family. In 1992, the Harvard-based RVW for 43200 (esophagoscopy base) was 1.68 and the Harvard-based RVW for 43235 (EGD base) was 2.52. This resulted in an RVW increment of 0.84. In 1995, the RUC reviewed both 43200 and 43235 and recommended maintaining the current RVW for each code (1.59 and 2.39, respectively). These RVWs were less than the 1992 values due to budget neutrality RVW adjustments that CMS made to all codes in the early years of the fee schedule. In 2005, the RUC reviewed 43235 and determined there was no change in work and recommended maintaining the current RVW of 2.39, which also maintain the incremental RVW difference in work of 0.80 between 43200 and 43235. In 2012, the RUC reviewed 43200 and determined there was no change in work and recommended maintaining the current RVW of 1.59.

*Physician work relates to both time and intensity/complexity.* Total physician work is not dependent solely on time. Consideration for intensity and complexity components are also important. There are many examples throughout the fee schedule of similar codes with the same intra-time that have different RVWs, such as the comparison of lesion removal from the back versus lesion removal from the eyelid (11400 vs 11440) or arthrocentesis of a small joint versus arthrocentesis of a large joint (20600 vs 20610).

#### Comparison to MPC and Other RUC-Reviewed Codes with 15 Minutes Intra-Service Time

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43235

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Commonly

Specialty GI Surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1185000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 395,000. 395,000 times 3 considering commercial patients is 1,185,000

Specialty Gastroenterology	Frequency 948000	Percentage 80.00 %
----------------------------	------------------	--------------------

Specialty GI Surgery	Frequency 118500	Percentage 10.00 %
----------------------	------------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

397,520 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is 397520.

Specialty Gastroenterology	Frequency 316000	Percentage 80.00 %
----------------------------	------------------	--------------------

Specialty GI Surgery	Frequency 39500	Percentage 10.00 %
----------------------	-----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43235

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43236	Tracking Number I2	Original Specialty Recommended RVU: <b>2.69</b>
		Presented Recommended RVU: <b>2.69</b>
Global Period: 000		RUC Recommended RVU: <b>2.57</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with directed submucosal injection(s), any substance

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60-year-old patient with weight loss and difficulty swallowing is referred for evaluation after imaging studies revealed a markedly dilated esophagus with a “bird’s beak” tapering near the gastroesophageal junction consistent with a diagnosis of achalasia. The patient is referred for therapeutic esophagogastroduodenoscopy with injection of botulinum toxin into the distal esophagus, and evaluation of the upper GI tract.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 81%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 72%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment

for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. The lower esophageal sphincter is identified. The endoscope is withdrawn to that level and Botulinum toxin A solution is injected submucosally at four quadrants under endoscopic direction. Photodocumentation of the exam findings including measurements of the lesion, labeling of the identified structures and magnified images of the abnormality are obtained and sent to a hard copy device. After observation to confirm the absence of bleeding, the endoscope is then withdrawn. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD code set, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43236 – Discussion and Recommendation

Code 43236 *Esophagogastroduodenoscopy, flexible, transoral; with directed submucosal injection(s), any substance* was identified through the MPC List / CMS Fastest Growing screens. This service was a new code added to CPT in 2003 and reviewed by the RUC in 2002 prior to the discussion of pre-time packages and moderate sedation work. The RUC did not accept the specialty's initial RVW and time recommendations and instead developed recommendations through facilitation, utilizing a review of incremental work compared with the base code. The AGA, ASGE, and SAGES conducted a RUC survey and received 315 responses. The consensus panel agrees that physician work for this service has not changed since the prior RUC review in 2002; however, the panel believes the increment of 0.31 established by the RUC in October 2012 for the esophagoscopy code pair 43200/43201 should apply to the EGD code pair 43235/43236.

**We recommend reducing the RVW to 2.69.** This value is less than the current RVW and less than the survey 25<sup>th</sup> percentile. This value is equal to the EGD base 43235 plus an increment of 0.30 (43201-43200) (ie, valuing the increment) approved by the RUC in October 2012.

**Pre-time Package 1b** is appropriate for 43236, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31625

Key Reference code 31625 was surveyed and presented to the RUC in 2003 prior to the discussion of pre-time packages and moderate sedation work. The RUC agreed that the CPT change was editorial and that work had not changed. The RVW was maintained and the survey data was accepted. The recommended RVW of 2.69 for 43236 compares favorably with the RVW for 31625.

