly
Specialty Vascular Surgery	How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. National Frequency Data is Not Available

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,296

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The new codes will represent 100% of the instances where 37204 is now used (30,764) and 100% of the instances where 37210 is now used (357). We estimate that uses of 75894 (36,341) will decline sharply, but that code will still be used with CPT codes 61624 & 61626.

Specialty Vascular Surgery	Frequency 945	Percentage 15.00 %
----------------------------	---------------	--------------------

Specialty Radiology	Frequency 5352	Percentage 85.00 %
---------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 37204

AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs

**Global Period:** 000

**Meeting Date:** April 2013

**CPT Long Descriptor:**

Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention;

**37241** *venous, other than hemorrhage (eg, congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)*

**37242** *arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms)*

**37243** *for tumors, organ ischemia, or infarction*

**37244** *for arterial or venous hemorrhage or lymphatic extravasation*

(Do not report 372X1-372X4 in conjunction with 36468, 36470, 36471, 36475-36479, 75894, 75898)

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The multispecialty organizations (SIR, ACR and SVS) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this procedure. The panel made recommendations based on existing inputs and the new coding conventions

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

The new surveyed codes are the result of a “reported together” screen. As such, we have included columns with the existing code’s inputs for reference. In addition to including the exiting inputs for 37210 *uterine fibroid embolization*, we included the inputs for CPT code 37224 *revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty*. CPT code 37224 has a similar process of care and was recently reviewed by the PE Subcommittee. It is typical that a selective catheter placement code would be performed along with these new embolization codes. There is no particular catheter placement code that appears in the billed together data as ‘typical’. Therefore, we have included the direct practice expense inputs for CPT Code 36247 *selective catheter placement, arterial system; initial*

*third order or more selective abdominal, pelvic, or lower extremity artery branch, within a vascular family, which has the highest billed together frequency with the embolization codes.*

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

Pre Service Period

We are requesting to maintain our pre service clinical time for these 000 services. The physician typically uses his/her own clinical staff to complete pre-service diagnostic/referral forms and to work with the insurance companies/radiation oncology benefits manager. They ensure all pre authorization forms are completed and forward approved forms to the appropriate personnel. Their clinical staff works with the facility to ensure that the facility is available as well as all the necessary supplies.

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

We are not requesting an increase over the current inputs.

**5. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

A clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. The clinical staff contacts the facility to make sure appropriate time for the room is available as well as all the supplies, which will be required for the scheduled procedure.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**Global Period:** 000

**Meeting Date:** April 2013

**CPT Long Descriptor:**

Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention;

**37241** *venous, other than hemorrhage (eg, congenital or acquired venous malformations, venous and capillary hemangiomas, varices, varicoceles)*

**37242** *arterial, other than hemorrhage or tumor (eg, congenital or acquired arterial malformations, arteriovenous malformations, arteriovenous fistulas, aneurysms, pseudoaneurysms)*

**37243** *for tumors, organ ischemia, or infarction*

**37244** *for arterial or venous hemorrhage or lymphatic extravasation*

(Do not report 37241-37244 in conjunction with 36468, 36470, 36471, 36475-36479, 75894, 75898)

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The multispecialty organizations (SIR, ACR and SVS) convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for this procedure. The panel made recommendations based on existing inputs and the new coding conventions

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

The new surveyed codes are the result of a “reported together” screen. As such, we have included columns with the existing code’s inputs for reference. In addition to including the exiting inputs for 37210 *uterine fibroid embolization*, we included the inputs for CPT code 37224 *revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty*. CPT code 37224 has a similar process of care and was recently reviewed by the PE Subcommittee. It is typical that a selective catheter placement code would be performed along with these new embolization codes. There is no particular catheter placement code that appears in the billed together data as ‘typical’. Therefore, we have included the direct practice expense inputs for CPT Code 36247 *selective catheter placement, arterial system; initial*

*third order or more selective abdominal, pelvic, or lower extremity artery branch, within a vascular family, which has the highest billed together frequency with the embolization codes.*

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

Pre Service Period

*Complete pre-service diagnostic and referral forms:*

A clinically trained individual (RN,/LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure.

*Coordinate pre-surgery services:*

Clinical staff member ensures that all appropriate labs (CBC, CHEM7, etc.) are drawn and results are acceptable.

*Follow-up phone calls and prescriptions:*

Clinical staff will contact the patient prior to the procedure to ensure that they will be NPO, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed, such as medication for contrast allergy or poor renal function.

Service Period

*Prepare Room, Equipment, Supplies*

Interventional technologist checks imaging equipment to make sure that it is turned on, warmed up, functioning properly, enters the patient demographics, opens the sterile tray and sets it up, goes to the storage room to pull all the supplies that will be used for the procedure, and brings them to the procedure room. The standard for prepare room is 2 minutes and the standard for prepare scope is 5 minutes. We are essentially accepting two standards on one line. We are 'preparing imaging equipment' as the second part of the prepare room, equipment and supplies line.

*Prepare and Position Patient*

Once the patient is brought into the procedure room, time is taken to ensure appropriate position of the patient on the procedure table. Care is taken to ensure the patient's comfort as they will be required to remain still for a long period of time. Time is taken to ensure an unobstructed the field of view over the targeted areas of interest; this involves making sure that nursing monitoring and other equipment that could obstruct the images is clear. The area around the angiographic imaging equipment is cleared to allow for manipulation of the equipment throughout the procedure. These activities take more than the standard of 2 minutes.

**4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:**

The procedures described by the new embolization codes were previously reported with base surgical codes 37204 or 37210. CPT code 37204 is currently not priced in the office (NF) setting. CPT code 37210 does currently have direct practice expense inputs. We are requesting that all four of these new embolization codes be priced in the office, though we acknowledge that 44 usage

will be extremely rare in a Non facility setting. Nonetheless, 44 patient care scenarios in the office are conceivable and our belief is that it is appropriate to establish non-facility inputs for 44 at this time.

### Compelling Evidence

#### *Changes in site-of-service*

When the embolization codes were created, they were not performed in the office. The 2011 Medicare data, however, now indicates that 13% of the procedures are preformed in the office setting. These procedures in general are safely done on an outpatient basis currently and are expected to have a transition into the office setting for appropriate patients.

### Increase In Current Clinical Staff Time

#### *Pre service Education*

The clinical staff educates the patient regarding the procedure, what to expect in the procedure room, reviews the risk of contrast and radiation, and obtains consent for the above.

#### *Addition of Clinical Staff*

The existing inputs currently have a nurse for sedation and scrubbed in angio tech (100%). We are requesting an additional individual who is not scrubbed who will assist with the imaging equipment and with opening supplies. This is the current standard for endovascular procedures performed in an angio suite. This is the blended staff type, which per prior discussions has been a blend of 75% angio tech, 25% of RN/ LVN / MTA (L037D) (therefore there are 3 FTEs present during the entire procedure.).

### Increase In Current Supplies

We are making recommendations to modify the clinical supplies for these new codes. Many of the supplies included in the existing inputs remain unchanged (Lines 89-119). We have deleted some of the existing inputs (Lines 127 -130). We are also recommending increases in quantity for the following items (Lines 82-86):

- **Surgical Masks, Caps and Shoe Covers**  
Four surgical masks with face shields, four caps and four sets of shoe covers are required for the physician, the scrubbed in angiography technologist, the RN who is providing IV sedation and monitoring to the patient, and the radiology technologist who is assisting with the imaging. Every person in the angio suite is required to don this attire as it is a sterile setting.
- **X-ray developer solution and x-ray fixer solution**  
While it is known that the film to digital workgroup will soon be making the appropriate conversions for radiology codes, the changes to these inputs are to reflect what has been the standard inputs in recently angiography vetted codes. (e.g. 37197, 37191-37193, 36251-36254).  
*(The new Embolization codes will bundle the S&I codes. So, we have included the film inputs from the existing S&I codes.)*  
*(As digital imaging inputs become available these inputs will be replaced.)*

We are recommending **adding** the following items (Lines 70-79):

➤ Detachable coils (***Invoice Attached***)

Detachable coils will be used for 41, 42 and 44

- *37241: Used to precisely deposit and reposition a coil in the superior aspect of the gonadal vein. This allows for a large coil to be placed that will prevent any of the pelvic coils from embolizing into the lungs and will allow repositioning if the coil protrudes into the renal vein.*
- *37242: Used to deposit and reposition the coils in the splenic artery distal to the aneurysm, in the aneurysm itself, and proximal to the aneurysm to ensure occlusion of the aneurysm.*
- *37244: Precisely deposit and reposition into multiple branches of pelvic arteries to control bleeding.*

➤ Non-Detachable coils (***Invoice Attached***)

NonDetachable coil will be used for 41

Non-detachable embolization coils are deposited in multiple pelvic branches of the gonadal vein and in entire length of the main gonadal vein. An additional detachable coil is used at the superior aspect of the gonadal vein just before it enters the renal vein, in order to position and reposition the coil such that it does not extends into renal vein and to ensure that it is large enough to prevent any of the coils lower in the pelvis from embolizing in the pulmonary circulation.

➤ LC Beads (***Invoice Attached***)

LC Beads will be used for 43

LC Beads are the standard embolic agent used for treatment of hypervascular tumors.

➤ Syringes

- *5cc syringes*  
*Three, smaller, 5cc syringes are needed for use with the microcatheter for injections of saline and, contrast. .*
- *10cc standard syringes*  
*Four 10cc standard syringes are used for injection of contrast by hand during the procedures as well as any intra-arterial medication required.*
- *20cc syringes*  
*Four 20cc standard syringes are used for saline flushes of the sheath and catheters during the procedure*
- *Presssure*  
*A specifically shaped and sized disposable syringe is used, in combination with high pressure tubing, to perform large volume contrast injections via a power injectorto obtain DSA (digital subtraction angiography) images with adequate filling of the vascular structures.*

➤ Hemostatic Patch

To obtain hemostasis of the venous puncture site a topical hemostatic patch is used.

- Closure Device  
To obtain hemostasis of the arterial puncture site a suture based closure device is typically used.
- High Pressure Tubing  
Used in combination with the pressure syringe, as mentioned above.
- Sterile Radio-opaque ruler  
A sterile ruler is required to accurately determine size of the target vessel so that correct size stents, PTA balloons, (or embolic) are chosen.

#### Increase In Equipment

We are including time for patient recovery on a stretcher. We recognize that a 'stretcher' is not an approved conscious sedation standard. However, the patient needs a stretcher/table in the recovery period. We are looking for feedback from the PE subcommittee and/or CMS regarding patient recovery stretchers/tables.

### **5. Please describe in detail the clinical activities of your staff:**

#### Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms: a clinically trained individual (RN, LPN/MA) will review and complete all referral forms for the various insurance entities and ensure that the indication has met medical necessity for the planned procedure and forward the approved forms to the appropriate personnel including by fax if necessary. Coordinate pre-surgery services: Clinical staff member ensures that all appropriate labs (CBC, CHEM7, etc.) are drawn and results are acceptable. Follow-up phone calls and prescriptions: Clinical staff will contact the patient prior to the procedure to ensure that they will be NPO, answer any questions the patient may have regarding the scheduled procedure, confirm their arrival time, review allergies and call the pharmacy with any prescription if needed, such as medication for contrast allergy or poor renal function. Other clinical activities: The angiography technologist prior to the patient's arrival will retrieve any prior imaging exams, hang or display these exams for the physician to review, verify orders, review the chart to incorporate any relative clinical information and confirm contrast protocol.

#### Intra-Service Clinical Labor Activities:

Greet patient, provide gowning, and ensure appropriate medical records are available: Patient is greeted by the clinical staff, escorted to the intake area, provided with gowning and given assistance with changing into the gown if needed. Obtain vital signs: blood pressure, heart rate, respiratory rate, temperature, rhythm strip and pulse oximetry, are all obtained. Provide pre-service education/obtain consent: the clinical staff educates the patient regarding the procedure, what to expect in the procedure room, reviews the risk of contrast and radiation, and obtains consent for the above. Prepare room, equipment, supplies: Interventional technologist checks imaging equipment to make sure that it is turned on, warmed up, functioning properly, enters the patient demographics, and sets baseline imaging protocols. The technologist also opens the sterile tray and sets it up, goes to the storage room to pull all the supplies that will be used for the

procedure, and brings them to the procedure room. Prepare and position patient/Monitor patient/Setup IV. Intra-service Time of varying clinical personnel: there is an RN that is present with the patient the entire time for monitoring for sedation, an angio tech is scrubbed next to the physician the entire case, an additional 3<sup>rd</sup> individual who is not scrubbed will assist with the imaging equipment and opening supplies. Monitor patient following service/Check tubes, monitors, drains. The standard recommendation of CMS is that patients are recovered at a ratio of 1 nurse for 4 patients. Check dressings and wound/home care instructions/coordinated office visits/prescriptions. In addition to checking the dressings and reviewing at home instructions the clinical staff will also discuss pain prescriptions for the patients and review the medications with them. Other clinical activities: The angiography tech post procedure annotates the images, processes them, and then either hangs the films for interpretation or sends digital images to PACS and ensures they are received.

Post-Service Clinical Labor Activities:

Conducts phone calls/call in prescription: the clinical staff calls the patient the day after the procedure to make sure that there are no complications, answers any questions, ensures that pain control is adequate, and calls in additional prescriptions if needed.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*MPC List Screen*

October 2012/January 2013/April 2013

**Esophagoscopy**

In September 2011, several esophagoscopy codes were identified through the CMS Multi-Specialty Points of Comparison (MPC) List screen as potentially misvalued. The specialties agreed to survey the entire family of codes (43200-43232). In developing vignettes, it was determined that the codes required revision at CPT to differentiate the approach (ie, rigid transoral, flexible transoral, flexible transnasal). In May 2012, the CPT Editorial Panel approved six new codes to report rigid transoral esophagoscopy (43191-6), two new codes to report flexible transnasal esophagoscopy (43197-8), revision to codes 43200-43232 to describe flexible transoral esophagoscopy and one new code for flexible transoral esophagoscopy (43206). In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with an additional five codes within the esophagoscopy family of services. These five codes were reviewed at the January 2013 RUC meeting. Finally, in January 2013, the RUC agreed with the specialty societies that the survey data for 43231 and 43232 were anomalous and should be resurveyed and presented at the April 2013 RUC meeting.

After survey of the procedures for April, the specialty societies noted that the esophagoscopy with EUS procedures (43231 and 43232) are not inherently performed with moderate sedation by the same physician. However, due to CMS' consistent position, at the April meeting and in multiple Medicare Physician Payment Rules, that the Agency is looking for larger bundling of services, not unbundling of services, the moderate sedation for these services will remain bundled. Therefore, these two services will remain on Appendix G in the CPT codebook.

**Rigid Esophagoscopy Services**

The Otolaryngologists presented compelling evidence for the six rigid transoral esophagoscopy codes. There were two compelling evidence arguments given: a change in physician work due to technique and incorrect assumptions made at the time of the previous review. First, since these new procedures now refer only to rigid esophagoscopy procedures, the typical patient and typical provider of these services have changed from the previous codes that were either rigid or flexible. A service using a rigid scope is only performed by a surgeon in the facility setting, under general anesthesia, since the typical patient is either a cancer patient or has a foreign body or other stricture that requires more intense work compared to a patient receiving a flexible esophagoscopy. Second, incorrect assumptions were made in the initial valuation of these services because Otolaryngologists were not surveyed. For three of the previously reported codes (43200, 43202 and 43215) only Harvard values exist, which excluded Otolaryngologists in the review process. For two of the previously reported codes (43220 and 43226) a RUC survey was completed, but the vignette only specified flexible esophagoscopy. For the final previously reported service (43201), a RUC survey was completed only by Gastroenterologists. Therefore, these new services as described, have never been properly valued to account for the typical provider and equipment. The RUC agreed with the compelling evidence that there is potential misvaluation for these services.

**43191 Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed**

The RUC reviewed the survey results from 59 Otolaryngologists and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 51 minutes, intra-service time of 20 minutes and immediate post-service time of 15 minutes. Package 4 Difficult patient/Difficult procedure was deemed appropriate for this code because the typical patient has cancer and is receiving this service under general anesthesia in the facility setting. Furthermore, 3 additional minutes for positioning is required to properly position the patient in the supine position, place a shoulder roll, ensure security and, working with the anesthetist, position the endotracheal tube.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the survey's 25<sup>th</sup> percentile, 2.78 work RVUs, is an accurate value for the physician work involved in this service. The RUC reviewed the key reference service CPT code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed* (work RVU= 2.78) and noted that while the reference code has 10 more minutes of intra-service time compared to 43191, the surveyed code has greater total time, 86 minutes compared to 65 minutes. Therefore, the RUC agreed that the recommended work RVU of 2.78 is appropriate for code 43191. To further justify this value, the RUC reviewed MPC code 51102 *Aspiration of bladder; with insertion of suprapubic catheter* (work RVU= 2.70) and noted that both the reference code and surveyed code have identical intra-service times and comparable physician work. Given these reference codes and compelling evidence that the previous work RVU for this service was misvalued, the RUC agreed that a work RVU of 2.78 accurately values 43191 relative to both the family of services and other similar services across the RBRVS. **The RUC recommends a work RVU of 2.78 for CPT code 43191.**

**43192 Esophagoscopy, rigid, transoral; with directed submucosal injection(s), any substance**

The RUC reviewed the survey results from 31 Otolaryngologists and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 56 minutes, intra-service time of 23 minutes and immediate post-service time of 20 minutes. Package 4 Difficult patient/Difficult procedure was deemed appropriate for this code because the typical patient has cancer and is receiving this service under general anesthesia in the facility setting. The RUC agreed that 3 additional minutes for positioning is required to properly position the patient in the supine position, place a shoulder roll, ensure security and, working with the anesthetist, position the endotracheal tube. The RUC agreed that 5 additional minutes of evaluation time to prepare the injection is required for CPT code 43192 compared to code 43191.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the survey's 25<sup>th</sup> percentile, 3.21 work RVUs, is an accurate value for the physician work involved in this service. The RUC reviewed the key reference service CPT code 31625 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU= 3.36) and noted that the reference code has 7 more minutes of intra-service time compared to 43192, and is slightly more intense, thus substantiating a slightly higher work value. To further justify a work RVU of 3.21, the RUC reviewed CPT code 32551 *Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open* (work RVU= 3.29) and noted that while the surveyed code has 3 additional minutes of intra-service time compared to the reference code, 32551 is a more intense procedure and should be valued slightly higher than 43192. Finally, the RUC compared 43192 to the diagnostic code 43191 and agreed that the increase of 3 minutes, 23 minutes compared to 20 minutes, in intra-service time for 43192 is accurate because of the additional time necessary to inject the wall of the esophagus. Furthermore, the addition of 5 minutes in the post-service period for 43192 is appropriate because these patients often have increased bleeding due to the injection

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

and require more post-operative management compared to the diagnostic procedure. Given these reference codes and time differences, the RUC concurred that a work RVU of 3.21 accurately values 43192 relative to both the family of services and other similar services across the RBRVS. **The RUC recommends a work RVU of 3.21 for CPT code 43192.**

**43193 Esophagoscopy, rigid, transoral; with biopsy, single or multiple**

The RUC reviewed the survey results from 35 Otolaryngologists and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 56 minutes, intra-service time of 30 minutes and immediate post-service time of 20 minutes. Package 4 Difficult patient/Difficult procedure was deemed appropriate for this code because the typical patient has cancer and is receiving this service under general anesthesia in the facility setting. The RUC agreed that 3 additional minutes for positioning is required to properly position the patient in the supine position, place a shoulder roll, ensure security and, working with the anesthetist, position the endotracheal tube. The RUC agreed that 5 minutes of additional evaluation time to prepare the biopsy equipment is required for CPT code 43193 compared to code 43191.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the survey's 25<sup>th</sup> percentile, 3.36 work RVUs, is an accurate value for the physician work involved in this service. The RUC reviewed the key reference service CPT code 31625 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU= 3.36) and noted that both the reference code and the surveyed code have identical intra-service times and should be valued identically. To further justify a work RVU of 3.36, the RUC reviewed CPT code 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU= 3.30) and agreed that with identical intra-service times the two services should be valued similarly. Finally, the RUC compared 43193 to the injection code 43192 and agreed that 7 additional minutes, 30 minutes compared to 23 minutes, of intra-service time is accurate as several biopsies are taken to ensure an adequate sample and bleeding must be monitored. The specialty noted that this additional time is intense procedure time and not just waiting for an initial pathology report. Given these reference codes and time differences, the RUC concurred that a work RVU of 3.36 accurately values 43193 relative to both the family of services and other similar services across the RBRVS. **The RUC recommends a work RVU of 3.36 for CPT code 43193.**

**43194 Esophagoscopy, rigid, transoral; with removal of foreign body**

The RUC reviewed the survey results from 34 Otolaryngologists and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 49 minutes, intra-service time of 30 minutes and immediate post-service time of 28 minutes. Package 3 Straightforward patient/Difficult procedure was deemed appropriate for this service because while the typical patient no longer has cancer, the procedure is very intense resulting from the emergent need to remove a large, sharp object from the patients' esophagus. The RUC agreed that 3 additional minutes for positioning is required to properly position the patient in the supine position, place a shoulder roll, ensure security and, working with the anesthetist, position the endotracheal tube.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the survey's 25<sup>th</sup> percentile, 3.99 work RVUs, is an accurate value for the physician work involved in this service. The RUC reviewed the key reference service CPT code 31638 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)* (work RVU= 4.88) and noted that while the reference code has more intra-service time than the surveyed code, 60 minutes compared to 30 minutes, the survey respondents indicated that code 43194 is more intense and complex procedure than code

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

31638. Therefore, the recommended work RVU of 3.99 for code 43194 is accurately valued in comparison to the reference code. To further justify this value, the RUC reviewed CPT code 20660 *Application of cranial tongs, caliper, or stereotactic frame, including removal* (work RVU= 4.00) and agreed that with identical intra-service time as the surveyed code, 30 minutes, the two codes should be valued similarly. Finally, the RUC compared 43194 to the other codes in the rigid esophagoscopy family and agreed that this emergent procedure requiring the removal of a foreign body is the most intense and complex procedure in the family because there is relatively little ramp up or ramp down in the intensity of physician work for this service. Given these reference codes, the RUC concurred that a work RVU of 3.99 accurately values 43194 relative to both the family of services and other similar services across the RBRVS. **The RUC recommends a work RVU of 3.99 for CPT code 43194.**

***43195 Esophagoscopy, rigid, transoral; with balloon dilation (less than 30 mm diameter)***

The RUC reviewed the survey results and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 49 minutes, intra-service time of 30 minutes and immediate post-service time of 15 minutes. Package 3 Straightforward patient/Difficult procedure was deemed appropriate for this service because while the typical patient no longer has cancer, the procedure is still intense and performed in the facility setting under general anesthesia. The RUC agreed that 3 additional minutes for positioning is required to properly position the patient in the supine position, place a shoulder roll, ensure security and, working with the anesthetist, position the endotracheal tube.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the respondents overestimated the work value of this service relative to similar services in the family of rigid esophagoscopy codes. To determine an appropriate value, the RUC compared code 43195 to 43192 (RUC recommended work RVU= 3.21) and noted that while 43195 has greater intra-service time compared to 43192, 30 minutes and 23 minutes, respectively, code 43195 has less total time in comparison. Therefore, the RUC agreed that these two services represent similar physician work and should both be valued at 3.21 work RVUs. To validate this work RVU, the RUC reviewed the key reference service CPT code 31625 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU= 3.36) and noted that both services have identical intra-service time, 30 minutes, and should be valued similarly. The RUC also reviewed CPT code 31296 *Nasal/sinus endoscopy, surgical; with dilation of frontal sinus ostium (eg, balloon dilation)* (work RVU= 3.29) and agreed that with identical intra-service and analogous total times, both codes should be valued similarly. **The RUC recommends a work RVU of 3.21 for CPT code 43195.**

***43196 Esophagoscopy, rigid, transoral; with insertion of guide wire followed by dilation over guide wire***

The RUC reviewed the survey results and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 49 minutes, intra-service time of 33 minutes and immediate post-service time of 20 minutes. Package 3 Straightforward patient/Difficult procedure was deemed appropriate for this service because while the typical patient no longer has cancer, the procedure is still intense and performed in the facility setting under general anesthesia. The RUC agreed that 3 additional minutes for positioning is required to properly position the patient in the supine position, place a shoulder roll, ensure security and, working with the anesthetist, position the endotracheal tube.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the respondents overestimated the work value of this service relative to similar services in the family of rigid esophagoscopy codes. To determine an appropriate value, the RUC compared code 43196 to 43193 (RUC recommended work RVU= 3.36) and noted that while 43196 has slightly more intra-service time compared to 43192, 33 minutes and 30 minutes, respectively, code 43196 has less total time in comparison. Therefore, the RUC agreed that these two services represent CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

similar physician work and should both be valued at 3.36 work RVUs. To validate this work RVU, the RUC compared 43196 to CPT code 31625 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU= 3.36) and noted that both 31625 and the surveyed code have similar intra-service times, 30 and 33 minutes, respectively, and should be valued identically. To further justify a work RVU of 3.36, the RUC reviewed CPT code 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU= 3.30) and agreed that with similar intra-service times, 30 and 33 minutes respectively, the two services should be valued similarly. **The RUC recommends a work RVU of 3.36 for CPT code 43196.**

#### **Flexible Esophagoscopy Services- Transnasal**

##### ***43197 Esophagoscopy, flexible, transnasal; diagnostic, includes collection of specimen(s) by brushing or washing, when performed***

The RUC reviewed the survey results from 74 otolaryngologists and gastroenterologists and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 25 minutes, intra-service time of 15 minutes and immediate post-service time of 10 minutes. The RUC determined Package 6 Non-facility procedure with anesthesia was appropriate for this service with 2 additional minutes of scrub, dress, wait time to spray the topical anesthetic on the nostrils and then place and remove pledgets.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the respondents overestimated the work value of this service relative to the previous value for reporting this procedure, code 43200 (work RVU= 1.59). Therefore the RUC agreed with the specialty that the current work RVU of 1.59 is an appropriate value for code 43197. To justify this value, the RUC reviewed the key reference service CPT code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed* (work RVU= 2.78) and noted that the reference code has double the intra-service time compared to the surveyed code, 30 minutes and 15 minutes, respectively. Therefore, the RUC agreed that the reference code should be valued higher and a work value of 1.59 for code 43197 maintains proper relativity with this similar service. The RUC also compared CPT code 62284 *Injection procedure for myelography and/or computed tomography, spinal (other than C1-C2 and posterior fossa)* (work RVU= 1.54) to the surveyed code and agreed that with identical intra-service time and analogous total times, these two codes should be valued similarly. **The RUC recommends and work RVU of 1.59 for CPT code 43197.**

##### ***43198 Esophagoscopy, flexible, transnasal; with biopsy, single or multiple***

The RUC reviewed the survey results from 75 otolaryngologists and gastroenterologists and agreed with the specialty society that the survey respondents, at the median level, accurately accounted for the time it takes to perform this service. The RUC recommends pre-service time of 25 minutes, intra-service time of 20 minutes and immediate post-service time of 10 minutes. The RUC determined Package 6 Non-facility procedure with anesthesia was appropriate for this service with 2 additional minutes of scrub, dress, wait time to spray the topical anesthetic on the nostrils and then place and remove pledgets.

The RUC reviewed the survey respondents' estimated work RVU and agreed with the specialty that the respondents overestimated the work value of this service relative to the previous value for reporting this procedure, code 43202 (work RVU= 1.89). Therefore, the RUC agreed with the specialty that the current work RVU of 1.89 is an appropriate value for code 43198. To justify this value, the RUC reviewed the key reference service CPT code 31625 *Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU= 3.36) and noted that reference code has 10 more minutes of intra-service time compared to the surveyed code. Therefore, the RUC

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

agreed that the reference code should be valued higher and a work value of 1.89 for code 43198 maintains proper relativity with this similar service. The RUC also compared CPT code 57455 *Colposcopy of the cervix including upper/adjacent vagina; with biopsy(s) of the cervix* (work RVU= 1.99) to the surveyed code and agreed that with identical intra-service time the two codes should be valued similarly. Finally, the RUC compared code 43198 to code 43197 and noted that the additional work increment associated with 5 more intra-service minutes to perform the biopsy places 43198 in proper relativity to the family of services. **The RUC recommends a work RVU of 1.89 for CPT code 43198.**

### **Flexible Esophagoscopy Services- Transoral**

The specialties societies presented compelling evidence for the remaining flexible esophagoscopy family of services. There were two compelling evidence arguments given: a change in physician work since the last valuation and incorrect assumptions made during the last valuation. Physician work for these procedures used to be performed using fiberoptic instruments and it is now standard to use high-definition video endoscopes and high definition video monitors. Furthermore, during the previous valuation of these codes, there were no regulations and/or requirements for a complete history and physical of the patient within 30 days of the procedure now there are numerous documentation requirements (e.g. pre-sedation assessment and documentation of a comprehensive examination updated on the day of procedure) to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. Incorrect assumptions were also made during previous reviews of the codes. Since the adoption of pre-service time packages by the RUC in 2008 the physician work of moderate sedation is now captured in the pre-service work rather than the intra-service work. Additionally, the Harvard review and subsequent CMS review only included gastroenterologists, although otolaryngologists and general surgeons also perform these services. The RUC agreed with the compelling evidence that there is potential misvaluation for these services of codes.

Prior to reviewing the transoral flexible esophagoscopy family of services the specialty societies explained the survey methodology used to obtain physician time and RVU recommendations. In May 2012, the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required a standard survey be conducted of the new base code for flexible transoral esophagoscopy, 43200, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the RUC agreed with the same pre- and post- service times for all of the codes in 43201-43232 as for the revised base code for flexible trans-oral esophagoscopy, 43200.

The RUC observed that the specialty societies recommended two different pre-service time packages one for a straightforward patient and one for a more complex patient. However, neither of the specialties' recommendations are greater than the median survey times for each code. Therefore, while the pre-service packages change within the family, it is uniform and stays within the median response from the survey respondents. In addition, the specialty recommended that the median post-service time of 10 minutes inadequately accounts for the typical post-operative physician work. The RUC, however, noted that considering the high number of respondents, 121, the survey's median post-service time of 10 minutes should be standard throughout the series of codes.

**43200 Esophagoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed**

The RUC reviewed the survey results of 121 gastroenterologists, otolaryngologists, and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 27 minutes, intra-service time of 15 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that pre-service package 1B *Facility straightforward patient under sedation* was appropriate with two additional minutes of pre-service time over the package is necessary to properly position the patient.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that a work RVU of 1.59, the current value and less than the survey 25<sup>th</sup> percentile, is appropriate for 43200. To justify this value, the RUC reviewed MPC code 57452 *Colposcopy of the cervix including upper/adjacent vagina* (work RVU=1.50) and determined that while both the reference code and surveyed code have identical intra-service time, 43200 requires work because moderate sedation is inherent and should be valued higher than 57452. The RUC also reviewed 91035 *Esophagus, gastroesophageal reflux test; with mucosal attached telemetry pH electrode placement, recording, analysis and interpretation* (work RVU=1.59) and agreed that since both codes have similar intra-service and total times these services should be valued identically. **The RUC recommends a work RVU of 1.59 for CPT code 43200.**

**43201 Esophagoscopy, flexible, transoral; with directed submucosal injection(s), any substance**

The RUC reviewed the survey results of 121 gastroenterologists gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 27 minutes, intra-service time of 15 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that pre-service package 1B *Facility straightforward patient under sedation* was appropriate with two additional minutes to properly position the patient.

The RUC first discussed the difference in the current survey median intra-service time, 15 minutes, compared to the previous intra-service time of 25 minutes. The specialties explained that this time change is due to the creation of pre-service time packages that has shifted the reporting of moderate sedation work from the intra-service to the pre-service. However, the RUC noted, and the specialties agreed, that the typical patient has changed from a patient with a stricture to a patient with achalasia and that the current value may not be appropriate. The RUC and the specialties also agreed that the current work RVU of 2.09 was too high and would create a rank order anomaly in this family of esophagoscopy codes. The RUC determined that although the times were the same as 43200, the intensity and complexity of work for 43201 would be greater and therefore the work RVU should be higher. To determine an accurate work value, the RUC reviewed MPC code 64483 *Injection, anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level* (work RVU=1.90) and code 54150 *Circumcision, using clamp or other device with regional dorsal penile or ring block* (work RVU=1.90) and agreed that both reference codes and the surveyed code have identical intra-service time of 15 minutes, with similar total times. Therefore, the RUC determined, and the specialty agreed, that a work RVU of 1.90, a direct crosswalk to CPT code 64483 and 54150, correctly ranks 43201 within the family of services. **The RUC recommends a work RVU of 1.90 for CPT code 43201.**

**43202 Esophagoscopy, flexible, transoral; with biopsy, single or multiple**

The RUC reviewed the survey results of 120 gastroenterologists, otolaryngologists, and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 27 minutes, intra-service time of 15 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that pre-service package 1B *Facility straightforward patient under sedation* was appropriate with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that the survey median work RVU and 25<sup>th</sup> percentile work RVU both overstated the work included in this service. The specialties argued and the RUC agreed that the work and time to perform this service has not changed and that 15 minutes of intra-time is appropriate. The RUC discussed the difference in the survey intra-service time compared to the current Harvard time and noted that it is due to the shift in reporting moderate sedation work in pre-service time rather than the intra-service time. Therefore, the current work RVU of 1.89 should be maintained for code 43202. To justify this value, the RUC reviewed MPC code 64483 *Injection, anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level* (work RVU=1.90) and code 54150 *Circumcision, using clamp or other device with regional dorsal penile or ring block* (work RVU=1.90) and determined that since these codes have identical intra-service times, 15 minutes, and similar total time their work RVUs should be analogous. The RUC also reviewed code 49084 *Peritoneal lavage, including imaging guidance, when performed* (work RVU=2.00, 23/20/15) and determined that code 43202 was more complex due to moderate sedation, but was slightly less total work because of the intra-time difference. Finally, the RUC agreed that the work of code 43202 and 43201, with identical time components, should be valued similarly. **The RUC recommends a work RVU of 1.89 for CPT code 43202.**

#### **43204 Esophagoscopy, flexible, transoral; with injection sclerosis of esophageal varices**

The RUC reviewed the survey results of 95 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 33 minutes, intra-service time of 20 minutes and post-service time of 10 minutes. The RUC also accepted pre-service package 2B *Facility difficult patient under sedation* with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty that the current work RVU of 3.76, the survey median, overestimated the physician work involved in this service. The RUC determined that a work RVU of 2.89, the survey 25<sup>th</sup> percentile, is an accurate measure of the physician work to perform code 43204. To justify this value, the RUC reviewed MPC code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU=2.78) and determined that the intensity and total physician work of 43204 is greater compared to the reference code because of a more complex patient. The RUC also noted that the higher intra-time in 31622 was due to moderate sedation work being included in the intra-time instead of pre-time component. In addition, the RUC reviewed code 49452 *Replacement of gastro-jejunostomy tube, percutaneous, under fluoroscopic guidance including contrast injection(s), image documentation and report* (work RVU=2.86) and noted that both codes have identical intra-service times and similar total times. The RUC reviewed code 93503 *Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes* (work RVU=2.91, 12/15/10), which has less total time, but higher intensity than code 43204. Finally, the RUC agreed with the specialties that this service was among the highest intensity services of this family of esophagoscopy codes because the patients undergoing this service are actively bleeding at the time of examination and treatment and typically have decompensated liver disease, as described in the vignette. The specialties noted, and the RUC agreed, that the difference in the current survey intra-time and Harvard intra-time is due to a shift of reporting moderate sedation work from the intra-service to the pre-service component. **The RUC recommends a work RVU of 2.89 for CPT code 43204.**

#### **43205 Esophagoscopy, flexible, transoral; with band ligation of esophageal varices**

The RUC reviewed the survey results of 108 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 33 minutes, intra-service time of 20 minutes and post-service time of 10 minutes. The RUC also accepted pre-service package 2B *Facility difficult patient under sedation* with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty that the current work RVU of 3.78, slightly above the survey median, overestimated the physician work involved in this service. The RUC determined that a work RVU of 3.00, the survey 25<sup>th</sup> percentile, is an accurate measure of the physician work to perform code 43205. To justify this value, the RUC reviewed MPC code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU=2.78) and determined that the intensity and total physician work of 43205 is greater compared to the reference code because of a more complex patient. The RUC also noted that the higher intra-time in 31622 was due to moderate sedation work being included in the intra-time instead of pre-time component. In addition, the RUC reviewed code 49452 *Replacement of gastro-jejunostomy tube, percutaneous, under fluoroscopic guidance including contrast injection(s), image documentation and report* (work RVU=2.86), which has identical intra-service time compared to code 43205, but includes less intense guidance work. The RUC reviewed code 93503 *Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes* (work RVU=2.91, 12/15/10), which has less total time, but higher intensity than code 43205. Finally, the RUC agreed with the specialties that this service was among the highest intensity services of this family of esophagoscopy codes because the patients undergoing this service are actively bleeding at the time of examination and treatment and typically have decompensated liver disease, as described in the vignette. The RUC determined that the difference in the current survey intra-time and previous RUC survey in 1993 is due to a shift of reporting moderate sedation work from the intra-service to the pre-service component. The RUC also compared the intensity difference between 43205 and 43204 and noted that the physician work was more intense for code 43205 due to increased complexity of banding varices in an actively bleeding patient. **The RUC recommends a work RVU of 3.00 for CPT code 43205.**

#### **43206 Esophagoscopy, flexible, transoral; with optical endomicroscopy**

The RUC reviewed the survey results of 109 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 27 minutes, intra-service time of 30 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that pre-service package 1B *Facility straightforward patient under sedation* was appropriate with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialties that both the survey median and 25<sup>th</sup> percentile work RVUs overstated the work included in this service. To determine an appropriate value, the RUC reviewed CPT code 12006 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 20.1 cm to 30.0 cm* (work RVU=2.39) and determined that with identical intra-service time of 30 minutes, this service would require similar total physician work even though 43206 includes moderate sedation and 12006 includes local anesthesia. Therefore, the RUC determined, and the specialty agreed, that a work RVU of 2.39, a direct crosswalk to code 12006, correctly ranks this new code to the base code 43200. In addition, the RUC considered that 43206 includes a diagnostic esophagoscopy followed by further diagnostic work utilizing an optical endomicroscope. This service is similar to two diagnostic services and that by applying the multiple procedure rule, would be equal to 2.39 work RVUs (1.59 + 1.59/2). **The RUC recommends a work RVU of 2.39 for CPT code 43206.**

#### **43215 Esophagoscopy, flexible, transoral; with removal of foreign body**

The RUC reviewed the survey results of 102 gastroenterologists, otolaryngologists, and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 33 minutes, intra-service time of 20 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that patients undergoing sclerotherapy of esophageal varices are considered difficult because of the underlying co-morbidities from cirrhosis, cancer, encephalopathy, and/or coagulopathy that are typical. The RUC also accepted pre-service package 2B *Facility difficult patient under sedation* with two additional minutes to properly position the patient.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated work RVUs and agreed with the specialty that they overestimated the work value at the 25<sup>th</sup> percentile. Therefore, the RUC determined that a work RVU of 2.60, the current value and less than the survey 25<sup>th</sup> percentile, is appropriate for CPT code 43215. To justify this value, the RUC reviewed three codes: MPC code 51102 *Aspiration of bladder; with insertion of suprapubic catheter* (work RVU=2.70); CPT code 52281 *Cystourethroscopy, with calibration and/or dilation of urethral stricture or stenosis, with or without meatotomy, with or without injection procedure for cystography, male or female* (work RVU=2.75) and CPT code 31295 *Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa* (work RVU=2.70). Each of these reference codes have identical intra-service time, 20 minutes, compared to the surveyed code and provide ample support that the current work RVU of 2.60 accurately values code 43215 relative to services across the RBRVS. Finally, the RUC discussed the differences in Harvard time compared to the current survey time. The specialties argued and the RUC agreed that the work to perform this service has not changed and that 20 minutes of intra-time is appropriate. The specialties noted that the difference in the current survey intra-time and Harvard intra-time is due to a shift of reporting moderate sedation work from the intra-service to the pre-service component. In addition, it was noted that the Harvard study did not include a typical patient and that code descriptor can represent a variety of foreign bodies. **The RUC recommends a work RVU of 2.60 for CPT code 43215.**

**43216 *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery***

The RUC reviewed the survey results of 99 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 33 minutes, intra-service time of 22 minutes and post-service time of 10 minutes. The specialties argued and the RUC agreed that the work to perform this service has not changed and that 22 minutes of intra-time is appropriate. The specialties noted that the time data included in the RUC database is asterisked to "not use for validation of physician work." As described in the RUC rationale, the value for this code is based on independent work by CMS to value the increment and not on survey data. The RUC also accepted pre-service package 2B *Facility difficult patient under sedation* with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated work RVUs and agreed with the specialty that they overestimated the work value at the 25<sup>th</sup> percentile. Therefore, the RUC determined that a work RVU of 2.40, the current value and less than the survey 25<sup>th</sup> percentile, is appropriate for CPT code 43216. To justify this value, the RUC reviewed MPC code 52000 *Cystourethroscopy (separate procedure)* (work RVU=2.23) and noted that the reference code has 7 minutes less intra-service time compared to the surveyed code and should be valued less. The RUC also reviewed two additional codes that bracket the recommended work value for 43216: CPT code 45341 *Sigmoidoscopy, flexible; with endoscopic ultrasound examination* (work RVU=2.60, intra-service time= 30 minutes) and CPT code 57454 *Colposcopy of the cervix including upper/adjacent vagina; with biopsy(s) of the cervix and endocervical curettage* (work RVU=2.33, intra-service time= 20 minutes). Finally, the RUC compared code 43216 to code 43215, *flexible foreign body removal*, and agreed that while 43216 has 2 more minutes of intra-service time, the physician work is less intense and should be valued slightly less. The current work RVU of 2.40 is also relative to CPT code 43202, *flexible biopsy*, (RUC recommended work RVU= 1.89) as 43216 has 7 additional intra-service minutes. **The RUC recommends a work RVU of 2.40 for CPT code 43216.**

**43217 *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique***

The RUC reviewed the survey results of 90 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 33 minutes, intra-service time of 30 minutes and post-service time of 10 minutes. The specialties argued and the RUC agreed that the work to perform this service has not changed and that 30 minutes of intra-time is appropriate. The RUC also accepted pre-service package 2B *Facility difficult patient under sedation* with two additional minutes to properly position the patient.

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

The RUC reviewed the survey respondents' estimated work RVUs and agreed with the specialty that they overestimated the work value at the 25<sup>th</sup> percentile. Therefore, the RUC determined that a work RVU of 2.90, the current value and less than the survey 25<sup>th</sup> percentile, is appropriate for CPT code 43217. To justify this value, the RUC reviewed MPC code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (work RVU=2.78) and agreed that given both services have identical intra-service time, 30 minutes, both codes should have similar work values. The RUC also reviewed two codes that bracket the recommended work RVUs: CPT code 49452 *Replacement of gastro-jejunostomy tube, percutaneous, under fluoroscopic guidance including contrast injection(s), image documentation and report* (work RVU=2.86, intra-service time= 20 minutes) is a less intense procedure and should be valued slightly less and CPT code 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU=3.30, intra-service time= 30 minutes) is a more intense procedure and should be valued higher than code 43217. Finally, the RUC noted that the recommended work value appropriately ranks code 43217 to 43216, *flexible lesion removal by hot biopsy*, as 43217 has 8 additional minutes of intra-service time. **The RUC recommends a work RVU of 2.90 for CPT code 43217.**

#### **43211 Esophagoscopy, flexible, transoral; with endoscopic mucosal resection**

The RUC reviewed the survey results from 62 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 45 minutes and post-service time= 18 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this new code, with a survey 25<sup>th</sup> percentile work RVU of 4.91. Consistent with the RUC approved EGD recommendations in January 2013, the RUC agreed that, to remain consistent, code 43211 should be valued less than the equivalent EGD code 43254 (recommended work RVU= 5.25). To define the appropriate reduction, the RUC determined the established increment between the base EGD code, 43235 (recommended work RVU= 2.26), and the base esophagoscopy code, 43200 (recommended work RVU= 1.59). Therefore, the resulting incremental difference of 0.67 work RVUs was subtracted from 43254, for a recommended work RVU of 4.58. To validate a work RVU of 4.58, the RUC compared the surveyed code to CPT code 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58) and agreed that since both codes have identical intra-service time, 45 minutes, and analogous physician work, both codes should be valued identically. In addition, the RUC reviewed CPT code 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU= 5.35) and noted that while both codes have identical intra-service time, the reference code is a more intense procedure and has more total time than 43211. Therefore, the RUC agreed that the reference code should be valued higher. **The RUC recommends a work RVU of 4.58 for CPT code 43211.**

**43212 Esophagoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)**

The RUC reviewed the survey results from 53 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this new code, with a survey 25<sup>th</sup> percentile work RVU of 4.36. Consistent with the RUC approved EGD recommendations in January 2013, the RUC agreed that, to remain consistent, code 43212 should be valued less than the equivalent EGD code 43266 (recommended work RVU= 4.40). To define the appropriate reduction, the RUC determined the established increment between the base EGD code, 43235 (recommended work RVU= 2.26), and the base esophagoscopy code, 43200 (recommended work RVU= 1.59). Therefore, the resulting incremental difference of 0.67 work RVUs was subtracted from 43266, for a recommended work RVU of 3.73. To validate a work RVU of 3.73, the RUC compared the surveyed code to CPT code 31296 *Nasal/sinus endoscopy, surgical; with dilation of frontal sinus ostium (eg, balloon dilation)* (work RVU= 3.29) and noted that while both codes have identical intra-service time, 30 minutes, 43212 should be valued higher due to greater intensity and complexity. The RUC also reviewed CPT code 20660 *Application of cranial tongs, caliper, or stereotactic frame, including removal (separate procedure)* (work RVU= 4.00) and noted that this reference code is more intense than 43212 and should be valued slightly higher. Finally, the RUC compared 43212 to 43214 and agreed that with almost identical physician time, the two services are correctly valued similarly. **The RUC recommends a work RVU of 3.73 for CPT code 43212.**

**43220 Esophagoscopy, flexible, transoral; with balloon dilation (less than 30 mm diameter)**

The RUC reviewed the survey results of 109 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 27 minutes, intra-service time of 20 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that pre-service package 1B *Facility straightforward patient under sedation* was appropriate with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated work RVUs and agreed with the specialty that they overestimated the work value at the 25<sup>th</sup> percentile. Therefore, the RUC determined that a work RVU of 2.10, the current value and less than the survey 25<sup>th</sup> percentile, is appropriate for CPT code 43220. To justify this value, the RUC reviewed CPT code 57421 *Colposcopy of the entire vagina, with cervix if present; with biopsy(s) of vagina/cervix* (work RVU=2.20) and noted that both codes have identical intra-service time, 20 minutes, and therefore, should be valued similarly. The RUC also reviewed CPT code 69801 *Labyrinthotomy, with perfusion of vestibuloactive drug(s); transcanal* (work RVU=2.06) and agreed that while reference code has 5 minutes less intra-service time compared to 43220, the surveyed code has much greater total time and should be valued slightly higher. CPT code 52000 *Cystourethroscopy (separate procedure)* (work RVU= 2.23) was also reviewed and the RUC agreed that with less total time compared to the surveyed code, 42 minutes and 57 minutes, respectively, the reference code is appropriately valued less than 43220. Finally, the RUC compared code 43220 to other similar codes in the family with 20 minutes of intra-service time and agreed that a work RVU of 2.10 accurately values this service relative to the other services. **The RUC recommends a work RVU of 2.10 for CPT code 43220.**

***43213 Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)***

The RUC reviewed the survey results from 45 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 45 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that since there is no equivalent esophagoscopy crosswalk to determine the incremental physician work, the survey's 25<sup>th</sup> percentile work RVU of 5.00 is appropriate. To validate this work value, the RUC compared the surveyed code to CPT code 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58) and agreed that while both services have identical intra-service time, 45 minutes, the surveyed code is a more intense procedure and should be valued slightly higher. The RUC also reviewed CPT code 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU= 5.35) and noted that this reference code has greater total time than the surveyed code, 116 minutes and 101 minutes, respectively. Therefore, 43213 is appropriately valued slightly less than 36251. **The RUC recommends a work RVU of 5.00 for CPT code 43213.**

***43214 Esophagoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)***

The RUC reviewed the survey results from 42 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 16 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this new code, with a survey 25<sup>th</sup> percentile work RVU of 3.86. Consistent with the RUC approved EGD recommendations in January 2013, the RUC agreed that, to remain consistent, code 43214 should be valued less than the equivalent EGD code 43233 (recommended work RVU= 4.45). To define the appropriate reduction, the RUC determined the established increment between the base EGD code, 43235 (recommended work RVU= 2.26), and the base esophagoscopy code, 43200 (recommended work RVU= 1.59). Therefore, the resulting incremental difference of 0.67 work RVUs was subtracted from 43233, for a recommended work RVU of 3.78. To validate a work RVU of 3.78, the RUC compared the surveyed code to 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU= 3.30) and noted that while both codes have identical intra-service time, 30 minutes, 43214 should be valued higher due to greater intensity and complexity. In addition, the RUC reviewed CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) and agreed that the reference code is a slightly more intense service compared to the surveyed code and is appropriately valued higher. **The RUC recommends a work RVU of 3.78 for CPT code 43214.**

**43226 Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire**

The RUC reviewed the survey results of 114 gastroenterologists, otolaryngologists, and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 27 minutes, intra-service time of 25 minutes and post-service time of 10 minutes. The RUC agreed with the specialties that pre-service package 1B *Facility straightforward patient under sedation* was appropriate with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated work RVUs and agreed with the specialty that they overestimated the work value at the 25<sup>th</sup> percentile. Therefore, the RUC determined that a work RVU of 2.34, the current value and less than the survey 25<sup>th</sup> percentile, is appropriate for CPT code 43226. To justify this value, the RUC reviewed CPT code 49083 *Abdominal paracentesis (diagnostic or therapeutic); with imaging guidance* (work RVU= 2.00) and agreed that while both services have identical intra-service time, code 43226 is a more intense and complex procedure to perform and should be valued higher. In addition, the RUC reviewed CPT code 57454 *Colposcopy of the cervix including upper/adjacent vagina; with biopsy(s) of the cervix and endocervical curettage* (work RVU=2.33) and agreed that since the surveyed code has more intra-service time it should be valued slightly higher than the reference code. CPT code 69801 *Labyrinthotomy, with perfusion of vestibuloactive drug(s); transcanal* (work RVU= 2.06) was also reviewed and the RUC agreed that with less total time compared to the surveyed code, 43 minutes and 57 minutes, respectively, the reference code is appropriately valued less than 43226. Finally, code 43226 was compared to code 43220 *flexible with balloon dilation* (RUC recommended work RVU= 2.10) and the RUC agreed that 43226 should be valued higher due to 5 more minutes of intra-service time. **The RUC recommends a work RVU of 2.34 for CPT code 43226.**

**43227 Esophagoscopy, flexible, transoral; with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator)**

The RUC reviewed the survey results of 87 gastroenterologists and gastrointestinal and endoscopic surgeons and recommend the following physician time components: pre-service time of 33 minutes, intra-service time of 30 minutes and post-service time of 10 minutes. The RUC also accepted pre-service package 2B *Facility difficult patient under sedation* with two additional minutes to properly position the patient.

The RUC reviewed the survey respondents' estimated work RVUs and agreed with the specialty that they overestimated the work value at the median level. Therefore, the RUC determined that the survey 25<sup>th</sup> percentile work RVU of 3.26, less than the current value, is appropriate for CPT code 43226. To justify this value, the RUC reviewed CPT code 31625 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU=3.36) and noted that both services have identical intra-service time, 30 minutes, and should be valued similarly. In addition, the RUC compared 43227 to CPT code 58555 *Hysteroscopy, diagnostic (separate procedure)* (work RVU=3.33) and agreed that while the reference code has 5 minutes less intra-service time, it has greater total time and should be valued slightly higher than code 43227. The RUC also reviewed MPC code 15002 *Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, trunk, arms, legs; first 100 sq cm or 1% of body area of infants and children* (work RVU=3.65, intra= 20 minutes) and noted that although the surveyed code has 10 minutes more intra-service time, the reference code has much greater total time, 102 minutes compared to 73 minutes, and is appropriately valued higher than 43227. Finally, the RUC agreed with the specialties that this service was among the highest intensity services of this family of esophagoscopy codes because the patients undergoing this service are actively bleeding at the time of examination and treatment, as described in the vignette. The specialties noted, and the RUC agreed, that the difference in the current survey intra-time and Harvard intra-time is due to a shift of reporting moderate sedation work from the intra-service to the pre-service component. **The RUC recommends a work RVU of 3.26 for CPT code 43227.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

***43229 Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)***

The RUC reviewed the survey results from 51 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 40 minutes, intra-service time= 45 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this new code, with a survey 25<sup>th</sup> percentile work RVU of 4.68. Consistent with the RUC approved EGD recommendations in January 2013, the RUC agreed that, to remain consistent, code 43229 should be valued less than the equivalent EGD code 43270 (recommended work RVU= 4.39). To define the appropriate reduction, the RUC determined the established increment between the base EGD code, 43235 (recommended work RVU= 2.26), and the base esophagoscopy code, 43200 (recommended work RVU= 1.59). Therefore, the resulting incremental difference of 0.67 work RVUs was subtracted from 43270, for a recommended work RVU of 3.72. To validate a work RVU of 3.72, the RUC compared the surveyed code to CPT code 19105 *Ablation, cryosurgical, of fibroadenoma, including ultrasound guidance, each fibroadenoma* (work RVU= 3.69) and agreed that since both codes have 45 minutes of intra-service time and almost identical total time, the two services should be valued similarly. The RUC also reviewed 31626 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of fiducial markers, single or multiple* (work RVU= 4.16) and noted that the reference code is a more intense procedure and should be valued higher than 43229. Finally, the RUC compared 43229 to 43212 and 43214 and agreed that while 43229 has 15 minutes more intra-service time compared to these two codes, this surveyed code should be valued similarly as it is a less intense services comparably. **The RUC recommends a work RVU of 3.72 for CPT code 43229.**

***43231 Esophagoscopy, flexible, transoral; with endoscopic ultrasound examination***

The RUC reviewed the survey results from 45 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the survey respondents' physician work values estimates and agreed with the specialty societies that they were overvalued. The RUC noted that the median intra-service time of 30 minutes is less than the current time of 40 minutes. However, the previous survey valued this procedure with moderate sedation inherent in the intra-service time. With the subsequent establishment of pre-service time packages, moderate sedation is now considered pre-service time. Removing 10 minutes of intra-service time, accounting for the moderate sedation, from the previous survey, provides a reasonable comparison to the new survey, and suggests that the recommended intra-service time of 30 minutes is accurate. Given this information and the fact that the physician work has not changed since the previous valuation, the RUC agreed with the specialty societies that the current work RVU of 3.19 is appropriate for this procedure. To justify this work value, the RUC compared the surveyed code to CPT codes 36200 *Introduction of catheter, aorta* (work RVU= 3.02, intra time= 30 minutes) and 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU= 3.30, intra time= 30 minutes) and noted that both reference services have identical intra-service time compared to the surveyed code, with comparable physician work. Therefore, the recommended work RVU of 3.19 is accurately valued between these two services. **The RUC recommends a work RVU of 3.19 for CPT code 43231.**

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

**43232 Esophagoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)**

The RUC reviewed the survey results from 38 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 45 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the survey respondents' physician work values estimates and agreed with the specialty societies that they were overvalued. To ensure that the recommendation remains consistent with the equivalent fine needle aspiration procedure in the EGD family, the RUC applied the incremental approach to value this service. As the base value, the RUC started with the RUC recommended EGD fine needle aspiration code (43238, RUC recommended work RVU= 4.50) and subtracted out the difference between the base EGD (43235, RUC recommended work RVU= 2.26) and esophagoscopy (43200, RUC recommended work RVU= 1.59) codes = 0.67 work RVUs. This ensures that the value contains only the esophagoscopy incremental work and not the increased work associated with EGD procedure. The RUC agreed that the resultant work value of 3.83 (4.50 - 0.67) was appropriate for 43232. To justify a work value of 3.83, the RUC first noted that the established increment of fine needle aspiration in the EGD family is 0.67 (43238, recommended work RVU= 4.50 – 43237, recommended work RVU= 3.85), validating the increment used in this methodology. Additionally, the RUC compared the surveyed code to CPT codes 32553 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple* (work RVU= 3.80, intra time= 45 minutes) and 11044 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); first 20 sq cm or less* (work RVU= 4.10, intra time= 45 minutes) and noted that both services have identical intra-service time and comparable physician work to the surveyed code. Therefore, the RUC agreed that the recommended value of 3.83 is appropriately placed between these two reference services. **The RUC recommends a work RVU of 3.83 for CPT code 43232.**

**Practice Expense:**

At the October 2012 RUC meeting the PE Subcommittee reviewed the direct practice expense inputs recommended by the specialties and made modifications to the clinical staff times, medical supplies, and equipment items and time. In addition, several items listed as new equipment were reclassified as supplies with existing codes and equipment minutes were converted from units to minutes. The RUC accepted the direct practice expense inputs for these codes as modified by the Practice Expense Subcommittee.

At the January 2013 RUC meeting the practice expense for these services was a direct crosswalk to the approved practice expense for the related esophagoscopy codes approved at the October 2012 RUC meeting. At the January 2013 RUC meeting the Practice Expense Subcommittee recommended and the RUC approved the following changes to the practice expense for esophagogastroduodenoscopy and the specialty requests that the changes be applied to the esophagoscopy codes that were previously approved at the October 2012 RUC meeting.

- Addition of 3 minutes to “Prepare room, equipment, supplies” (L037D) for code 43252 (Esophagogastroduodenoscopy; with optical endomicroscopy) for the technician to turn on the optical endomicroscope processor unit system added to its esophagoscopy counterpart, 43206 (Esophagoscopy, flexible, transoral; with optical endomicroscopy)
- At the last meeting the Practice Expense Subcommittee used equipment practice expense input EQ322 Radiofrequency generator (Angiodynamics), liver RFA as a proxy. The specialty will identify a more appropriate RF ablation system for 43270 (Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)) and provide an invoice for this equipment. It should also be added to its esophagoscopy

CPT five-digit codes, two-digit modifiers, and descriptions only are copyright by the American Medical Association.

counterpart 43229 (Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)) which replaced 43228

- Addition of “Instrument pack basic (\$500 - \$1,499)” (EQ137) for 43248 (Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire) added to its esophagoscopy counterpart 43226 (Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire)
- Addition of “Pack, cleaning, surgical instruments” (SA043) for 43248 (Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire) for cleaning the dilators added to its counterpart 43226 (Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire)

In April 2013, the RUC recommends the direct practice expense for the two facility only codes, 43231 and 43232, as submitted by the specialty societies and approved by the Practice Expense Subcommittee.

#### Work Neutrality:

The RUC’s recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<p>For endoscopic procedures, code appropriate endoscopy of each anatomic site examined.</p> <p><u>When bleeding occurs as a result of an endoscopic procedure, control of bleeding is not reported separately during the same operative session.</u></p> <p><u>Esophagoscopy includes examination from the cricopharyngeus muscle (upper esophageal sphincter) to and including the gastroesophageal junction. It may also include examination of the-proximal region of the stomach via retroflexion when performed.</u> Surgical endoscopy always includes diagnostic endoscopy.</p>				
●43191	C1	<p>Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed</p> <p><u>(To report transnasal esophagoscopy, see 43197-43198)</u></p> <p><u>(For diagnostic flexible transoral esophagoscopy, use 43200)</u></p>	000	2.78

#◎●43212	C26	with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed) <u>(Do not report 43212 in conjunction with 43220, 43226)</u>	000	3.73

◎▲43220	C19	<p>with <u>transendoscopic</u> balloon dilation (less than 30 mm diameter)  <u>(For rigid transoral esophagoscopy with balloon dilation [less than 30 mm diameter], use 43195)</u>          (If imaging guidance is performed, use 74360)          (For <u>esophageal endoscopic</u> dilation with balloon 30 mm diameter or larger, use 43458<u>43214</u>)          (For dilation without <u>endoscopic</u> visualization, <u>see 43450, 43453</u>)  <del>(For diagnostic fiberoptic esophagogastrosocopy, use 43200, 43235)</del>  <del>(For fiberoptic esophagogastrosocopy with biopsy or collection of specimen, see 43200, 43202, 43235, 43239)</del>  <del>(For fiberoptic esophagogastrosocopy with removal of foreign body, use 43215, 43247)</del>  <del>(For fiberoptic esophagogastrosocopy with removal of polyp(s), use 43217, 43251)</del>  <u>(Do not report 43220 in conjunction with 43212, 43226, 43229)</u></p>	000	2.10 (No Change)
#◎●43213	C27	<p>with dilation of esophagus, by balloon or dilator, retrograde          (includes fluoroscopic guidance, when performed)  <u>(Do not report 43213 in conjunction with 74360, 76000, 76001)</u></p>	000	5.00
#◎●43214	C28	<p>with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)  <u>(Do not report 43214 in conjunction with 74360, 76000, 76001)</u></p>	000	3.78
◎▲43226	C20	<p>with insertion of guide wire followed by <u>dilation passage of dilator(s)</u> over guide wire          (For radiological supervision and interpretation, use 74360)  <u>(For rigid transoral esophagoscopy with insertion of guide wire followed by dilation over guide wire, use 43196)</u>  <u>(Do not report 43226 in conjunction with 43212, 43229)</u></p>	000	2.34 (No Change)

◎▲43227	C21	with control of bleeding, any method ( <del>eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator</del> )  (Do not report 43227 in conjunction with 43204, 43205)	000	3.26
D43228	C22	<del>with ablation of tumor(s), polyp(s), or other lesion(s), not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique</del>  (43228 has been deleted. To report, use 43229)	000	N/A
#◎●43229	C29	with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)  (Do not report 43229 with 43220, 43226)  (For esophagoscopy photodynamic therapy, report <del>43228</del> 43229 in conjunction with 96570, 96571 as appropriate)	000	3.72
◎▲43231	C23	with endoscopic ultrasound examination  (Do not report 43231 in conjunction with 76975)	000	3.19 (No Change)
◎▲43232	C24	with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)  (Do not report 43232 in conjunction with <u>43231</u> , 76942, 76975) (For interpretation of specimen, see 88172-88173) (Code is out of numerical sequence. See 43235-43273)	000	3.83
D43234		<del>Upper gastrointestinal endoscopy, simple primary examination (eg, with small diameter flexible endoscope) (separate procedure);</del>  (43234 has been deleted. To report <u>esophagogastrosocopy</u> , see 43197, use <u>43200</u> , <u>43235</u> )	000	N/A

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43191      Tracking Number C1      Original Specialty Recommended RVU: **2.78**  
 Presented Recommended RVU: **2.78**  
 Global Period: 000      RUC Recommended RVU: **2.78**

CPT Descriptor: Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60 year-old man with newly diagnosed squamous cell carcinoma of the oral cavity presents with dysphagia. A rigid esophagoscopy is performed for further evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 24%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

**Description of Pre-Service Work:**

After the decision is made to perform a diagnostic rigid esophagoscopy the physician must perform the following steps to prepare the patient and the room for the procedure.

- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Assess need for beta-blockers, order as required.
- Review medical history, pathology, and radiology report.
- Review radiographic images.
- Review results of preoperative testing (labs, EKG, CXR).
- Review reports of consultants providing preoperative assessment and clearance as indicated.
- Meet with patient and family to review planned procedure and postoperative management.
- Reexamine patient to ensure that physical findings have not changed and dictate history and physical.
- Obtain informed consent.
- Review airway and medical management with anesthesiologist.
- Review planned procedure with OR staff.
- Verify that all required instruments and supplies are available, set up scopes, suction, light source, and photodocumentation equipment and ensure functionality.
- Change into scrub clothes.
- Observe/wait during induction of anesthesia and intubation.
- Monitor/assist with positioning of the patient (supine, shoulder roll, ensure security and position of endotracheal tube).

- Ensure that radiographic images are available in the OR.
- Monitor/assist with draping.
- Scrub and gown.
- Operating table is turned with head toward endoscopist.
- Perform surgical "time out" with operating surgical team.

#### Description of Intra-Service Work:

The mouth is opened and teeth/gums protected. Suction pharyngeal secretions. The rigid esophagoscope is introduced and passed through mouth, behind the endotracheal tube and larynx into cricopharyngeus and into the esophagus. The esophagoscope is advanced to the distal esophagus, the scope and patient position are readjusted as needed to ensure safe and smooth passage of the scope and suctioning secretions. The mucosa (lining) is evaluated and photodocumentation recorded. The esophagoscope is removed and the pharynx examined for bleeding and suctioned free of secretions. The patient is returned to the anesthesia position.

#### Description of Post-Service Work:

- Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and operative findings with family and the patient.
- Write postoperative note. Dictate operative note and copy to referring physician.
- Monitor patient progress. Chart notes.
- Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function
- Assess pain scores and adequacy of analgesia.
- Discuss post-discharge management with nursing staff and answer questions
- Home restrictions (i.e., diet, activity) are discussed with the patient, family members and discharging nurse.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
31622	000	2.78	RUC Time

CPT Descriptor Bronchoscopy, rigid or flexible, with or without fluoroscopic guidance; diagnostic, with or without cell washing (separate procedure).

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
51102	000	2.70	RUC Time	14,057

CPT Descriptor 1 Aspiration of bladder; with insertion of suprapubic catheter.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
19103	000	3.69	RUC Time	116,377

CPT Descriptor 2 Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
31623	000	2.88	RUC Time

CPT Descriptor Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with brushing or protected brushings.

**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Key Reference Code: 35      % of respondents: 59.3 %**

**TIME ESTIMATES (Median)**

	<u>CPT Code:</u> <u>43191</u>	<u>Key Reference CPT Code:</u> <u>31622</u>	<u>Source of Time</u> <u>RUC Time</u>
Median Pre-Service Time	51.00	20.00

------------------------------------	------	------

Post-Service intensity/complexity	2.89	2.86
-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review all of the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 (Esophagoscopy, rigid or flexible; with directed submucosal injection(s), any substance) code. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting.

### **Description of Random Survey Sample**

Our physician work RVU recommendation was derived by conducting a random survey of our Membership, using the standard 000 global survey instrument. Surveys were sent to nearly 700 Otolaryngologists, including the subspecialties of laryngology and broncoesophagology, as well as to the Academy's leadership and key committees, such as the Airway and Swallowing and Voice, which contain clinicians who were most likely to be familiar with the services under review.

### **Physician Time**

#### **Pre-Time**

Regarding physician time, we recommend using pre-service package 4 (difficult patient/difficult procedure) which includes 40 minutes of evaluation, 3 minutes of positioning, and 20 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that the vignette for this service represents an elderly patient with cancer who requires a rigid esophagoscopy procedure. Our experts believed this patient is often sicker and more complex than a standard patient undergoing flexible, transoral esophagoscopy. In addition, this procedure is only performed in the facility setting and must be done under general anesthesia. Therefore, prepackage 4 is most appropriate for the preservice work required for the typical patient. While our experts felt that the 40 minutes of evaluation time associated with prepackage 4 was appropriate for this procedure, our survey respondents only indicated 35 minutes of evaluation time, therefore we are recommending a reduction of 5 minutes of evaluation time in order to maintain consistency with our survey data. Similarly, our panel reviewed the 20 minutes of scrub dress and wait time assigned by the prepackage and felt this amount of time was not necessary for this procedure. Therefore we recommend reducing this to 10 minutes for scrub, dress and wait which is also consistent with our survey responses. In contrast, we believe that the package time of 3 minutes for positioning is not sufficient for patients undergoing this procedure and therefore, recommend adding 3 minutes of positioning time. We believe this increase in positioning time is justified, given that the physician must position the patient in the supine position, place a shoulder roll, ensure security and position the endotracheal tube together with the anesthetist. Prior to beginning the procedure, the operating table must also be turned so that the patient's head is facing the endoscopist. These modifications result in an overall pre-service time recommendation of 35/6/10 for 43191.

#### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 20 minutes for intra service work.

#### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 15 minutes. This results in a request for a total of 86 minutes of physician work time for CPT 43191.

### **Physician Work / Compelling Evidence**

After concluding the survey, the results were analyzed by our expert panel and it was determined that for the newly developed rigid esophagoscopy codes (43191-6) the existing work RVUs were not sufficient for the amount of work being done for procedures where the physician is using a rigid scope in the facility setting, under general anesthesia. In addition, it has come to our attention that the previous code used to bill this service, 43200, is a Harvard valued code which was surveyed by 21 Gastroenterologists. Therefore, given that no Otolaryngologists participated in the original survey of the 43200 code, it is unlikely that the work for diagnostic esophagoscopy using a rigid scope has ever been properly valued or even considered as part of the survey for 43200, as Gastroenterologists do not perform esophagoscopy procedures using a rigid endoscope.

Thus, we believe there is compelling evidence for re-valuation of the new CPT code 43191 given that incorrect assumptions were made in previous valuations of the service where the dominant provider of rigid esophagoscopy services,

Otolaryngology, were not included in the initial survey of the former combination code (43200). Upon review of this history, our expert panel determined that the work RVUs for the service (Esophagoscopy, rigid or flexible; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)) are not sufficient to value the work performed when an esophagoscopy is administered in the facility setting, using a rigid scope, under general anesthesia. Our expert panel therefore, recommends that the RVW for the new code 43191 (Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed) should be increased based on the compelling evidence outlined above to more accurately represent the correct specialty mix for rigid esophagoscopy procedures as well as the more intense and complex work of performing an esophagoscopy procedure in the facility setting with a rigid scope, under general anesthesia. **Therefore, we are recommending an increased work RVU of 2.78 for CPT 43191 which is above the existing RVU of 1.59, and equals the survey's 25<sup>th</sup> percentile.**

We believe the above recommendation is also supported by the key reference code, 31622, which has an identical work RVU of 2.78 and which survey respondents indicated was similar in intensity and complexity to the new 4319X1 CPT code. We are also providing the following reference tables which include recently reviewed services which support our requested values for physician time and work for CPT 43191.

#### Comparison to key reference code

<u>CPT Code</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>43191</b>	2.78	0.0722	86	35	6	10	20	15
<b>31622</b>	2.78	0.0689	65	10	5	5	30	15

#### Comparison to MPC codes

<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>51102</b>	Aspiration of bladder; with insertion of suprapubic catheter	2.70	0.0938	60	19	1	5	20	15
<b>43191</b>	Esophagoscopy, rigid transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed.	2.78	0.0722	86	35	6	10	20	15
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating	3.69	0.0969	65	20	0	0	30	15

The table below compares the survey code to other RUC reviewed codes of similar time and work, providing further support that the recommended value for 4319X1 is appropriate.

<u>RUC Reviewed</u>	<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>

#### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☒ Other reason (please explain) Diagnostic evaluation under anesthesia of a patient with cancer in the upper aerodigestive tract often includes both laryngoscopy and esophagoscopy using different instruments for evaluation of distinct regions.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Diagnostic rigid esophagoscopy would typically be reported with one of the following laryngoscopy codes. See clinical explanation above. When coded together, the primary procedure or service will be reported as listed. The additional procedure or service will be identified by appending modifier 51 to the additional procedure or service code.

CPT Code	Global	Work RVU	Pre time	Intra	Post
43191	000	2.78	51	20	15
31525	000	2.63	14	19	14
31526	000	2.57	30	32	16
31535	000	3.16	35	24	13
31536	000	3.55	32	39	12

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43200

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 18957

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 71 percent of the existing 43200 will continue to be attributable to Otolaryngology. Second, that 60 percent of the Otolaryngology portion of the existing 43200 volume will be reported using the new 4319X1 code, 30 percent will be attributed to the revised 43200 code, and 10 percent will be attributed to the new 4319X7 code. In addition, we have assumed that the national volume will be three times that of the Medicare volume given that about 1/3 of the patient population with cancer will be elderly and Medicare patients.

Specialty Otolaryngology                      Frequency 18957                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,319

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 60 percent of the current Otolaryngology volume for existing CPT 43200 will be represented by the new CPT code 43191.

Specialty Otolaryngology	Frequency 6319	Percentage 100.00 %
--------------------------	----------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31575

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43192      Tracking Number C2      Original Specialty Recommended RVU: **3.21**  
 Presented Recommended RVU: **3.21**  
 Global Period: 000      RUC Recommended RVU: **3.21**

CPT Descriptor: Esophagoscopy, rigid, transoral; with directed submucosal injection(s), any substance.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75-year-old man with a history of radiation therapy for lung cancer has difficulty swallowing due to an esophageal stricture. A rigid esophagoscopy is performed and the stenotic area is injected with steroid solution.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 26%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

**Description of Pre-Service Work:**

- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Assess need for beta-blockers, order as required.
- Review medical history, pathology, and radiology report
- Review radiographic images
- Review results of preoperative testing (labs, EKG, CXR)
- Review reports of consultants providing preoperative assessment and clearance as indicated
- Meet with patient and family to review planned procedure and postoperative management
- Reexamine patient to ensure that physical findings have not changed and dictate history and physical
- Obtain informed consent
- Review airway and medical management with anesthesiologist
- Review planned procedure with OR staff
- Verify that all required instruments and supplies are available, set up scopes, suction, light source, injection needle, steroid/medication) to ensure readiness
- Change into scrub clothes
- Observe/wait during induction of anesthesia and intubation
- Monitor/assist with positioning of the patient (supine, shoulder roll, ensure security and position of endotracheal tube)
- Ensure that radiographic images are available in the OR
- Monitor/assist with draping
- Scrub and gown

- Operating table is turned with head toward endoscopist
- Perform surgical "time out" with operating surgical team.

#### Description of Intra-Service Work:

The mouth is opened and teeth/gums protected. Suction pharyngeal secretions. Rigid esophagoscope is introduced and passed through mouth, behind the endotracheal tube and larynx into cricopharyngeus and into the esophagus. The esophagoscope is advanced, the mucosa is evaluated, and a stricture is encountered and visualization optimized, readjusting scope and patient position as needed to ensure safe and smooth passage of the scope and suctioning secretions. Photodocumentation is obtained. The stenotic ring is injected in several locations under direct vision and blood is removed with suction, observing the injection site while bleeding dissipates. Hemostatic treatment is provided as needed. The esophagoscope is removed and the pharynx examined for bleeding and suctioned free of secretions. The patient is returned to the anesthesia position.

#### Description of Post-Service Work:

- Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and operative findings with family and the patient.
- Write postoperative note. Dictate operative note and copy to referring physician.
- Monitor patient progress. Chart notes.
- Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function
- Assess pain scores and adequacy of analgesia.
- Discuss post-discharge management with nursing staff and answer questions
- Home restrictions (i.e., diet, activity) are discussed with the patient, family members and discharging nurse.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

**INTENSITY/COMPLEXITY MEASURES (Mean)****(of those that selected Key Reference code)****Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered	3.40	3.27
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.33	3.20
Urgency of medical decision making	3.20	3.20

**Technical Skill/Physical Effort (Mean)**

Technical skill required	3.73	3.53
Physical effort required	3.53	3.33

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	3.87	3.47
Outcome depends on the skill and judgment of physician	3.67	3.53
Estimated risk of malpractice suit with poor outcome	3.87	3.27

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	3.20	3.07
Intra-Service intensity/complexity	3.67	3.53
Post-Service intensity/complexity	2.80	2.93

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting

### **Physician Time**

#### **Pre Time**

Regarding physician time, we recommend using pre-service package 4 (difficult patient/difficult procedure) which includes 40 minutes of evaluation, 3 minutes of positioning, and 20 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that the vignette for this service represents an elderly patient with cancer who requires a rigid esophagoscopy procedure. Our experts believed this patient is often sicker and more complex than a standard patient undergoing flexible, transoral esophagoscopy. In addition, this procedure is only performed in the facility setting and must be done under general anesthesia. Therefore, prepackage 4 is most appropriate for the preservice work required for the typical patient. Our experts felt that the 40 minutes of evaluation time associated with prepackage 4 was appropriate for this procedure. This was also supported by our survey responses. Therefore we recommend the prepackage 4 standard of 40 minutes for evaluation. In contrast, our panel reviewed the 20 minutes of scrub dress and wait time assigned by the prepackage and felt this amount of time was not necessary for this procedure. Therefore we recommend reducing this to 10 minutes for scrub, dress and wait which is also consistent with our survey responses. In addition, we believe that the package time of 3 minutes for positioning is not sufficient for patients undergoing this procedure and therefore, recommend adding 3 minutes of positioning time. We believe this increase in positioning time is justified, given that the physician must position the patient in the supine position, places a shoulder roll, ensure security and position the endotracheal tube together with the anesthetist. Prior to beginning the procedure, the operating table must also be turned so that the patient's head is facing the endoscopist. These modifications result in an overall pre-service time recommendation of 40/6/10 for 43192.

#### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 23 minutes for intra service work.

#### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 20 minutes. This results in a request for a total of 99 minutes of physician work time for CPT 43192.

### **Physician Work / Compelling Evidence**

After concluding the survey, the results were analyzed by our expert panel and it was determined that for the newly developed rigid esophagoscopy codes (43191-6) the existing work RVUs were not sufficient for the amount of work being done for procedures where the physician is using a rigid scope in the facility setting, under general anesthesia. While the existing code, 43201, was surveyed in 2002, no Otolaryngologists participated in the survey due to the dominant providers of the existing code being Gastroenterology (55%) and the extremely low volume of this service (506 in 2011). Therefore, it is unlikely that the work for Esophagoscopy, rigid, transoral; with directed submucosal injection(s), any substance has ever been properly valued, or even considered, as part of the survey for 43201, as Gastroenterologists do not perform esophagoscopy procedures using a rigid endoscope.

Thus, we believe there is compelling evidence for re-valuation of the new CPT code 43192 given that incorrect assumptions were made in previous valuations of the service where the dominant provider of rigid esophagoscopy services, Otolaryngology, were not included in the survey of the former combination code (43201). Upon review of this history, our expert panel determined that the work RVU for the existing service (Esophagoscopy, rigid or flexible; with directed submucosal injection(s), any substance) is not sufficient to value the work performed when the procedure is administered in the facility setting, using a rigid scope, under general anesthesia. Our expert panel therefore, recommends that the RVW for the new code 43192 (Esophagoscopy, rigid, transoral; with directed submucosal injection(s), any substance) should be increased based on the compelling evidence, outlined above, to more accurately represent the correct specialty mix for rigid esophagoscopy procedures as well as the more intense and complex work of performing an esophagoscopy procedure in

the facility setting with a rigid scope, under general anesthesia. **Therefore, we are recommending an increased work RVU of 3.21 for CPT 43192 which is above the existing RVU of 2.09, but equals the 25<sup>th</sup> percentile value indicated by our survey.**

This recommendation is supported by the key reference code 31625 which survey respondents said was slightly less intense and complex than the new code, 43192, being reviewed. 31625 includes a work RVU of 3.36 and less total physician time (65 minutes). We are also providing the following reference tables which include recently reviewed services which support our requested values for physician time and work for CPT 43192.