### Comparison to EGD Base Code 43235

*Estimating time in 5 minute increments.* As discussed in the compelling evidence, respondents for the EGD surveys reported intra-time in increments of 5 minutes. The median of 15 minutes for 43235 and 20 minutes for 43236 masks slight differences of +/- a few minutes that would be shown using time and motion studies.

*Establishment of increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between and within families were key to maintaining relativity. The consensus panel reviewing this family of codes believes the increment of 0.30 established for the esophagoscopy pair 43200/43201 is correct for the similar EGD pair 43235/43236.

## Comparison to MPC and Other RUC-Reviewed Codes with 20 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43236

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty GI Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 43200

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 14,400. 14,400 times 3 considering commercial patients is 43,200

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43237	Tracking Number I3	Original Specialty Recommended RVU: <b>3.85</b>
		Presented Recommended RVU: <b>3.85</b>
Global Period: 000		RUC Recommended RVU: <b>3.85</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination limited to the esophagus

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 66 year-old patient with recent onset dysphagia is found to have an exophytic mass lesion in the mid- esophagus which on prior biopsy was proven to be an adenocarcinoma. Imaging studies demonstrate thickening of the mid-esophagus without evidence of distant metastases. Diagnostic esophagogastroduodenoscopy of the upper GI tract is performed, then endoscopic ultrasound of the esophagus is performed to evaluate and stage the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 60%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 33%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach. Residual fluid is removed from the stomach. The endoscope is advanced through the pylorus into the duodenal bulb, and then

around the bulb apex to the second portion of the duodenum. Examination is conducted of the duodenum, the entire stomach including the gastric cardia in a retroflexed scope position, and the entire esophagus, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the radial-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. Echoendoscopic evaluation is conducted of all abnormalities identified, correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the esophageal wall as well as vascular and other structures of the mediastinum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Post procedure orders are completed and discussed with staff. Photographs are reviewed and labeled. Radiographic images are reviewed with the technologist for entry into the image storing system. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications and follow-up plans or further treatments. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

Post-Service intensity/complexity	3.25	3.13

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set.

### 43237 – Discussion and Recommendation

Code 43237 *Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination limited to the esophagus* was identified as a family code through the MPC List screen. This service was reviewed by the RUC as a new code in 2003, with 27 survey respondents. To maintain proper rank order, the RUC utilized valuing the increment by adding the incremental RVW assigned to code 43231 Esophagoscopy, EUS and subtracting the RVW of code 43200 Esophagoscopy, which results in an RVW increment of 1.60. This incremental work value represents the intra-service work only of esophageal EUS. Adding 1.60 to the RVW of 2.39 for base EGD code resulted in a sum of 3.99. The current value for code 43237 is 3.98. A survey was conducted and 37 responses were received, with almost all respondents familiar with the procedure.

**We recommend the 25<sup>th</sup> percentile RVW of 3.85 which is less than the current value.** We note that the code pair 43231/43237 compares to code pair 43200/43235 in that the incremental work for each pair represents the incremental work of full EGD vs. esophagoscopy alone. Recent RUC valuation of 43200 and 43235 results in an increment of 0.67 RVU between them; adding this amount to the value of 3.19 for 43231 results in a sum of 3.86 which is comparable to the recommendation of 3.85 for this code.

### Comparison to Key Ref 31625

Key Reference code 31625 was surveyed and presented to the RUC in 2003 prior to the discussion of pre-time packages and moderate sedation work. The RUC agreed that the CPT change was editorial and that work had not changed. The RVW was maintained and the survey data was accepted. The recommended RVW of 3.85 for 43237 compares favorably with the RVW for 31625.