**Comparison to key reference code**

<u>CPT Code</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>43192</b>	3.21	0.0718	99	40	6	10	23	20
<b>31625</b>	3.36	0.0869	70	10	5	10	30	15

**Comparison to MPC codes**

<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>31622</b>	Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed	2.78	0.0689	65	10	5	5	30	15
<b>43192</b>	Esophagoscopy, rigid, transoral; with directed submucosal injection(s), any substance.	3.21	0.0718	99	40	6	10	23	20
<b>19103</b>	Biopsy of breast; percutaneous, automated vacuum assisted or rotating	3.69	0.0969	65	20	0	0	30	15

The table below compares the survey code to other RUC reviewed codes of similar time and work, providing further support that the recommended value for 43192 is appropriate.

<u>RUC Reviewed</u>	<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43201

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 383

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 36 percent of the existing 43200 will continue to be attributable to Otolaryngology. Second, that 70 percent of the Otolaryngology portion of 43200 will be reported using the new 43192 code and 30 percent will be reported with the revised 43201 code. In addition, we have assumed that the national volume of the new 43192 code will be three times that of the Medicare volume given that about 1/3 of the patient population with cancer will be elderly and Medicare age patients.

Specialty Otolaryngology                      Frequency 383                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 128

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 70 percent of the current Otolaryngology volume for existing CPT 43201 will be represented by the new CPT code 43192.

Specialty Otolaryngology                      Frequency 128                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31575

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43193      Tracking Number   C3      Original Specialty Recommended RVU: **3.36**  
 Presented Recommended RVU: **3.36**  
 Global Period: 000      RUC Recommended RVU: **3.36**

CPT Descriptor: Esophagoscopy, rigid, transoral; with biopsy, single or multiple.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60 year-old man with newly diagnosed squamous cell carcinoma of the oral cavity presents with dysphagia. A rigid esophagoscopy is performed revealing a lesion in mid esophagus. A biopsy of the lesion is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 31%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

**Description of Pre-Service Work:**

- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Assess need for beta-blockers, order as required.
- Review medical history, pathology, and radiology report
- Review radiographic images
- Review results of preoperative testing (labs, EKG, CXR)
- Review reports of consultants providing preoperative assessment and clearance as indicated
- Meet with patient and family to review planned procedure and postoperative management
- Reexamine patient to ensure that physical findings have not changed and dictate history and physical
- Obtain informed consent
- Review airway and medical management with anesthesiologist
- Review planned procedure with OR staff
- Verify that all required instruments and supplies are available, set up scopes, suction, light source, biopsy forceps) to ensure readiness
- Change into scrub clothes
- Observe/wait during induction of anesthesia and intubation.
- Monitor/assist with positioning of the patient (supine, shoulder roll, ensure security and position of endotracheal tube)
- Ensure that radiographic images are available in the OR
- Monitor/assist with draping

- Scrub and gown
- Operating table is turned with head toward endoscopist
- Perform surgical "time out" with operating surgical team.

#### Description of Intra-Service Work:

The mouth is opened and teeth/gums protected. Suction pharyngeal secretions. Rigid esophagoscope is introduced and passed through mouth, behind the endotracheal tube and larynx into cricopharyngeus and into the esophagus. The esophagoscope is advanced to the stomach and visualization optimized, readjusting scope and patient position as needed to ensure safe and smooth passage of the scope and suctioning secretions. A suspicious lesion is visualized and the location (distance from the upper incisors) documented along with photodocumentation. Biopsy forceps are passed through the esophagoscope under direct vision and several samples obtained and placed in specimen containers. Blood is removed with suction, observing the biopsy site while bleeding dissipates. Hemostatic treatment is performed as needed. The esophagoscope is removed and the pharynx examined for bleeding and suctioned free of secretions. The patient is returned to the anesthesia position. Pathology requisition form is reviewed and signed.

#### Description of Post-Service Work:

- Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and operative findings with family and the patient.
- Write postoperative note. Dictate operative note and copy to referring physician.
- Monitor patient progress. Chart notes.
- Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function
- Assess pain scores and adequacy of analgesia.
- Discuss post-discharge management with nursing staff and answer questions
- Home restrictions (i.e., diet, activity) are discussed with the patient, family members and discharging nurse.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all of the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting.

## **Physician Time**

### **Pre Time**

Regarding physician time, we recommend using pre-service package 4 (difficult patient/difficult procedure) which includes 40 minutes of evaluation, 3 minutes of positioning, and 20 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that the vignette for this service represents an elderly patient with cancer who requires a rigid esophagoscopy procedure. Our experts believed this patient is often sicker and more complex than a standard patient undergoing flexible, transoral esophagoscopy. In addition, this procedure is only performed in the facility setting and must be done under general anesthesia. Therefore, prepackage 4 is most appropriate for the preservice work required for the typical patient. Our experts felt that the 40 minutes of evaluation time associated with prepackage 4 was appropriate for this procedure. This was also supported by our survey responses. Therefore we recommend the prepackage 4 standard of 40 minutes for evaluation. In contrast, our panel reviewed the 20 minutes of scrub dress and wait time assigned by the prepackage and felt this amount of time was not necessary for this procedure. Therefore we recommend reducing this to 10 minutes for scrub, dress and wait which is also consistent with our survey responses. In addition, we believe that the package time of 3 minutes for positioning is not sufficient for patients undergoing this procedure and therefore, recommend adding 3 minutes of positioning time. We believe this increase in positioning time is justified, given that the physician must position the patient in the supine position, places a shoulder roll, ensure security and position the endotracheal tube together with the anesthetist. Prior to beginning the procedure, the operating table must also be turned so that the patient's head is facing the endoscopist. These modifications result in an overall pre-service time recommendation of 40/6/10 for 43193.

### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 30 minutes for intra service work.

### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 20 minutes. This results in a request for a total of 106 minutes of physician work time for CPT 43193.

## **Physician Work / Compelling Evidence**

After concluding the survey, the results were analyzed by our expert panel and it was determined that for the newly developed rigid esophagoscopy codes (43191-6) the existing work RVUs were not sufficient for the amount of work being done for procedures where the physician is using a rigid scope in the facility setting, under general anesthesia. In addition, it has come to our attention that the previous code used to bill this service, 43202, is a Harvard valued code which was surveyed by 21 Gastroenterologists. Therefore, given that no Otolaryngologists participated in the original survey of the 43202 code, it is unlikely that the work for Esophagoscopy, rigid, transoral; with biopsy, single or multiple has ever been properly valued or even considered as part of the survey for 43202, as Gastroenterologists do not perform esophagoscopy procedures using a rigid endoscope.

Thus, we believe there is compelling evidence to increase the value of the new CPT code 43193 given that incorrect assumptions were made in previous valuations of the service where the dominant provider of rigid esophagoscopy services, Otolaryngology, were not included in the initial survey of the former combination code (43202). Upon review of this history, our expert panel determined that the work RVU for the existing service (Esophagoscopy, rigid or flexible; with biopsy, single or multiple) is not sufficient to value the work performed when the procedure is provided in the facility setting, using a rigid scope, under general anesthesia. Our expert panel therefore, recommends that the RVW for the new code 43193 (Esophagoscopy, rigid, transoral; with biopsy, single or multiple) should be re-valued based on the compelling evidence outlined above to more accurately represent the correct specialty mix for rigid esophagoscopy procedures as well as the more intense and complex work of performing an esophagoscopy procedure in the facility setting with a rigid scope,

under general anesthesia. **Therefore, we are recommending an increased work RVU of 3.36 for CPT 43193 which is above the existing RVU of 1.89, but equals the 25<sup>th</sup> percentile value recommended by survey respondents.**

This recommendation is supported by the key reference code 31625 which survey respondents said was less intense and complex which is valued at 3.36 work RVUs, but has significantly less time with 70 total minutes. We are also providing the following reference tables which include recently reviewed services that support our requested values for physician time and work for CPT 43193.

#### **Comparison to key reference code**

<b><u>CPT Code</u></b>	<b><u>RVW</u></b>	<b><u>IWPUT</u></b>	<b><u>Total Time</u></b>	<b><u>Eval</u></b>	<b><u>Posit</u></b>	<b><u>SDW</u></b>	<b><u>INTRA</u></b>	<b><u>Post</u></b>

#### **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☒ Other reason (please explain) Diagnostic evaluation under anesthesia of a patient with cancer in the upper aerodigestive tract often includes both laryngoscopy and esophagoscopy using different instruments for evaluation of distinct regions.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Diagnostic rigid esophagoscopy would typically be reported with one of the following laryngoscopy codes. See clinical explanation above. When coded together, the primary procedure or service will be reported as listed. The additional procedure or service will be identified by appending modifier 51 to the additional procedure or service code.

CPT Code	Global	Work RVU	Pre time	Intra	Post
43193	000	3.36	56	30	20
31525	000	2.63	14	19	14
31526	000	2.57	30	32	16
31535	000	3.16	35	24	13
31536	000	3.55	32	39	12

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43202

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2148

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 31 percent of the existing 43203 will continue to be attributable to Otolaryngology. Second, that 60 percent of the Otolaryngology portion of 43203 volume will be reported using the new 43193 code, 30 percent will be reported using the revised 43203 code, and 10 percent will be attributed to the new 43198 code. In addition, we have assumed that the national volume of the new 43193 code will be three times that of the Medicare volume given that about 1/3 of the patient population with cancer will be elderly and Medicare patients.

Specialty Otolaryngology Frequency 2148 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 716  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 60 percent of the current Otolaryngology volume for existing CPT 43203 will be represented by the new CPT code 43193.

Specialty Otolaryngology	Frequency 716	Percentage 100.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31575

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43194      Tracking Number C4      Original Specialty Recommended RVU: **3.99**  
 Presented Recommended RVU: **3.99**  
 Global Period: 000      RUC Recommended RVU: **3.99**

CPT Descriptor: Esophagoscopy, rigid, transoral; with removal of foreign body.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 40 year-old woman is eating chicken and feels pain in her upper neck and chest, suspicious for having swallowed a bone. A rigid esophagoscopy is performed with the bone visualized in the distal esophagus. The foreign body is removed.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 26%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

**Description of Pre-Service Work:**

- Review history and examination.  
Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Review medication history, and radiology report
- Review radiographic images
- Review results of preoperative testing (labs, EKG, CXR)
- Review reports of consultants providing preoperative assessment and clearance as indicated
- Meet with patient and family to review planned procedure and postoperative management
- Obtain informed consent
- Review airway and medical management with anesthesiologist
- Review planned procedure with OR staff
- Verify that all required instruments and supplies are available, set up scopes, optical forceps, suction, light source,) to ensure readiness
- Change into scrub clothes
- Observe/wait during induction of anesthesia and intubation.
- Monitor/assist with positioning of the patient (supine, shoulder roll, ensure security and position of endotracheal tube)
- Ensure that radiographic images are available in the OR
- Monitor/assist with draping
- Scrub and gown
- Operating table is turned with head toward endoscopist

- Perform surgical "time out" with operating surgical team.

#### Description of Intra-Service Work:

The mouth is opened and teeth/gums protected. Suction pharyngeal secretions. Rigid esophagoscope is introduced and passed through mouth, behind the endotracheal tube and larynx into cricopharyngeus and into the esophagus. The esophagoscope is advanced to the foreign body and visualization optimized and the location (distance from the upper incisors) is documented. The scope and patient position are adjusted as needed to ensure safe and smooth passage of the scope and suctioning secretions. Select appropriate instrument for removal of foreign body and pass through the esophagoscope under direct vision to grasp the object. Remove the foreign body (through the scope for small object, with the scope for large objects). Revisualize the site of foreign body impaction. Blood is removed with suction, observing the site for damage and while bleeding dissipates. Photodocumentation is obtained. The esophagoscope is removed and the pharynx examined for bleeding and suctioned free of secretions. The patient is returned to the anesthesia position. Pathology requisition form is reviewed and signed.

#### Description of Post-Service Work:

- Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and operative findings with family and the patient.
- Order chest xray, wait for xray to become available, review films with radiologist.
- Write postoperative note. Dictate operative note and copy to referring physician.
- Monitor patient progress. Chart notes.
- Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function
- Assess pain scores and adequacy of analgesia.
- Discuss post-discharge management with nursing staff and answer questions
- Home restrictions (i.e., diet, activity) are discussed with the patient, family members and discharging nurse.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all of the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan

was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting

## **Physician Time**

### **Pre Time**

Regarding physician time, we recommend using pre-service package 3 (Straightforward Patient/Difficult Procedure) which includes 33 minutes of evaluation, 3 minutes of positioning, and 15 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that the vignette for this service represents a middle aged patient who most likely presents in the emergency room setting and requires a rigid esophagoscopy procedure. Our experts believed this procedure is more complex than a standard flexible, transoral esophagoscopy due to the fact that it is performed using a rigid scope under general anesthesia. Therefore, prepackage 3 is the most appropriate for the preservice work required for the typical patient. Our experts felt the 33 minutes of evaluation time associated with prepackage 3 was appropriate for this procedure, and in fact, our survey respondents indicated they required 40 minutes for evaluation of the patient undergoing this procedure. Despite this, our expert panel recognized that it is the policy of the RUC to accept preservice package times in scenarios where the survey exceeds the prepackage allotted time. Therefore, we recommend the standard 33 minutes for evaluation. Similarly, our panel reviewed the 15 minutes of scrub dress and wait time assigned by the prepackage and felt this amount of time was not necessary for this procedure. Therefore we recommend reducing this to 10 minutes for scrub, dress and wait which is also consistent with our survey responses. In contrast, we believe that the package time of 3 minutes for positioning is not sufficient for patients undergoing this procedure and therefore, recommend adding 3 minutes of positioning time. We believe this increase in positioning time is justified, given that the physician must position the patient in the supine position, places a shoulder roll, ensure security and position the endotracheal tube together with the anesthetist. Prior to beginning the procedure, the operating table must also be turned so that the patient's head is facing the endoscopist. These modifications result in an overall pre-service time recommendation of 33/6/10 for 43194.

### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 30 minutes for intra service work.

### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 28 minutes. This results in a request for a total of 107 minutes of physician work time for CPT 43194.

## **Physician Work / Compelling Evidence**

After concluding the survey, the results were analyzed by our expert panel and it was determined that for the newly developed rigid esophagoscopy codes (43191-6) the existing work RVUs were not sufficient for the amount of work being done for procedures where the physician is using a rigid scope in the facility setting, under general anesthesia. In addition, it has come to our attention that the previous code used to bill this service, 43215, is a Harvard valued code which was surveyed by 21 Gastroenterologists. Therefore, given that no Otolaryngologists participated in the original survey of the 43215 code, it is unlikely that the work for Esophagoscopy, rigid, transoral; with removal of foreign body has ever been properly valued, or even considered, as part of the survey for 43215, as Gastroenterologists do not perform esophagoscopy procedures using a rigid endoscope.

Thus, we believe there is compelling evidence for re-valuation of the new CPT code 43194 given that incorrect assumptions were made in previous valuations of the service where the dominant provider of rigid esophagoscopy services, Otolaryngology, were not included in the initial survey of the former combination code (43215). Upon review of this history, our expert panel determined that the work RVU for the existing service (Esophagoscopy, rigid or flexible; with removal of foreign body) is not sufficient to value the work performed when the procedure is provided in the facility setting, using a rigid scope, under general anesthesia. Our expert panel therefore, recommends that the RVW for the new code 43194 (Esophagoscopy, rigid, transoral; with removal of foreign body) should be increased based on the compelling evidence outlined above to more accurately represent the correct specialty mix for rigid esophagoscopy procedures as well as the more intense and complex work of performing an esophagoscopy procedure in the facility setting with a rigid scope, under general anesthesia. **Therefore, we are recommending an increased work RVU of 3.99 for CPT 43194 which is higher than the existing RVU of 2.60, but equals the survey's 25<sup>th</sup> percentile.**

This recommendation is supported by the key reference code 31638 which survey respondents said was similar in intensity and complexity, but is valued at a higher work RVU of 4.88 and includes additional physician time equaling 140 minutes. We are also providing the following reference tables which include recently reviewed services that support our requested values for physician time and work for CPT 43194.

#### Comparison to key reference code

#### **SERVICES REPORTED WITH MULTIPLE CPT CODES**

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43215

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1028

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 18 percent of the existing 43215 will continue to be reported by Otolaryngology. Second, that 70 percent of the Otolaryngology portion of 43215 will be reported using the new 43194 code and 30 percent will be reported using the revised 43215 code. In addition, we have assumed that the national volume of the new 43194 code will be four times that of the Medicare volume due to the patient population representing a middle aged, or younger patient, rather than predominantly Medicare age patients.

Specialty Otolaryngology                      Frequency 1028                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 206

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 70 percent of the current Otolaryngology volume for existing CPT 43215 will be represented by the new CPT code 43194.

Specialty Otolaryngology                      Frequency 206                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31575

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43195      Tracking Number C5      Original Specialty Recommended RVU: **3.48**  
 Presented Recommended RVU: **3.21**  
 Global Period: 000      RUC Recommended RVU: **3.21**

CPT Descriptor: Esophagoscopy, rigid, transoral; with balloon dilation (less than 30 mm diameter)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: An elderly patient with a peptic stricture of the distal esophagus presents with increasing dysphagia. A rigid esophagoscopy and a balloon dilation of the stricture are performed.

Percentage of Survey Respondents who found Vignette to be Typical: 71%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 29%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 4%

**Description of Pre-Service Work:**

- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Assess need for beta-blockers, order as required.
- Review medical history, pathology, and radiology report
- Review radiographic images
- Review results of preoperative testing (labs, EKG, CXR)
- Review reports of consultants providing preoperative assessment and clearance as indicated
- Meet with patient and family to review planned procedure and postoperative management
- Reexamine patient to ensure that physical findings have not changed and dictate history and physical
- Obtain informed consent
- Review airway and medical management with anesthesiologist
- Review planned procedure with OR staff
- Verify that all required instruments and supplies are available, set up scopes, suction, light source, balloon catheters) to ensure readiness
- Change into scrub clothes
- Observe/wait during induction of anesthesia and intubation.
- Monitor/assist with positioning of the patient (supine, shoulder roll, ensure security and position of endotracheal tube)
- Ensure that radiographic images are available in the OR
- Monitor/assist with draping
- Scrub and gown

- Operating table is turned with head toward endoscopist
- Perform surgical "time out" with operating surgical team.

#### Description of Intra-Service Work:

The mouth is opened and teeth/gums protected. Suction pharyngeal secretions. Rigid esophagoscope is introduced and passed through mouth, behind the endotracheal tube and larynx into cricopharyngeus and into the esophagus. The esophagoscope is advanced to the distal esophageal stricture and visualization optimized, the location (distance from the upper incisor) is documented. The scope and patient position is readjusted as needed to ensure safe and smooth passage of the scope and suctioning secretions. Photodocumentation is performed. A balloon catheter is selected and inserted under direct vision. The balloon is inflated with saline adjusting position as needed. The balloon is deflated and the effect of dilation viewed, repeating the inflation of balloon as indicated. The balloon is removed and blood is removed with suction, observing the dilation site while bleeding dissipates. Hemostatic treatment is performed as needed. The esophagoscope is removed and the pharynx examined for bleeding and suctioned free of secretions. The patient is returned to the anesthesia position.

#### Description of Post-Service Work:

- Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and operative findings with family and the patient.
- Write postoperative note. Dictate operative note and copy to referring physician.
- Monitor patient progress. Chart notes.
- Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function
- Assess pain scores and adequacy of analgesia.
- Discuss post-discharge management with nursing staff and answer questions
- Home restrictions (i.e., diet, activity) are discussed with the patient, family members and discharging nurse.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting

## **Physician Time**

### **Pre Time**

Regarding physician time, we recommend using pre-service package 3 (Straightforward Patient/Difficult Procedure) which includes 33 minutes of evaluation, 3 minutes of positioning, and 15 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that the vignette for this service indicates only that the patient is elderly and requiring rigid esophagoscopy, but does not indicate that they are presenting with cancer as was the case for new codes 43191-43193. Despite this, our experts noted this procedure is still more complex than a standard flexible, transoral esophagoscopy due to the fact that it is performed using a rigid scope under general anesthesia. Therefore, prepackage 3 is most appropriate for the preservice work required for the typical patient. Our experts felt the 33 minutes of evaluation time associated with prepackage 3 was appropriate for this procedure, and in fact our survey respondents indicated they required 40 minutes for evaluation of the patient undergoing this procedure. Despite this, our expert panel recognized that it is the policy of the RUC to accept preservice package times in scenarios where the survey exceeds the prepackage allotted time. Therefore, we recommend the standard 33 minutes for evaluation. Similarly, our panel reviewed the 15 minutes of scrub dress and wait time assigned by the prepackage and felt this amount of time was not necessary for this procedure. Therefore we recommend reducing this to 10 minutes for scrub, dress and wait which is also consistent with our survey responses. In contrast, we believe that the package time of 3 minutes for positioning is not sufficient for patients undergoing this procedure and therefore, recommend adding 3 minutes of positioning time. We believe this increase in positioning time is justified, given that the physician must position the patient in the supine position, places a shoulder roll, ensure security and position the endotracheal tube together with the anesthetist. Prior to beginning the procedure, the operating table must also be turned so that the patient's head is facing the endoscopist. These modifications result in an overall pre-service time recommendation of 33/6/10 for 43195.

### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 30 minutes for intra service work.

### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 15 minutes. This results in a request for a total of 94 minutes of physician work time for CPT 43195.

## **Physician Work / Compelling Evidence**

After concluding the survey, the results were analyzed by our expert panel and it was determined that for the newly developed rigid esophagoscopy codes (43191-6) the existing work RVUs were not sufficient for the amount of work being done for procedures where the physician is using a rigid scope in the facility setting, under general anesthesia. While the existing code, 43220, was surveyed in 1993, following significant coding changes to the gastrointestinal endoscopy section of CPT. However, the vignette used during that survey described only a flexible scope and no Otolaryngologists participated in the survey (the code was surveyed by GI and General Surgery) because the dominant providers of the existing code being Gastroenterology (49%) and the extremely low volume of this service (3,041 in 2011). Therefore, it is clear, based on the vignette used for the 1993 survey, that the work for Esophagoscopy, rigid, transoral; with balloon dilation (less than 30mm diameter), has ever been properly valued, or even considered, as part of the survey for 43220, as Gastroenterologists do not perform esophagoscopy procedures using a rigid endoscope and the vignette used did not consider the provision of this service using a rigid scope.

Thus, we believe there is compelling evidence for re-valuation of new CPT code 43195 given that incorrect assumptions were made in previous valuations of the service where the dominant provider of rigid esophagoscopy services, Otolaryngology, were not included in the survey of the former combination code (43220), and a vignette was used for survey that did not consider the use of a rigid scope. Upon review of this history, our expert panel determined that the

work RVU for the existing service (Esophagoscopy, rigid or flexible; with balloon dilation (less than 30mm diameter)) is not sufficient to value the work performed when the procedure is administered in the facility setting, using a rigid scope, under general anesthesia. Our expert panel therefore, recommends that the RVW for the new code, 43195, (Esophagoscopy, rigid, transoral; with balloon dilation (less than 30mm diameter) should be increased based on the compelling evidence, outlined above, to accurately represent the correct specialty mix and the use of a rigid scope for this procedure which represents more intense and complex work where a provider provides an esophagoscopy procedure in the facility setting, with a rigid scope, under general anesthesia. **Therefore, we are recommending an increased work RVU of 3.21 for CPT 43195 which is higher than the existing RVU of 2.10, but below the survey's 25<sup>th</sup> percentile.**

We arrived at this value in response to the discussion held at the pre-facilitation meeting for this family of codes, and determined that in order to maintain relativity among the new rigid, transoral esophagoscopy codes, the value for 43195 should be reduced below the 25<sup>th</sup> percentile to more accurately coincide with services in the rigid esophagoscopy group with similar work. We note that the work of 43195 is very similar to that of 43192. Specifically, the 43192 and 43195 code have similar intraservice and total time and although 43192 has fewer intraservice minutes, 43195 involves service provided to a less acute patient, and has slightly fewer total minutes. Therefore, we believe that 43195 involves very similar work to 43192 and these two codes should be valued the same. This recommendation is supported by the key reference code 31625 which survey respondents said was slightly less intense and complex, but similarly valued with a work RVU of 3.36 and with physician time of 70 total minutes; as well as several other comparator codes. The comparator codes used to support the value of 3.21 RVUs for 43195 are: 31296, nasal/sinus endoscopy with an RVU of 3.29, intra time of 30 minutes and total time of 88 minutes; as well as 50386, removal of internally dwelling ureteral stent, also with 30 minutes of intra time and 90 minutes of total time.

We are also providing the following reference tables which include recently reviewed services which support our requested values for physician time and work for CPT 43195.

#### **Comparison to key reference code**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43220

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology

How often? Sometimes

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1788

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 28 percent of the existing 43220 will continue to be reported by Otolaryngology. Second, that 70 percent of the of the Otolaryngology portion of existing 43220 will continue to be preorted using the new 43195 code and 30 percent will be reported using the revised 43220 code. In addition, we have assumed that the national volume of the new 43195 code will be three times that of the Medicare volume due to the patient population representing elderly patients which will predominantly be Medicare patients.

Specialty Otolaryngology	Frequency 1788	Percentage 100.00 %
--------------------------	----------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 596  
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 70 percent of the current Otolaryngology volume for existing CPT 43220 will be represented by the new CPT code 43195.

Specialty Otolaryngology	Frequency 596	Percentage 100.00 %
--------------------------	---------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31575

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43196      Tracking Number C6      Original Specialty Recommended RVU: **4.00**  
 Presented Recommended RVU: **3.36**  
 Global Period: 000      RUC Recommended RVU: **3.36**

CPT Descriptor: Esophagoscopy, rigid, transoral; with insertion of guide wire followed by dilation over guide wire.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A middle-aged patient known to have a distal esophageal stricture presents with increasing dysphagia. A rigid esophagoscopy is performed. A guide wire is passed through the narrowed segment. Bougie dilators are passed over the guide wire and the stricture is dilated.

Percentage of Survey Respondents who found Vignette to be Typical: 86%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 27%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

**Description of Pre-Service Work:**

- Select and order the appropriate antibiotic(s) and confirm timing and administration.
- Assure appropriate selection, timing, and administration of DVT prophylaxis.
- Assess need for beta-blockers, order as required.
- Review medical history, pathology, and radiology report
- Review radiographic images
- Review results of preoperative testing (labs, EKG, CXR)
- Review reports of consultants providing preoperative assessment and clearance as indicated
- Meet with patient and family to review planned procedure and postoperative management
- Reexamine patient to ensure that physical findings have not changed and dictate history and physical
- Obtain informed consent
- Review airway and medical management with anesthesiologist
- Review planned procedure with OR staff
- Verify that all required instruments and supplies are available, set up scopes, suction, light source, guide wire and dilators) to ensure readiness
- Change into scrub clothes
- Observe/wait during induction of anesthesia and intubation.
- Monitor/assist with positioning of the patient (supine, shoulder roll, ensure security and position of endotracheal tube)
- Ensure that radiographic images are available in the OR
- Monitor/assist with draping

- Scrub and gown
- Operating table is turned with head toward endoscopist
- Perform surgical "time out" with operating surgical team.

#### Description of Intra-Service Work:

The mouth is opened and teeth/gums protected. Suction pharyngeal secretions. Rigid esophagoscope is introduced and passed through mouth, behind the endotracheal tube and larynx into cricopharyngeus and into the esophagus. The esophagoscope is advanced to the entry point of the stricture and visualization optimized, the location (distance from the upper incisor) is documented. The scope and patient position are adjusted as needed to ensure safe and smooth passage of the scope and suctioning secretions. The guide wire is passed via the esophagoscope through the stricture under direct vision. Small bougies are passed over the wire through the esophagoscope under direct vision, then removed, and the effect of dilation assessed by direct vision. If appropriate, the esophagoscope is then removed over the wire, and progressively larger bougies are passed over the wire to perform additional dilation. The esophagoscope is inserted again over the wire after dilation to evaluate the dilation site. Photodocumentation is performed. Blood is removed with suction, observing the site while bleeding dissipates. The esophagoscope is removed and the pharynx examined for bleeding and suctioned free of secretions. The patient is returned to the anesthesia position. Pathology requisition form is reviewed and signed.

#### Description of Post-Service Work:

- Monitor patient during reversal of anesthesia. Monitor transport of patient from OR to recovery room. Discuss postoperative recovery care with anesthesia and nursing staff. Write postoperative orders. Discuss procedure and operative findings with family and the patient.
- Write postoperative note. Dictate operative note and copy to referring physician.
- Monitor patient progress. Chart notes.
- Monitor overall medical condition of the patient including fluid balance, vital signs, and urinary function
- Assess pain scores and adequacy of analgesia.
- Discuss post-discharge management with nursing staff and answer questions
- Home restrictions (i.e., diet, activity) are discussed with the patient, family members and discharging nurse.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation
- All appropriate medical records are completed, including day of discharge progress notes, discharge summary and discharge instructions, and insurance forms.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all of the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan

was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting.

## **Physician Time**

### **Pre Time**

Regarding physician time, we recommend using pre-service package 3 (Straightforward Patient/Difficult Procedure) which includes 33 minutes of evaluation, 3 minutes of positioning, and 15 minutes of scrub, dress, and wait time. Our expert panel felt this package was most appropriate given that the vignette for this service represents a middle aged patient who does not present with cancer, but requires a rigid esophagoscopy procedure. Our experts believed this procedure is more complex than a standard flexible, transoral esophagoscopy due to the fact that it is performed using a rigid scope under general anesthesia. Therefore, prepackage 3 is most appropriate for the preservice work required for the typical patient. Our experts felt the 33 minutes of evaluation time associated with prepackage 3 was appropriate for this procedure, and in fact our survey respondents indicated they required 40 minutes for evaluation of the patient undergoing this procedure. Despite this, our expert panel recognized that it is the policy of the RUC to accept preservice package times in scenarios where the survey exceeds the prepackage allotted time. Therefore, we recommend the standard 33 minutes for evaluation. Similarly, our panel reviewed the 15 minutes of scrub dress and wait time assigned by the prepackage and felt this amount of time was not necessary for this procedure. Therefore we recommend reducing this to 10 minutes for scrub, dress and wait which is consistent with our recommendations for all the rigid codes in this family. In contrast, we believe that the package time of 3 minutes for positioning is not sufficient for patients undergoing this procedure and therefore, recommend adding 3 minutes of positioning time. We believe this increase in positioning time is justified, given that the physician must position the patient in the supine position, places a shoulder roll, ensure security and position the endotracheal tube together with the anesthetist. Prior to beginning the procedure, the operating table must also be turned so that the patient's head is facing the endoscopist. These modifications result in an overall pre-service time recommendation of 33/6/10 for 43196.

### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 33 minutes for intra service work.

### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 20 minutes. This results in a request for a total of 102 minutes of physician work time for CPT 43196.

## **Physician Work / Compelling Evidence**

After concluding the survey, the results were analyzed by our expert panel and it was determined that for the newly developed rigid esophagoscopy codes (43191-6) the existing work RVUs were not sufficient for the amount of work being done for procedures where the physician is using a rigid scope in the facility setting, under general anesthesia. While the existing code, 43226, was surveyed in 1993, following significant coding changes to the gastrointestinal endoscopy section of CPT. However, the vignette used during that survey described only a flexible scope and no Otolaryngologists participated in the survey (the code was surveyed by GI and General Surgery) because the dominant providers of the existing code being Gastroenterology (59%) and the extremely low volume of this service (2,785 in 2011). Therefore, it is clear, based on the vignette used for the 1993 survey, that the work for Esophagoscopy, rigid, transoral; with insertion of guide wire followed by dilation over guide wire, has ever been properly valued, or even considered, as part of the survey for 43226, as Gastroenterologists do not perform esophagoscopy procedures using a rigid endoscope and the vignette used did not consider the provision of this service using a rigid scope.

Thus, we believe there is compelling evidence for re-valuation of new CPT code 43196 given that incorrect assumptions were made in previous valuations of the service where the dominant provider of rigid esophagoscopy services, Otolaryngology, were not included in the survey of the former combination code (43226), and a vignette was used for survey that did not consider the use of a rigid scope. Upon review of this history, our expert panel determined that the work RVU for the existing service (Esophagoscopy, rigid or flexible; with insertion of guide wire followed by dilation over guide wire) is not sufficient to value the work performed when the procedure is administered in the facility setting, using a rigid scope, under general anesthesia. Our expert panel therefore, recommends that the RVW for the new code, 43196,

(Esophagoscopy, rigid, transoral; with insertion of guide wire followed by dilation over guide wire) should be increased based on the compelling evidence, outlined above, to accurately represent the correct specialty mix and the use of a rigid scope for this procedure which represents more intense and complex work where a provider administers an esophagoscopy procedure in the facility setting, with a rigid scope, under general anesthesia. **Therefore, we are recommending an increased work RVU of 3.36 for CPT 43196 which is higher than the existing RVU of 2.34, but below the survey's 25<sup>th</sup> percentile.**

We arrived at this value in response to the discussion held at the pre-facilitation meeting for this family of codes, and determined that in order to maintain relativity among the new rigid, transoral esophagoscopy codes, the value for 43196 should be reduced below the 25<sup>th</sup> percentile to more accurately coincide with the value for 43193. We feel this is appropriate because the 43193 and 43196 codes have similar intraservice and total time and it would not be appropriate for a service provided to a less acute patient, represented by the 43196 code, to be valued higher than codes in the family with more acute patient populations, such as the 43193 code. We found the key reference service less applicable in supporting this value given its' higher value of 4.88 RVUs and substantially longer physician time of 140 total minutes, however, we believe there are several comparator codes which strongly support the recommended value for 43196. Specifically, 31625, bronchoscopy, rigid or flexible, including fluoroscopic guidance, with 3.36 RVUs, intra time of 30 minutes and 70 minutes of total time; 50386, removal of internally dwelling ureteral stent, also with 30 minutes of intra time and 90 minutes of total time; as well as 19296, placement of radiotherapy afterloading expandable catheter into the breast, with 30 minutes of intra time and 119 total minutes.

We are also providing the following reference tables which include recently reviewed services that support our requested values for physician time and work for CPT 43196.

#### **Comparison to key reference code**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43226

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology

How often? Sometimes

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1560

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 20 percent of the existing 43226 will continue to be reported by Otolaryngology. Second, that 70 percent of the Otolaryngology portion of 43226 volume will be continue to be reported using the new 43196 code and 30 percent will be reported using the revised 43226 code. In addition, we have assumed that the national volume of the new 43196 code will be three times that of the Medicare volume due to the patient population representing an elderly patient which will predominantly include Medicare age patients.

Specialty Otolaryngology	Frequency 1560	Percentage 100.00 %
--------------------------	----------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 390

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 70 percent of the current Otolaryngology volume for existing CPT 43226 will be represented by the new CPT code 43196.

Specialty Otolaryngology	Frequency 390	Percentage 100.00 %
--------------------------	---------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31638

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43197      Tracking Number C7      Original Specialty Recommended RVU: **1.59**  
 Presented Recommended RVU: **1.59**  
 Global Period: 000      RUC Recommended RVU: **1.59**

CPT Descriptor: Esophagoscopy, flexible, transnasal; diagnostic, includes collection of specimen(s) by brushing, when performed.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 59-year-old male presents with chronic cough, hoarseness, and dysphagia. Gastroesophageal reflux is suspected. The patient's symptoms persist despite treatment with antireflux medications and lifestyle counseling. The patient undergoes transnasal esophagoscopy (TNE) for diagnostic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 34%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 11%

Description of Pre-Service Work: After the decision is made for the need for esophagoscopy, taking into account the indications and patient factors, consideration is given to rigid esophagoscopy, sedated transoral esophagoscopy, and unsedated transnasal esophagoscopy (TNE). The decision is made to perform TNE.

- The patient is moved to a room equipped with the video tower and a protective drape is placed on the patient.
- Vital signs are obtained.
- The physician ensures that the transnasal esophagoscope, suction, air source for insufflation, and video recording equipment are available and functioning properly.
- The procedure is explained and consent obtained.
- A time out is performed.
- The physician washes hands and dons proper gloves.
- Topical decongestant and anesthetic sprays are applied to the nostrils followed by a 5 minute wait time.
- The distal nasal cavities are examined to determine the more patent nostril and further anesthetic and decongestant solutions on pledgets is applied with the nasal speculum and bayonet forceps. This is applied visually to specific areas requiring more profound anesthesia such as nasal spurs, large inferior turbinates and the middle turbinate. This is left in place for 2 minutes and the pledgets are then removed.
- The patient is positioned in the upright position in the examination chair leaning slightly forward.

Description of Intra-Service Work: The distal portion of the esophagoscope is lubricated with viscous lidocaine or surgical lubricant and then passed under direct vision into the nasal cavity. The physician is careful to avoid nasal spurs, nasal septal deviations, tubinates, nasal polyps and other areas of constriction which cause pain and bleeding and takes the most open

route to the nasopharynx. The patient is instructed to breath steadily and calmly through the nose to open the nasopharynx and the endoscope is passed into the oropharynx. The larynx is visualized and care taken not to stimulate it to avoid potential laryngospasm. The patient is asked to tilt is head towards his chest and swallow, at this moment the endoscopist advances the endoscope into the hypopharynx and through the pharyngoesophageal segment. The endoscope is then advanced under direct vision towards the gastroesophageal (GEJ) junction using a combination of air insufflation and instilling water. The region of the GEJ is evaluated in detail. The patient is asked to swallow and often given water to drink via a straw as air is insufflated to facilitate a complete examination of the mechanics and mucosa of the GEJ. The endoscope is then advanced into the stomach and a retro-flexed view is then obtained of the GEJ and gastric cardia. This is performed by full flexion of the endoscope and rotating it 180 degrees. Air is then suctioned from the stomach to alleviate any patient bloating. As the endoscope is slowly removed a complete inspection of the entire circumference of the esophageal mucosa is made using a combination of air insufflation, water instillation, and rotation of the endoscope. Near the conclusion of the endoscopy air is given to allow visualization of the post-cricoid area. The esophagoscope is then withdrawn, carefully observing the esophageal mucosa, capturing digital images of areas of interest as well as video imaging the entire examination.

#### Description of Post-Service Work:

- Monitor patient during recover period.
- Home restrictions (i.e. diet, activity), treatment and findings are explained to the patient using the procedure video recording and pointing out areas of normal anatomy and pathology.
- Subsequent evaluation and therapeutic plan are discussed.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation.
- The examination and any still images are saved on the digital recording system. The procedure note is dictated and findings communicated to the referring physician.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all of the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new

codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting

### **Description of Random Survey**

The Otolaryngology physician work RVU recommendations were derived by conducting a random survey of the Memberships. Otolaryngology used the 000 global survey instrument with one revision instructing respondents to include time for administering topical anesthetic, where appropriate, in the pre-service time. The GI societies surveyed their members using a mini-survey due to the volume of codes they were asking surveyees to respond to. The GI survey of 43197 and 43198 did not include the revision instructing respondents to include time for administering topical anesthetic. Instead, the GI survey used the standard Question #6 for moderate sedation. Both survey instruments were approved by the Research Subcommittee in advance of distribution. Surveys were sent to nearly 700 Otolaryngologists, including the subspecialties of laryngology and broncoesophagology, as well as to the Academy's leadership and key committees such as the Airway and Swallowing and Voice which contain clinicians who were most likely to be familiar with the services under review. The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions (<http://www.census.gov/regions/>). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. Of the 74 responses obtained for the random survey of 43197, an equivalent number of responses were received from both specialties (37 from ENT and 37 from GI).