### 43237 Comparison To Other RUC-Reviewed Codes with 30-35 Minutes Intra-Service Time

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43237

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2550

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 850 ( $3 \times 850 = 2250$ )

Specialty Gastroenterology                      Frequency 2142                      Percentage 84.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 850

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 850

Specialty Gastroenterology                      Frequency 714                      Percentage 84.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43237

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

		Presented Recommended RVU: <b>4.50</b>
Global Period: 000		RUC Recommended RVU: <b>4.50</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s), esophagus (includes endoscopic ultrasound examination limited to the esophagus)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 66 year-old patient with long-standing tobacco use, weight loss and abdominal discomfort is found to have mediastinal lymphadenopathy on imaging studies. Esophagogastroduodenoscopy of the upper GI tract is performed, with endoscopic ultrasound for staging of suspected cancer and trans-endoscopic fine needle aspiration biopsy of the lymphadenopathy for cytologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 63%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 37%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach. Residual

fluid is removed from the stomach. The endoscope is advanced through the pylorus into the duodenal bulb, and then around the bulb apex to the second portion of the duodenum. Examination is conducted of the duodenum, the entire stomach including the gastric cardia in a retroflexed scope position, and the entire esophagus, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the radial-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. Echoendoscopic evaluation is conducted of all abnormalities identified, correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the esophageal wall as well as vascular and other structures of the mediastinum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated including identification of vascular structures in the anticipated track of the biopsy needle. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. The radial-view echoendoscope is withdrawn; the linear-view biopsy echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the proximal stomach. The area of interest is re-imaged and fully characterized, noting the correlation of the sagittal/coronal image to the transverse image previously obtained. The fine needle aspiration (FNA) device is inserted into the endoscope. Under continuous endoscopic and ultrasound guidance the FNA needle tip is advanced intramurally or transmurally into the location to be biopsied, taking care to avoid vascular structures and using Doppler imaging as needed to identify such structures. The FNA needle is inserted into the area to be biopsied, the stylette is withdrawn, and suction is applied. The needle is thrust in and out of the region to be biopsied, taking care that the correct needle position is maintained. The needle is withdrawn and the contents of the needle are expressed on to microscope slides and/or into appropriate cytological fixative. Cytology slides are smeared and fixed. The biopsy procedure is repeated until a cytopathologist confirms that adequate tissue has been obtained; or, in the absence of immediate cytopathological evaluation, until 4-8 biopsies are obtained. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	04/2013				
<b>Presenter(s):</b>	Bruce Cameron, MD (ACG), Joel Brill, MD (AGA), Shivan Mehta, MD (AGA), Nicholas Nickl, MD (ASGE), Edward Bentley, MD (ASGE)

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### 43238 – Discussion and Recommendation

Code 43238 Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s), esophagus (includes endoscopic ultrasound examination limited to the esophagus) was identified as a family code through the MPC List screen. This service was reviewed by the RUC as a new code in 2003. The RUC did not use a building block approach for this code since it would have produced a rank order anomaly. Therefore this code was cross walked to code 31641 Bronchoscopy, (rigid or flexible); with destruction of tumor or relief of stenosis by any method other than excision (eg, laser therapy, cryotherapy) (work RVU = 5.03).

**We recommend the 25<sup>th</sup> percentile RVW of 4.50 which is less than the current value.** We note that code pair 43238/43237 compares to pair 43231/43232 in that the incremental work between each pair, esophageal FNA, is the same. The recommended value for this code establishes the incremental work above 43237 at 0.65 which is comparable to the recommended increment for code pair 43231/43232 of 0.67. This value is supported by a comparison to other codes representing needle aspiration or needle biopsy (see table)

Code	Descriptor	RUC review	RVW	IS time
10021	FNA w/o image guidance	1995	1.27	17
10022	FNA w/ imaging	1995	1.27	20
19100	Breast Bx, no image guidance	1993	1.27	30
19102	Breast Bx, w/ image guidance	2000	2.00	30
32405	Lung Bx, percutaneous needle	2010	1.93	30
38505	Needle BX, lymph node		1.14	28
49082	Abd paracentesis wo/ image guidance	2010	1.24	10
49083	Abd paracentesis w/ image guidance	2010	2.00	25
49180	Needle Bx, percutaneous mass	1995	1.73	22
55700	Prostate Bx	2005	2.58	15
60100	Thyroid Bx, percutaneous needle	2000	1.56	25
60300	Thyroid cyst, aspiration	1995	0.97	15
64530	Celiac plexus block		1.58	30
76937	UTZ guidance, vascular access	2003	0.30	10
76942	UTZ guidance, needle placement		0.67	30
76946	UTZ guidance, amniocentesis		0.38	15
76975	GI endoscopic UTZ, S+I	1993	0.81	34
93306	Cardiac echo with 2D, m-mode, color flow and spectral Doppler	2007	1.30	20
93307	Cardiac echo with 2D, m-mode, no Doppler	2009	0.92	18
93312	TEE, including probe placement, S+I	1996	2.20	13
93313	TEE, probe placement	1996	0.95	25
93314	TEE, S+I only	1996	1.25	25

### Comparison to Key Ref 31638

Key Reference code 31638 requires lower intensity fluoroscopic guidance which increases the intra-service time. The difference in RVW compared with 43238 accounts for longer total time, but at lower intensity.

**43238 Comparison To MPC and Other RUC-Reviewed Codes with 45 Minutes Intra-Service Time**

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43238

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2100

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 700. (700 \* 3 = 2100)

Specialty Gastroenterology Frequency 1600 Percentage 76.19 %

Specialty Frequency 0 Percentage 0.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 700  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 700

Specialty Gastroenterology	Frequency 540	Percentage 77.14 %
----------------------------	---------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43238

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43239	Tracking Number I5	Original Specialty Recommended RVU: <b>2.69</b>
		Presented Recommended RVU: <b>2.69</b>
Global Period: 000		RUC Recommended RVU: <b>2.56</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with biopsy, single or multiple

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 63 year old patient with abdominal pain and persistent dyspepsia undergoes esophagogastroduodenoscopy. Evaluation of the upper GI tract is performed, and multiple biopsies are taken for histology and H. pylori rapid urease test.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 81%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 67%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. Endoscopically directed biopsies are taken of abnormal tissue. After observation to confirm the absence of bleeding, the endoscope is then withdrawn into the esophagus suctioning air to deflate the stomach, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence

of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Pathology forms are completed; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

RUC Meeting Date (mm/yyyy)		01/2013				
Presenter(s):	Drs. Brill, Nickl, Bentley, and Selzer					
Specialty(s):	AGA, ASGE, SAGES					
CPT Code:	43239					
Sample Size:	7558	Resp N:	310	Response: 4.1 %		
Description of Sample:	The AGA and ASGE conducted an enhanced random sample of member gastroenterologists as approved by the Research Subcommittee. The methodology consisted of a random sample with the addition of an expert panel consisting of physicians from industry, members of ASGE Special Interest Groups (SIG) who perform specific procedures (e.g. endoscopic ultrasound, optical endomicroscopy, stent placement, etc.) and survey volunteers who responded to educational articles and identified themselves as performers of therapeutic endoscopic services. SAGES conducted a random sample of their members.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

### 43239 – Discussion and Recommendation

Code 43239 *Esophagogastroduodenoscopy, flexible, transoral; with biopsy, single or multiple* was identified as a family code through the MPC List screen. This service has been reviewed by the RUC three times, most recently in 2000 during the second 5YR. The AGA, ASGE, and SAGES conducted a RUC survey and received 310 responses. The consensus panel agrees that physician work for this service has not changed since the prior RUC review in 2000, however, the panel believes the increment of 0.30 established by the RUC in October 2012 for the esophagoscopy code pair 43200/43202 should apply to the EGD code pair 43235/43239.

**We recommend reducing the RVW to 2.69.** This value is less than the current RVW and less than the survey 25<sup>th</sup> percentile. This value is equal to the base code 43235 plus an increment of 0.30 (43202-43200) (ie, valuing the increment) approved by the RUC in October 2012.

**Pre-time Package 1b** is appropriate for 43239, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31625

Key Reference code 31625 was surveyed and presented to the RUC in 2003 prior to the discussion of pre-time packages and moderate sedation work. The RUC agreed that the CPT change was editorial and that work had not changed. The RVW was maintained and the survey data was accepted.

### Comparison to EGD Base Code 43235

*Estimating time in 5 minute increments.* As discussed in the compelling evidence, respondents for the EGD surveys reported intra-time in increments of 5 minutes. The median of 15 minutes for both 43235 and 43239 masks slight differences of +/- a few minutes that would be shown using time and motion studies. We do not believe that the intra-service time for 43239 is identical to 43235 and the survey median of 15 minutes is an artifact of estimating time in 5 minute increments.