### **Physician Time**

#### **Pre Time**

Following a review of the pre-time survey data, our expert panel determined that preservice package 6 (Non-Facility procedure with sedation/anesthesia care) was most appropriate. Prepackage 6 assigns 17 minutes for evaluation, 1 minute for positioning, and 5 minutes for scrub, dress, and wait. Our expert panel felt this was the most appropriate package given that service is predominantly provided in a physician's office and topical anesthetic and decongestant is utilized to numb the nose prior to providing a TNE procedure. The expert panel reviewed the survey pre times and determined that the prepackage evaluation time of 17 minutes was appropriate and supported by the survey. In fact, respondents indicated that they typically require 28 minutes of evaluation time, however, the panel felt it was appropriate to reduce the recommended evaluation time down to 17 in order to maintain consistency with the requested preservice package. Similarly, the survey respondents indicated 5 minutes was typical for positioning the patient for a TNE procedure. Our experts, however, felt that the standard 1 minute indicated in the package was more accurate, resulting in a recommendation of 1 minute for positioning. In contrast, our experts felt that the package's 5 minutes of scrub, dress, and wait time was insufficient to represent the work done to prepare the patient for the procedure. Therefore, we are recommend an increase to the package's scrub, dress, and wait time of 2 minutes, from 5 to 7. The additional two minutes are justified by the need to spray topical decongestant and anesthetic on the nostrils and allow 5 minutes for them to take effect. The distal nasal cavities must be examined to determine the more patent nostril and further anesthetic and decongestant solutions are applied using pledgets. This is applied to the areas requiring more profound anesthesia. Pledgets are left in place for 2 minutes and then removed. This results in a total pre-service time recommendation of 17/1/7 with 17 minutes for evaluation, 1 minute for positioning, and 7 minutes for scrub, dress, and wait.

#### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 15 minutes for intra service work.

#### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 10 minutes. This results in a request for a total of 50 minutes of physician work time for CPT 43197.

### **Physician Work Recommendation**

After concluding the survey, the results were analyzed by an expert panel and it was determined that for the newly developed transoral, flexible esophagoscopy code (43197) the existing work RVU is appropriate and should be maintained.

This is justified by the increased difficulty of performing the procedure on a patient who is unsedated, and often anxious and moving, during the procedure. The patient often experiences gagging and other discomfort, such as bloating, that adds to the intensity of the procedure as the physician must work to keep the patient calm and in the necessary position throughout the entire procedure. Since the transnasal esophagoscope only has one wheel to allow maneuvering of the endoscope, a great deal of endoscope rotation is usually required to perform a complete esophagoscopy which also adds to the complexity of the procedure. **Therefore, we recommend that the current work RVU of 1.59, which is below the survey's 25<sup>th</sup> percentile, be maintained for CPT 43197.**

This recommendation is supported by the key reference code 31622 which survey respondents said was similar in intensity and complexity, but has a slightly higher work RVU of 2.78 and slightly longer physician time of 65 total minutes. Our expert panel also felt CPT 31575 served as an excellent reference code for this service and has a work RVU of 1.10 and a total time of 28 minutes. We are also providing the following reference tables which include recently reviewed services which support our requested values for physician time and work for CPT 43197.

#### **Comparison to key reference code**

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43200

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology                      How often? Commonly

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4212

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 71 percent of the existing 43200 will continue to be reported by Otolaryngology. Second, that 10 percent of the Otolaryngology portion of 43200 will continue to be reported using the new 43197 code, 30 percent will be reported using the revised 43200 code, and 60 percent will be reported using the new 43191 code. In addition, we have assumed that the national volume of the new 43197 code will be four times that of the Medicare volume due to the patient population representing middle aged patients who are not predominantly Medicare age patients.

Specialty Otolaryngology                      Frequency 3790                      Percentage 89.98 %

Specialty Gastroenterology                      Frequency 422                      Percentage 10.01 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,053

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 10 percent of the current Otolaryngology volume for existing CPT 43200 will be represented by the new CPT code 43197 and of that 10 percent, 90 percent of services will be provided by Otolaryngology and 10 percent will be performed by GI.

Specialty Otolaryngology	Frequency 948	Percentage 90.02 %
Specialty Gastroenterology	Frequency 105	Percentage 9.97 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31575

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43198      Tracking Number C8      Original Specialty Recommended RVU: **1.89**  
 Presented Recommended RVU: **1.89**  
 Global Period: 000      RUC Recommended RVU: **1.89**

CPT Descriptor: Esophagoscopy, flexible, transnasal; with biopsy, single or multiple.

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 62-year-old female presents with chronic cough, hoarseness, and dysphagia. Despite treatment with antireflux medications and lifestyle counseling, her symptoms persist raising concern for the presence of Barrett's esophagus or esophageal neoplasm. The patient undergoes transnasal esophagoscopy (TNE) with identification and biopsy of the suspicious lesion(s).

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 25%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 15%

Description of Pre-Service Work: After the decision is made for the need for esophagoscopy, taking into account the indications and patient factors, consideration is given to rigid esophagoscopy, sedated transoral esophagoscopy, and unsedated transnasal esophagoscopy (TNE). The decision is made to perform TNE.

- The patient is moved to a room equipped with the video tower and a protective drape is placed on the patient.
- Vital signs are obtained.
- The physician ensures that the transnasal esophagoscope, suction, air source for insufflation, and video recording equipment are available and functioning properly.
- The procedure is explained and consent obtained.
- A time out is performed.
- The physician washes hands and dons gloves.
- Topical decongestant and anesthetic sprays are applied to the nostrils followed by a 5 minute wait time.
- The distal nasal cavities are examined to determine the more patent nostril and further anesthetic and decongestant solutions on pledgets is applied with the nasal speculum and bayonet forceps. This is applied visually to specific areas requiring more profound anesthesia such as nasal spurs, large inferior turbinates and the middle turbinate. This is left in place for 2 minutes and the pledgets are then removed.
- The patient is positioned in the upright position in the examination chair leaning slightly forward.

Description of Intra-Service Work: The distal portion of the esophagoscope is lubricated with viscous lidocaine or surgical lubricant and then passed under direct vision into the nasal cavity. The physician is careful to avoid nasal spurs, nasal septal deviations, tubinates, nasal polyps and other areas of constriction which cause pain and bleeding and takes the most open

route to the nasopharynx. The patient is instructed to breath steadily and calmly through the nose to open the nasopharynx and the endoscope is passed into the oropharynx. The larynx is visualized and care taken not to stimulate it to avoid potential laryngospasm. The patient is asked to tilt is head towards his chest and swallow, at this moment the endoscopist advances the endoscope into the hypopharynx and through the pharyngoesophageal segment. The endoscope is then advanced under direct vision towards the gastroesophageal (GEJ) junction using a combination of air insufflation and instilling water. The region of the GEJ is evaluated. The patient is asked to swallow and often given water to drink via a straw as air is insufflated to facilitate a complete examination of the mechanics and mucosa of the GEJ. The endoscope is then advanced into the stomach and a retro-flexed view is then obtained of the GEJ and gastric cardia. This is performed by full flexion of the endoscope and rotating it 180 degrees. Air is then suctioned from the stomach to alleviate any patient bloating. As the endoscope is slowly removed a complete inspection of the entire circumference of the esophageal mucosa is made using a combination of air insufflation, water instillation, and rotation of the endoscope. Near the conclusion of the endoscopy air is given to allow visualization of the post-cricoid area.

After a lesion is noted, 2.0 mm biopsy forceps are passed through the working channel of the flexible esophagoscope. Under direct vision the endoscopist orients the endoscope to to insert the forceps into the lesion and perform the biopsy. The forceps are then removed and the specimen is removed from its jaws and placed into the marked specimen container. It is then rinsed and reinserted into the esophagoscope and passed along its 60-110 cm length. Several biopsies are taken of all noted lesions. The esophagoscope is then withdrawn, observing the esophageal mucosa, capturing digital images of areas of interest as well as video imaging the entire examination.

#### Description of Post-Service Work:

- Monitor patient during recover period.
- Home restrictions (i.e. diet, activity), treatment and findings are explained to the patient using the procedure video recording and pointing out areas of normal anatomy and pathology.
- Subsequent evaluation and therapeutic plan are discussed.
- Write prescriptions for medications and supplies needed post-discharge
- Perform medication reconciliation.
- The examination and any still images are saved on the digital recording system. The procedure note is dictated and findings communicated to the referring physician.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The esophagoscopy family of codes 43200-43232 was identified in the CY 2012 Final Physician Fee Schedule by CMS as potentially misvalued services. In response to this request, several Gastroenterology societies proposed a schedule for review of all of the gastrointestinal endoscopic services, during the January RAW subcommittee meeting. This action plan was approved. Subsequently, a code change proposal was submitted for the May 2012 CPT meeting which created 8 new

codes to describe transoral approach with a rigid scope and transnasal approach with a flexible scope. These services were previously reported using the 43200 series of (Esophagoscopy, rigid or flexible) codes. The 43200 series of codes were revised to limit use to esophagoscopies performed using a transoral approach with a flexible scope. This revised family of codes is now being presented for valuation by the AMA RUC at the October 2012 meeting.

### **Description of Random Survey**

The Otolaryngology physician work RVU recommendations were derived by conducting a random survey of the Memberships. Otolaryngology used the 000 global survey instrument with one revision instructing respondents to include time for administering topical anesthetic, where appropriate, in the pre-service time. The GI societies surveyed their members using a mini-survey due to the volume of codes they were asking surveyees to respond to. The GI survey of 43197 and 43198 did not include the revision instructing respondents to include time for administering topical anesthetic. Instead, the GI survey used the standard Question #6 for moderate sedation. Both survey instruments were approved by the Research Subcommittee in advance of distribution. Surveys were sent to nearly 700 Otolaryngologists, including the subspecialties of laryngology and broncoesophagology, as well as to the Academy's leadership and key committees such as the Airway and Swallowing and Voice which contain clinicians who were most likely to be familiar with the services under review. The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions (<http://www.census.gov/regions/>). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. Of the 74 responses obtained for the random survey of 43197, an equivalent number of responses were received from both specialties (37 from ENT and 37 from GI).

### **Physician Time**

#### **Pre Time**

Following a review of the pre-time survey data, our expert panel determined that preservice package 6 (Non-Facility procedure with sedation/anesthesia care) was most appropriate. Prepackage 6 assigns 17 minutes for evaluation, 1 minute for positioning, and 5 minutes for scrub, dress, and wait. Our expert panel felt this was the most appropriate package given that service is predominantly provided in a physician's office and topical anesthetic and decongestant is utilized to numb the nose prior to providing a TNE procedure. The expert panel reviewed the survey pre times and determined that the prepackage evaluation time of 17 minutes was appropriate and supported by the survey. In fact, respondents indicated that they typically require 28 minutes of evaluation time, however, the panel felt it was appropriate to reduce the recommended evaluation time down to 17 in order to maintain consistency with the requested preservice package. Similarly, the survey respondents indicated 5 minutes was typical for positioning the patient for a TNE procedure. Our experts, however, felt that the standard 1 minute indicated in the package was more accurate, resulting in a recommendation of 1 minute for positioning. In contrast, our experts felt that the package's 5 minutes of scrub, dress, and wait time was insufficient to represent the work done to prepare the patient for the procedure. Therefore, we are recommend an increase to the package's scrub, dress, and wait time of 2 minutes, from 5 to 7. The additional two minutes are justified by the need to spray topical decongestant and anesthetic on the nostrils and allow 5 minutes for them to take effect. The distal nasal cavities must be examined to determine the more patent nostril and further anesthetic and decongestant solutions are applied using pledgets. This is applied to the areas requiring more profound anesthesia. Pledgets are left in place for 2 minutes and then removed. This results in a total pre-service time recommendation of 17/1/7 with 17 minutes for evaluation, 1 minute for positioning, and 7 minutes for scrub, dress, and wait.

#### **Intra Time**

Our expert panel agreed with our surveyees regarding the time for intra service work and are recommending the survey median time of 20 minutes for intra service work.

#### **Post Time**

Likewise, our experts felt that the survey's post time was an accurate reflection of the post time required for this procedure and are recommending the median post time of 10 minutes. This results in a request for a total of 55 minutes of physician work time for CPT 43198.

### **Physician Work Recommendation**

After concluding the survey, the results were analyzed by an expert panel and it was determined that for the newly developed transoral, flexible esophagoscopy code (43198) the existing work RVU is appropriate and should be maintained. This is justified by the increased difficulty of performing the procedure on a patient who is unsedated, and often anxious and moving, during the procedure. The patient often experiences gagging and other discomfort, such as bloating, that adds to the intensity of the procedure as the physician must work to keep the patient calm and in the necessary position throughout the entire procedure. Since the transnasal esophagoscope only has one wheel to allow maneuvering of the endoscope, a great deal of endoscope rotation is usually required to perform a complete esophagoscopy which also adds to the complexity of the procedure. **Therefore, we recommend that the current work RVU of 1.89, which is below the survey's 25<sup>th</sup> percentile, be maintained for CPT 43198.**

This recommendation is supported by the key reference code 31625 which survey respondents said was similar in intensity and complexity, and has similar times of 55 minutes, but a slightly higher work RVU of 3.36. In addition, our expert panel felt CPT 31575 was an excellent alternate reference code for this service as it has a work RVU of 1.10 and a total time of 28 minutes.

#### Comparison to key reference code

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43202

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology How often? Commonly

Specialty Gastroenterology How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 477

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on several assumptions. First, that 31 percent of the existing 43203 will continue to be reported by Otolaryngology. Second, that 10 percent of the Otolaryngology portion of 43203 will continue to be reported using the new 43198 code, 30 percent will be reported using the revised 43203 code, and 60 percent will be reported using the new 43193 code. In addition, we have assumed that the national volume of the new 43198 code will be four times that of the Medicare volume due to the patient population representing middle aged patients which are not predominantly Medicare age patients.

Specialty Otolaryngology Frequency 429 Percentage 89.93 %

Specialty Gastroenterology Frequency 48 Percentage 10.06 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 119

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the assumption that 10 percent of the current Otolaryngology

volume for existing CPT 43203 will be represented by the new CPT code 43198 and of that 10 percent, 90 percent of services will be provided by Otolaryngology and 10 percent will be performed by GL.

Specialty Otolaryngology	Frequency 107	Percentage 89.91 %

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43200      Tracking Number

Original Specialty Recommended RVU: **1.59**Presented Recommended RVU: **1.59**

Global Period: 000

RUC Recommended RVU: **1.59**

CPT Descriptor: Esophagoscopy, flexible, transoral; diagnostic, including collection of specimen(s) by brushing or washing when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 67 year old patient with difficulty swallowing undergoes diagnostic esophagoscopy with brushings or washings

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 85%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 74%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. If indicated, brushings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012					
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Wayne M. Koch, MD (AAO-HNS), John Lanza, MD (AAO-HNS), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)					
<b>Specialty(s):</b>	AGA, ASGE, AAO-HNS, SAGES					
<b>CPT Code:</b>	43200					
<b>Sample Size:</b>	5029	<b>Resp N:</b>	121	<b>Response:</b> 2.4 %		
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE endoscopy Special Interest Groups, and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. AAO-HNS conducted a random sampling of 704 physicians. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for AAO-HNS, SAGES, AGA and ASGE was 5,029.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* RVW, 1.59, physician time, (27/15/13) was initially Harvard valued in 1993 and reviewed by the RUC in the 1<sup>st</sup> five-year review in 1995. This code is being reviewed in response to comments by CMS in the Proposed Rule and Final Rule for CY 2012, requesting review of a number of gastrointestinal endoscopic services as being potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Triological Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43200, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using the same pre- and post- service times for all of the codes in 43201-43232 as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 121 respondents of 5029 queried (2.4 %). Of the responses received, 86% were from Gastroenterologists, 11% were from Otolaryngologists, and 3% were from Endoscopic Surgeons. 96% found the vignette to be typical. The median service performance rate was 75. 85% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 15 minutes and post-service time of 10 minutes. 25 (21%) of the respondents chose key reference service 49421 (Insertion of tunneled intraperitoneal catheter for dialysis, open 46/45/20 RVW 4.21) and considered 43200 to be of slightly greater intensity in 10 of 11 measures and almost equal intensity in 1 of 11 measures. The median survey RVW was 2.78. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (75) was substantially higher than would be expected for a typical gastroenterologist in solo or small group practice and that those who responded most likely overrepresented high volume referral centers comprising more experienced and efficient practitioners. The

expert panel felt this supported the concept that the survey respondents were more experienced than the typical practitioner, and that this should be considered in the development of work recommendations.

The panel noted there has been a change in the practice pattern for this service since it was initially valued by Harvard in 1993. In the 1980s and 1990s when code 43200 was first valued, flexible esophagoscopy was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s and early 2000s when this code was previously valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for diagnostic esophagoscopy, code 43200 – which includes flexible trans-oral, rigid trans-oral, and flexible trans-nasal esophagoscopy – have declined over a seven year period from 18,000 in 2005 to 14,834 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 14,834) reveals that code 43200 was reported 70.74% percent of the time by otolaryngologists, 15.33% by gastroenterologists, and 4.42% by general surgeons. For Medicare, the procedure was performed 47.58% in the outpatient hospital, 22.71% in the inpatient hospital, 18.67% in the physician office, and 10.53% in the ambulatory surgery center setting. In comparison, the remaining codes in 43201-43232 are reported primarily by gastroenterologists. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia. Similarly, one can make only an estimate assumption as to the percentage of services performed in the office setting represent flexible trans-oral vs. trans-nasal esophagoscopy.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring

during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 1b with changes of times to 19/3/5 for a total of 27 minutes of pre-service time when the procedure is performed in the facility setting, as follows:

**Evaluation:** 19 minutes, which is the package time, but less than the survey median.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes, which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes which is equivalent to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* reviewed by the RUC in April 2009. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service;* reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 15 minutes and felt that, even though the survey group represented a more experienced referral center practitioner group, this time was acceptable as it represented approximately 1/3 of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, which was reviewed by the RUC in April 2010, and approximately twice the intra-service time of code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic*, which was reviewed by the RUC in the 2005 five-year review. Of note is that laryngoscopy is a service which does not inspect the esophagus. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 1.80 and 2.78, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43200 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 1.80 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43200 from 1.59.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43200 were greater. Adjusting for the differences in times, the panel concluded that the current RVW of 1.59 and revised IWPOT (0.0480) for code 43200 is

consistent with MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904)* which is considered to be a more intense service, and less than code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open (000 global, 49/45/20, RVW 4.21, IWPUT 0.0639)* which is considered to be a more intense service. The panel considered MPC code 57410 *Pelvic examination under anesthesia (other than local) (000 global, 30/15/25 RVW 1.75, IWPUT 0.0345)* to be a reasonable comparable code of lesser complexity. In addition code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure) (000 global 25/30/15 RVW 2.78, IWPUT 0.0688)* compares favorably with 43200 adjusting for the difference in intra service times.

While there was compelling evidence to recommend an increase in the wRVU times for code 43200, based on the survey times adjusted for pre-service package 1b in the facility setting, the expert panel recommends that the existing wRVU value of 1.59 should be retained with physician times 27/15/15 (compared to the previous Harvard valuation of 27/15/13).

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43200

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 10167

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~Medicare 2011 volume 14,834 x (15.33% (GI cases) + {[70.74% (ENT) + 4.42% (Surgery)] x 10%}. 70.74%+4.42%= 75.16% x 10% = 7.516% x 14834 = 1115 ; 14834 x 15.33% = 2274; (1115 + 2274)\*3 = 10,167

Specialty Gastroenterology	Frequency 6822	Percentage 67.09 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43200

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43201	Tracking Number	Original Specialty Recommended RVU: <b>2.09</b>
		Presented Recommended RVU: <b>2.09</b>
Global Period: 000		RUC Recommended RVU: <b>1.90</b>

CPT Descriptor: Esophagoscopy, flexible, transoral; with directed submucosal injection(s), any substance

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 68 year-old patient with achalasia undergoes therapeutic esophagoscopy with injection of botulinum toxin

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 87%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 83%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. The lower esophageal sphincter is identified. The endoscope is withdrawn to 38cm and Botulinum toxin A solution is injected submucosally at four quadrants under endoscopic direction. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. After observation to confirm the absence

of bleeding, the endoscope is then withdrawn. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43201				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	121	<b>Response:</b> 2.7 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

43201 *Esophagoscopy, flexible; transoral diagnostic, with directed submucosal injection(s), any substance* RVW, 2.09, physician time, (12/25/27.5) was initially reviewed by the RUC in April 2002. This code is being reviewed in response to comments by CMS in the Proposed Rule and Final Rule for CY 2012, requesting review of a number of gastrointestinal endoscopic services as being potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Triological Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43201, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using the same pre- and post- service times for all of the codes in 43201-43232 as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 121 respondents of 4325 queried (2.7 %). Of the responses received, 98% were from Gastroenterologists and 2% were from Endoscopic Surgeons. Of those who participated in the survey, 73 (60%) responded to a subsequent email asking whether the vignette was typical. Of the 73 who responded, 97% found the vignette to be typical. The median service performance rate was 10. 87% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 15 minutes and post-service time of 10 minutes. 23 (19%) of the respondents chose key reference service 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open* (wRVW 4.21 46/45/20). The survey intra-service intensity of 43201 was 4.15, compared to the comparison code intra-service intensity of 3.42. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (10) was what would be expected for a typical gastroenterologist in solo or small group practice.

When 43201 is performed in the facility setting, the panel recommended pre-service package **1b**, Facility Straightforward Patient / Straightforward Procedure (With sedation / anesthesia care), which would be used for this non-incisional trans-oral endoscopic procedure. The expert panel felt the survey respondents underestimated the time necessary to complete all of the elements included in the facility pre-service package

that are typically performed with 43201 and failed to consider all of the elements in their time estimation (indications and contraindications for sedation, history of relevant cardiovascular, pulmonary, and neurological conditions, focused physical examination including modified Mallampati score to predict ease of intubation, ASA physical status classification, and summative determination of sedation requirement) and therefore recommended an adjustment of times to reflect the pre-service package and work.

Medicare claims for diagnostic esophagoscopy, with directed submucosal injection(s), any substance code 43201 – which includes flexible trans-oral, rigid trans-oral, and flexible trans-nasal esophagoscopy – have increased slightly over a seven year period from 409 in 2005 to 506 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 506) reveals that code 43201 was reported 35.98% percent of the time by otolaryngologists, 55.13% by gastroenterologists, 2.94 % by thoracic surgeons and 2.75% by general surgeons. For Medicare, the procedure was performed 73.25% in the outpatient hospital, 16.64% in the inpatient hospital, 2.33% in the physician office, and 7.79% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia. Similarly, one can make only an estimate assumption as to the percentage of services performed in the office setting represent flexible trans-oral vs. trans-nasal esophagoscopy.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 1b with changes of times to 19/3/5 for a total of 27 minutes of pre-service time when the procedure is performed in the facility setting, as follows:

**Evaluation:** 19 minutes which is the package time, but less than the survey median.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes which is equivalent to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* reviewed by the RUC in April 2009. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service;* reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 15 minutes and considered it an underestimate as it was the same intraservice time as the base code and a reduction of 10 minutes since it was last reviewed. Nevertheless, the panel felt that this time was acceptable as it represented approximately 1/3 of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, which was reviewed by the RUC in April 2010, and approximately twice the intra-service time of code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic*, which was reviewed by the RUC in the 2005 five-year review. Of note is that laryngoscopy is a service which does not inspect the esophagus. The panel felt that although the intraservice time was approximately two thirds of the previous valuation, the intensity of the service (i.e. the necessity to successfully perform the service without complication in a shorter period of time) had substantially increased. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 2.10 and 3.00 which was consistent with the increase in intensity. The expert panel then reviewed the rank order of code 43200 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 2.10, the lack of compelling evidence which would otherwise merit a work value increase could not justify recommending an increase in the current valuation of code 43201 from 2.09.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 49421 were greater. Adjusting for the differences in times, the panel concluded that the current RVW of 2.09 and revised IWPUT (0.081) for code 43201 is consistent with MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic* (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904) which is considered to be a more intense service, and less than code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open* (wRVW 4.21, IWPUT 0.0639) which is considered to be a slightly more intense service. The panel considered MPC code 57410 *Pelvic examination under anesthesia (other than local)* (000 global, 30/15/25 RVW 1.75, IWPUT 0.0345) to be a reasonable comparable code of lesser complexity. In addition code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (000 global 25/30/15 RVW 2.78, IWPUT 0.0688) compares favorably with 43201 adjusting for the difference in intra service times.

Since there was no compelling evidence to recommend an increase in the wRVU times for code 43201, based on the survey times adjusted for pre-service package 1b in the facility setting, the expert panel recommends that the existing wRVU value of 2.09 should be retained with physician times 27/15/15 (compared to the previous RUC valuation of 12/25/27.5).

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43201

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data 2011 = 506.  $(506 \times 3) = \sim 1,500$ . We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures.

Specialty Gastroenterology                      Frequency 1350                      Percentage 90.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 378

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data 2011 = 506. leftover utilization not going to 4319X2

Specialty Gastroenterology                      Frequency 341                      Percentage 90.21 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43201

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**CPT Long Descriptor:**

- 77280 Therapeutic radiology simulation-aided field setting; simple
  - 77285 Therapeutic radiology simulation-aided field setting; intermediate
  - 77290 Therapeutic radiology simulation-aided field setting; complex
  - 77293 Respiratory motion management simulation  
(List separately in addition to code for primary procedure)  
(Use +77293 in conjunction with 77295, 77301)
  - 77295 3-dimensional radiotherapy plan, including dose volume histograms
- 

**Global Period:** 77280, 77285, 77290 & 77295 XXX and 77293 ZZZ

**Meeting Date:** January 2013

**Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

ASTRO convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these procedures.

**You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

For the four existing codes, ASTRO included the current direct practice expense inputs as well as the recommended inputs for the procedures. We also included the direct practice expense inputs for CPT codes that are sometimes billed with the procedures as a point of reference to ensure there is no double counting. ASTRO included recommendations for the new code. One of the existing codes 77014 can serve as a reference code for this new procedure.

**If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**Please describe in detail the clinical activities of your staff:**

**Pre Service Clinical Activities**

N/A

**Intra-Service Clinical Labor Activities**

*CPT codes 77280*

The radiation therapist will first prepare the CT room. This will include positioning the CT table at its lowest position, placing any pads on the table and setting the moveable patient positioning lasers at their zero position. The Radiation Therapist will gather and ready any necessary supplies for patient marking.

The radiation therapist will then greet the patient and give them a brief explanation of the simulation procedure and its expected duration. The patient will be led to the changing area and instructed to change into the appropriate exam gown.

After gowning, the radiation therapist will bring the patient into the CT room and verify the patient's identity according to department policy. The therapist will explain the CT procedure in detail, ask if they have any questions or concerns and provide any additional information as necessary. The therapist will then take a face photo of the patient. The therapist will assist the patient onto the CT table and place them into the appropriate position. The patient's arms and legs will then be positioned according to scan protocol and/or patient comfort considerations. Knee wedges, arm straps and other pads may be added as needed to ensure patient comfort and stability. The patient positioning lasers are used to verify patient alignment. Markers are placed on the patient's skin as directed by the radiation oncologist.

After verifying with the radiation oncologist the extent of the area to be scanned, the therapist manually moves the patient into the CT unit bore checking for sufficient clearance between the patient, table and the CT unit. The table is then positioned using the internal CT lasers to the start position for the scanning sequence. The radiation therapist chooses the appropriate scanning parameters at the CT console and takes AP and lateral scout images.

The scout images are shown to the radiation oncologist and reviewed. Adjustments are made to patient position as necessary to improve patient alignment and/or comfort. Scout images are then repeated and the final patient positioning verified. At this point the field of view for the scan, including the superior/inferior scan extent, is set by the therapist. The patient is then scanned and the images are reconstructed.

The scan images are then reviewed by the radiation therapist and radiation oncologist. It is verified that the patient position is acceptable, that the scan extends sufficiently in the superior/inferior directions, and that no part of the patient's skin contour is cut off. The image quality of the scan is also noted, in particular any artifacts that might arise from contrast agents or metallic implants.

The scan images are then sent to the virtual simulation workstation where the radiation oncologist places the treatment fields and sets isocenter. The radiation therapist then generates digitally reconstructed radiographs (DRR's) from the virtual treatment fields.

The therapist then exports the isocenter coordinates to the laser system which projects the isocenter position onto the patient. The therapist tattoos the patient with the projected isocenter position as well as any other ancillary leveling and positioning marks that will be used for patient set up on the treatment unit. The therapist documents these tattoos with photos. The therapist then assists the patient off of the CT table and takes them back to the changing area.

Back in the CT room, the therapist exports the scan images and DRR's to the PACS system and the radiation therapy planning computer and uploads the patient face and tattoo photos into the record and verify system. The therapist then completes the simulation documentation and prepares the patient set up instructions for use at the treatment unit. The pads and other positioning devices are then removed from the CT table. The table and other equipment is then cleaned and disinfected and unused supplies are put away.

#### CPT Code 77285

The radiation therapist will first prepare the CT room. This will include positioning the CT table at its lowest position, installing any immobilization devices or pads on the table and setting the moveable patient positioning lasers at their zero position. The Radiation Therapist will gather and ready any necessary supplies for patient marking.

The radiation therapist will then greet the patient and give them a brief explanation of the simulation procedure and its expected duration. The patient will be led to the changing area and instructed to change into the appropriate exam gown.

After gowning, the radiation therapist will bring the patient into the CT room and verify the patient's identity according to department policy. The therapist will explain the CT procedure in detail, ask if they have any questions or concerns and provide any additional information as necessary. The therapist will then take a face photo of the patient. The therapist will assist the patient onto the CT table and place them into the appropriate position. This may involve placing the patient into immobilization devices such as a mold or mask or other supporting devices as appropriate. The patient's arms and legs will then be positioned according to scan protocol and/or patient comfort considerations. Knee wedges, arm straps and other pads may be added as needed to ensure patient comfort and stability. The patient positioning lasers are used to verify patient alignment. Markers for the first treatment area are placed on the patient's skin as directed by the radiation oncologist.

After verifying with the radiation oncologist the extent of the area to be scanned, the therapist manually moves the patient into the CT unit bore checking for sufficient clearance between the patient, table and immobilization devices and the CT unit. The table is then positioned using the internal CT lasers to the start position for the scanning sequence. The radiation therapist chooses the appropriate scanning parameters at the CT console and takes AP and lateral scout images.

The scout images are shown to the radiation oncologist and reviewed. Adjustments are made to patient position as necessary to improve patient alignment and/or comfort. The scout images may indicate that an alternative patient position would be advantageous in which case the patient

positioning sequence would be repeated. Scout images are then repeated and the final patient positioning verified. At this point the field of view for the scan, including the superior/inferior scan extent, is set by the therapist. The patient is then scanned and the images are reconstructed.

The scan images are then reviewed by the radiation therapist and radiation oncologist. It is verified that the patient position is acceptable, that the scan extends sufficiently in the superior/inferior directions, and that no part of the patient's skin contour is cut off. The image quality of the scan is also noted, in particular any artifacts that might arise from contrast agents or metallic implants.

The patient is then repositioned, as necessary, for scanning of the second treatment area. New markers are placed on the patient's skin, clearances are checked and AP and lateral scout images are obtained as described above. They are reviewed, patient position is adjusted as necessary and scouts are repeated. After approval by the radiation oncologist, the second treatment area of the patient is scanned.

Both sets of scan images are then sent to the virtual simulation workstation where the radiation oncologist places the treatment fields and sets isocenters for both treatment areas. The radiation therapist then generates digitally reconstructed radiographs (DRR's) for both sites from the virtual treatment fields.

The therapist then exports the isocenter coordinates for the first treatment site to the laser system which projects the isocenter position onto the patient. The therapist tattoos the patient with the projected isocenter position as well as any other ancillary leveling and positioning marks that will be used for patient set up on the treatment unit. This process is then repeated for the second treatment area. The therapist documents the tattoos for both sites with photos. The therapist then assists the patient off of the CT table and takes them back to the changing area.

Back in the CT room, the therapist exports the scans and DRR's to the PACS system and the radiation therapy planning computer and uploads the patient face and tattoo photos into the record and verify system. The therapist then completes the simulation documentation and prepares the patient set up instructions for use at the treatment unit. The immobilization equipment and other devices are then removed from the CT table. The table and other equipment is then cleaned and disinfected and unused supplies are put away.

#### CPT Code 77290

The radiation therapist will first prepare the CT room. This will include positioning the CT table at its lowest position, installing the customized immobilization device that was fabricated for the patient and setting the moveable patient positioning lasers at their zero position. The Radiation Therapist will gather and ready any necessary supplies for patient marking.

The radiation therapist will then greet the patient and give them a brief explanation of the simulation procedure and its expected duration. The patient will be led to the changing area and instructed to change into the appropriate exam gown.

After gowning, the radiation therapist will bring the patient into the CT room and verify the patient's identity according to department policy. The therapist will explain the CT procedure in detail, ask if they have any questions or concerns and provide any additional information as

necessary. The therapist will then take a face photo of the patient. The therapist will assist the patient onto the CT table and place them into the immobilization device. This consists of an angled support structure which holds the patient's torso and arms in positions which permit optimum treatment geometry. The support structure incorporates a customized mold for the patient to ensure reproducibility of the patient's position. Treatment of the breast and supraclavicular area require complicated treatment beam geometry and it is vital that the patient be positioned correctly and reproducibly. Extra time is required for such positioning. Knee wedges, straps and other pads may be added as needed to ensure patient comfort and stability. The patient positioning lasers are used to verify patient alignment. Markers are placed on the patient's skin as directed by the radiation oncologist.

After verifying with the radiation oncologist the extent of the area to be scanned, the therapist manually moves the patient into the CT unit bore checking for sufficient clearance between the patient, table and immobilization devices and the CT unit. This must be checked very carefully due to the size of the immobilization device and the position of the patient's arm over her head. The table is then positioned using the internal CT lasers to the start position for the scanning sequence. The radiation therapist chooses the appropriate scanning parameters at the CT console and takes AP and lateral scout images.

The scout images are shown to the radiation oncologist and reviewed. Adjustments are made to patient position as necessary to improve patient alignment and/or comfort. The scout images may indicate that an alternative arm position or angle of the patient's torso would be advantageous in which case the immobilization device would be modified and the patient positioning sequence would be repeated. Scout images are then repeated and the final patient positioning verified. At this point the field of view for the scan, including the superior/inferior scan extent, is set by the therapist. The patient is then scanned and the images are reconstructed.

The scan images are then reviewed by the radiation therapist and radiation oncologist. It is verified that the patient position is acceptable, that the scan extends sufficiently in the superior/inferior directions, and that no part of the patient's skin contour is cut off. The image quality of the scan is also noted, in particular any artifacts that might arise from contrast agents or metallic implants.

The scan images are then sent to the virtual simulation workstation where the radiation oncologist places the treatment fields for both the breast and the nodal areas and sets one or more isocenters for those beams. The radiation therapist then generates digitally reconstructed radiographs (DRR's) from the virtual treatment fields.

The therapist then exports the isocenter coordinates to the laser system which projects the isocenter position onto the patient. The therapist tattoos the patient with the projected isocenter position as well as any other ancillary leveling and positioning marks that will be used for patient set up on the treatment unit. If multiple isocenters will be utilized, each will be exported, projected onto the patient and tattooed. The therapist documents all of the tattoos with photos. The therapist then assists the patient off of the CT table and takes them back to the changing area.

Back in the CT room, the therapist exports the scans and DRR's to the PACS system and the radiation therapy planning computer and uploads the patient face and tattoo photos into the

record and verify system. The therapist then completes the simulation documentation and prepares the patient set up instructions for use at the treatment unit. The immobilization equipment and other devices are then removed from the CT table. The table and other equipment is then cleaned and disinfected and unused supplies are put away.

CPT code 77293 -- ZZZ

The Radiation Therapist (RT) positions the respiratory transducers (infrared reflective device, respiratory sensing belt, active breathing control, etc.) on the patient and verifies connectivity with the 4D CT scanning system and/or respiratory signal processing computer.

The physicist then assists the physician in coaching the patient to achieve an optimal yet natural breathing cycle consistent with minimizing respiratory excursion. The resultant transducer signal is tracked over a length of time similar to what will be necessary to acquire the 4D data set. The respiratory cycle duration is measured. The coaching and tracking process is repeated to assure that the measured respiratory cycle characteristics are reproducible and will be typical of the cycle that will occur when the patient is treated.

In consultation with the physician and physicist, a decision is made as to triggering on phase or amplitude, the computer system is programmed to reflect that choice and a sample trigger data set is run to assure that the respiratory cycle will be properly segmented by the trigger signal. If the segmentation is sub-optimal, the transducer placement – coaching- tracking and triggering analysis is repeated.

Based upon the analysis of the respiratory cycle, appropriate cine and/or pitch parameters are calculated. A set of orthogonal scout images is acquired and the desired scan positions are set. The slice thickness, slice number, pitch/cine time and x-ray output parameters are optimized based on tube heating/cooling characteristics and maximum slice number constraints. The RT then adjusts the scan position parameters to be congruent with the initial CT simulation image data set and acquires the 4D data set. The physicist and physician observe both the progression of the scan acquisition and the integrity of the triggering signal overlaid on the respiratory cycle curve. If significant anomalies in the respiratory cycle curve occur the coaching/positioning/ respiratory cycle confirmation/ scan acquisition process is repeated.

At the conclusion of the raw data acquisition, the physicist adjusts the recorded respiratory trigger signal to account for minor deviations in the respiratory cycle. A 4D reconstruction is then implemented, generally creating a segmented series of 10 image data sets, each imaging 10% of the respiratory cycle. The physicist then reviews the resultant 4D data set in both static and Cine modes with the physician, and if acceptable, creates a Maximum Intensity Projection data Set (MIP) and an average or ungated data set. The RT then transmits the entire series (10 respiratory segments, MIP and Average) to a processing station for the physician to create an ITV or series of GTV's.

CPT Code 77295

The dosimetrist reviews the patient chart and prescription and receives guidance from the physician as to the particular issues related to the development of the 3-D isodose plan. The dosimetrist then enters the patient demographics into the Radiation Therapy Planning (RTP) computer, verifying that the patient name and medical record number are identical across the RTP system, the Record and Verify (RV) system and the CT simulation system.

The dosimetrist then imports the CT simulation image data sets into the RTP system and reviews each data set for completeness and appropriate planning characteristics. The dosimetrist contours the basic 3D organs at risk structures (i.e. skin) and then reviews the contours with the physician, making modifications as directed. As the physician draws the 3-D GTV, CTV and PTV structures, and critical structures, the dosimetrist assists as necessary, and then modifies adjacent or overlapping OAR structures using Boolean operators to avoid over-determined constraints during the development of the 3D isodose plan.