*Establishment of increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between and within families were key to maintaining relativity across the fee schedule. In 1992, the Harvard-based RVW for 43235 (EGD base) was 2.52 and the Harvard-based RVW for 43239

(EGD biopsy) was 2.83. This resulted in an RVW increment of 0.31. In 1995, the RUC reviewed both 43235 and 43239 and recommended maintaining the current RVW for each code (2.39 and 2.69, respectively). These RVWs were less than the 1992 values due to budget neutrality RVW adjustments that CMS made to all codes in the early years of the fee schedule. In 2000, the RUC reviewed 43239 and determined there was a change in work and recommended increasing the RVW to 2.87. The consensus panel reviewing this family of codes and the current survey data believe the increment of 0.30 established for the esophagoscopy pair 43200/43202 is correct for the similar EGD pair 43235/43239.

#### Comparison to MPC and Other RUC-Reviewed Codes with 15-20 Minutes Intra-Service Time

#### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

#### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43239

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Commonly

Specialty GI Surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4425000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 1,475,000. 1,475,000 times 3 considering commercial patients is 4,425,000

Specialty Gastroenterology                      Frequency 3628500                      Percentage 82.00 %

Specialty GI Surgery                      Frequency 354000                      Percentage 8.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,475,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 1,475,000.

Specialty Gastroenterology                      Frequency 1209500                      Percentage 82.00 %

Specialty GI Surgery                      Frequency 118000                      Percentage 8.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43239

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

SUMMARY OF RECOMMENDATION**

CPT Code: 43240	Tracking Number I6	Original Specialty Recommended RVU: <b>7.25</b>
		Presented Recommended RVU: <b>7.25</b>
Global Period: 000		RUC Recommended RVU: <b>7.25</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with transmural drainage of pseudocyst (includes placement of transmural drainage catheter[s]/stent[s], when performed, and endoscopic ultrasound, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 68-year-old patient with a history of acute pancreatitis has developed a symptomatic pancreatic pseudocyst that has failed to resolve despite conservative measures. Esophagogastroduodenoscopy with evaluation of the upper GI tract, transmural drainage of the pseudocyst under endoscopic ultrasound guidance, and placement of stents to maintain drainage of the pseudocyst into the stomach is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 13%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for procedure is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. The devices to be used to accomplish pseudocyst drainage are reviewed. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach. Residual fluid is removed from the stomach. The endoscope is advanced through the pylorus into the duodenal bulb, and then around the bulb apex to the second portion of the duodenum. Examination is conducted of the duodenum, the entire stomach including the gastric cardia in a retroflexed scope position, and the entire esophagus, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the linear-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the

esophagus into the stomach and to the duodenum or jejunum. Echoendoscopic evaluation is conducted of the pseudocyst(s), correlating the endoscopic and ultrasonographic images. The locations of the pseudocyst(s) are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including vascular and other structures of the mediastinum or abdomen/retroperitoneum. Multiple transducer frequencies are utilized as needed to fully visualize the pseudocyst(s). Doppler imaging of appropriate areas is completed when indicated including identification of vascular structures in the anticipated track of the pseudocyst drainage. A determination of risk and benefit to drain the pseudocyst is performed. The needle aspiration (FNA) device is inserted into the endoscope. Under continuous endoscopic and ultrasonographic guidance, the needle tip is advanced transmurally into the pseudocyst, taking care to avoid vascular structures and using Doppler imaging as needed to identify such structures. Pseudocyst fluid is aspirated through the FNA needle to confirm the correct position. A guidewire is inserted through the needle into the pseudocyst, and the needle is withdrawn over the guidewire. An electrocautery accessory such as a sphincterotome is advanced over the guidewire and electrocautery is used to open a stoma into the pseudocyst. Fluid which drains into the stomach is aspirated. The stoma is enlarged to the appropriate size using further cautery. The electrocautery accessory is removed over the guidewire; balloon dilators may be passed over the guidewire to further dilate the stoma. An enteral stent is advanced over the guidewire using the appropriate positioning device system and is deployed into the appropriate position straddling the stoma. The guidewire and deployment system is removed. When clinically indicated, the guidewire may be re-placed into the pseudocyst for enlargement of the stoma, creation of additional stoma(s), or placement of additional stents using the same technique. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. A focused abdominal exam is conducted to evaluate for evidence of pseudocyst leakage or bleeding, and for effective cyst decompression. Post procedure orders are completed and discussed with staff. Photographs are reviewed and labeled. Radiographic images are reviewed with the technologist for entry into the image storing system. Cytology and/or pathology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications and follow-up plans or further treatments, specifically including stent removal plans. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Compelling Evidence - 43240

The expert panel reviewed the prior valuation history of this service as well as changes in practice pattern since the last valuation, and concluded that there were reasons to present compelling evidence for re-valuation of the code.

#### Change in patient:

Code 43240 *Esophagogastroduodenoscopy, flexible, transoral; with transmural drainage of pseudocyst (includes placement of transmural drainage catheter[s]/stent[s], when performed, and endoscopic ultrasound, when performed)* was new for CPT 2000. When this service was last valued by the RUC in 2000, the standard method for pancreatic pseudocyst marsupialization was surgical cyst-enterostomy. Endoscopic drainage was utilized primarily for the simpler cases: pseudocysts < 6 cm without internal debris or infection and which are unilocular without septations, in patients who are otherwise healthy. Management of pancreatic pseudocysts has evolved over the past decade: today endoscopic drainage is the standard first line therapy, with surgical drainage largely reserved for those who have failed endoscopic treatment or are not candidates. Endoscopic treatment is now performed on giant pseudocysts > 10 cm, multiloculated and septated pseudocysts, pseudocysts containing solid and necrotic debris, and infected pseudocysts (pancreatic abscesses). Additionally, because it is less invasive than surgery, endoscopic treatment is preferred for sicker patients, particularly those who are poor surgical candidates due to severe malnutrition associated with the pancreatic disease. Finally, new treatment guidelines by the GI endoscopy authorities (ASGE 2005, Varadarajulu 2011), based on recent natural history data, now recommend non-drainage treatment of simple unilocular pseudocysts in healthy asymptomatic patients. Thus those patients who typically had endoscopic drainage in 2000 are now rarely drained at all, while the more sick patients with more complex and technically demanding pseudocysts previously treated surgically are currently being managed with endoscopic therapy. This represents a major shift in the clinical practice pattern since the last valuation. We note that the Medicare frequency has grown from 89 (2001) to 314 (2011). This infrequently performed procedure is still largely confined to tertiary care centers. In addition, pancreatitis with pseudocysts is more common in younger populations, so that a preponderance of claims are in Medicaid and commercial patients. The 10 year trend in this procedure represents both a slow growth in volume in addition to the dramatic shift in the clinical profile as described.

#### Flawed methodology:

Code 43240 was reviewed by the RUC as a new code in 2000. Because there were only six survey responses, the RUC recommended an RVW equivalent to code 43262 *Endoscopic retrograde cholangio-pancreatography (ERCP); with sphincterotomy/papilotomy* (work RVU = 7.39) based on a comparison of total survey time (from 6 responses). When created, this new code was very infrequently performed, resulting in the low survey response rate. Although the survey median RVW was 10.00, the RUC crosswalked the value to another code based on time. Subsequent to the RUC review, CMS reduced the RVW to 6.86 as part of refinement after the second five-year-review. We do not believe the current RVW is survey based and we do not believe the current value correctly reflects the relative work compared with other codes, including those in the EGD family of codes.

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43240

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 900

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 300

Specialty Gastroenterology                      Frequency 801                      Percentage 89.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~300

Specialty Gastroenterology                      Frequency 267                      Percentage 89.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43240

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Re: Direct Practice Expense Inputs for Neonatal Hypothermia Services (99481-99482;  
Tracking Codes K1-K2; Tab 18)

Dear Dr Levy:

Codes 99481-99482 (*Total body systemic/selective head hypothermia in a critically ill neonate per day*) are among the codes being considered during the January 2013 RUC meeting.

The American Academy of Pediatrics (AAP) has conducted physician work surveys for codes 99481-99482 and developed work RVU recommendations based on the survey results.

However, we recommend no direct practice expense inputs for codes 99481-99482.

If you have any questions, please contact Linda Walsh, AAP staff, at 800/433-9016 ext 7931 or [lwalsh@aap.org](mailto:lwalsh@aap.org). Thank you.

Sincerely,

A handwritten signature in black ink, appearing to read "Steve Krug".