Based upon the contour sets designed/approved by the physician, the dosimetrist positions the isocenter to allow the optimal linac beam configuration, assigns beam energies, initial field sizes, gantry and table angles and beam weights in consultation with the physicist. The collimation of the beams is reviewed with the physician and adjusted as necessary with the aid of beams-eye views overlaid on digitally reconstructed radiographs (DRRs). A 3-D plan is then generated using the beam-modeling algorithm recommended by the physicist. Dose volume histograms are generated from the 3-D dose matrix of the plan, and beam parameters (beam energies, initial field sizes, gantry and table angles and beam weights) are adjusted as necessary. Additional trials (typically 3-4) with modified beam parameters are created and the dose volume histograms and isodose curve displays are compared to assist in plan optimization. The resultant 3-D information is reviewed with the physicist and physician and additional modifications are made as directed.

Once the physician has made a final decision on the 3-D isodose plan, the dosimetrist generates final treatment beam DRR's and orthogonal set-up DRR's, locks and archives the plan, exports it to the RV system, creates and reviews treatment field definitions in the RV system based upon the data imported from the RTP system and creates the treatment delivery notes for the Radiation Therapist to use during the patient treatment.

Lastly, the dosimetrist verifies that the beam delivery parameters transmitted from the RV system are correctly implemented on the linear accelerator delivery computer console.

SUMMARY OF RECOMMENDATION**

CPT Code: 43204	Tracking Number	Original Specialty Recommended RVU: <b>3.76</b>
		Presented Recommended RVU: <b>2.89</b>
Global Period: 000		RUC Recommended RVU: <b>2.89</b>

CPT Descriptor: Esophagoscopy, flexible, transoral: with injection sclerosis of esophageal varices

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 53 year old patient with cirrhosis and esophageal varices undergoes therapeutic esophagoscopy with injection sclerosis for control of active variceal hemorrhage.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 86%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 82%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. Actively bleeding 3-4+ esophageal varices are identified. The area is washed. After obtaining adequate visibility of the most likely bleeding site, a sclerotherapy needle is inserted into the bleeding varix. Injections of sclerosing agent are performed to the primary bleeding varix. The level of sedation of the patient is reassessed and additional medication is administered as needed. The sclerotherapy needle is withdrawn, inserted at a second site in the varix, and injections of sclerosing agent are performed. Subsequent insertion of the sclerotherapy

needle and injections of sclerosing agent are performed for all other prominent varices identified as active or potential bleeding sources. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)

<b>CPT Code:</b>	43204				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	95	<b>Response:</b> 2.1 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Rationale and comments for 43204**

43204 *Esophagoscopy, flexible; transoral diagnostic, with injection sclerosis of esophageal varices* RVW, 3.76, physician time, (42/43/20) was last reviewed by the RUC in April 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43204, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43204, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43204 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 95 respondents of 4325 queried (2.1 %). Of the responses received, 97% were from Gastroenterologists and 3% were from Endoscopic Surgeons. 96% found the vignette to be typical. The median service performance rate was 2. 86% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 20 minutes. 23 (23.2%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open* (wRVW 4.21 45/45/20). The survey intra-service intensity of 43204 was 4.93, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 3.76. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (2) was what would be expected for a typical gastroenterologist in solo or small group practice. This reflects the change in practice patterns since this code was valued in 1993, with band ligation as the primary elective treatment of esophageal varices and variceal

sclerotherapy being reserved for cases which are more emergent or urgent, severe, and/or refractory to band ligation.

When 43204 is performed, the panel recommended pre-service package **2b**, Facility Difficult Patient / Straightforward Procedure (With sedation / anesthesia care), which would be used for this incisional trans-oral endoscopic procedure. Patients undergoing sclerotherapy of esophageal varices are considered difficult because of the underlying co-morbidities from cirrhosis, cancer, encephalopathy, and/or coagulopathy that are often seen in these patients. Patients with active bleeding from esophageal varices carries a greater risk of aspiration, uncontrollable bleeding, pain and perforation associated with the procedure. The expert panel felt the survey respondents underestimated the time necessary to complete all of the elements included in the facility pre-service package that are typically performed with 43204 and failed to consider all of the elements in their time estimation (indications and contraindications for sedation, history of relevant cardiovascular, pulmonary, and neurological conditions, focused physical examination including modified Mallampati score to predict ease of intubation, ASA physical status classification, and summative determination of sedation requirement) and therefore recommended an adjustment of times to reflect the pre-service package and work.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade. Finally, the panel noted that treatment of esophageal varices today is almost entirely by band ligation, which was not yet commercially available in 1993, and sclerotherapy is almost exclusively performed on those most severe cases which fail band ligation therapy.

Medicare claims for Esophagoscopy, rigid or flexible; with injection sclerosis of esophageal varices (code 43204) have declined over a seven year period from 216 in 2005 to 91 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 91) reveals that code 43204 was reported 3.53% percent of the time by otolaryngologists, 50.55% by gastroenterologists, 24.72% by internal medicine specialists, and 21.19% by general surgeons. For Medicare, the procedure was performed 50.55 % in the outpatient hospital, 41.17% in the inpatient hospital, 7.06% in the physician office, and 1.21% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic,*

with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure) which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 2b with changes of times to 25/3/5 for a total of 33 minutes of pre-service time, as follows:

**Evaluation:** 25 minutes which is the survey median time, but less than the package time.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes similar to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service*; reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 20 minutes and felt that this time was acceptable as it represented slightly less than half of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel felt that although the intraservice time was approximately half of the previous valuation the intensity of the service (i.e. the necessity to successfully perform the service without complication in a shorter period of time) had substantially increased due to the change in practice caused by the introduction of band ligation resulting in use of this service in sicker patients. The panel also compared

the 20 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 5 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 2.89 and 3.76 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43204 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43216 from 3.76 which is the median RVW recommendation of the survey.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43204 were less. Adjusting for the differences in times, the panel concluded that the current RVW and revised IWPUT (0.138) for code 43204 is consistent with code MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904)* and proportional to code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open (wRVW 4.21, IWPUT 0.0639)*. The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance (000 global, 20/30/15 RVW 3.69, IWPUT 0.0969)* compares appropriately with 43204 adjusting for the difference in service times and complexity. Code 57410 *Pelvic examination under anesthesia (other than local) (000 global, 30/15/25, RVW 1.75, IWPUT 0.0345)*, and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure) (000 global 20/30/15, RVW 2.78, IWPUT 0.0688)*, were identified as comparable codes of lesser complexity.

While there was compelling evidence to recommend an increase in the wRVU times for code 43204 based on the survey times adjusted for pre-service package 2b, the expert panel recommends that the existing wRVU value of 3.76 should be retained with physician times 33/20/15 (compared to the previous RUC valuation of 42/43/20). The expert panel also recommends that code 43204 should be valued only in the facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43204

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 270

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~270 (Medicare data 2011 = 91\*3). We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures.

Specialty Gastroenterology                      Frequency 243                      Percentage 90.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 91 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. ~91 (Medicare data 2011 = 91).

Specialty Gastroenterology                      Frequency 82                      Percentage 90.10 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43204

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION**

CPT Code: 43205	Tracking Number	Original Specialty Recommended RVU: <b>3.78</b>
		Presented Recommended RVU: <b>3.00</b>
Global Period: 000		RUC Recommended RVU: <b>3.00</b>

CPT Descriptor: Esophagoscopy, flexible, transoral: with band ligation of esophageal varices

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 55 year old patient with cirrhosis and esophageal varices undergoes therapeutic esophagoscopy with band ligation for control of active variceal hemorrhage.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 84%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 74%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa and varices. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn and the band ligator is attached to the end of the scope. The endoscope is reinserted, advanced into the stomach and then withdrawn to the largest varix just proximal to the gastroesophageal junction. The varix is banded and observed. The level of sedation of the patient is reassessed and additional medication is administered as needed. The endoscope is withdrawn to the next largest varix. The varix is

banded and observed. All remaining varices in the distal esophagus are banded. Photodocumentation of the exam findings including measurements of the varices and labeling of the identified structures are obtained and sent to a hard copy device. After observation to confirm the absence of bleeding, the endoscope is then withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43205				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	108	<b>Response:</b> 2.4 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Rationale and comments for 43205**

43205 *Esophagoscopy, flexible, transoral; with band ligation of esophageal varices* RVW 3.78 physician time, 20/30/20 was previously valued by the RUC in April 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43205, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43205, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43204 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 108 respondents of 4325 queried (2.4 %). Of the responses received 97% were from Gastroenterologists and 3% were from Endoscopic Surgeons. 95% found the vignette to be typical. The median service performance rate was 12. 84% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 20 minutes. 24 (22.2%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (wRVW 4.21 45/45/20). The survey intra-service intensity of 43205 was 4.87, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 3.80. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (12) was what would be expected for a typical gastroenterologist in solo or small group practice.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for Esophagoscopy, rigid or flexible; with band ligation of esophageal varices (code 43205) have declined over a seven year period from 479 in 2005 to 265 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 265) reveals that code 43205 was reported 0.41% percent of the time by otolaryngologists, 88.35% by gastroenterologists, 8.03% by internal medicine specialists, and 3.21% by general surgeons. For Medicare, the procedure was performed 56.60% in the outpatient hospital, 36.16% in the inpatient hospital, 0.41% in the physician office, and 4.41% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs.

gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 2b with changes of times to 25/3/5 for a total of 33 minutes of pre-service time, as follows:

**Evaluation:** 25 minutes which is the survey median time, but less than the package time.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes similar to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service*; reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 20 minutes and felt that this time was acceptable as it represented slightly less than half of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel felt that although the intraservice time was approximately two thirds of the previous valuation, the intensity of the service (i.e. the necessity to successfully perform the service without complication in a shorter period of time) had substantially increased. The panel also compared the 20 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 5 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 3.00 and 3.80 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43205 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the median RVW recommendation of 3.80 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43205 from 3.78.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43205 were less. Adjusting for the differences in times, the panel concluded that the current RVW (3.78) and revised IWPUT (0.139) for code 43205 is consistent with code MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic* (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904) and proportional to code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open* (wRVW 4.21, IWPUT 0.0639). The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance* (000 global,

20/30/15 RVW 3.69, IWPUT 0.0969) compares appropriately with 43205 adjusting for the difference in service times and complexity. Code 57410 *Pelvic examination under anesthesia (other than local) (000 global, 30/15/25, RVW 1.75, IWPUT 0.0345)*, and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure) (000 global 20/30/15, RVW 2.78, IWPUT 0.0688)*, were identified as comparable codes of lesser complexity.

While there was compelling evidence to recommend an increase in the wRVU times for code 43205 based on the survey times adjusted for pre-service package 2b in the facility setting, the expert panel recommends that the existing wRVU value of 3.78 should be retained with physician times 33/22/15 (compared to the previous RUC valuation of 20/30/20). The expert panel also recommends that code 43205 be valued in only the facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43205

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 800

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~800 (Medicare data 2011 = 265\*3) We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures.

Specialty Gastroenterology                      Frequency 700                      Percentage 87.50 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 265  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. ~265 (Medicare data 2011 = 265)

Specialty Gastroenterology	Frequency 233	Percentage 87.92 %
----------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43205

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Code: 43206	Tracking Number	Original Specialty Recommended RVU: <b>3.00</b>
		Presented Recommended RVU: <b>2.39</b>
Global Period: 000		RUC Recommended RVU: <b>2.39</b>

CPT Descriptor: Esophagoscopy, flexible, transoral; with optical endomicroscopy

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: Typical Patient: A 59 year old patient with reflux symptoms and Barrett's epithelium with mucosal irregularity undergoes diagnostic esophagoscopy with optical endomicroscopy for examination.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 79%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 64%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. Abnormal tissue in the distal esophagus at 33-37cm from the incisors suspicious for Barrett's esophagus is identified. An optical endomicroscopy probe is passed through the endoscope to examine the abnormal tissue. Real-time images are reviewed by the endoscopist, identifying areas that are suspicious for pre-malignant and/or malignant tissue, facilitating performance of biopsy (separate procedure). Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Wayne M. Koch, MD (AAO-HNS), John Lanza, MD (AAO-HNS), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43206				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	109	<b>Response:</b> 2.5 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### 43206 *Esophagoscopy, flexible; transoral diagnostic, with optical endomicroscopy*

At the February 2012 CPT Editorial Panel the GI Societies, as part of a multi-specialty comprehensive review of esophagoscopy codes, brought forth coding proposals for two endoscopic procedures for optical endomicroscopy: 43206 *Esophagoscopy, flexible, transoral; with optical endomicroscopy* and 43252. At the April 2012 RUC meeting, the GI societies requested that these codes be carrier priced for 2013 so that the societies could include the surveys for these new services along with the surveys of the esophagoscopy (43200) and upper endoscopy (43235) families. Code 43206 (43206) is now being surveyed with the 43200-43232 family. Code 43252 will be reviewed along with the other codes in the esophagogastrroduodenoscopy (43235-43259) family at the January 2013 RUC meeting.

Although this code family was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Triological Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number for the base procedure, 43200, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using the same pre- and post- service times for all of the codes in 43201-43232 as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 109 respondents of 4325 queried (2.5 %). Of the responses received, 98% were from Gastroenterologists and 2% were from Endoscopic Surgeons. Of those who participated in the survey, 55 (50%) responded to a subsequent email asking whether the vignette was typical. Of the 55 who responded, 98% found the vignette to be typical. The median service performance rate was 13. 79% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 30 minutes and post-service time of 10 minutes. 24 (22%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open* (46/45/20 RVW 4.21). The survey intra-service intensity of 43206 was 4.89, compared to the comparison code intra-service intensity of 3.42. The median survey RVW was 4.00. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference

service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (13) was substantially higher than would be expected for a typical gastroenterologist in solo or small group practice and that those who responded most likely overrepresented high volume referral centers comprising more experienced and efficient practitioners. The expert panel felt this supported the concept that the survey respondents were more experienced than the typical practitioner, and that this should be considered in the development of work recommendations.

When 43206 is performed in the facility setting, the panel recommended pre-service package **1b**, Facility Straightforward Patient / Straightforward Procedure (With sedation / anesthesia care), which would be used for this non-incisional trans-oral endoscopic procedure. The expert panel felt the survey respondents underestimated the time necessary to complete all of the elements included in the facility pre-service package that are typically performed with 43206 and failed to consider all of the elements in their time estimation (indications and contraindications for sedation, history of relevant cardiovascular, pulmonary, and neurological conditions, focused physical examination including modified Mallampati score to predict ease of intubation, ASA physical status classification, and summative determination of sedation requirement) and therefore recommended an adjustment of times to reflect the pre-service package and work.

The panel noted there has been a change in the practice pattern for the base code of this family of services since it was initially valued by Harvard in 1993. In the 1980s and 1990s when code 43200 was first valued, flexible esophagoscopy was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s and early 2000s when this code was previously valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is

accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 1b with changes of times to 19/3/5 for a total of 27 minutes of pre-service time when the procedure is performed in the facility setting, as follows:

**Evaluation:** 19 minutes which is the package time, but less than the survey median.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel identified several crosswalks that would be equivalent in terms of physician pre-service time to this procedure. Code 31626, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of fiducial markers, single or multiple*, (wRVW 4.16, 25/45/15), preservice package 1b, with 25 minutes of preservice time (eval 19, positioning 1, scrub/dress/wait 5) and 15 minutes of postservice time, was reviewed by the RUC in April 2009. Code 32553, *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple*, (wRVW 3.80, 25/45/20), preservice package 1b, with 25 minutes of preservice time (eval 19, positioning 1, scrub/dress/wait 5) and 20 minutes of postservice time, was reviewed by the RUC in April 2009. Code 55876, *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple* (wRVW 1.73, 29/20/10), with 19 minutes of evaluation and 10 minutes of positioning time, was reviewed by the RUC in April 2010. Code 64446, *Injection, anesthetic agent; sciatic nerve, continuous infusion by catheter (including catheter placement)*, (wRVW 1.81, 29/20/15), preservice package 1b, with 29 minutes of preservice time (eval 19, positioning 5, scrub/dress/wait 5), was reviewed by the RUC in April 2008. The panel noted that in October 2010 at the 4<sup>th</sup> five-year review, the societies recommended and the RUC accepted 3 minutes positioning for 45331, *Sigmoidoscopy, flexible; with biopsy, single or multiple*. The panel believes that positioning time for 43200 is similar to that for 45331 and, while noting that CMS revised the positioning time for 45331 to 5 minutes, recommends that 3 minutes is the correct time for this element of work.

The panel felt that the median post-service time of 10 minutes underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes which is equivalent to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* reviewed by the RUC in April 2009. The panel determined

that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service*; reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 30 minutes and considered it an accurate estimation, even though the survey group represented a more experienced referral center practitioner group. The panel considered the time acceptable as it represented two-thirds the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, which was reviewed by the RUC in April 2010, and approximately three times the intra-service time of code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic*, which was reviewed by the RUC in the 2005 five-year review. Of note is that laryngoscopy is a service which does not inspect the esophagus. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 3.00 and 4.00. The expert panel then reviewed the rank order of code 43206 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that the 25<sup>th</sup> percentile RVW recommendation of 3.00 provided the best estimate.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 49421 were greater. Adjusting for the differences in times, the panel concluded that the RVW of 3.0 for code 43206 is consistent with code 49421 which is considered to be a similar to slightly less intense service (IWPUT 0.071 for 43206 compared with 0.0639 for 49421) and less than the IWPUT for code 31575 (IWPUT 0.0904). The panel considered MPC codes 31575 *Laryngoscopy, flexible fiberoptic; diagnostic* (000 global, 15/8/5 RVW 1.10) and 57410 *Pelvic examination under anesthesia (other than local)* (000 global, 30/15/25 RVW 1.75) to be reasonable comparable codes of lesser complexity. In addition code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (000 global 20/30/15 RVW 2.78) compares favorably with 43206 adjusting for the difference in intra service times.

Based on the survey times adjusted for pre-service package 1b in the facility setting the expert panel recommends that the survey 25th percentile wRVU value of 3.0 with physician times 27/30/15.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43200 + 43499 unlisted procedure, esophagus

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 190

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data 2011 for 43499 = 634. ( $634 \times 3 = \sim 1900$ ) We estimate that 43206 accounted for approximately 10% of the volume of 43499 ( $\sim 1900 \times 10\% = 190$ ). We believe that 90% of these procedures will now be reported by GI using 43206.

Specialty Gastroenterology                      Frequency 170                      Percentage 89.47 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 60 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data 2011 for 43499 = 634. We estimate that 43206 accounted for approximately 10% of the volume of 43499 ( $634 \times 10\% = \sim 60$ ). We believe that 90% of these procedures will now be reported by GI using 43206.

Specialty Gastroenterology                      Frequency 55                      Percentage 91.66 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

CPT Descriptor: Esophagoscopy, flexible, transoral; with removal of foreign body

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 74 year old patient with acute dysphagia undergoes therapeutic esophagoscopy for removal of an obstructing impaction.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 79%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 73%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. Several solid meat boluses are identified, lodged at 34cm from the incisors. Suctioning through the endoscope is performed, clearing retained secretions above the obstruction. The endoscope is advanced cautiously until the distal most impacted portion is identified at 39cm from the incisors. The endoscope is withdrawn through the mouth, and a retrieval hood is affixed to the tip of the endoscope. The endoscope is then inserted through the mouth into the oropharynx and advanced through the esophagus to the area of the foreign body. Using a tripod grasper biopsy forceps, the meat bolus is picked apart, loosened, grasped, and pulled to the tip of the endoscope. The endoscope and foreign body are withdrawn through the mouth. The meat bolus is removed and the

endoscope is reinserted through the mouth into the oropharynx and advanced through the esophagus. Retained secretions and materials are suctioned. The process is repeated as necessary until the food bolus is removed and residual materials are cleared from the esophagus. The level of sedation of the patient is reassessed during the procedure and additional medication is administered as needed. The endoscope is inserted into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors. The esophagus is assessed for the presence of a hiatal hernia and for the cause of the obstruction. The remainder of the distal, mid, and proximal esophageal mucosa is examined. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality responsible for the foreign body obstruction are obtained and sent to a hard copy device. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Wayne M. Koch, MD (AAO-HNS), John Lanza, MD (AAO-HNS), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, AAO-HNS, SAGES				
<b>CPT Code:</b>	43215				
<b>Sample Size:</b>	5030	<b>Resp N:</b>	102	<b>Response:</b> 2.0 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. AAO-HNS conducted a random sampling of 705 physicians. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for AAO-HNS, SAGES, AGA and ASGE was 5,030.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### Rationale and comments for 43215

43215 *Esophagoscopy, flexible, transoral; with removal of foreign body* RVW 2.60 physician time, 29/39/15 was previously valued by Harvard and reviewed by the RUC in July 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43215, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43215, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43215 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 102 respondents of 5030 queried (2.0 %). Of the responses received, 90% were from Gastroenterologists, 7% were from Endoscopic Surgeons, and 3% were from Otolaryngologists. 96% found the vignette to be typical. The median service performance rate was 3. 79% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 20 minutes. 23 (22.5%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, 4.21 45/45/20 the intra-service intensity of 43215 to be 4.40, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 3.50. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (3) was what would be expected for a typical gastroenterologist in solo or small group practice.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy with insertion of guide wire followed by dilation over guide wire (code 43226) was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for Esophagoscopy, rigid or flexible; with removal of foreign body (code 43215) have declined over a seven year period from 2210 in 2005 to 1632 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 1632) reveals that code 43215 was reported 17.56% percent of the time by otolaryngologists, 48.23% by gastroenterologists, 8.68% by thoracic surgeons and 16.84% by general surgeons. For Medicare, the procedure was performed 46.48% in the outpatient hospital, 37% in the inpatient hospital, 2.1% in the physician office, and 2.68% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 2b with changes of times to 25/3/5 for a total of 33 minutes of pre-service time, as follows:

**Evaluation:** 25 minutes which is the survey median time, but less than the package time.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes which is equivalent to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* reviewed by the RUC in April 2009. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service;* reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 20 minutes and felt that this time was acceptable as it represented approximately half of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel felt that although the intraservice time was approximately half of the Harvard valuation the intensity of the service (i.e. the necessity to successfully perform the service without complication in a shorter period of time) had substantially increased. The panel also compared the 20 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 5 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 2.80 and 3.50 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43215 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 3.25 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43215 from 2.60.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43215 were less. Adjusting for the differences in times, the panel concluded that the current RVW of 2.60 and revised IWPUT (0.0798) for code 43215 is consistent with code MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic* (000 global, 15/8/5 RVW 1.10,

IWPUT 0.0904) and proportional to code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open (wRVW 4.21, IWPUT 0.0639)*. The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance (000 global, 20/30/15 RVW 3.69, IWPUT 0.0969)* compares appropriately with 43215 adjusting for the difference in service times and complexity. Code 57410 *Pelvic examination under anesthesia (other than local) (000 global, 30/15/25, RVW 1.75, IWPUT 0.0345)*, and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure) (000 global 20/30/15, RVW 2.78, IWPUT 0.0688)*, were identified as comparable codes of lesser complexity.

While there was compelling evidence to recommend an increase in the wRVU times for code 43215 based on the survey times adjusted for pre-service package 2b, the expert panel recommends that the existing wRVU value of 2.60 should be retained with physician times 33/20/15 (compared to the previous RUC valuation of 29/39/15). The expert panel also recommends that code 43215 be valued in both the facility and non-facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43215

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 0

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~4,900 (Medicare data 2011 = 1,632\*3) In the future gastroenterologists will perform 90 percent of these procedures.

Specialty Gastroenterology	Frequency 4500	Percentage 0.00 %

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 83%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 79%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. A 3mm lesion is identified at 27cm from the incisors. The identified lesion is removed with hot biopsy forceps until there is no residual. The level of sedation of the patient is reassessed and additional medication is administered as needed. The area is observed for bleeding. Photodocumentation of

the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43216				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	99	<b>Response:</b> 2.2 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Rationale and comments for 43216**

43216 *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery* RVW 2.40 physician time, 12/33/20 was previously valued by the RUC in April 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43216, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43216, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43216 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 99 respondents of 4,325 queried (2.2 %). Of the responses received 97% were from Gastroenterologists and 3% were from Endoscopic Surgeons. 92% found the vignette to be typical. The median service performance rate was 5. 83% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 20 minutes. 23 (23.2%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (wRVW 4.21 45/45/20). The survey intra-service intensity of 43216 was 4.77, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 3.88. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (5) was what would be expected for a typical gastroenterologist in solo or small group practice.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy with insertion of guide wire followed by dilation over guide wire (code 43216) was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for Esophagoscopy, rigid or flexible; with removal of foreign body (code 43216) have declined over a seven year period from 150 in 2005 to 75 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 75) reveals that code 43216 was reported 8.70% percent of the time by otolaryngologists, 38.42% by gastroenterologists, and 34.27% by general surgeons. For Medicare, the procedure was performed 68.54% in the outpatient hospital, 17.14% in the inpatient hospital, 4.28% in the physician office, and 10.04 % in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 2b with changes of times to 25/3/5 for a total of 33 minutes of pre-service time, as follows:

**Evaluation:** 25 minutes which is the survey median time, but less than the package time.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes similar to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service*; reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 22 minutes and felt that this time was acceptable as it represented approximately half of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel felt that although the intraservice time was approximately two thirds of the previous valuation the intensity of the service (i.e. the necessity to successfully perform the service without complication in a shorter period of time) had substantially increased. The panel also compared the 22 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 7 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 2.99 and 3.88 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43216 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 2.99 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43216 from 2.40.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43216 were less. Adjusting for the differences in times, the panel concluded that the current RVW of 2.40 and revised IWPUT (0.0635) for code 43216 is consistent with code MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic* (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904) and proportional to code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis*,

*open (wRVW 4.21, IWPUT 0.0639). The panel also noted that MPC code 19103 Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance (000 global, 20/30/15 RVW 3.69, IWPUT 0.0969) compares appropriately with 43216 adjusting for the difference in service times and complexity. Code 57410 Pelvic examination under anesthesia (other than local) (000 global, 30/15/25, RVW 1.75, IWPUT 0.0345), and code 31622 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure) (000 global 20/30/15, RVW 2.78, IWPUT 0.0688), were identified as comparable codes of lesser complexity.*

While there was compelling evidence to recommend an increase in the wRVU times for code 43216 based on the survey times adjusted for pre-service package 2b, the expert panel recommends that the existing wRVU value of 2.40 should be retained with physician times 33/22/15 (compared to the previous RUC valuation of 12/33/20). The expert panel also recommends that code 43216 be valued in both the facility and non-facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43216

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often? Rarely

Specialty                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 250

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~250 (Medicare data 2011 = 75\*3) In the future GI will perform 90 percent of these procedures.

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43217	Tracking Number	Original Specialty Recommended RVU: <b>2.90</b>
		Presented Recommended RVU: <b>2.90</b>
Global Period: 000		RUC Recommended RVU: <b>2.90</b>

CPT Descriptor: Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 68 year old patient with dysphagia and a partially obstructing polyp on barium swallow undergoes therapeutic esophagoscopy for snare removal of the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 82%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 75%

**Description of Pre-Service Work:** Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

**Description of Intra-Service Work:** The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. A 8mm polypoid lesion is identified at 33cm from the incisors. A snare is passed through the endoscope and looped around the lesion. As the snare is tightened, electrocautery is applied in a controlled manner and the identified lesion is removed. The snare is withdrawn, and a retrieval device is inserted through the endoscope to capture the polyp. The retrieval device and polyp are withdrawn to the tip of the endoscope. The

endoscope with the device and polyp are withdrawn through the mouth. The lesion is placed in a biopsy container. The level of sedation of the patient is reassessed and additional medication is administered as needed. The endoscope is reinserted through the mouth to the area of the lesion. The base of the lesion is examined; if there is residual tissue the snare technique is repeated until there is no residual. The area is observed for bleeding. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Wayne M. Koch, MD (AAO-HNS), John Lanza, MD (AAO-HNS), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43217				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	90	<b>Response:</b> 2.0 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### Rationale and comments for 43217

43217 *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique* RVW 2.90 physician time, 30/29/18 was previously valued by Harvard and reviewed by the RUC in June 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43217, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43215, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43217 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 90 respondents of 4325 queried (2.0 %). Of the responses received, 97% were from Gastroenterologists and 3% were from Endoscopic Surgeons. 98% found the vignette to be typical. The median service performance rate was 5. 82% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 30 minutes. 19 (21.1%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (wRVW 4.21 45/45/20). The survey intra-service intensity of 43217 was 4.87, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 4.20. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (5) was what would be expected for a typical gastroenterologist in solo or small group practice.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy with removal of tumor(s), polyp(s), or other lesion(s) by snare technique (code 43217) was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for Esophagoscopy, rigid or flexible; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique (code 43217) have not changed over a seven year period from 210 in 2005 to 220 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 220) reveals that code 43217 was reported 4.37% percent of the time by otolaryngologists, 54.35% by gastroenterologists, and 27.15% by general surgeons. For Medicare, the procedure was performed 65.01% in the outpatient hospital, 14.58% in the inpatient hospital, 3.92% in the physician office, and 16.49% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 2b with changes of times to 25/3/5 for a total of 33 minutes of pre-service time, as follows:

**Evaluation:** 25 minutes which is the survey median time, but less than the package time.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel noted that in 2010 at the third five-year review, the societies recommended and the RUC accepted 3 minutes positioning for 45331, *Sigmoidoscopy, flexible; with biopsy, single or multiple*. The panel believes that positioning time for 43200 is similar to that for 45331 and, while noting that CMS revised the positioning time for 45331 to 5 minutes, continues to believe that 3 minutes is the correct time for this work element.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes similar to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service*; reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 30 minutes and felt that this time was acceptable as it represented approximately two thirds of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel noted that the intraservice time was essentially the same as the intraservice time when valued by Harvard. The panel also compared the 30 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 15 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 3.31 and 4.20 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43217 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 3.31 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43217 from 2.90.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code

even though the total and intraservice times for code 43217 were less. Adjusting for the differences in times, the panel concluded that the current RVW of 2.90 and revised IWPUT (0.0632) for code 43217 is consistent with code MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904)* and proportional to code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open (wRVW 4.21, IWPUT 0.0639)*. The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance (000 global, 20/30/15 RVW 3.69, IWPUT 0.0969)* compares appropriately with 43217 adjusting for the difference in service times and complexity. Code 57410 *Pelvic examination under anesthesia (other than local) (000 global, 30/15/25, RVW 1.75, IWPUT 0.0345)*, and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure) (000 global 20/30/15, RVW 2.78, IWPUT 0.0688)*, were identified as comparable codes of lesser complexity.

While there was compelling evidence to recommend an increase in the wRVU times for code 43217 based on the survey times adjusted for pre-service package 2b, the expert panel recommends that the existing wRVU value of 2.90 should be retained with physician times 33/30/15 (compared to the previous RUC valuation of 30/29/18). The expert panel also recommends that code 43217 be valued in both the facility and non-facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43217

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often? Rarely

Specialty How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 650

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~650 (Medicare data 2011 = 220\*3) We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures..

Specialty Gastroenterology	Frequency 600	Percentage 92.30 %
----------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 220

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. ~220 (Medicare data 2011 = 220)

Specialty Gastroenterology	Frequency 200	Percentage 90.90 %
----------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43217

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43211      Tracking Number   C25

Original Specialty Recommended RVU: **4.62**

Global Period: 000

Presented Recommended RVU: **4.58**RUC Recommended RVU: **4.58**

CPT Descriptor: Esophagoscopy, flexible, transoral; with endoscopic mucosal resection

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 62-year-old patient with heartburn unresponsive to pharmacological treatment is found to have dysplastic Barrett's esophagus. The patient is referred for therapeutic esophagoscopy with endoscopic mucosal resection of the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 58%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 45%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. The lesion to be resected is identified and assessed. The endoscope may be withdrawn and a cap placed on the endoscope tip for cap assisted resection or a band ligation device is fitted on the endoscope tip. Cautery marks are then applied to the borders of the lesion. Submucosal injection assisted EMR of saline with epinephrine and dilute methylene blue is performed circumferentially at the base of the lesion. The lesion is resected

with appropriate cutting devices inserted through the biopsy channel. If a cap assisted EMR technique is used, the lesion is suctioned into the cap and then resected using a cutting device inserted through the biopsy channel. If band ligation EMR technique is used, the target is suctioned into the cap and a band is deployed to capture the lesion. The lesion is then resected with appropriate cutting devices inserted through the biopsy channel. Hemostasis is accomplished with electrocautery, clips, or other devices as appropriate. Mucosal defects are closed with endoscopically placed clips. The lesion is retrieved with a retrieval device and placed in a specimen container. The endoscope is reinserted to the point of mucosal resection and the area is observed for bleeding and assessed for perforation. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Pathology forms are completed; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. Post procedure radiographs are ordered and reviewed. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy codeset.

### Compelling Evidence

For a detailed discussion of compelling evidence, please see the Attachment to the cover letter that was submitted with the SoRs for this family of esophagoscopy codes.

### Overview of Esophagoscopy Family RVW Recommendations

Similar to the review of new EGD codes, for new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable.

Code 43211 *Esophagoscopy, flexible, transoral; with endoscopic mucosal resection* is a new code for 2014. The AGA and ASGE conducted a RUC survey and received 62 responses.

**We recommend an RVW of 4.62.** This value is less than the survey 25<sup>th</sup> percentile is based on: 1) payment policy for multiple endoscopy work; and 2) increments approved by the RUC for esophagoscopy codes at the October 2012 meeting.

Code 43211 includes the work of snaring, banding, and injection. This incremental work would be added to the base esophagoscopy code 43200. To develop the incremental work, we used the RVW increment approved for the esophagoscopy code pairs below (total RVW increment = 3.03) plus the RVW for 43200 (1.59). This equals 4.62.

		Rec RVW	Base 43200	RVW increment
43217	Snare	2.90	1.59	1.31
43205	Band	3.00	1.59	1.41
43201	Inject	1.89	1.59	0.30
				<b>3.02</b>

**Pre-time Package 2b** is appropriate for 43211, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31267

Many different codes were chosen by survey respondents for this new service. Code 31267 was chosen most often. The similarity in time and difference in anesthesia (ie, 31267 does not include moderate sedation), support the recommended RVW for 43211.

### Comparison To MPC Other RUC-Reviewed Codes with 40-45 Minutes Intra-Service Time

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43201

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 900

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 750 procedures in Year 1 with a 10% increase each year for the first three years

Specialty Gastroenterology Frequency 900 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 43201 was performed 509 in 2011. 3% of that is performed by this code.

Specialty Gastroenterology Frequency 300 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

RUC Recommended RVU: **3.73**

CPT Descriptor: Esophagoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 74 year old patient with progressive dysphagia and weight loss is found to have an obstructing, concentric mass lesion in the mid-esophagus that is not amenable to surgical resection. The patient is referred for therapeutic esophagoscopy and placement of an esophageal stent.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 60%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The obstructing, stricture is identified and, if appropriate, an alternative flexible endoscope of appropriate diameter to traverse the lesion is inserted through the mouth into the esophagus. When necessary, a dilating balloon is passed through the strictured area using endoscopic and fluoroscopic guidance and the stricture is dilated. Additional dilations are performed until the endoscope can be passed through the stricture, confirming the length of the stricture from the incisors. The endoscope is then passed into the

proximal stomach and, when indicated, retroflexed to allow examination of the cardia, confirming the absence of other abnormal tissue in the distal esophagus and proximal stomach. The endoscope is withdrawn, allowing measurement of the stricture and marking the distal and proximal margins for stent placement. The endoscope is reinserted to 2 cm past the distal end of the stricture and a guidewire is inserted through the endoscope. The endoscope is withdrawn through the mouth while visually confirming proper positioning of the guidewire. The level of sedation of the patient is reassessed and additional medication is administered as needed. Using fluoroscopic guidance, the expandable wire mesh stent and introducing device is advanced over the guidewire through the mouth into the esophagus and positioned across the stricture. If necessary, contrast is inserted under fluoroscopic guidance to confirm positioning of the stent. Fluoroscopic imaging is obtained and spot digital images are taken. The stent is slowly deployed across the stricture under fluoroscopic and/or endoscopic guidance, with repositioning if necessary. Once the stent is placed, the guidewire and introducing device are withdrawn through the mouth and the endoscope is reinserted through the mouth to confirm proper positioning of the stent and confirming that the endoscope can be passed through the stented area without difficulty. If necessary, contrast is injected through the endoscope to assess placement and patency with additional fluoroscopic imaging. The area is observed to confirm absence of active bleeding. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	01/2013				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE)

Post-Service intensity/complexity	3.79	3.52
-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy codeset.

### Compelling Evidence

For a detailed discussion of compelling evidence, please see the Attachment to the cover letter that was submitted with the SoRs for this family of esophagoscopy codes.

### Overview of Esophagoscopy Family RVW Recommendations

Similar to the review of new EGD codes, for new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable.

Code 43212 *Esophagoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)* is a new/revised code for 2014 that adds balloon dilation to the work of to-be-deleted code 43219 *Esophagoscopy, rigid or flexible; with insertion of plastic tube or stent*. The AGA and ASGE conducted a RUC survey and received 53 responses.

**We recommend an RVW of 3.31.** This is less than the 25<sup>th</sup> percentile and is based on: 1) multiple endoscopy payment policy; and 2) increments approved by the RUC for esophagoscopy codes at the October 2012 meeting.

Code 43212 includes the work of esophagoscopy stent (43219) plus the incremental work of balloon dilation (43220-43200) or 2.80 + (2.10-1.59).

**Pre-time Package 2b** is appropriate for 43212, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

### Comparison To Other RUC-Reviewed Codes with 30 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43219

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43219 (Esophagoscopy, rigid or flexible; with insertion of plastic tube or stent) multiplied by 3 ( $700 \times 3$ ) = ~2,000, which will be deleted from CPT and replaced by 43212.

Specialty Gastroenterology                      Frequency 950                      Percentage 47.50 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 693

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43219 (Esophagoscopy, rigid or flexible; with insertion of plastic tube or stent) = 693, which will be deleted from CPT and replaced by 43212

Specialty Gastroenterology                      Frequency 325                      Percentage 46.42 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43219

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43220	Tracking Number	Original Specialty Recommended RVU: <b>2.10</b>
		Presented Recommended RVU: <b>2.10</b>
Global Period: 000		RUC Recommended RVU: <b>2.10</b>

CPT Descriptor: Esophagoscopy, flexible, transoral; with balloon dilation (less than 30 mm diameter)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 61 year old patient with dysphagia due to a previously identified stenosis of the distal esophagus undergoes therapeutic esophagoscopy for balloon dilation of the stenosis.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 85%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. A stricture is identified at 35cm from the incisors. The endoscope is positioned. A through-the-scope fixed wire balloon catheter is advanced through the endoscope, positioned across the stricture, and inflated to a diameter of approximately 15 mm. The balloon catheter is deflated and the stricture is observed. The level of sedation of the patient is reassessed and additional medication is administered as needed. If necessary, the balloon dilator is removed and subsequent balloon catheters of larger diameter are inserted through the endoscope,

positioned across the stricture, and inflated. The balloon catheter is then deflated, and the stricture is observed to confirm adequate dilation of the stricture. When dilation is adequate, the balloon catheter is removed. Following dilation, the area is observed for bleeding. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. The endoscope is withdrawn. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43220				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	109	<b>Response:</b> 2.5 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

43220 *Esophagoscopy, flexible, transoral; with balloon dilation (less than 30 mm diameter)* RVW 2.10 physician time, 15/22/15 was previously valued by the RUC in June 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43220, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43220, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43220 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 109 respondents of 4325 queried (2.5 %). Of the responses received, 97% were from Gastroenterologists and 3% were from Endoscopic Surgeons. Of those who participated in the survey, 58 (53%) responded to a subsequent email asking whether the vignette was typical. Of the 58 who responded, 100% found the vignette to be typical. The median service performance rate was 15. 85% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 20 minutes. 24 (22%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open* (wRVW 4.21 46/45/20). The survey intra-service intensity of 43220 was 4.50, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 3.55. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (15) was what would be expected for a typical gastroenterologist in solo or small group practice.