Steven E. Krug, MD, FAAP  
AAP RUC Advisor

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code:43242	Tracking Number I8	Original Specialty Recommended RVU: <b>5.39</b>
		Presented Recommended RVU: <b>5.39</b>
Global Period: 000		RUC Recommended RVU: <b>5.39</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69 year old patient with weight loss and painless jaundice is found to have a tumor in the head of the pancreas on imaging studies. The patient is referred for diagnostic esophagogastroduodenoscopy with evaluation of the upper GI tract, then endoscopic ultrasound staging of the tumor of the pancreatic head is performed with transendoscopic fine needle aspiration biopsy of the pancreatic head for cytologic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 56%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 13%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach. Residual

fluid is removed from the stomach. The endoscope is advanced through the pylorus into the duodenal bulb, and then around the bulb apex to the second portion of the duodenum. Examination is conducted of the duodenum, the entire stomach including the gastric cardia in a retroflexed scope position, and the entire esophagus, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the radial-view or linear-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach and to the duodenum or jejunum. Echoendoscopic evaluation is conducted of all abnormalities identified, correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the GI tract wall as well as vascular and other structures of the mediastinum or abdomen/retroperitoneum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated including identification of vascular structures in the anticipated track of the biopsy needle. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. The radial-view echoendoscope is withdrawn (if used); the linear-view biopsy echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus to the area to be biopsied. The area of interest is re-imaged and fully characterized, noting the correlation of the sagittal/coronal image to the transverse image previously obtained. The fine needle aspiration (FNA) device is inserted into the endoscope. Under continuous endoscopic and ultrasound guidance the FNA needle tip is advanced intramurally or transmurally into the location to be biopsied, taking care to avoid vascular structures and using Doppler imaging as needed to identify such structures. The FNA needle is inserted into the area to be biopsied, the stylette is withdrawn, and suction is applied. The needle is thrust in and out of the region to be biopsied, taking care that the correct needle position is maintained. The needle is withdrawn and the contents of the needle are expressed on to microscope slides and/or into appropriate cytological fixative. Cytology slides are smeared and fixed. The biopsy procedure is repeated until a cytopathologist confirms that adequate tissue has been obtained; or, in the absence of immediate cytopathological evaluation, until 4-8 biopsies are obtained. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	04/2013

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**43242 – Discussion and Recommendation**

Code 43242 *Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)* was identified as a family code through the MPC List screen. This service was reviewed by the RUC as a new code in 2000. Because there were only eight survey responses, the RUC recommended 5.51 based on valuing the increment of biopsy to 43259. The biopsy increment was based on a blend between 19291 (0.63) and the increment between 31629 and 31622. CMS accepted the RUC recommendation for 2001, however, after the second 5-year-review that included other EGD codes, CMS refinement increased 43242 to 7.31 to maintain rank order. The RUC again reviewed 43242 as part of a family of new and revised codes in 2003 and determined that the RVW of 7.31 correctly valued this service.

The panel noted that the median survey RVW was 6.65 which is less than the current value of the code. The panel observed that the code pair 43259/43242 compares to code pairs 43231/43232 and 43237/43238 in that the incremental work for each pair represents performance of FNA biopsy under ultrasound guidance. For the 43231/43232 and 43237/43238 code pairs this interval was, respectively 0.67 and 0.65 RVUs, which was consistent with other needle aspiration biopsy codes. The panel noted that both median and 25th percentile RVWs provide inconsistent increments for this work. The panel determined that, to maintain internal consistency and relativity within and outside the code set, 43242 is most appropriately valued as the sum of code 43259, 4.74 RVUs, plus 0.65 RVUs for FNA under ultrasound guidance, yielding 5.39. This value is between the 25th percentile and the median.

**We recommend a value of 5.39 RVU, which is less than the current value.**

This value is supported by a comparison to other codes representing needle aspiration or needle biopsy (see table)

Code	Descriptor	RUC review	RVW	IS time
10021	FNA w/o image guidance	1995	1.27	17
10022	FNA w/ imaging	1995	1.27	20
19100	Breast Bx, no image guidance	1993	1.27	30
19102	Breast Bx, w/ image guidance	2000	2.00	30

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43242

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 79500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 26,500

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43242

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43243	Tracking Number 19	Original Specialty Recommended RVU: <b>4.37</b>
		Presented Recommended RVU: <b>4.37</b>
Global Period: 000		RUC Recommended RVU: <b>4.37</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with injection sclerosis of esophageal / gastric varices