When 43220 is performed in the facility setting, the panel recommended pre-service package **1b**, Facility Straightforward Patient / Straightforward Procedure (With sedation / anesthesia care), which would be used

for this non-incisional trans-oral endoscopic procedure. The expert panel felt the survey respondents underestimated the time necessary to complete all of the elements included in the facility pre-service package that are typically performed with 43220 and failed to consider all of the elements in their time estimation (indications and contraindications for sedation, history of relevant cardiovascular, pulmonary, and neurological conditions, focused physical examination including modified Mallampati score to predict ease of intubation, ASA physical status classification, and summative determination of sedation requirement) and therefore recommended an adjustment of times to reflect the pre-service package and work.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy with insertion of guide wire followed by dilation over guide wire (code 43216) was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for Esophagoscopy, rigid or flexible; with balloon dilation (less than 30 mm diameter) (code 43220) have declined over a seven year period from 4,595 in 2005 to 3,041 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 3,041) reveals that code 43220 was reported 27.74% percent of the time by otolaryngologists, 49.28% by gastroenterologists, and 10.79% by general surgeons. For Medicare, the procedure was performed 70.81% in the outpatient hospital, 12.58% in the inpatient hospital, 1.47% in the physician office, and 14.88 % in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's

introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 1b with changes of times to 19/3/5 for a total of 27 minutes of pre-service time when the procedure is performed in the facility setting, as follows:

**Evaluation:** 19 minutes which is the package time, but less than the survey median.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel identified several crosswalks that would be equivalent in terms of physician pre-service time to this procedure. Code 31626, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of fiducial markers, single or multiple*, (wRVW 4.16, 25/45/15), preservice package 1b, with 25 minutes of preservice time (eval 19, positioning 1, scrub/dress/wait 5) and 15 minutes of postservice time, was reviewed by the RUC in April 2009. Code 32553, *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple*, (wRVW 3.80, 25/45/20), preservice package 1b, with 25 minutes of preservice time (eval 19, positioning 1, scrub/dress/wait 5) and 20 minutes of postservice time, was reviewed by the RUC in April 2009. Code 55876, *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple* (wRVW 1.73, 29/20/10), with 19 minutes of evaluation and 10 minutes of positioning time, was reviewed by the RUC in April 2010. Code 64446, *Injection, anesthetic agent; sciatic nerve, continuous infusion by catheter (including catheter placement)*, (wRVW 1.81, 29/20/15), preservice package 1b, with 29 minutes of preservice time (eval 19, positioning 5, scrub/dress/wait 5), was reviewed by the RUC in April 2008. The panel noted that in October 2010 at the 4<sup>th</sup> five-year review, the societies recommended and the RUC accepted 3 minutes positioning for 45331, *Sigmoidoscopy, flexible; with biopsy, single or multiple*. The panel believes that positioning time for 43200 is similar to that for 45331 and, while noting that CMS revised the positioning time for 45331 to 5 minutes, recommends that 3 minutes is the correct time for this element of work.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes similar to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without*

*irrigation, instillation, or ureteropyelography, exclusive of radiologic service;* reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 20 minutes and felt that this time was acceptable as it represented approximately half of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel noted that the intraservice time was approximately the same as the previous valuation. The panel also compared the 20 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 5 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 2.76 and 3.55 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43220 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 2.76 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43220 from 2.10.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43220 were less. Adjusting for the differences in times, the panel concluded that the RVW of 2.10 for code 43220 is consistent with code 49421 which is considered to be a similar to slightly less intense service (IWPUT 0.062 for 43220 compared with 0.0639 for 49421) and less than the IWPUT for code 31575 (IWPUT 0.0904). Code 57410 *Pelvic examination under anesthesia (other than local)* (000 global, 30/15/25 RVW 1.75), and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (000 global 20/30/15 RVW 2.78), were identified as comparable codes of lesser complexity. The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance* (000 global, 20/30/15 RVW 3.69) compares appropriately with 43216 adjusting for the difference in service times and complexity.

While there was compelling evidence to recommend an increase in the wRVU times for code 43220 based on the survey times adjusted for pre-service package 1b in the facility setting the expert panel recommends that the existing wRVU value of 2.10 should be retained with physician times 27/20/15 (compared to the previous RUC valuation of 15/22/15). The expert panel also recommends that code 43220 be valued in both the facility and non-facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43220

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology	How often? Rarely
----------------------------	-------------------

Specialty	How often?
-----------	------------

Specialty	How often?
-----------	------------

Estimate the number of times this service might be provided nationally in a one-year period? 9000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~9,000 (Medicare data 2011 = 3,041) We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures.

Specialty Gastroenterology	Frequency 8100	Percentage 90.00 %

-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,445

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. ~2,445 (Medicare data 2011 = 3,041) Leftover utilization not going to new code 4319X5.

Specialty Gastroenterology	Frequency 2201	Percentage 90.02 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43220

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43213      Tracking Number   C27

Original Specialty Recommended RVU: **5.00**Presented Recommended RVU: **5.00**

Global Period: 000

RUC Recommended RVU: **5.00**

CPT Descriptor: Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 71-year-old patient with a history of esophageal cancer, post resection with esophagogastric anastomosis and gastrostomy, and treatment with radiation therapy, is unable to swallow liquids. Imaging studies reveal an occlusive stricture at the anastomosis. A previous upper endoscopy to dilate the stricture was unsuccessful. The patient is referred for retrograde dilation of the esophageal stricture through the gastrostomy and therapeutic esophagoscopy.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 22%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A flexible upper endoscope is inserted through the fistulous opening and advanced retrograde into and through the esophagus to the strictured area. A guidewire is advanced through the biopsy channel and endoscopically manipulated through the stricture and out the patient's mouth. The endoscope is withdrawn maintaining the position of the guidewire. A dilator is advanced over the guidewire through the strictured area using fluoroscopic and or endoscopic guidance when indicated. Additional dilators of increasing size are passed over the guidewire until a satisfactory dilation has been achieved. The endoscope is

reinserted to examine the strictured area and assess bleeding. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

Post-Service intensity/complexity	3.46	3.31
-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy codeset.

### Compelling Evidence

For a detailed discussion of compelling evidence, please see the Attachment to the cover letter that was submitted with the SoRs for this family of esophagoscopy codes.

### Overview of Esophagoscopy Family RVW Recommendations

Similar to the review of new EGD codes, for new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable.

Code 43213 *Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)* is a new code for 2014. The AGA and ASGE conducted a RUC survey and received 45 responses.

**We recommend the 25<sup>th</sup> percentile RVW of 5.00.** There is no equivalent work in the esophagoscopy family for retrograde dilation. This service would have been reported using 43499 *Unlisted procedure, esophagus*. The value appropriately ranks 43213 within the esophagoscopy family of codes.

**Pre-time Package 2b** is appropriate for 43213, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 52342

Many different codes were chosen by survey respondents for this new service. Code 52342 was chosen most often. This code was surveyed and presented to the RUC in 2010. Because of the difference in time and RVW, this is not a good comparator code.

### Comparison To Other RUC-Reviewed Codes with 45 Minutes Intra-Service Time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43456

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology	How often? Rarely
----------------------------	-------------------

Specialty	How often?
-----------	------------

Specialty	How often?
-----------	------------

Estimate the number of times this service might be provided nationally in a one-year period? 5000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43456 (Dilation of esophagus, by balloon or dilator, retrograde) multiplied by 3 ( $1,700 \times 3$ ) = ~5,000, which will be deleted from CPT and replaced by 4320X2

Specialty Gastroenterology	Frequency 4000	Percentage 80.00 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,752

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43456 = 1752

Specialty Gastroenterology	Frequency 1600	Percentage 91.32 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43456

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43214      Tracking Number C28

Original Specialty Recommended RVU: **3.86**Presented Recommended RVU: **3.78**

Global Period: 000

RUC Recommended RVU: **3.78**

CPT Descriptor: Esophagoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69-year-old patient with malnutrition and increasing inability to swallow liquids undergoes imaging studies revealing a tapered, “bird’s beak” appearance of the distal esophagus. Esophageal motility studies confirm findings consistent with achalasia. The patient is referred for therapeutic esophagoscopy and large diameter balloon dilation of the lower esophageal sphincter.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 74%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 55%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. The gastroesophageal junction is identified and assessed. A guidewire is inserted through the biopsy channel of the endoscope into the stomach and the endoscope is withdrawn

maintaining the position of the guidewire. A greater than 30 cm balloon catheter is advanced over the guidewire and positioned across the lower esophageal sphincter using fluoroscopy and/or a reinserted endoscope to confirm the position. The balloon is inflated to a diameter of greater than 30 mm. The balloon catheter is deflated and the stricture is observed. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope and dilating balloon are withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Post procedure radiographic studies are ordered and reviewed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	01/2013

**Background**

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy codeset.

### Compelling Evidence

For a detailed discussion of compelling evidence, please see the Attachment to the cover letter that was submitted with the SoRs for this family of esophagoscopy codes.

### Overview of Esophagoscopy Family RVW Recommendations

Similar to the review of new EGD codes, for new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable.

Code 43214 *Esophagoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)* is a new code for 2014. The AGA and ASGE conducted a RUC survey and received 42 responses.

**We recommend an RVW of 3.86.** This value is the same as the 25<sup>th</sup> percentile and is based on: 1) the sum of to-be-deleted code 43458 plus 0.5 x diagnostic esophagoscopy (43200); and 2) multiple procedure payment policy.

Code 43458 *Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia* has a 000-global period and does not include endoscopy work. The new code will bundle 43458 with 43200 (esophagoscopy base) which also has a 000-global period. Payment for this bundled work would be based on the multiple procedure payment rule ( $100\% \times 43458 + 50\% \times 43200$ ) or  $3.06 + 0.5 \times 1.59 = 3.86$ .

**Pre-time Package 2b** is appropriate for 43214, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

### Comparison To Other RUC-Reviewed Codes with 30 Minutes Intra-Service Time

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43458 + 74360

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 data for 43458 (Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia) multiplied by 3 (1,600\*3) = ~5,000, which will be deleted from CPT and replaced with 43214.

Specialty Gastroenterology                      Frequency 3000                      Percentage 60.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 780

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 data for 43458 (Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia) = ~1,561 / 2. Half will be reported by 43233.

Specialty Gastroenterology                      Frequency 750                      Percentage 96.15 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43458

CPT Descriptor: Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 73 year old patient with dysphagia due to a previously identified stenosis of the distal esophagus undergoes therapeutic esophagoscopy for guidewire-directed dilation of the stenosis

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 79%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 74%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and then examination of the esophageal mucosa. The area to be dilated is identified at 33cm. A guidewire is placed through the endoscope into the esophagus and advanced into the stomach, beyond the area to be dilated. The endoscope is withdrawn through the mouth while visually confirming proper positioning of the guidewire. A dilator is advanced over the guidewire

through the mouth into the esophagus past the area to be dilated, while the endoscopist monitors the patient for signs of pain or discomfort. The level of sedation of the patient is reassessed and additional medication is administered as needed. The initial dilator is withdrawn, and dilators of increasing diameter are passed sequentially over the guide wire through the mouth into the esophagus in a similar manner. At the conclusion of the sequential dilations, the guidewire is withdrawn and the endoscope is inserted through the mouth into the esophagus to assess the site of dilation for bleeding, trauma and/or injury. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Wayne M. Koch, MD (AAO-HNS), John Lanza, MD (AAO-HNS), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, AAO-HNS, SAGES				
<b>CPT Code:</b>	43226				
<b>Sample Size:</b>	5030	<b>Resp N:</b>	114	<b>Response:</b> 2.2 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. AAO-HNS conducted a random sampling of 705 physicians. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for AAO-HNS, SAGES, AGA and ASGE was 5,030.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

43226 *Esophagoscopy, flexible; transoral with insertion of guide wire followed by dilation over guide wire* RVW 2.34 physician time, 15/21/15 was previously valued by the RUC in July 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43226, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43226, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43226 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 114 respondents of 5030 queried (2.2 %). Of the responses received, 90% were from Gastroenterologists, 7% were from Otolaryngologists, and 3% were from Endoscopic Surgeons. Of those who participated in the survey, 58 (51%) responded to a subsequent email asking whether the vignette was typical. Of the 58 who responded, 100% found the vignette to be typical. The median service performance rate was 10. 79% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 25, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 25 minutes. 24 (21%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, 4.21 46/45/20 the intra-service intensity of 43226 to be 4.94, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 4.00. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (10) was substantially higher than would be expected for a typical gastroenterologist in solo or small group practice and that those who responded most likely overrepresented high volume referral centers comprising more experienced and efficient practitioners. The

expert panel felt this supported the concept that the survey respondents were more experienced than the typical practitioner, and that this should be considered in the development of work recommendations.

When 43226 is performed in the facility setting, the panel recommended pre-service package **1b**, Facility Straightforward Patient / Straightforward Procedure (With sedation / anesthesia care), which would be used for this non-incisional trans-oral endoscopic procedure. The expert panel felt the survey respondents underestimated the time necessary to complete all of the elements included in the facility pre-service package that are typically performed with 43226 and failed to consider all of the elements in their time estimation (indications and contraindications for sedation, history of relevant cardiovascular, pulmonary, and neurological conditions, focused physical examination including modified Mallampati score to predict ease of intubation, ASA physical status classification, and summative determination of sedation requirement) and therefore recommended an adjustment of times to reflect the pre-service package and work.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy with insertion of guide wire followed by dilation over guide wire (code 43226) was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed - during the past decade.

Medicare claims for esophagoscopy with insertion of guide wire followed by dilation over guide wire (code 43226) have declined over a seven year period from 3,551 in 2005 to 2,785 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 2,785) reveals that code 43226 was reported 19.96% percent of the time by otolaryngologists, 58.69% by gastroenterologists, 12.54% by thoracic surgeons and 4.13% by general surgeons. For Medicare, the procedure was performed 66.69% in the outpatient hospital, 9.68% in the inpatient hospital, 0.53% in the physician office, and 23.02% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which

moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 1b with changes of times to 19/3/5 for a total of 27 minutes of pre-service time when the procedure is performed in the facility setting, as follows:

**Evaluation:** 19 minutes, which is the package time, but less than the survey median.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes, which is equal to the survey median and package time.

The panel identified several crosswalks that would be equivalent in terms of physician pre-service time to this procedure. Code 31626, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with placement of fiducial markers, single or multiple*, (wRVW 4.16, 25/45/15), preservice package 1b, with 25 minutes of preservice time (eval 19, positioning 1, scrub/dress/wait 5) and 15 minutes of postservice time, was reviewed by the RUC in April 2009. Code 32553, *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), percutaneous, intra-thoracic, single or multiple*, (wRVW 3.80, 25/45/20), preservice package 1b, with 25 minutes of preservice time (eval 19, positioning 1, scrub/dress/wait 5) and 20 minutes of postservice time, was reviewed by the RUC in April 2009. Code 55876, *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), prostate (via needle, any approach), single or multiple* (wRVW 1.73, 29/20/10), with 19 minutes of evaluation and 10 minutes of positioning time, was reviewed by the RUC in April 2010. Code 64446, *Injection, anesthetic agent; sciatic nerve, continuous infusion by catheter (including catheter placement)*, (wRVW 1.81, 29/20/15), preservice package 1b, with 29 minutes of preservice time (eval 19, positioning 5, scrub/dress/wait 5), was reviewed by the RUC in April 2008. The panel noted that in October 2010 at the 4<sup>th</sup> five-year review, the societies recommended and the RUC accepted 3 minutes positioning for 45331, *Sigmoidoscopy, flexible; with biopsy, single or multiple*. The panel believes that positioning time for 43200 is similar to that for 45331 and, while noting that CMS revised the positioning time for 45331 to 5 minutes, recommends that 3 minutes is the correct time for this element of work.

The panel noted the survey median intra-service time was 25 minutes and felt that, even though the survey group represented a more experienced referral center practitioner group, this time was acceptable as it

represented approximately half of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel felt that the additional 4 minutes for 43226 over the previous time value accurately reflects the current practice of more aggressive dilation using multiple staged dilators, which is more typical than when the code was valued in 1993. The panel also compared the 25 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 10 minutes of incremental time represents an appropriate incremental work time. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 3.25 and 4.00, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43226 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the 25<sup>th</sup> percentile RVW recommendation of 3.25 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43226 from 2.34.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43226 were less. Adjusting for the differences in times, the panel concluded that the RVW of 2.34 for code 43226 is consistent with code 49421 which is considered to be a similar to slightly less intense service (IWPUT 0.059 for 43226 compared with 0.0639 for 49421) and less than the IWPUT for code 31575 (IWPUT 0.0904). Code 57410 *Pelvic examination under anesthesia (other than local)* (000 global, 30/15/25 RVW 1.75), and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (000 global 20/30/15 RVW 2.78), were identified as comparable codes of lesser complexity. The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance* (000 global, 20/30/15 RVW 3.69) compares appropriately with 43226 adjusting for the difference in service times and complexity.

While there was compelling evidence to recommend an increase in the wRVU times for code 43226 based on the survey times adjusted for pre-service package 1b in the facility setting the expert panel recommends that the existing wRVU value of 2.34 should be retained with physician times 27/25/15 (compared to the previous RUC valuation of 15/21/15). The expert panel also recommends that code 43226 be valued in both the facility and non-facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the

provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43226

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~8,500 (Medicare data 2011 = 2,785) We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures..

Specialty Gastroenterology                      Frequency 7600                      Percentage 89.41 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,395

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. ~2,395 (Medicare data 2011 = 2,785) leftover utilization not going to new code 4319X6

Specialty Gastroenterology                      Frequency 2156                      Percentage 90.02 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43226

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 43227	Tracking Number	Original Specialty Recommended RVU: <b>3.59</b>
		Presented Recommended RVU: <b>3.26</b>
Global Period: 000		RUC Recommended RVU: <b>3.26</b>

CPT Descriptor: Esophagoscopy, flexible, transoral; with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74 year old patient with hematemesis undergoes therapeutic esophagoscopy for control of a bleeding esophageal ulcer.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 80%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 79%

**Description of Pre-Service Work:** Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. A bite block is placed in the mouth. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat.

**Description of Intra-Service Work:** The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assess for presence of a hiatal hernia, and then examination of the esophageal mucosa where an esophageal ulcer with active bleeding is identified at 36cm from the incisors. A bipolar cautery probe is inserted through the endoscope and positioned on the bleeding lesion; therapy is applied to control the bleeding. The level of sedation of the patient is reassessed and additional medication is

administered as needed. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. The area is observed for further bleeding. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	10/2012				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE), Michael Edye, MD (SAGES), Don J. Selzer, MD (SAGES)				
<b>Specialty(s):</b>	AGA, ASGE, SAGES				
<b>CPT Code:</b>	43227				
<b>Sample Size:</b>	4325	<b>Resp N:</b>	87	<b>Response:</b> 2.0 %	
<b>Description of Sample:</b>	The AGA and ASGE conducted a random sample of their member gastroenterologists using the Census Department office regions ( <a href="http://www.census.gov/regions/">http://www.census.gov/regions/</a> ). Between 150 and 200 gastroenterologists were randomly selected in each region for a total of 2,000 gastroenterologists. The AGA and ASGE enhanced the random sample by adding 514 members of the ASGE Special Interest Groups and 786 physicians who perform esophagoscopy EUS and stent, TNE and optical endomicroscopy and ablation provided by Industry. The AGA and ASGE also added 86 volunteers who responded to the educational article on the RUC survey process that was approved by the Research Subcommittee and was distributed to all AGA and ASGE members. The AGA and ASGE's total survey sample size was 3,386. SAGES sent a total of 1,000 emails (939 successfully delivered) using a random selection of 250 members from each of the four CMS DME Regions A-D (ie, geographically distributed). The total survey sample size for SAGES, AGA and ASGE was 4,325.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### **Rationale and comments for 43227**

43227 *Esophagoscopy, flexible, transoral; with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator)* RVW 3.59 physician time, 45/36/23 was previously valued by the RUC in April 1993. This code is being reviewed in response to the CMS comments in the Proposed Rule and Final Rule for CY 2012, requesting review of gastrointestinal endoscopic services as potentially misvalued.

Although this code was not specifically identified by CMS in the Final Rule, the societies that committed to a comprehensive review of gastrointestinal endoscopic services – the AGA, ACG, ASGE and SAGES – identified that code 43200 was primarily performed by otolaryngologists, while the remaining codes in the 43200-43232 family were primarily performed by gastroenterologists and endoscopic surgeons. In view of such, a coding change proposal was brought to the February 2012 CPT Editorial Panel in conjunction with the AAO-HNS and the Trilogical Society, requesting the development of new codes for trans-nasal esophagoscopy (primarily performed in the non-facility setting without moderate sedation) and rigid esophagoscopy (primarily performed in the OR setting with anesthesia administered by an anesthesia professional). While the code number, 43227, remains the same, this code is now specific for a flexible, transoral, esophagoscopy procedure.

In May 2012 the AGA, ASGE and SAGES requested that the Research Subcommittee consider a mini-survey methodology for this and the other codes in the 43200-43232 family, which was approved. The Research Subcommittee required that a standard survey be conducted of the new base code for flexible trans-oral esophagoscopy, 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)*, specifically including the elements of pre- and post-service physician work. For the remaining codes that were surveyed in the 43201-43232 family, including code 43227, the mini-survey instrument only asked the physician to address the intra-service work component for the procedure. Accordingly, the societies submitting these recommendations are using for 43227 the same pre- and post- service times as for the revised base code for flexible trans-oral esophagoscopy, 43200.

A survey of practicing physicians representing urban, suburban and rural community and academic settings was performed with 87 respondents of 4325 queried (2.0 %). Of the responses received 97% were Gastroenterologists and 3% were Endoscopic Surgeons. 100% found the vignette to be typical. The median service performance rate was 5. 80% typically used moderate sedation in the facility (hospital outpatient, ambulatory surgery center) setting. In the base code survey of pre-service and post-service times, as described above, the respondents reported median pre-service evaluation, positioning, and scrub/dress/wait times of 10, 5, and 5 minutes respectively, and post service time of 10 minutes. The respondents reported a median intra-service time of 30 minutes. 18 (16.5%) of the respondents chose key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (wRVW 4.21 45/45/20). The survey intra-service intensity of 43227 was 4.69, compared to the comparison code intra-service intensity of 3.42. As the mini-survey methodology only captured intra-service intensity / complexity, we are unable to provide an assessment regarding the relative intensity of the surveyed code to the comparison code on other measures. The median survey RVW was 4.05. We note that as all of the gastrointestinal endoscopy codes are being surveyed over the next two years, the reference service list (RSL) does not contain any endoscopic procedures that would be familiar to the physicians completing the surveys.

The specialty societies convened an expert panel to review the survey results and make recommendations. The panel noted that the median service performance rate (5) was what would be expected for a typical gastroenterologist in solo or small group practice.

The panel noted there has been a change in the practice pattern for this service since it was most recently valued by the RUC in 1993. In the 1980s and 1990s when this code was first valued, flexible esophagoscopy with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator) (code 43227) was performed with fiberoptic instruments; today's standard of practice is the use of high-definition video endoscopes and high definition video monitors. In the early 1990s, conscious sedation used rapid intravenous administration of meperidine and diazepam without routine monitoring of pulse oximetry; in 2012, moderate sedation using benzodiazepines and opiates is administered in a controlled, titrated manner with automated monitoring of pulse oximetry, electrocardiogram and, in some settings, capnography. In the 1990s when this code was valued, there were no regulations and/or requirements for a complete History and Physical of the patient within 30 days of the procedure, documentation of a comprehensive examination updated on the day of procedure, a pre-sedation assessment including ASA physical status, airway and cardiac risk completed prior to the procedure, a mandatory timeout before beginning the procedure, or photodocumentation of the findings – all of which are now required to meet various local, state, payor and Medicare accreditation, quality standards, and/or patient safety requirements. In the early 1990s eosinophilic esophagitis had not been described, endoscopic management of Barrett's esophagus, endoscopic mucosal resection of tumors and stenting of esophageal cancer was in development, and endoscopic ultrasound was yet to be commercially available. The panel also noted that "open access" endoscopy, where the patient is not seen by the endoscopist until the day of the procedure, has gained increasing acceptance in a number of settings – community, academic, teaching, military, VA and public; urban, suburban and rural; single and multi-specialty group; independent and employed – during the past decade.

Medicare claims for Esophagoscopy, rigid or flexible; with control of bleeding (eg, injection, bipolar cautery, unipolar cautery, laser, heater probe, stapler, plasma coagulator) (code 43227) have declined over a seven year period from 928 in 2005 to 521 in 2011. A review of a 5% Medicare claims file from 2011 (total 2011 claims 521) reveals that code 43227 was reported 1.10% percent of the time by otolaryngologists, 81.78% by gastroenterologists, 7.18% by internal medicine specialists, and 9.18% by general surgeons. For Medicare, the procedure was performed 24.04% in the outpatient hospital, 70.80% in the inpatient hospital, 2.20% in the physician office, and 2.58% in the ambulatory surgery center setting. As otolaryngologists and surgeons perform both rigid and flexible esophagoscopy, one can make only an estimate assumption that a percentage of the services performed by those specialties in facility settings represent rigid esophagoscopy procedures performed under general anesthesia.

The expert, multi-society panel notes that a change has occurred in the way that the work of moderate sedation is calculated for the purposes of the RUC's recommendations to CMS. Prior to 2012, the RUC and CMS affirmed that physician work of administering moderate sedation was part of the intra-service time, as in endoscopic procedures 43235 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* and 45378 *Colonoscopy, flexible, proximal to splenic flexure; diagnostic, with or without collection of specimen(s) by brushing or washing, with or without colon decompression (separate procedure)* which were surveyed in the 2005 Third Five-Year review, and 43262 *Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy* which was surveyed in the 2010 Fourth Five-Year review. In fact, an overwhelming majority (89%) of codes in Appendix G in which moderate sedation is intrinsic to the service, where moderate sedation is specifically identified in the RUC work descriptors, describe moderate sedation as occurring during the intra-service period. The decision by the RUC's Research Subcommittee to change how the physician work of administering moderate sedation is accounted for as pre-service, not intra-service work, may constitute recognition that there has been a change in the physician work of performing endoscopic procedures over the past 20 years. In view of such, the RUC's introduction of the standardized pre-service packages in 2008 which specify a difference in pre-service evaluation minutes depending on whether a procedure involves sedation / anesthesia care, and the Research Subcommittee's 2012 clarification that the administration of moderate sedation constitutes work as occurring during the pre-service period, represents an important change in the way that physician work for procedures involving moderate sedation is valued, and constitutes compelling evidence for re-valuation of the gastrointestinal endoscopy codes.

The expert panel felt that in view of the change in how the procedure was performed, new diagnoses, and new requirements to ensure patient safety, the predominance of otolaryngologists performing code 43200 vs. gastroenterologists performing the predominance of other procedures in the 43201-43232 family, and the inability to distinguish the percentage of previous services that represent rigid trans-oral, flexible trans-oral, and flexible trans-nasal procedures, the flexible, trans-oral esophagoscopy procedure has changed since the initial valuation by Harvard, providing compelling evidence for re-valuation.

After assessing the pre-service work that is performed, the expert panel determined that the assumption that all endoscopic procedures would have identical pre- and post-service time may have been incorrect. We note that the survey instrument approved by the Research Subcommittee did not allow the expert panel to draw any conclusions about the role of moderate sedation in the valuation of the pre-service work. The expert panel attempted to address this by reviewing similar services, based on whether the typical patient and typical procedure was straightforward or complex. For this procedure, we are recommending pre-service package 2b with changes of times to 25/3/5 for a total of 33 minutes of pre-service time, as follows:

**Evaluation:** 25 minutes which is the survey median time, but less than the package time.

**Positioning:** Addition of 2 minutes (3 min total) to account for positioning the patient, anesthesia lines, and video/scope equipment to allow access for the procedure and moderate sedation monitoring.

**Scrub/Dress/Wait:** 5 minutes which is equal to the survey median and package time.

The panel felt that the median post-service time of 10 minutes also underestimated the elements of post service work. The panel reviewed other scope procedures that had recently been reviewed by the RUC and recommended adjusting the post service time work to 15 minutes similar to code 31622, *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)*. The panel determined that the post-service time should be less than the 20 minutes of post-service work for code 52005, *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service*; reviewed by the RUC in October 2010 at the 4<sup>th</sup> Five-Year review.

The panel noted the survey median intra-service time was 30 minutes and felt that this time was acceptable as it represented approximately two thirds of the intra-service time for the key reference service 49421, *Insertion of tunneled intraperitoneal catheter for dialysis, open*, (000 global, 46/45/20, RVW 4.21) which was reviewed by the RUC in April 2010. The panel felt that although the intraservice time was approximately 20% less than the previous valuation the intensity of the service (i.e. the necessity to successfully perform the service without complication in a shorter period of time) had substantially increased. The panel also compared the 30 minutes survey time to the intra-service time of 15 minutes for the base code, 43200, and felt that the 10 minutes of incremental time represents an appropriate incremental work time for the typical procedure. The panel noted that the respondent 25<sup>th</sup> percentile and median RVW recommendation were respectively 3.26 and 4.05 reflecting the increased intensity of service, which along with the changes in the practice patterns and new diagnoses represented compelling evidence to recommend a revaluation in the physician work of this procedure. The expert panel then reviewed the rank order of code 43227 along with the intra-service times for the other codes surveyed in the 43200-43232 family. Based on the comprehensive review of the family of codes surveyed, the expert panel determined that despite the median RVW recommendation of 4.05 and the presence of compelling evidence which would otherwise merit a work value increase, the panel could not justify recommending an increase in the current valuation of code 43227 from 3.59.

As the physicians who completed the surveys were significantly limited in their choice of key reference codes within the endoscopic family, the panel felt that code 49421 represented an appropriate key reference code even though the total and intraservice times for code 43227 were less. Adjusting for the differences in times, the panel concluded that the current RVW of 3.59 and revised IWPOT (0.0862) for code 43227 is consistent

with code MPC code 31575 *Laryngoscopy, flexible fiberoptic; diagnostic* (000 global, 15/8/5 RVW 1.10, IWPUT 0.0904) and proportional to code 49421 *Insertion of tunneled intraperitoneal catheter for dialysis, open* (wRVW 4.21, IWPUT 0.0639). The panel also noted that MPC code 19103 *Biopsy of breast; percutaneous, automated vacuum assisted or rotating biopsy device, using imaging guidance* (000 global, 20/30/15 RVW 3.69, IWPUT 0.0969) compares appropriately with 43215 adjusting for the difference in service times and complexity. Code 57410 *Pelvic examination under anesthesia (other than local)* (000 global, 30/15/25, RVW 1.75, IWPUT 0.0345), and code 31622 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)* (000 global 20/30/15, RVW 2.78, IWPUT 0.0688), were identified as comparable codes of lesser complexity

While there was compelling evidence to recommend an increase in the wRVU times for code 43227 based on the survey times adjusted for pre-service package 2b, the expert panel recommends that the existing wRVU value of 3.59 should be retained with physician times 33/30/15 (compared to the previous RUC valuation of 45/36/23). The expert panel also recommends that code 43227 be valued in both the facility and non-facility setting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43227

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often? Rarely

Specialty                      How often? Rarely

Estimate the number of times this service might be provided nationally in a one-year period? 1700

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. ~1,700 (Medicare data 2011 = 581\*3) We believe that 90% of the previously reported procedures will now be reported using the codes specific for flexible, transoral esophagoscopy procedures..

Specialty Gastroenterology	Frequency 1550	Percentage 91.17 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 581  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. (Medicare data 2011 = 581).

Specialty Gastroenterology	Frequency 535	Percentage 92.08 %
----------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43227

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43229      Tracking Number   C29

Original Specialty Recommended RVU: **3.76**Presented Recommended RVU: **3.72**

Global Period: 000

RUC Recommended RVU: **3.72**

CPT Descriptor: Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65 year old patient with heartburn unresponsive to pharmacological therapy and known Barrett's esophagus is found to have dysplasia on surveillance. The patient is referred for therapeutic esophagoscopy and thermal ablation of the dysplastic tissue.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 56%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 44%

Description of Pre-Service Work: Review with the patient any symptoms and ascertain characteristics of the dysphagia problem when it is clear there is dysphagia. The patient's history is reviewed to assess for the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed and documented; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained and the physician must sign the consent. The physician verifies all endoscopic equipment is available and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach and, when indicated, retroflexed to allow examination of the cardia. The endoscope is withdrawn, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assess for presence of a hiatal hernia, and then examination of the esophageal mucosa. Abnormal tissue in the esophagus is identified from 34-37cm, which has previously been confirmed as consistent with Barrett's esophagus, high grade dysplasia . Under endoscopic visualization, a guidewire is passed through the endoscope beyond the gastroesophageal junction, and the endoscope is

withdrawn. The endoscope tip is fitted with a blunt cap. The sizing balloon catheter is placed over the guidewire and advanced to the squamocolumnar and gastro-esophageal junction. The sizing balloon is inflated to ascertain the luminal diameter to be treated. The sizing balloon is removed and an ablation catheter is passed over the guidewire into the esophagus in a side-by-side manner with the endoscope. The level of sedation of the patient is reassessed and additional medication is administered as needed. The endoscope positions the balloon electrode to the proximal edge of the Barrett's segment and radiofrequency ablation of the lesion proceeds under direct visualization. The catheter is deflated, removed, and cleaned. The endoscope is advanced to inspect the esophageal mucosa for extent of coagulation effect. The ablation area is cleaned of coagulative debris with irrigation, suctioning, and scrapping using endoscope cap. The catheter is then reintroduced over the guidewire and positioned at the proximal end of the ablated area and a subsequent treatment is performed. The endoscope, ablation catheter, and guidewire are removed. If inadequately treated regions remain a cap electrode device, with spot ablation capability, is fitted on the tip of the endoscope. The endoscope is passed through the mouth into the esophagus to the level of lesion to be treated after anatomical landmarks have been visualized. The area is ablated and coagulative debris is removed from the ablation area, followed by removal of the endoscope and cap electrode device for electrode surface cleaning outside the body. The endoscope and cap electrode device are then reinserted to the ablated area and additional ablation is performed. At the conclusion of the ablation procedure, the area is observed for bleeding. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. The endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

------------------------------------	------	------

Post-Service intensity/complexity	4.17	3.75
-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy codeset.

### Compelling Evidence

For a detailed discussion of compelling evidence, please see the Attachment to the cover letter that was submitted with the SoRs for this family of esophagoscopy codes.

### Overview of Esophagoscopy Family RVW Recommendations

Similar to the review of new EGD codes, for new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable.

Code 43229 *Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)* is a new/revised code for 2014 that adds dilation and passage of guidewire to the work of to-be-deleted code 43228 *Esophagoscopy, rigid or flexible; with ablation of tumor(s), polyp(s), or other lesion(s), not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique*. The AGA and ASGE conducted a RUC survey and received 51 responses.

**We recommend an RVW of 3.76.** This value is less than the 25<sup>th</sup> percentile and is based on: 1) multiple endoscopy payment policy; and 2) increments approved by the RUC for esophagoscopy codes at the October 2012 meeting.

Code 43229 includes the work of esophagoscopy ablation (43228) plus the incremental work of balloon dilation (43220-43200) or 3.25 + (2.10-1.59).

**Pre-time Package 2b** is appropriate for 43229, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

### Comparison To Other RUC-Reviewed Codes with 45 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43228

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 13500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43228 (Esophagoscopy, rigid or flexible; with ablation of tumor(s), polyp(s), or other lesion(s), not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique) multiplied by 3 ( $4,500 \times 3$ ) = ~13,500, which will be deleted from CPT and replaced by 43229.

Specialty Gastroenterology                      Frequency 11500                      Percentage 85.18 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,359

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43228 (Esophagoscopy, rigid or flexible; with ablation of tumor(s), polyp(s), or other lesion(s), not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique) = 4359, which will be deleted from CPT and replaced by 43229.

Specialty Gastroenterology                      Frequency 3800                      Percentage 84.44 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43228

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43231      Tracking Number   C23

Original Specialty Recommended RVU: **3.19**Presented Recommended RVU: **3.19**

Global Period: 000

RUC Recommended RVU: **3.19**

CPT Descriptor: Esophagoscopy, flexible, transoral; with endoscopic ultrasound examination

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 72 year-old patient with recent onset dysphagia is found to have a submucosal mass on imaging studies. Diagnostic esophagoscopy with endoscopic ultrasound is performed to evaluate the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 70%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. Examination is conducted of the entire esophagus and of the gastric cardia in a retroflexed scope position, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the radial-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. Echoendoscopic evaluation is conducted of all abnormalities identified,

correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the esophageal wall as well as vascular and other structures of the mediastinum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Post procedure orders are completed and discussed with staff. Photographs are reviewed and labeled. Radiographic images are reviewed with the technologist for entry into the image storing system. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications and follow-up plans or further treatments. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy code set.

In October 2012, the RUC reviewed the survey data for 43231 and 43232 (EUS codes) and noted that the survey respondents' median performance rate was low, with the 75<sup>th</sup> percentile performance for 43232 at zero. The RUC also noted that both the intra-service time and recommended RVU for 43232 compared to 43231 were incompatible, indicating that a substantial number of respondents did not understand the survey. The specialties recommended, and the RUC agreed, that 43231 and 43232 should be re-surveyed in conjunction with the upper gastrointestinal endoscopy codes that include ultrasound examination and/or ultrasound-guided treatment. The Research Subcommittee approved the use of a random plus targeted survey sample that included physicians in a special interest group who are familiar with EUS.

## 43231 – Discussion and Recommendation

Code 43231 *Esophagoscopy, flexible, transoral; with endoscopic ultrasound examination* was identified as a family code through the MPC List screen. This service was reviewed by the RUC as a new code in 2000. Because there were only eight survey responses, the RUC recommended 4.09 based on valuing the increment of ultrasound [43259 (4.89) – 43235 (2.39) = 2.50] plus the base code 43200 (1.59). CMS accepted this value for CY 2000, however, in 2001 after the second 5-year-review which included many esophagoscopy codes, CMS refinement reduced 43231 to 3.19. There is no Federal Register discussion regarding this reduction. Summary: the RUC recommended RVW for 43231 was reduced 22% by CMS for CY 2002 and was independent of the survey data from 8 survey respondents. A new survey was conducted and 45 responses were received, with almost all respondents familiar with the procedure.

**We recommend the current RVW of 3.19.** In consideration of the reduction of intraservice time by 10 minutes which had previously been allocated to the administration of moderate sedation, the survey times support maintaining the current value.

## Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 500. (500\*3 ~ 1,500)

Specialty Gastroenterology Frequency 1275 Percentage 85.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 500

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 data ~500

Specialty Gastroenterology Frequency 425 Percentage 85.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43231

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43232      Tracking Number   C24

Original Specialty Recommended RVU: **3.83**Presented Recommended RVU: **3.83**

Global Period: 000

RUC Recommended RVU: **3.83**

CPT Descriptor: Esophagoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69 year-old patient with long-standing tobacco use is found to have mediastinal enlargement on chest CT scan. Diagnostic esophagoscopy with endoscopic ultrasound and fine needle aspiration biopsy is performed to plan therapy.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 56%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 40%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. Examination is conducted of the entire esophagus and of the gastric cardia in a retroflexed scope position, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard

upper endoscope is withdrawn; the radial-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. Echoendoscopic evaluation is conducted of all abnormalities identified, correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the esophageal wall as well as vascular and other structures of the mediastinum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated including identification of vascular structures in the anticipated track of the biopsy needle. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. The radial-view echoendoscope is withdrawn; the linear-view biopsy echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. The area of interest is re-imaged and fully characterized, noting the correlation of the sagittal/coronal image to the transverse image previously obtained. The fine needle aspiration (FNA) device is inserted into the endoscope. Under continuous endoscopic and ultrasound guidance the FNA needle tip is advanced intramurally or transmurally into the location to be biopsied, taking care to avoid vascular structures and using Doppler imaging as needed to identify such structures. The FNA needle is inserted into the area to be biopsied, the stylet is withdrawn, and suction is applied. The needle is thrust in and out of the region to be biopsied, taking care that the correct needle position is maintained. The needle is withdrawn and the contents of the needle are expressed on to microscope slides and/or into appropriate cytological fixative. Cytology slides are smeared and fixed. The biopsy procedure is repeated until a cytopathologist confirms that adequate tissue has been obtained; or, in the absence of immediate cytopathological evaluation, until 4-8 biopsies are obtained. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Post procedure orders are completed and discussed with staff. Photographs are reviewed and labeled. Radiographic images are reviewed with the technologist for entry into the image storing system. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications and follow-up plans or further treatments. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	04/2013				
<b>Presenter(s):</b>	Bruce Cameron, MD (ACG), Joel Brill, MD (AGA), Shivan Mehta, MD (AGA), Nicholas Nickl, MD (ASGE), Edward Bentley, MD (ASGE)

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

In review of the family of esophagoscopy codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved further revised guidelines along with addition of codes within the esophagoscopy code set.

In October 2012, the RUC reviewed the survey data for 43231 and 43232 (EUS codes) and noted that the survey respondents' median performance rate was low, with the 75<sup>th</sup> percentile performance for 43232 at zero. The RUC also noted that both the intra-service time and recommended RVU for 43232 compared to 43231 were incompatible, indicating that a substantial number of respondents did not understand the survey. The specialties recommended, and the RUC agreed, that 43232 should be re-surveyed in conjunction with the upper gastrointestinal endoscopy codes that include ultrasound examination and/or ultrasound-guided treatment. The Research Subcommittee approved the use of a random plus targeted survey sample that includes physicians in a special interest group who are familiar with EUS.

## 43232 – Discussion and Recommendation

Code 43232 *Esophagoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)* was identified as a family code through the MPC List screen. This service was reviewed by the RUC as a new code in 2000. Because there were only seven survey responses, the RUC recommended 4.71 by adding an increment for biopsy to the calculated value of 4.09 for code 43231 (w/o biopsy). The biopsy increment was based on a blend between 19291 (0.63) and the increment between 31629 and 31622. CMS accepted the RVW of 4.71 for CY 2000, however, in 2001 after the second 5-year-review which included many esophagoscopy codes, CMS refinement reduced 43232 to 4.48. There is no Federal Register discussion regarding this reduction. Summary: the RUC recommended RVW for 43231 was reduced 5% by CMS for CY 2002 and was independent of the survey data from 7 survey respondents. A new survey was conducted and 38 responses were received, with almost all respondents familiar with the procedure.

**We recommend an RVW of 3.83 which is less than the current value and less than the 25<sup>th</sup> percentile.** This establishes the increment of 0.67 RVU between 43238 and 43232, representing the additional work required to perform esophageal FNA. This value is supported by a comparison to other codes representing needle aspiration or needle biopsy (see table)

Code	Descriptor	RUC review	RVW	IS time
10021	FNA w/o image guidance	1995	1.27	17
10022	FNA w/ imaging	1995	1.27	20

**Pre-time Package 4** is appropriate.

#### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

#### 43232 Comparison To MPC and Other RUC-Reviewed Codes with 40-45 Minutes Intra-Service Time

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43232

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1200

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume ~ 400 ( $400 \times 3 = 1200$ )

Specialty Gastroenterology                      Frequency 936                      Percentage 78.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 400

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume ~ 400

Specialty Gastroenterology                      Frequency 312                      Percentage 78.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43232

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

February 11, 2013

Barbara Levy, MD  
Chair, AMA / Specialty Society Relative Value Update Committee  
Scott Manaker, MD, PhD  
Chair, Practice Expense Subcommittee  
515 N. State St.  
Chicago, IL 60657

Dear Drs. Levy and Manaker,

During the January 2013 RUC meeting the Practice Expense Subcommittee recommended and the RUC approved the following changes to the American Gastroenterological Association (AGA) and the American Society for Gastrointestinal Endoscopy (ASGE) practice expense proposal for Tab 8 (Esophagogastroduodenoscopy). As per the discussion at the RUC meeting we respectfully request that the RUC apply these changes to the practice expense for the related esophagoscopy codes that were previously approved at the October 2012 RUC meeting.

Tab 8:

- Addition of 3 minutes to “Prepare room, equipment, supplies” (L037D) for code 43252 (*Esophagogastroduodenoscopy; with optical endomicroscopy*) for the technician to turn on the optical endomicroscope processor unit system added to its esophagoscopy counterpart, 43206 (*Esophagoscopy, flexible, transoral; with optical endomicroscopy*)
- Replacement of “Radiofrequency generator (Angiodynamics), liver RFA” with “RF ablation system” for 4326X9 (*Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)*) added to its esophagoscopy counterpart 4320X5 (*Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)*) which replaced 43228
- Addition of “Instrument pack basic (\$500 - \$1,499)” (EQ137) for 43248 (*Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire*) added to its

esophagoscopy counterpart 43226 (*Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire*)

- Addition of “Pack, cleaning, surgical instruments” (SA043) for 43248 (*Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire*) for cleaning the dilators added to its counterpart 43226 (*Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire*)

Please let us know if you have any questions or concerns.

Respectfully,

Joel V. Brill, MD  
AGA RUC Advisor

Nicholas Nickl, MD  
ASGE RUC Advisor

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: Esophagoscopy, rigid, transoral; diagnostic, including collection of specimen(s) by brushing or washing, when performed.

Global Period: 000

Meeting Date: October 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our society convened an expert panel to review the practice expense inputs from the existing esophagoscopy codes used to report rigid transoral esophagoscopy (43200, 43201, 43202, 43215, 43220, and 43226). The panel was comprised of AAO-HNS RUC Advisors and Alternate Advisors as well as members of our Physician Payment Policy (3P) workgroup who are familiar with these procedures. The experts modified the practices expense as necessary and added new inputs for equipment required specifically for transnasal esophagoscopy.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale: The 2003 practice expense for CPT 43200 was selected as our reference code for new CPT code 43191 given that this is the code formerly used to report the service.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

A RN/LPN/MTA staff blend provides assistance to the physician on the day prior to the procedure by completing pre-service diagnostic and referral forms, coordinating pre-surgery services, scheduling space and equipment in the facility, providing pre-service education and obtaining consent, and following up with phone calls and prescriptions.

Intra-Service Clinical Labor Activities:

Overall, there is very little clinical staff time during the intra-service period given that this procedure is only performed in the facility setting. The clinical staff will however, provide assistance during discharge of the patient on the same date of service by providing home care instructions and discharge information to the patient following the procedure.

Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: Esophagoscopy, rigid, transoral; with directed submucosal injection(s), any substance.

Global Period: 000

Meeting Date: October 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our society convened an expert panel to review the practice expense inputs from the existing esophagoscopy codes used to report rigid transoral esophagoscopy (43200, 43201, 43202, 43215, 43220, and 43226). The panel was comprised of AAO-HNS RUC Advisors and Alternate Advisors as well as members of our Physician Payment Policy (3P) workgroup who are familiar with these procedures. The experts modified the practices expense as necessary and added new inputs for equipment required specifically for transnasal esophagoscopy.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale: CPT 31625 was selected as our reference code for new CPT code 43192 given that this was the reference code chosen by survey respondents and there was no PE file available from the 2003 review.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

A RN/LPN/MTA staff blend provides assistance to the physician on the day prior to the procedure by completing pre-service diagnostic and referral forms, coordinating pre-surgery services, scheduling space and equipment in the facility, providing pre-service education and obtaining consent, and following up with phone calls and prescriptions.

CPT Long Descriptor:

Immunohisto-chemistry or immunocyto-chemistry, each separately identifiable antibody per block, cytologic preparation, or hematologic smear; first separately identifiable antibody per slide

(When multiple antibodies are applied to the same slide, use one unit of 88342 for the first separately identifiable antibody and one unit of 8834XX for each additional separately identifiable antibody)

(Do not report 88342 in conjunction with 88360 or 88361 for the same antibody)

(For quantitative or semiquantitative immunohistochemistry, see 88360, 88361)

Global Period: XXX Meeting Date: October 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Individuals with expertise in this service were consulted through a series of conference calls in order to develop the typical practice expense inputs. CAP's expert panel reviewed and compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment. These inputs were further refined with individual pathologists who perform this service.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:  
88342 is the service being revised.

Individuals with expertise in this service were consulted through a series of conference calls in order to develop the typical practice expense inputs. CAP's expert panel reviewed and compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment. These inputs were further refined with individual pathologists who perform this service.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: 88342 is the service being revised.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Initially, the immunohistochemistry stain order is verified and accessioned into the laboratory information system. Control blocks have been previously embedded in paraffin as per routine histology procedures and are specific for each immunohistochemical antibody used. The histotechnologist pulls and verifies the patient tissue block and the correct control block and carefully cuts the positive control tissue on the microtome per routine histology procedures. The patient tissue block is then cut on the microtome and placed on the same slide with the positive control tissue. The patient tissue block is then again cut on the microtome and placed on a separate slide for the negative control.

The slides then are placed in the isotemp oven, incubated for 60 minutes, and removed.

Patient data is entered into the Ventana Ultra system with the specific antibodies to be used. Slide barcode labels are generated and placed on slides.

The histotechnologist typically then removes the detection kit and antibodies from refrigerator, loads the antibody, detection kit dispensers and required reagents onto the reagent tray and places the tray on the automated slide stainer. The slides are loaded onto the automated slide stainer, and the equipment is started. The slides are removed from the instrument after they are stained, placed in a slide holder, and rinsed in soapy water so that the coverslip material is removed. Slides are then dehydrated, cleared, and coverslipped by hand with permanent mounting media.

Positive and negative control slides are reviewed. Workload recordings are logged, and the slides and paperwork are collated. Slides and paperwork are then delivered to the pathologist.

Service Clinical Labor Activities:

None.

Post-Service Clinical Labor Activities:

Typically, the histotechnologist then re-files the block, unloads and stores the antibody, the detection kit and reagents. The lab technician cleans the equipment and work station in the histology lab. The lab technician then disposes the hazardous waste material and specimens.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor: Esophagoscopy, flexible, transnasal; diagnostic, includes collection of specimen(s) by brushing, when performed.

Global Period: 000 Meeting Date: October 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our societies convened an expert panel to review the practice expense inputs from the existing esophagoscopy code used to report diagnostic transnasal esophagoscopy (43200). The panel was comprised of the AGA/ASGE/AAO-HNS RUC Advisors and Alternate Advisors as well as several identified TNE experts in the Otolaryngology community. The experts modified the practices expense as necessary and added new inputs for equipment required specifically for transnasal esophagoscopy.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: 31622 was selected as our reference code for new CPT code 43197. We selected this reference code because it was chosen as the key reference code by survey respondents.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Our expert panel felt there were no clinical inputs for the day prior to the procedure when performed in the office setting.

Service Clinical Labor Activities:

After the patient arrives at the office for their transnasal esophagoscopy (43197), the Medical Technical Assistant greets the patient and gowns them. They ensure the appropriate medical records are available, obtain vital signs, provide pre-service education and obtain consent. They prepare the room, equipment, supplies, set up the scope and prepare and position the patient. They also assist with applying topical anesthesia.

During the procedure, the Assistant assists the physician performing the procedure and is present for the entire intra service period to assist in the procedure.

Following the procedure, the Assistant monitors the patient and checks monitors, cleans the room and equipment, cleans the scope, and cleans the surgical instruments.

Post-Service Clinical Labor Activities:

Following the procedure, the Assistant will call in prescriptions

CPT Long Descriptor: Esophagoscopy, flexible, transoral: diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)

Global Period: 000Meeting Date: Oct 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AGA, ASGE, SAGES and AAO-HNS convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Code 43200 *Esophagoscopy, flexible; transoral diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)* was previously reviewed for practice expense in January 2003. All codes in the family of 43200-43232 are being reviewed for practice expense and physician work.

Our specialties have identified the following reference codes for the Practice Expense inputs recommended for this code.

- Code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic* was reviewed for practice expense in January 2003.
- Code 43236, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance* was reviewed for practice expense when the RUC reviewed this code in April 2002.
- Code 43246, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube* was reviewed for practice expense in February 2005.
- Code 91110, *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* was reviewed for practice expense when the RUC reviewed this code in April 2003
- Code 91038, *Esophageal function test, gastroesophageal reflux test with nasal catheter intraluminal impedance electrode(s) placement, recording, analysis and interpretation; prolonged (greater than 1 hour, up to 24 hours)* was reviewed for practice expense in February 2010.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Schedule space and equipment in facility
- Provide pre-service education/ obtain consent
- Follow-up phone calls and prescriptions

Service Clinical Labor Activities:

- None

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

Our specialties have identified the following reference codes for the Practice Expense inputs recommended for this code.

- Code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic* was reviewed for practice expense in January 2003.
- Code 43236, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance* was reviewed for practice expense when the RUC reviewed this code in April 2002.
- Code 43246, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube* was reviewed for practice expense in February 2005.
- Code 91110, *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* was reviewed for practice expense when the RUC reviewed this code in April 2003
- Code 91038, *Esophageal function test, gastroesophageal reflux test with nasal catheter intraluminal impedance electrode(s) placement, recording, analysis and interpretation; prolonged (greater than 1 hour, up to 24 hours)* was reviewed for practice expense in February 2010.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

**Non-facility**

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Follow-up phone calls & prescriptions

Service Clinical Labor Activities:

**Non-Facility**

○ **Pre-Service**

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education / obtain consent
- Enter pre-service procedure information into electronic medical record
- Enter pre-service vital signs into electronic medical record
- Prepare room, equipment, supplies
- Set up dilators
- Review / confirm procedure
- Prepare and position patient / monitor patient / set up IV
- Moderate sedation / observe (wait) anesthesia care

○ **Intra-service**

- Moderate sedation (RN, 100%, cannot perform any other tasks)
- Assist physician in performing procedure (RN, LPN, MTA, 100%)

○ **Post-service**

- Monitor patient following service.
- Check tubes, monitors, drains
- Clean room / equipment by physician staff
- Clean dilators
- Complete diagnostic forms, lab & X-ray requisitions
- Enter procedure information into electronic medical record
- Document that patient is stable for discharge from office
- Enter post-procedure information into electronic medical record
- Check dressings / home care instructions / coordinate office visits / prescriptions

○ **End: Patient leaves office**

Post-Service Clinical Labor Activities:

**Non-facility**

- Phone call

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: Esophagoscopy, flexible, transoral; with optical endomicroscopy

Global Period: 000 Meeting Date: Oct 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AGA, ASGE, and SAGES convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Code 43206 *Esophagoscopy, flexible, transoral; with optical endomicroscopy* is a new code in this family referred to the RUC for evaluation by the CPT Editorial Panel in April 2012. All codes in the family of 43200-43232 are being reviewed for practice expense and physician work.

Our specialties have identified the following reference codes for the Practice Expense inputs recommended for this code.

- Code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic* was reviewed for practice expense in January 2003.
- Code 43236, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance* was reviewed for practice expense when the RUC reviewed this code in April 2002.
- Code 43246, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube* was reviewed for practice expense in February 2005.
- Code 91110, *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* was reviewed for practice expense when the RUC reviewed this code in April 2003
- Code 91038, *Esophageal function test, gastroesophageal reflux test with nasal catheter intraluminal impedance electrode(s) placement, recording, analysis and interpretation; prolonged (greater than 1 hour, up to 24 hours)* was reviewed for practice expense in February 2010.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Schedule space and equipment in facility
- Provide pre-service education/ obtain consent
- Follow-up phone calls and prescriptions

Service Clinical Labor Activities:

- None

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

- Code 43236, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance* was reviewed for practice expense when the RUC reviewed this code in April 2002.
- Code 43246, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube* was reviewed for practice expense in February 2005.
- Code 91110, *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* was reviewed for practice expense when the RUC reviewed this code in April 2003
- Code 91038, *Esophageal function test, gastroesophageal reflux test with nasal catheter intraluminal impedance electrode(s) placement, recording, analysis and interpretation; prolonged (greater than 1 hour, up to 24 hours)* was reviewed for practice expense in February 2010.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

**Non-facility**

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Follow-up phone calls & prescriptions

Service Clinical Labor Activities:

**Non-Facility**

○ **Pre-Service**

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education / obtain consent
- Enter pre-service procedure information into electronic medical record
- Enter pre-service vital signs into electronic medical record
- Prepare room, equipment, supplies
- Set up dilators
- Review / confirm procedure
- Prepare and position patient / monitor patient / set up IV
- Moderate sedation / observe (wait) anesthesia care

○ **Intra-service**

- Moderate sedation (RN, 100%, cannot perform any other tasks)
- Assist physician in performing procedure (RN, LPN, MTA, 100%)

○ **Post-service**

- Monitor patient following service.
- Check tubes, monitors, drains
- Clean room / equipment by physician staff
- Clean dilators
- Complete diagnostic forms, lab & X-ray requisitions
- Enter procedure information into electronic medical record
- Document that patient is stable for discharge from office
- Enter post-procedure information into electronic medical record
- Check dressings / home care instructions / coordinate office visits / prescriptions

○ **End: Patient leaves office**

Post-Service Clinical Labor Activities:

**Non-facility**

- Phone call

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery

Global Period: 000 Meeting Date: Oct 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AGA, ASGE, and SAGES convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Code 43216, *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery* was last reviewed by the Practice Expense Subcommittee in January 2004. All codes in the family of 43200-43232 are being reviewed for practice expense and physician work.

Our specialties have identified the following reference codes for the Practice Expense inputs recommended for this code.

- Code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic* was reviewed for practice expense in January 2003.
- Code 43236, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance* was reviewed for practice expense when the RUC reviewed this code in April 2002.
- Code 43246, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube* was reviewed for practice expense in February 2005.
- Code 91110, *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* was reviewed for practice expense when the RUC reviewed this code in April 2003
- Code 91038, *Esophageal function test, gastroesophageal reflux test with nasal catheter intraluminal impedance electrode(s) placement, recording, analysis and interpretation; prolonged (greater than 1 hour, up to 24 hours)* was reviewed for practice expense in February 2010.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Schedule space and equipment in facility
- Provide pre-service education/ obtain consent
- Follow-up phone calls and prescriptions

Service Clinical Labor Activities:

- None

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

SUMMARY OF RECOMMENDATION**

CPT Code: 93582	Tracking Number U1	Original Specialty Recommended RVU: <b>14.00</b>
		Presented Recommended RVU: <b>14.00</b>
Global Period: 000		RUC Recommended RVU: <b>14.00</b>

CPT Descriptor: Percutaneous transcatheter closure of patent ductus arteriosus

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 10-month old presents for evaluation of a continuous heart murmur and is discovered to have a hemodynamically significant patent ductus arteriosus (PDA) by transthoracic echocardiography. The child is asymptomatic with good growth and appetite, yet has moderate left heart enlargement due to chronic left-to-right shunting via the PDA. Due to concern for the long-term effects of this volume overload the child is referred for catheter based intervention.

Percentage of Survey Respondents who found Vignette to be Typical: 71%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 44%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. This may include review of the echocardiographic or other imaging studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study. A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered for those patients who have not required general anesthesia.

Description of Intra-Service Work: Percutaneous venous access is obtained, typically through the femoral vein. A thin-walled needle is inserted percutaneously into the vein through which a flexible guide wire is inserted into the vein. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and sidearm of the sheath is flushed to remove any clot or air. A pulmonary artery catheter is inserted through the sheath, a balloon on the tip of the catheter is inflated, and congenital right heart catheterization is performed. The catheter is passed through to the inferior vena cava, superior vena cava, right atrium, right ventricle and into the pulmonary artery. As the catheter tip passes through the heart into the lungs, pressure measurements are obtained within each cardiac chamber or major vessel. The catheter may be advanced further to a point that the balloon tip occludes the pulmonary artery. The pressure transduced from the tip of the catheter in this position represents a pulmonary wedge pressure, an indirect measurement of left atrial and left ventricular end diastolic pressure. Oxygen saturation measurements are obtained to assess for intracardiac shunts and to assess cardiac output. Blood gas measurements may also be performed. Measurements of cardiac output may be obtained. The shunt fraction is calculated. Serial injections may be performed through the catheter to measure thermodilution cardiac output.

A thin-walled needle is inserted percutaneously into a peripheral artery, through which a flexible guide wire is inserted into the artery. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. An appropriate catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. Pressure is measured in the aortic root. The catheter is then used to cross the aortic valve retrograde into the left ventricle. Left ventricular pressure is measured. The catheter is carefully pulled back across the aortic valve to assess for an aortic valve gradient. The catheter is then pulled back across the aortic arch and then into the descending aorta to assess for coarctation of the aorta.

The pigtail catheter is withdrawn to the level of the patent ductus arteriosus and biplane thoracic aortography is performed to visualize the ductus. More than one aortogram may be required to assess the ductus. Quantitative angiographic measurements are performed on the PDA. The length of the PDA and the diameters of the aortic end, pulmonary end, and body of the PDA are calculated.

Appropriate anticoagulation is administered to therapeutic levels. A catheter is advanced from the femoral artery and placed in the aorta and directed toward the patent ductus arteriosus. Another catheter is advanced into the left pulmonary artery (LPA) at the level of the PDA. A guide wire is advanced through the aortic catheter and attempts are initiated to cross the PDA from the aorta into the LPA. Frequently this requires several different catheters to find the best shape to direct the wire into the PDA. This requires several catheter exchanges over a guide wire to position the different catheters in the aorta at the level of the PDA. Multiple repositioning of the catheter(s) and multiple attempts to cross the PDA are generally required. This frequently also requires multiple angulations of the camera to help direct the wire across. Once the wire is across the PDA marking its location, a separate wire is advanced through the catheter in the LPA and a similar approach is used to try to direct a wire from the LPA across the PDA into the aorta. If this is not successful (as the wire is working against flow from the aorta through the ODA to the LPA), a loop snare is advanced through the PA catheter and positioned in the LPA at the position of the PDA entry site. The snare is used to capture the wire coming from the aorta across the PDA and into the LPA. Typically this requires multiple repositioning of the PA catheter. Once the wire is passed through the snare, the snare is tightened to capture the wire and the wire is brought back through the right heart chambers and out through the femoral vein sheath. This creates a "rail" from the femoral vein, through the right heart, through the LPA, across the PDA into the aorta, and down the aorta to the femoral artery and then out of the body. Exquisite attention is required to prevent wire trauma to the pulmonary valve, tricuspid valve and the subvalvular apparatus.

Once a wire position is established from the LPA across the PDA to the aorta, an appropriate catheter is advanced over the wire from the femoral vein through the right heart, through the PDA and into the descending aorta. The wire is withdrawn through the catheter and replaced with a stiff wire. Next a delivery sheath is advanced over the wire from the femoral vein through the right heart, through the LPA, across the PDA into the aorta, and down into the descending aorta. The sheath is flushed. An appropriate size occlude device is selected. A pigtail catheter is now advanced from the femoral artery up to the level of the PDA again and connected to a power injector. The occluder is advanced through the delivery sheath to near the distal end of the sheath. The sheath is withdrawn back to the aortic entrance to the PDA. The distal end of the occluder is extruded from the sheath and the sheath and occlude are pulled back to seat the device in the aortic entrance to the PDA. Biplane aortogram is performed to ensure the device is seated appropriately at the aortic end. The sheath is then withdrawn while holding tension on the occluder delivery cable to keep it in place. The device is thus deployed in the PDA back to its pulmonary end. Biplane aortogram is now performed to ensure the device is seated appropriately at both the

aortic and pulmonary ends. If the device is not appropriately seated or sized, the delivery sheath is advanced over the device to recapture the occluder. The occluder is removed and the same procedure is performed with a better sized device. Once the device is in proper position angiographically, the device is released by unscrewing its delivery cable from the occluder. At this point, the patient is monitored for device embolization under fluoroscopy.

The patient is then observed for a period of time to ensure the device does not move. Aortography is typically performed again to assess PDA closure and to ensure no aortic trauma. The pigtail is used to recross the aortic valve and remeasure left ventricular end diastolic pressure to ensure the left ventricle is tolerating the increased afterload. The occluder delivery sheath is removed over a wire and a pulmonary artery catheter is often used to repeat the right heart catheterization to assess hemodynamics using the same technique as described for the initial right heart catheterization.

The patient's arterial pressure, electrocardiogram, and oxygen saturation are constantly monitored through the procedure. All catheters are removed once angiography is completed. Images are reviewed to ensure no additional views are required before leaving the procedure suite. Angiography of the access site may be performed to assess for any complications and suitability for a percutaneous closure device. The catheters and sheaths are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision.

Description of Post-Service Work: Angiographic images and hemodynamics are reviewed and a formal report is generated. The patient family and the referring physician are notified of the results. When appropriate, a plan of management is developed and implemented and discussed with the patient and family. The patient is observed to ensure no bleeding from the access site prior to disposition. Post procedural vital signs and telemetry are monitored to ensure no immediate complication.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 93582 will be used to report transcatheter repair of patent ductus arteriosus (PDA closure). This service has previously been reported with codes 37204 and 75894. These two codes are used to report a wide array of cardiovascular embolization procedures, and were identified as frequently reported together. ACC, ACR, SIR, and SVS referred the issue to CPT for creation of new bundled codes for relevant services. 93582 addresses only the transcatheter PDA closure service.

An email seeking survey volunteers was sent to the entire membership of the Society for Cardiovascular Angiography and Interventions (SCAI). Surveys were distributed to those who responded, a method previously accepted as random by the RUC. The survey was completed by physicians who have experience providing the service.

A RUC panel from ACC and SCAI reviewed the preservice time and selected package 4 for a difficult procedure on a difficult patient undergoing a procedure in a facility with adjustment to the time for scrub/dress/wait to reflect the survey.

The key reference service is 93580, Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant. Survey respondents indicated that 93582 takes less time and is less intense/complex to perform than 93580. The median survey RVU was 15.00.

We recommend a work RVU of 14.00, the survey 25<sup>th</sup> percentile. The RUC panel determined it is more appropriate than the median for this service. The resulting increase in intensity compared to the key reference code is reasonable since this rare procedure is performed by few cardiologists on infants.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) In 2010, code 37204 (reported with 75894) appeared on the RAW screen identifying codes reported together 75% or more with recommendation made by ACC, ACR, SIR and SVS to refer this service to CPT for the development of new bundled codes that will more accurately reflect the current clinical practice of these procedures. Codes 37204/75894 are currently used to report a very wide array of cardiovascular embolization procedures. This proposal seeks to create a bundled code specific for reporting transcatheter PDA closure. Additionally, commercial carriers' coding guidelines for PDA have not been consistent across the country with at least one carrier recommending use of an unlisted code for one type of transcatheter PDA closure. Using an unlisted code to report such a well-established, typically covered procedure creates an undue burden on practices performing these procedures and carriers claims processing systems.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology                      How often? Rarely

Specialty                      How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4800

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Without a specific code to report and track utilization for transcatheter PDA closure, we do not have precise utilization estimates. The preliminary number of U.S. births in 2010 was 4,000,279. (Source: [http://www.cdc.gov/nchs/data/nvsr/nvsr60/nvsr60\\_02.pdf](http://www.cdc.gov/nchs/data/nvsr/nvsr60/nvsr60_02.pdf); viewed 6/6/12). From available sources (<http://emedicine.medscape.com/article/891096-overview#a0156>), PDA occurs in 0.002 to 0.008%, supporting estimates of 2,000 to 32,000 babies born each year suffering from PDA. Depending on the physiology, PDA may be treated medically or surgically using either open or transcatheter-based techniques. Using the highest estimates of incidence, and assuming that 15% of these children eventually require treatment using the minimally invasive transcatheter techniques, approximately 4,800 patients could be treated each year with transcatheter PDA closure.

Specialty cardiology	Frequency less than 4800	Percentage 100.00 %
----------------------	--------------------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States?

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93580

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique

Global Period: 000 Meeting Date: Oct 2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AGA, ASGE, and SAGES convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform this service. The committee served as the consensus panel to finalize these recommendations.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Code 43217, *Esophagoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique* was last reviewed by the Practice Expense Subcommittee in January 2003. All codes in the family of 43200-43232 are being reviewed for practice expense and physician work.

Our specialties have identified the following reference codes for the Practice Expense inputs recommended for this code.

- Code 31575, *Laryngoscopy, flexible fiberoptic; diagnostic* was reviewed for practice expense in January 2003.
- Code 43236, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed submucosal injection(s), any substance* was reviewed for practice expense when the RUC reviewed this code in April 2002.
- Code 43246, *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with directed placement of percutaneous gastrostomy tube* was reviewed for practice expense in February 2005.
- Code 91110, *Gastrointestinal tract imaging, intraluminal (eg, capsule endoscopy), esophagus through ileum, with physician interpretation and report* was reviewed for practice expense when the RUC reviewed this code in April 2003
- Code 91038, *Esophageal function test, gastroesophageal reflux test with nasal catheter intraluminal impedance electrode(s) placement, recording, analysis and interpretation; prolonged (greater than 1 hour, up to 24 hours)* was reviewed for practice expense in February 2010.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Schedule space and equipment in facility
- Provide pre-service education/ obtain consent
- Follow-up phone calls and prescriptions

Service Clinical Labor Activities:

- None

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

**Non-facility**

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Follow-up phone calls & prescriptions

Service Clinical Labor Activities:

**Non-Facility**

○ **Pre-Service**

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education / obtain consent
- Enter pre-service procedure information into electronic medical record
- Enter pre-service vital signs into electronic medical record
- Prepare room, equipment, supplies
- Set up dilators
- Review / confirm procedure
- Prepare and position patient / monitor patient / set up IV
- Moderate sedation / observe (wait) anesthesia care

○ **Intra-service**

- Moderate sedation (RN, 100%, cannot perform any other tasks)
- Assist physician in performing procedure (RN, LPN, MTA, 100%)

○ **Post-service**

- Monitor patient following service.
- Check tubes, monitors, drains
- Clean room / equipment by physician staff
- Clean dilators
- Complete diagnostic forms, lab & X-ray requisitions
- Enter procedure information into electronic medical record
- Document that patient is stable for discharge from office
- Enter post-procedure information into electronic medical record
- Check dressings / home care instructions / coordinate office visits / prescriptions

○ **End: Patient leaves office**

Post-Service Clinical Labor Activities:

**Non-facility**

- Phone call

Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor:

43231	Esophagoscopy, flexible, transoral; with endoscopic ultrasound examination
43232	Esophagoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s)

Global Period: 000

Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACG, AGA and ASGE convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform these services. The committee served as the consensus panel to develop PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

Current Time data					Survey Code Recommendation			
CPT	Source	Pre	Intra	Post	CPT	Pre	Intra	Post
43231	PEAC-03	19	0	3	<b>43231</b>	19	0	3
43232	PEAC-03	19	0	3	<b>43232</b>	19	0	3

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: NA

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: NA

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

For all codes shown above:

- Three minutes to complete pre-service diagnostic and referral forms.
- Five minutes to coordinate pre-surgery services with other qualified healthcare providers
- Three minutes for scheduling space and equipment in facility
- Five minutes to perform pre-service education/ obtain consent
- Three minutes for pre-op prescriptions

Intra-Service Clinical Labor Activities:

NA

Post-Service Clinical Labor Activities:

For all codes shown above:

- Three minutes for a follow-up phone call to patient

## AMA/Specialty Society Update Process Practice Expense Summary of Recommendation **Facility Direct Inputs**

**CPT Code / Long Descriptor:**

<b>43211</b>	Esophagoscopy, flexible, transoral; with endoscopic mucosal resection
<b>43213</b>	Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)
<b>43214</b>	Esophagoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)
<b>43212</b>	Esophagoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)
<b>43229</b>	Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)

**Global Period: 000**

**Meeting Date: January 2013**

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The AGA and ASGE convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform these services. The committee served as the consensus panel to develop PE recommendations.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

These are all new services. Reference codes chosen are matched where possible with the similar service for esophagoscopy. All crosswalk reference codes were just reviewed and approved by the PE Subcommittee in October 2012.

Crosswalk Code Data					Survey Code Recommendation			
CPT	Source	Pre	Intra	Post	CPT	Pre	Intra	Post
<b>43217</b>	RUC-12	19	0	3	<b>43211</b>	19	0	3
<b>43220</b>	RUC-12	19	0	3	<b>43213</b>	19	0	3
<b>43220</b>	RUC-12	19	0	3	<b>43214</b>	19	0	3

<b>43228</b>	RUC-12	19	0	3	<b>43229</b>	19	0	3

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**4. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

- Three minutes to complete pre-service diagnostic and referral forms.
- Five minutes to coordinate pre-surgery services with other qualified healthcare providers
- Three minutes for scheduling space and equipment in facility
- Five minutes to perform pre-service education/ obtain consent
- Three minutes for pre-op prescriptions

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

- Three minutes for a follow-up phone call to patient

## AMA/Specialty Society Update Process Practice Expense Summary of Recommendation **Non-Facility Direct Inputs**

**Tab 9 - CPT Code / Long Descriptor:**

<b>43211</b>	N/A NON-FACILITY ONLY
<b>43213</b>	Esophagoscopy, flexible, transoral; with dilation of esophagus, by balloon or dilator, retrograde (includes fluoroscopic guidance, when performed)
<b>43214</b>	N/A NON-FACILITY ONLY
<b>43212</b>	N/A NON-FACILITY ONLY
<b>43229</b>	Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)

Crosswalk Code Data (non-RN*)					Survey Code non-RN* Recommendation			
CPT	Source	Pre	Intra	Post	CPT	Pre	Intra	Post
<b>43220</b>	RUC-12	9	78	3	<b>43213</b>	9	103	3
<b>43228</b>	RUC-12	9	93	3	<b>43229</b>	9	103	3

**\* Note: RN time** will be equal to 2 minutes (standard for sedate apply MS) PLUS 100% physician time for scope-in-scope out PLUS 15 minutes to monitor the patient after scope out during anesthesia reversal

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A – these are new codes.

**4. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

- Three minutes to complete pre-service diagnostic and referral forms.
- Five minutes to coordinate pre-surgery services with other qualified healthcare providers
- Three minutes for pre-op prescriptions

Intra-Service Clinical Labor Activities:

- Three minutes: Greet patient, provide gowning, ensure appropriate medical records are available
- Five minutes: 4-6 vitals
- Three minutes: Provide pre-service education/obtain consent
- Two minutes: Prepare room, equipment, supplies
- Five minutes: Setup scope (non facility setting only)
- Two minutes: Prepare and position patient/ monitor patient/ set up IV
- Minutes vary with procedure – 100% MD time to assist physician in performing procedure
- Three minutes: Clean room/equipment by physician staff
- Thirty minutes: Clean flexible scope
- Two minutes: Complete diagnostic forms, lab & X-ray requisitions
- Three minutes: Check dressings & wound/ home care instructions /coordinate office visits /prescriptions

Post-Service Clinical Labor Activities:

- Three minutes for a follow-up phone call to patient

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*MPC List Screen*

January 2013/April 2013

**Esophagoscopy Gastroscopy Duodenoscopy (EGD)**

Several Esophagogastroduodenoscopy (EGD) codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were necessary to describe current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set. In the Panel Action memo from the October CPT Editorial Panel meeting CPT requested clarifications from the involved specialty societies regarding instructions affecting the EGD codes (43235-43259). A specific request was made for the societies to provide clarification regarding the reporting of reduced service modifiers and an EGD service. After discussions with CPT and RUC staff it was determined that the CPT Editorial Panel's request for clarification will require a material change to codes 43237 and 43238 requiring approval by the CPT Editorial Panel. Therefore, the RUC approved the specialty societies' request to refer these services back to CPT and requested that they be surveyed for presentation at the April 2013 RUC meeting. Additionally, 43246 and 43251 were re-surveyed for April 2013 as the survey median times presented at the January 2013 meeting were anomalous.

After survey of the procedures for April, the specialty societies noted that the EGD with EUS procedures (43237-8, 43240, 43242, 43259 and 43253) are not inherently performed with moderate sedation by the same physician. However, due to CMS' consistent position, at the April meeting and in multiple Medicare Physician Payment Rules, that the Agency is looking for larger bundling of services, not unbundling of services, the moderate sedation for these services will remain bundled. Therefore, the EGD with EUS family of services will remain on Appendix G in the CPT codebook.

Prior to valuing this series of EGD codes, the RUC discussed the difference in survey methodologies between this series and the previously RUC recommended series of esophagoscopy codes in October 2012. The esophagoscopy codes surveyed for the October 2012 RUC meeting were conducted under a mini-survey format in which only the base code 43200 was fully surveyed and the rest of the family was only surveyed for the work value and intra-service time. Given that only one survey existed for pre and post-service times, this resulted in standardized time components. Following the October 2012 meeting, the specialty societies requested and received approval from the Research Subcommittee to fully survey all elements of the codes moving forward. The RUC agreed with the specialty societies that in order to accurately value each procedure, the surveyed times should be used rather than arbitrarily deriving times from a previous survey.

To maintain relativity with this family of services and the esophagoscopy services, the RUC and specialty societies agreed on a standardized set of methodologies to arrive at appropriate work values. The RUC administered three primary methodologies to value these services:

1. If a corresponding esophagoscopy code exists, and the previously billed codes are in the same endoscopic family, the RUC applied the Endoscopy Rule incremental approach.
2. If a corresponding esophagoscopy code exists and the additional codes were part of a different family of endoscopic procedure, the RUC applied the appropriate multiple procedure reduction.
3. If a corresponding esophagoscopy code did NOT exist, either the current value or the survey 25<sup>th</sup> percentile was recommended, whichever was lower.

***43235 Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with collection of specimen(s) by brushing or washing, when performed***

The RUC reviewed the survey results from 315 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 27 minutes, intra-service time= 15 minutes and post-service time= 12 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the survey's estimated work RVU and agreed that respondents overestimated the work value, with a 25<sup>th</sup> percentile (work RVU= 2.59) above the current value. Furthermore, the RUC noted that because the survey's median intra-service time is 5 minutes less compared to the current time, the current work RVU of 2.39 was also overvalued. To determine an appropriate work RVU, the RUC reviewed analogous CPT code 31579 *Laryngoscopy, flexible or rigid fiberoptic, with stroboscopy* (work RVU= 2.26) and agreed that with identical intra-service time, 15 minutes, and similar total time, the two services should have identical work values. Therefore, 43235 should be valued at 2.26 work RVUs. To validate this RVU, the RUC reviewed MPC codes 64479 *Injection(s), anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); cervical or thoracic, single level* (work RVU= 2.29) and 52000 *Cystourethroscopy* (work RVU= 2.23) and agreed that the services, with identical intra-service times, should all be valued similarly. **The RUC recommends a work RVU of 2.26 for CPT code 43235.**

***43236 Esophagogastroduodenoscopy, flexible, transoral; with directed submucosal injection(s), any substance***

The RUC reviewed the survey results from 78 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 27 minutes, intra-service time= 20 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. In addition, since the median intra-service time was less than the current time, the current value of 2.92 was deemed too high as well. Consistent with the previously approved esophagoscopy recommendations in October 2012, the RUC noted that the identical increment between the esophagoscopy

base code, 43200 (recommended work RVU= 1.59), and the submucosal injection code, 43201 (recommended work RVU= 1.90), should be maintained in this family of EGD services. Therefore, the established increment of 0.31 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 2.57 for 43236. To validate a work RVU of 2.57, the RUC compared the surveyed code to CPT code 32556 *Pleural drainage, percutaneous, with insertion of indwelling catheter; without imaging guidance* (work RVU= 2.50) and agreed that with identical intra-service time, 20 minutes, and similar total time, the two services should be valued similarly. Code 43236 was also compared to MPC code 51102 *Aspiration of bladder; with insertion of suprapubic catheter* (work RVU= 2.70) and it was agreed that while both services have identical intra-service time, the reference code is slightly more intense and should therefore be valued higher. **The RUC recommends a work RVU of 2.57 for CPT code 43236.**

***43237 Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination limited to the esophagus***

The RUC reviewed the survey results from 37 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 38 minutes, intra-service time= 35 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the current work value of 3.98 for this procedure is too high. The RUC noted that while the surveyed intra-service time is 10 minutes less than the current time, the previous survey valued this procedure with moderate sedation inherent in the intra-service time. With the subsequent establishment of pre-service time packages, moderate sedation is now considered pre-service time. Removing 10 minutes of intra-service time, accounting for the moderate sedation, from the previous survey, provides a reasonable comparison to the new survey, and suggests that the recommended intra-service time of 35 minutes is accurate. The RUC agreed with the specialty societies that the survey 25<sup>th</sup> percentile work RVU of 3.85 accurately reflects the physician work involved in 43237. To validate this work value, the RUC compared the surveyed code to the key reference service 31625 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with bronchial or endobronchial biopsy(s), single or multiple sites* (work RVU= 3.36) and noted that 43237 should be valued higher due to greater intra-service time compared to the reference code, 35 minutes and 30 minutes, respectively. In addition, the RUC reviewed CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) and agreed while 43237 has 5 additional minutes of intra-service time, the reference code is more intense and should be valued higher. **The RUC recommends a work RVU of 3.85 for CPT code 43237.**

***43238 Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s), esophagus (includes endoscopic ultrasound examination limited to the esophagus)***

The RUC reviewed the survey results from 33 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 38 minutes, intra-service time= 45 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the current work value of 5.02 for this procedure is too high. The RUC noted that while the surveyed intra-service time is less than the current time, the previous survey valued this procedure with moderate sedation inherent in the intra-service time. With the subsequent establishment of pre-service time packages, moderate sedation is now considered pre-service time. However, even removing intra-service time, accounting for the moderate sedation, from the previous survey, the survey intra-service time of 45 minutes is still lower. Therefore, the RUC agreed with the specialty societies that the survey 25<sup>th</sup> percentile work RVU of 4.50 accurately values the physician work of 43238. To justify this work value, the RUC compared the surveyed code to the key reference service 31638 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)* (work RVU= 4.88, intra time= 60 minutes) and agreed that while 43238 has less intra-service time compared to the reference code, the survey respondents indicated the EGD code is a more intense procedure. Given this, the RUC agreed that the recommended value, 4.50, slightly less than the reference code, is appropriate. The RUC also reviewed CPT code 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58) and agreed that since both codes have identical intra-service time, the codes should be valued similarly. **The RUC recommends a work RVU of 4.50 for CPT code 43238.**

#### **43239 Esophagogastroduodenoscopy, flexible, transoral; with biopsy, single or multiple**

The RUC reviewed the survey results from 310 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 27 minutes, intra-service time= 15 minutes and post-service time= 12 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, it was also agreed upon that the current work RVU of 2.87 was too high. Consistent with the previously approved esophagoscopy recommendations in October 2012, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (recommended work RVU= 1.59), and the biopsy code, 43202 (recommended work RVU= 1.89), should be maintained in this family of EGD services. Therefore, the established increment of 0.30 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 2.56 for 43239. To validate a work RVU of 2.56, the RUC compared the surveyed code to MPC code 36556 *Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older* (work RVU= 2.50) and CPT code 55700 *Biopsy, prostate; needle or punch, single or multiple, any approach* (work RVU= 2.58) and determined that with identical intra-service time, 15 minutes, the recommended work value is relative to other similar reference codes in the RBRVS. Finally, the RUC compared 43239 to 43236 and agreed that while the intra-service times are slightly different, the work values should be almost identical to maintain relativity within the family of EGD and esophagoscopy codes. **The RUC recommends a work RVU of 2.56 for CPT code 43239.**

**43240 Esophagogastroduodenoscopy, flexible, transoral; with transmural drainage of pseudocyst (includes placement of transmural drainage catheter[s]/stent[s], when performed, and endoscopic ultrasound, when performed)**

The RUC reviewed the survey results from 33 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 70 minutes and post-service time= 30 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

Prior to valuing this procedure, the specialty societies presented compelling evidence that the current work value of 6.85 for CPT code 43240 may be misvalued. First, there has been a change in technique and patient population since the last valuation. When this service was last valued by the RUC in 2000, the standard method for pancreatic pseudocyst marsupialization was surgical cyst-enterostomy. Endoscopic drainage was utilized primarily for the simpler cases. Management of pancreatic pseudocysts has evolved over the past decade: today endoscopic drainage is the standard first line therapy, with surgical drainage largely reserved for those who have failed endoscopic treatment or are not candidates. Finally, new treatment guidelines by the GI endoscopy authorities, based on recent natural history data, now recommend non-drainage treatment of simple unilocular pseudocysts in healthy asymptomatic patients. Thus, those patients who typically had endoscopic drainage in 2000 are now rarely drained at all, while the sicker patients with more complex and technically demanding pseudocysts previously treated surgically are currently being managed with endoscopic therapy. Secondly, flawed assumptions were used in the previous valuation. The RUC originally valued this procedure based off a crosswalk to an endoscopic code outside the EGD family CPT code 43262 *Endoscopic retrograde cholangio-pancreatography (ERCP); with sphincterotomy/papilotomy*, which was Harvard valued at the time. Furthermore, this comparison for 43240 was derived from survey data from only 6 respondents, for what was then a new procedure. Given these arguments, the RUC accepted that there is compelling evidence that this procedure is currently misvalued.

The RUC agreed with the specialty society that the survey 25<sup>th</sup> percentile work RVU of 7.25, slightly above the current work value of 6.85, is appropriate. To justify this value, the RUC compared the surveyed code to CPT code 20555 *Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)* (work RVU= 6.00) and agreed that while both services have identical intra-service time, 70 minutes, 43240 is a more intense procedure and should be valued higher than the reference code. The RUC also reviewed CPT code 31276 *Nasal/sinus endoscopy, surgical with frontal sinus exploration, with or without removal of tissue from frontal sinus* (work RVU= 8.84) and agreed since the reference code has 5 minutes more intra-service time, the recommended work RVU is appropriately valued less than this reference code. Finally, the RUC reviewed the incremental approach to ensure the recommendation is relative to other codes in the family. The RUC noted that 43240 contains the work of an upper diagnostic endoscopy with fine needle aspiration (CPT code 43242, RUC recommended work RVU= 5.39) and the approved incremental value of 2.14 for placement of an endoscopic stent. Added together, the resultant work value of 7.53 is comparable to the recommended value. **The RUC recommends a work RVU of 7.25 for CPT code 43240.**

***43241 Esophagogastroduodenoscopy, flexible, transoral; with insertion of intraluminal tube, or catheter***

The RUC reviewed the survey results from 39 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 33 minutes, intra-service time= 30 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents greatly overestimated the value of this code, with a 25<sup>th</sup> percentile value of 3.50. The RUC noted that since there is no equivalent esophagoscopy code to compare, the current work RVU of 2.59 is appropriate. The RUC compared the surveyed code to CPT code 52005 *Cystourethroscopy, with ureteral catheterization, with or without irrigation, instillation, or ureteropyelography, exclusive of radiologic service* (work RVU= 2.37) and agreed that while both codes have identical intra-service time, 30 minutes, and nearly identical total time, 43241 is a more intense procedure and should be valued slightly higher. Additionally, the RUC reviewed CPT code 57156 *Insertion of a vaginal radiation afterloading apparatus for clinical brachytherapy* (work RVU= 2.69) and agreed that since both this code and the surveyed code have identical intra-service time and comparable physician work, the recommended value for 43241 is appropriate. **The RUC recommends a work RVU of 2.59 for CPT code 43241.**

***43242 Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)***

The RUC reviewed the survey results from 36 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 50 minutes and post-service time= 23 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, it was also agreed that the current work RVU of 7.30 was too high. Consistent with recently RUC reviewed fine needle aspiration recommendations, the RUC noted that the identical increment between the fine needle aspiration code, 43238 (RUC recommended work RVU= 4.50), and the endoscopic ultrasound (limited to esophagus) code, 43237 (RUC recommended work RVU= 3.85), should be maintained in this family of EGD services. Therefore, the established increment of 0.65 work RVUs was added to the base EGD with endoscopic ultrasound code, 43259 (recommended work RVU= 4.74), for a recommended work RVU of 5.39 for 43242. To justify this value, the RUC compared the surveyed code to CPT codes 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when*

*performed; unilateral* (work RVU= 5.35, intra time= 45 minutes) and code 52282 *Cystourethroscopy, with insertion of permanent urethral stent* (work RVU= 6.39, intra time= 50 minutes) and noted that both reference codes have almost identical physician time components as the surveyed code and comparable physician work. Therefore, the RUC agreed that the recommended work value of 5.39 for 43242 is accurately valued between these two reference codes. **The RUC recommends a work RVU of 5.39 for CPT code 43242.**

**43243 *Esophagogastroduodenoscopy, flexible, transoral; with injection sclerosis of esophageal / gastric varices***

The RUC reviewed the survey results from 58 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC agreed with the specialty societies that the current work RVU of 4.56 was too high relative to the RUC recommendations in this family of services. Since no equivalent esophagoscopy code exists to compare, the survey's 25<sup>th</sup> percentile work RVU of 4.37 was deemed appropriate. To validate this recommended work value, the RUC compared the surveyed code to CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) and agreed since the two services have identical intra-service time, 30 minutes, both should be valued analogously. In addition, CPT code 52234 *Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of; SMALL bladder tumor(s) (0.5 up to 2.0 cm)* (work RVU= 4.62, intra time= 30 minutes) was compared to 43243 and the RUC agreed that the reference code should be valued slightly higher than the surveyed code due to greater intensity and complexity. **The RUC recommends a work RVU of 4.37 for CPT code 43243.**

**43244 *Esophagogastroduodenoscopy, flexible, transoral; with band ligation of esophageal / gastric varices***

The RUC reviewed the survey results from 69 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC agreed with the specialty societies that the current work RVU of 5.04 was too high relative to the RUC recommendations in this family of services. Since no equivalent esophagoscopy code exists to compare, the survey's 25<sup>th</sup> percentile work RVU of 4.50 was deemed appropriate. To validate this recommended work value, the RUC compared the surveyed code to CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) and agreed that while the two services have identical intra-service time, 30 minutes, 43244 should be valued higher as it is a more intense service. In addition, the RUC reviewed CPT code 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging*

*guidance (ultrasound and fluoroscopy), when performed* (work RVU= 4.71) and noted that the two services, with identical intra-service time and analogous total time, should be valued similarly. Finally, the RUC compared 43244 to 43243 and agreed that while both codes have identical physician time, 43244 is a more intense procedure and is accurately valued slightly higher than 43243. **The RUC recommends a work RVU of 4.50 for CPT code 43244.**

***43245 Esophagogastroduodenoscopy, flexible, transoral; with dilation of gastric / duodenal stricture(s) (eg, balloon, bougie)***

The RUC reviewed the survey results from 56 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 33 minutes, intra-service time= 23 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code, with a 25<sup>th</sup> percentile value of 3.58. The RUC noted that since there is no equivalent esophagoscopy code to compare, the current work RVU of 3.18 is appropriate. The RUC compared the surveyed code to CPT code 58555 *Hysteroscopy, diagnostic* (work RVU= 3.33) and agreed that the reference code, with slightly greater intra-service time compared to the surveyed code, 25 minutes and 23 minutes, respectively, should be valued higher. Additionally, CPT code 43245 was compared to CPT code 52287 *Cystourethroscopy, with injection(s) for chemodenervation of the bladder* (work RVU= 3.20) and it was agreed that while the surveyed code has two additional minutes of intra-service time, both services should be valued similarly. **The RUC recommends a work RVU of 3.18 for CPT code 43245.**

***43246 Esophagogastroduodenoscopy, flexible, transoral; with directed placement of percutaneous gastrostomy tube***

The RUC reviewed the survey results from 57 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

Prior to valuing this service, the RUC noted that this service was previously surveyed for the January 2013 meeting. The RUC and specialty societies agreed that the survey median intra-service time of 23 minutes grossly underestimated the time it takes to perform this procedure. The RUC agreed with the specialty societies that the surveyed intra-service time of 30 minutes for this meeting is a much better representation of the physician work for this procedure for two reasons. First, during the last valuation of this service, in 2005, the RUC approved imputed intra-service time, 38 minutes, greater than the median time from the survey, 30 minutes. Second, since moderate sedation was included as intra-service time during the previous valuation, and is now included as pre-service time, reducing the current time by 10 minutes, to 28 minutes, provides a comparison that matches up well with the surveyed time of 30 minutes. Given this, the RUC agreed with the specialty societies that the physician work has not changed and the current work RVU of 4.32 is appropriate for 43246. To justify this value, the RUC compared the surveyed code to CPT codes 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17, intra time= 30 minutes) and 37191 *Insertion of intravascular vena cava filter*,

*endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU= 4.71, intra time= 30 minutes) and noted that both reference codes have identical physician time components as the surveyed code and comparable physician work. Therefore, the RUC agreed that the recommended work value of 4.32 for 43246 is accurately valued between these two reference codes. **The RUC recommends a work RVU of 4.32 for CPT code 43246.**

***43247 Esophagogastroduodenoscopy, flexible, transoral; with removal of foreign body***

The RUC reviewed the survey results from 68 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 23 minutes, intra-service time= 30 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, it was also agreed upon that the current work RVU of 3.38 was too high. Consistent with the previously approved esophagoscopy recommendations in October 2012, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (recommended work RVU= 1.59), and the removal of foreign body code, 43215 (recommended work RVU= 2.60), should be maintained in this family of EGD services. Therefore, the established increment of 1.01 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 3.27 for 43247. To validate a work RVU of 3.27, the RUC compared the surveyed code to 36200 *Introduction of catheter, aorta* (work RVU= 3.02) and agreed that while both services have identical intra-service time, 30 minutes, the surveyed code should be valued higher due to greater intensity and complexity. Additionally, the RUC reviewed CPT code 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU= 3.30) and agreed that with identical times and analogous intensity, this reference code and 43247 should be valued similarly. **The RUC recommends and work RVU of 3.27 for CPT code 43247.**

***43248 Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire***

The RUC reviewed the survey results from 50 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 27 minutes, intra-service time= 20 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, it was also agreed upon the current work RVU of 3.15 was too high. Consistent with the previously approved esophagoscopy recommendations in October 2012, the RUC noted that the identical increment between the esophagoscopy base

code, 43200 (recommended work RVU= 1.59), and the insertion of guide wire with dilation code, 43226 (recommended work RVU= 2.34), should be maintained in this family of EGD services. Therefore, the established increment of 0.75 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 3.01 for 43248. To validate a work RVU of 3.01, the RUC compared the surveyed code to 31295 *Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa* (work RVU= 2.70) and agreed that while the two services have identical intra-service time, 20 minutes, the surveyed code should be valued higher, as it is a more intense procedure. In addition, the RUC reviewed CPT code 32551 *Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open* (work RVU= 3.29) and agreed that while this reference code has the same intra-service time as the surveyed code, the reference code has greater total time and should thus be valued higher. **The RUC recommends a work RVU of 3.01 for CPT code 43248.**

**43249 Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic balloon dilation of esophagus (less than 30 mm diameter)**

The RUC reviewed the survey results from 56 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 27 minutes, intra-service time= 20 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, it was also agreed upon the current work RVU of 2.90 was too high. Consistent with the previously approved esophagoscopy recommendations in October 2012, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (recommended work RVU= 1.59), and the balloon dilation code, 43220 (recommended work RVU= 2.10), should be maintained in this family of EGD services. Therefore, the established increment of 0.51 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 2.77 for 43249. To validate a work RVU of 2.77, the RUC compared the surveyed code to 31295 *Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa* (work RVU= 2.70) and agreed that with identical intra-service time, 20 minutes, and analogous intensity and complexity, the two services should be valued similarly. In addition, the RUC also reviewed CPT code 32551 *Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open* (work RVU= 3.29) and agreed that while this reference code and the surveyed code have identical intra-service time, the reference code has greater total time, 83 minutes compared to 62 minutes, and should be valued higher. Finally, the RUC compared this service to 43248 and noted that while both services have identical physician time components, 43249 is appropriately valued lower than 43248, as it is a less intense procedure. **The RUC recommends a work RVU of 2.77 for CPT code 43249.**

***43233 Esophagogastroduodenoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)***

The RUC reviewed the survey results from 35 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 38 minutes, intra-service time= 30 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work value from the survey for this new code and agreed with the specialty societies that the 25<sup>th</sup> percentile work RVU of 4.45 accurately values this service. To validate this work value, the RUC compared the surveyed code to CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) and noted that while both codes have identical intra-service time, 30 minutes, the surveyed code should be valued higher because it is a more intense and complex to perform. The RUC also reviewed CPT code 93452 *Left heart catheterization including intraprocedural injection(s) for left ventriculography, imaging supervision and interpretation, when performed* (work RVU= 4.75) and agreed that since the reference code has greater total time compared to 43233, 108 minutes and 88 minutes, respectively, it is appropriately valued higher. **The RUC recommends a work RVU of 4.45 for CPT code 43233.**

***43250 Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery***

The RUC reviewed the survey results from 59 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 24 minutes, intra-service time= 20 minutes and post-service time= 14 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, it was also agreed upon the current work RVU of 3.20 was too high. Consistent with the previously approved esophagoscopy recommendations in October 2012, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (recommended work RVU= 1.59), and the removal of tumor by biopsy forceps code, 43216 (recommended work RVU= 2.40), should be maintained in this family of EGD services. Therefore, the established increment of 0.81 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 3.07 for 43250. To validate a work RVU of 3.07, the RUC compared the surveyed code to 31295 *Nasal/sinus endoscopy, surgical; with dilation of maxillary sinus ostium (eg, balloon dilation), transnasal or via canine fossa* (work RVU= 2.70) and agreed that while the two service have identical intra-service time, 20 minutes, the surveyed code should be valued higher, as it is a more intense procedure. In addition, the RUC reviewed CPT code 32551 *Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open* (work RVU= 3.29) and agreed that while this reference code has the same intra-service time as the surveyed code, the

reference code has greater total time and should thus be valued higher. Finally, the RUC reviewed 43250 in comparison to 43248 and 43249 and agreed that all three codes have identical intra-service time and are appropriately valued similarly. **The RUC recommends a work RVU of 3.07 for CPT code 43250.**

***43251 Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique***

The RUC reviewed the survey results from 39 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 33 minutes, intra-service time= 20 minutes and post-service time= 10 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

Prior to valuing this service, the RUC noted that this service was previously surveyed for the January 2013 meeting. The RUC and specialty societies agreed that the survey median intra-service time of 20 minutes grossly underestimated the time it takes to perform this procedure. A five minute time differential between the base code 43235, 15 minutes, and 43251, 20 minutes, does not accurately account for the additional work in removing a lesion by snare technique. The specialty societies resurveyed code 43251 and the RUC reviewed the survey results in April 2013, . The RUC noted that the median intra-service time was 20 minutes. The RUC remains convinced that the time is anomalous, especially considering that the analogous code for esophageal snare polypectomy, 43217, has an incremental intra-service time above the base code 43200, both surveyed in 2012, of 15 minutes.

Following discussion of the survey time data, the RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. Consistent with the recently approved esophagoscopy removal of lesion by snare technique recommendations, the RUC noted that the identical increment between the removal of lesion by snare technique code, 43217 (RUC recommended work RVU= 2.90), and the base esophagoscopy code, 43200 (RUC recommended work RVU= 1.59), should be maintained in this family of EGD services. Therefore, the established increment of 1.31 work RVUs was added to the base diagnostic EGD code, 43235 (RUC recommended work RVU= 2.26), for a recommended work RVU of 3.57 for 43251. This recommendation is lower than the current value. To justify this value, the RUC compared the surveyed code to CPT 32551 *Tube thoracostomy, includes connection to drainage system (eg, water seal), when performed, open (separate procedure)* (work RVU= 3.29) and noted that while both services have identical intra-service time, 20 minutes, 43251 is a more intense procedure and should be valued higher. Additionally, the RUC reviewed CPT code 16035 *Escharotomy; initial incision* (work RVU= 3.74, intra time= 20 minutes) and agreed that since the reference code has greater total time compared to 43251, 70 minutes and 63 minutes, respectively, it is appropriately valued slightly higher than the surveyed code. **The RUC recommends a work RVU of 3.57 for CPT code 43251.**

***43252 Esophagogastroduodenoscopy, flexible, transoral; with optical endomicroscopy***

The RUC reviewed the survey results from 26 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 27 minutes, intra-service time= 30 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code. To ensure relativity within the family of services, the RUC compared this new service to the newly created esophagoscopy optical endomicroscopy code 43206. To ensure consistency, the RUC maintained the identical increment between the esophagoscopy base code, 43200 (recommended work RVU= 1.59), and the optical endomicroscopy code, 43206 (recommended work RVU= 2.39). Therefore, the established increment of 0.80 work RVUs was added to the base EGD diagnostic code, 43235 (recommended work RVU= 2.26), for a recommended work RVU of 3.07 for 43250. To validate a work RVU of 3.06, the RUC compared the surveyed code to 36200 *Introduction of catheter, aorta* (work RVU= 3.02) and agreed that since both codes have identical intra-service time, 30 minutes, and comparable physician work, the two services should be valued similarly. In addition, the RUC reviewed CPT code 50386 *Removal (via snare/capture) of internally dwelling ureteral stent via transurethral approach, without use of cystoscopy, including radiological supervision and interpretation* (work RVU= 3.30) and noted that while the two services have identical intra-service time, the reference code has greater total time compared to the surveyed code, 90 minutes and 77 minutes, respectively. Therefore, the 43252 is appropriately valued less than 50386. **The RUC recommends and work RVU of 3.06 for CPT code 43252.**

***43253 Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided transmural injection of diagnostic or therapeutic substance(s) (eg, anesthetic, neurolytic agent) or fiducial marker(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)***

The RUC reviewed the survey results from 34 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 40 minutes and post-service time= 23 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code at the median level. Consistent with the recently approved EGD fine needle aspiration recommendations, the RUC noted that the identical increment between the fine needle aspiration code, 43238 (RUC recommended work RVU= 4.50), and the endoscopic ultrasound (limited to esophagus) code, 43237 (RUC recommended work RVU= 3.85), should be maintained in this family of EGD services. Therefore, the established increment of 0.65 work RVUs was added to the base EGD with endoscopic ultrasound code, 43259 (RUC recommended work RVU= 4.74), for a recommended work RVU of 5.39 for 43253, lower than the survey median work RVU (5.77). To justify a work RVU of 5.39, the RUC compared the surveyed code to CPT codes 52315 *Cystourethroscopy, with removal of foreign body, calculus, or ureteral stent from urethra or bladder (separate procedure); complicated* (work RVU= 5.20, intra time= 45 minutes) and 36222 *Selective catheter placement, common carotid or innominate artery, unilateral,*

*any approach, with angiography of the ipsilateral extracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the cervicocerebral arch, when performed* (work RVU= 5.53, intra time= 40 minutes) and noted that both reference codes have similar intra-service and total time compared to the surveyed code. Therefore, the RUC agreed that a work value of 5.39 for 43253 accurately places this service between these two reference codes. **The RUC recommends a work RVU of 5.39 for CPT code 43253.**

***43254 Esophagogastroduodenoscopy, flexible, transoral; with endoscopic mucosal resection***

The RUC reviewed the survey results from 43 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 38 minutes, intra-service time= 45 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work value from the survey and agreed with the specialty societies that the 25<sup>th</sup> percentile work RVU of 5.25 accurately values this service. To validate this work value, the RUC noted that this service contains three additional services from the base code: removal of lesion by snare, band ligation, and submucosal injection. The consistent increment approach was applied to sum the incremental differences between the equivalent esophagoscopy codes and the base code, 43200 (recommended work RVU= 1.59): 43217 (recommended work RVU= 2.90), increment difference= 1.31; 43205 (recommended work RVU= 3.00), incremental difference= 1.41; and 43201 (recommended work RVU= 1.90), incremental difference= 0.31). Adding the work RVU differences, 3.03, to the base EGD code 43235 (recommended work RVU= 2.26) arrives at a work RVU of 5.29, slightly higher than the recommended work value of 5.25. The RUC compared the surveyed code to CPT code 52315 *Cystourethroscopy, with removal of foreign body, calculus, or ureteral stent from urethra or bladder (separate procedure); complicated* (work RVU= 5.20) and agreed that since these two codes have identical intra-service time, 45 minutes, and comparable physician work, they should be valued similarly. Finally, the RUC reviewed CPT code 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU= 5.35) and noted that while both services have identical intra-service time, the reference code has greater total time compared to 43254, 116 minutes and 103 minutes, respectively. Therefore, the reference code is accurately valued higher than the surveyed code. **The RUC recommends a work RVU of 5.25 for CPT code 43254.**

***43255 Esophagogastroduodenoscopy, flexible, transoral; with control of bleeding, any method***

The RUC reviewed the survey results from 82 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 30 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC agreed with the specialty societies that the current work RVU of 4.81 was too high relative to the RUC recommendations in this family of services. Since no equivalent esophagoscopy code exists to compare, the survey's 25<sup>th</sup> percentile work RVU of 4.20 was deemed appropriate. To validate this recommended work value, the RUC compared the surveyed code to CPT code 32550 *Insertion of indwelling tunneled pleural catheter with cuff* (work RVU= 4.17) and agreed that since both codes have identical intra-service time (30 minutes), and analogous total time, the two services should be valued similarly. Additionally, the RUC reviewed CPT code 37191 *Insertion of intravascular vena cava filter, endovascular approach including vascular access, vessel selection, and radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance (ultrasound and fluoroscopy), when performed* (work RVU= 4.71) and noted that while the reference code has identical intra-service time compared to 43255, 37191 should be valued greater because it is a more intense and complex service. **The RUC recommends a work RVU of 4.20 for CPT code 43255.**

***43266 Esophagogastroduodenoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)***

The RUC reviewed the survey results from 51 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 40 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work value from the survey for this new code and agreed with the specialty societies that the 25<sup>th</sup> percentile work RVU of 4.40 accurately values this service. To validate this work value, the RUC compared the surveyed code to CPT code 49418 *Insertion of tunneled intraperitoneal catheter (eg, dialysis, intraperitoneal chemotherapy instillation, management of ascites), complete procedure, including imaging guidance, catheter placement, contrast injection when performed, and radiological supervision and interpretation, percutaneous* (work RVU= 4.21) and noted that since both codes have identical intra-service time, 40 minutes, and analogous physician work, the two services should be valued similarly. The RUC also reviewed CPT code 58558 *Hysteroscopy, surgical; with sampling (biopsy) of endometrium and/or polypectomy, with or without D & C* (work RVU= 4.74) and agreed that the reference code should be valued higher since it is a more intense procedure than 43266. Finally, the RUC compared 43266 to 43233 (recommended work RVU= 4.45) and agreed that while 43266 has 10 minutes more intra-service time, placement of an endoscopic stent is a more intense procedure than balloon dilation of the esophagus, therefore, both services should be valued similarly. **The RUC recommends a work RVU of 4.40 for CPT code 43266.**

***43257 Esophagogastroduodenoscopy, flexible, transoral; with delivery of thermal energy to the muscle of lower esophageal sphincter and/or gastric cardia, for treatment of gastroesophageal reflux disease***

The RUC reviewed the survey results from 25 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 45 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC agreed with the specialty societies that the current work RVU of 5.50 was too high relative to the RUC recommendations in this family of services. Since no equivalent esophagoscopy code exists to compare, the survey's 25<sup>th</sup> percentile work RVU of 4.25 was deemed appropriate. To validate this recommended work value, the RUC compared the surveyed code to CPT code 31648 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with removal of bronchial valve(s), initial lobe* (work RVU= 4.20) and agreed that since both services have identical intra-service time, 45 minutes, and analogous intensity, they should both be valued similarly. The RUC also reviewed CPT code 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58) and noted that while both services have identical intra-service time, the reference code has much greater total time compared to the surveyed code and should thus be valued higher. **The RUC recommends a work RVU of 4.25 for CPT code 43257.**

***43270 Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)***

The RUC reviewed the survey results from 49 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 45 minutes and post-service time= 15 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work value from the survey for this new code and agreed with the specialty societies that the 25<sup>th</sup> percentile work RVU of 4.39 accurately values this service. To validate this work value, the RUC compared the surveyed code to CPT code 11044 *Debridement, bone (includes epidermis, dermis, subcutaneous tissue, muscle and/or fascia, if performed); first 20 sq cm or less* (work RVU= 4.10) and agreed that while both codes have identical intra-service time, 45 minutes, 43270 is a more intense and complex service and should be valued higher than the reference code. The RUC also reviewed CPT code 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58) and noted that with greater total time compared to the surveyed code, 123 minutes and 101 minutes, respectively, the reference code is accurately valued higher than 43270. **The RUC recommends a work RVU of 4.39 for CPT code 43270.**

***43259 Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)***

The RUC reviewed the survey results from 36 gastroenterologists and gastrointestinal and endoscopic surgeons and recommends the following physician time components: pre-service time= 41 minutes, intra-service time= 45 minutes and post-service time= 20 minutes. The RUC agreed that two additional minutes of pre-service time above the standard was warranted to position the patient, endoscopy equipment/monitor and anesthesia lines/equipment prior to induction of moderate sedation.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents overestimated the value of this code at the median level, a work RVU of 5.45. The RUC also noted that the surveyed intra-service time is lower than the current time of 69 minutes. However, since moderate sedation was included as intra-service time during the previous valuation, and is now included as pre-service time, reducing the current time by 10 minutes, to 59 minutes, provides a comparison between the surveys. Considering the surveyed time is still lower, the RUC agreed with the specialty societies that the current work RVU of 5.19 is too high and accepted the survey 25<sup>th</sup> percentile work RVU of 4.74. To justify this value, the RUC compared the surveyed code to CPT codes 20902 *Bone graft, any donor area; major or large* (work RVU= 4.58, intra time= 45 minutes) and 36251 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; unilateral* (work RVU= 5.35, intra time= 45 minutes) and noted that both reference codes have identical intra-service time as the surveyed code. Therefore, the RUC agreed that the current work value of 4.74 for 43259 is accurately valued between these two reference codes. Finally, the specialty societies explained that 43259 needs to be valued greater than 43237 *EGD with EUS limited to the esophagus* (RUC recommended work RVU= 3.85) because there is more to examine (stomach and either duodenum or surgically altered stomach) in the surveyed code. **The RUC recommends a work RVU of 4.74 for CPT code 43259.**

#### **Practice Expense:**

The practice expense for these services was a direct crosswalk to the approved practice expense for the related esophagoscopy codes approved at the October 2012 RUC meeting. At the January 2013 RUC meeting the Practice Expense Subcommittee recommended and the RUC approved the following changes to the practice expense for esophagogastroduodenoscopy and the specialty requests that the changes be applied to the esophagoscopy codes that were previously approved at the October 2012 RUC meeting.

- Addition of 3 minutes to “Prepare room, equipment, supplies” (L037D) for code 43252 (*Esophagogastroduodenoscopy; with optical endomicroscopy*) for the technician to turn on the optical endomicroscope processor unit system added to its esophagoscopy counterpart, 43206 (*Esophagoscopy, flexible, transoral; with optical endomicroscopy*)
- At the last meeting the Practice Expense Subcommittee used equipment practice expense input EQ322 *Radiofrequency generator (Angiodynamics), liver RFA* as a proxy. The specialty will identify a more appropriate RF ablation system for 43270 (*Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)*) and provide an invoice for this equipment. It should also be added to its esophagoscopy counterpart 4320X5 (*Esophagoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)*) which replaced 43228
- Addition of “Instrument pack basic (\$500 - \$1,499)” (EQ137) for 43248 (*Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire*) added to its esophagoscopy counterpart 43226 (*Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire*)

- Addition of “Pack, cleaning, surgical instruments” (SA043) for 43248 (*Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire*) for cleaning the dilators added to its counterpart 43226 (*Esophagoscopy, flexible, transoral; with insertion of guide wire followed by dilation over guide wire*)

In April 2013, the RUC recommended the direct practice expense inputs for CPT codes 43237-8, 43240, 43242, 43259 and 43253 and submitted by the specialty societies and approved by the Practice Expense Subcommittee.

#### Work Neutrality:

The RUC’s recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

#### RUC Database Flag:

The RUC agreed that the low IWPOT for CPT code 43241 was anomalous in comparison to the entire family of EGD services. Additionally, the RUC agreed that CPT code 43251 has anomalous intra-service time. A 5 minute time differential between the base code 43235, 15 minutes, and 43251, 20 minutes, does not accurately account for the additional work in removing a lesion by snare technique. Therefore, a flag will be added to the database to indicate that these codes should not be used for valuation comparisons.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
		<p><u>(For examination of the esophagus from the cricopharyngeus muscle [upper esophageal sphincter] to and including the gastroesophageal junction, including examination of the proximal region of the stomach via retroflexion when performed, see 43197, 43198, 43200, 43201, 43202, 43204, 43205, 43206, 43211, 43213, 43214, 43212, 43229, 43215, 43216, 43217, 43212, 43220, 43226, 43227, 43231, 43232)</u></p> <p><u>(Use 43235, 43236, 43237, 43238, 43239, 43253, 43233, 43266, 43270 for examination of a surgically altered stomach where the jejunum is examined distal to the anastomosis [eg, gastric bypass, gastroenterostomy {Billroth II}])</u></p> <p><u>(To report esophagogastrosocopy where the duodenum is deliberately not examined (eg judged clinically not pertinent), or because significant situations preclude such exam (eg significant gastric retention precludes safe exam of duodenum), append modifier 52 if repeat examination is not planned, or modifier 53 if repeat examination is planned.)</u></p>		

◎ ▲ 43235	I1	<del>Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate</del> Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with <del>or without</del> collection of specimen(s) by brushing or washing, <u>when performed (separate procedure)</u>	000	2.26
◎ ▲ 43236	I2	with directed submucosal injection(s), any substance (For injection sclerosis of esophageal and/or gastric varices, use 43243) <u>(Do not report 43236 in conjunction with 43254, 43243, 43255)</u>	000	2.57
◎ ▲ 43237	I3	with endoscopic ultrasound examination limited to the esophagus <u>(Do not report 43237 in conjunction with 76942, 76975)</u>	000	3.85
◎ ▲ 43238	I4	with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s), esophagus (includes endoscopic ultrasound examination limited to the esophagus) <u>(Do not report 43238 in conjunction with 43237, 76942, <del>or</del> 76975)</u>	000	4.50
◎ ▲ 43239	I5	with biopsy, single or multiple	000	2.56
◎ ▲ 43240	I6	with transmural drainage of pseudocyst <u>(includes placement of transmural drainage catheter[s]/stent[s], when performed, and endoscopic ultrasound, when performed)</u> <u>(Do not report 43240 in conjunction with 43242, 43266, 43259)</u> <u>(For endoscopic pancreatic necrosectomy, use 48999)</u>	000	7.25

SUMMARY OF RECOMMENDATION**

CPT Code: 43235	Tracking Number II	Original Specialty Recommended RVU: <b>2.39</b>
		Presented Recommended RVU: <b>2.39</b>
Global Period: 000		RUC Recommended RVU: <b>2.26</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with collection of specimen(s) by brushing or washing, when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 67-year-old patient with dyspepsia and weight loss refractory to pharmacological therapy is referred for diagnostic esophagogastroduodenoscopy and collection of specimens by brushings.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 81%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 67%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are

obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

RUC Meeting Date (mm/yyyy)		01/2013				
Presenter(s):	Drs. Brill, Nickl, Bentley, and Selzer					
Specialty(s):	AGA, ASGE, SAGES					
CPT Code:	43235					
Sample Size:	7554	Resp N:	315	Response: 4.1 %		
Description of Sample:	The AGA and ASGE conducted an enhanced random sample of member gastroenterologists as approved by the Research Subcommittee. The methodology consisted of a random sample with the addition of an expert panel consisting of physicians from industry, members of ASGE Special Interest Groups (SIG) who perform specific procedures (e.g. endoscopic ultrasound, optical endomicroscopy, stent placement, etc.) and survey volunteers who responded to educational articles and identified themselves as performers of therapeutic endoscopic services. SAGES conducted a random sample of their members.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43235 – Discussion and Recommendation

Code 43235 *Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with collection of specimen(s) by brushing or washing, when performed* was identified through the MPC List / CMS High Expenditure screens. This service has been reviewed by the RUC four times, most recently in 2005 during the third 5YR. The AGA, ASGE, and SAGES conducted a RUC survey and received 315 responses. The consensus panel agrees that physician work for this service has not changed since the prior RUC review in 2005. The survey intra-time is consistent with the prior review after the shift in reporting moderate sedation from intra-service to pre-service is considered.

**We recommend maintaining the current RVW of 2.39.** This value is less than the survey 25<sup>th</sup> percentile and maintains the base code increment established by Harvard and maintained by the RUC and CMS.

**Pre-time Package 1b** is appropriate for 43235, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31622

Key Reference code 31622 was surveyed and presented to the RUC in 2005 prior to the discussion of pre-time packages and moderate sedation work. The RUC did not accept the specialty survey results and recommendations and did not accept the survey pre-time. In addition, the intra-service work description includes initiation of moderate sedation. Noting that none of the 106+ endoscopy codes being surveyed during 2012-2014 could be included on the RSL, while code 31622 may not be a good comparator to 43235, it was likely chosen by survey respondents because of the similarity in service description.

### Comparison to Esophagoscopy Base Code 43200

*Estimating time in 5 minute increments.* As discussed in the compelling evidence, respondents for the EGD surveys reported intra-time in increments of 5 minutes. The median of 15 minutes for both 43200 and 43235 masks slight differences of +/- a few minutes that would be shown using time and motion studies.

*Establishment of base code increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between the base codes were key to developing values for each