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 53-year-old patient with a history of hepatitis C, and cirrhosis presents with hematemesis and hypotension. Therapeutic esophagogastroduodenoscopy with evaluation of the upper GI tract for the site(s) of bleeding is performed, followed by injection sclerosis of actively bleeding varices.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 82%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 73%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents and blood. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are

obtained of suspicious abnormalities. Actively bleeding 3-4+ esophageal varices are identified. The area is washed. After obtaining adequate visibility of the most likely bleeding site, a sclerotherapy needle is inserted into the bleeding varix. Injections of sclerosing agent are performed to the primary bleeding varix. The sclerotherapy needle is withdrawn, inserted at a second site in the varix, and injections of sclerosing agent are performed. Subsequent insertion of the sclerotherapy needle and injections of sclerosing agent are performed for all other prominent varices identified as active or potential bleeding sources. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

### 43243 – Discussion and Recommendation

Code 43243 *Esophagogastroduodenoscopy, flexible, transoral; with injection sclerosis of esophageal / gastric varices* was identified as a family code through the MPC List screen. This service has never been reviewed by the RUC. The AGA and ASGE conducted a RUC survey and received 58 responses.

The expert panel determined that direct application of the esophagoscopy code pair (43200/43204) to EGD work was not appropriate for 43243 because the presence of pooled blood and clot in the stomach requires additional work to achieve adequate gastroduodenal visualization which is not a factor in examination confined to the esophagus alone. Based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the 25<sup>th</sup> percentile RVW of 4.37.**

**Pre-time Package 2b** is appropriate for 43243, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

### Comparison to Other RUC-Reviewed Codes with 30 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43243

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty GI Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 6600

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 2,200. 2,200 times 3 considering commercial patients is 6,600

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43244	Tracking Number I10	Original Specialty Recommended RVU: <b>4.50</b>
		Presented Recommended RVU: <b>4.50</b>
Global Period: 000		RUC Recommended RVU: <b>4.50</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with band ligation of esophageal / gastric varices

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 55-year-old patient with a history of alcoholism and cirrhosis presents with hematemesis. Esophagogastroduodenoscopy of the upper GI tract reveals varices with stigmata of recent hemorrhage; band ligation of the varices is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 79%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 69%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment

for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. The endoscope is withdrawn and the band ligator is attached to the end of the scope. The endoscope is reinserted, advanced into the stomach and then withdrawn to the largest varix just proximal to the gastroesophageal junction. The varix is banded and observed. The level of sedation of the patient is reassessed and additional medication is administered as needed. The endoscope is withdrawn to the next largest varix. The varix is banded and observed. All remaining varices in the distal esophagus are banded. Photodocumentation of the exam findings including measurements of the varices and labeling of the identified structures are obtained and sent to a hard copy device. After observation to confirm the absence of bleeding, the endoscope is then withdrawn. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Compelling Evidence

For a detailed discussion of compelling evidence, please see the Attachment to the cover letter that was submitted with the SoRs for this family of EGD codes.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

### 43244 – Discussion and Recommendation

Code 43244 *Esophagogastroduodenoscopy, flexible, transoral; with band ligation of esophageal / gastric varices* was identified as a family code through the MPC List screen. This service was reviewed by the RUC twice. In 1993, the RUC reviewed 43244 as a new code for 1994. The RUC utilized CMS's methodology of valuing the increment to identify consistent physician work relationships. The RUC recommended an RVW of 4.68 and accepted pre/intra/post times of 20/30/20. The RUC again reviewed 43244 in 2000 as part of the second 5YR and determined that the work and time had increased based on compelling evidence and a new survey using a value the increment survey. The RUC recommended an increased RVW of 5.05. The AGA and ASGE conducted a RUC survey and received 69 responses. The current survey time is the same as the times surveyed in 1993.

The expert panel determined that direct application of the esophagoscopy code pair (43200/43205) to EGD work was not appropriate for 43244 because the presence of pooled blood and clot in the stomach requires additional work to achieve adequate gastroduodenal visualization which is not a factor in examination confined to the esophagus alone. Based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the 25<sup>th</sup> percentile RVW of 4.50**. This value is below the RUC recommended value from 1993, even though the times are the same as they were in 1993.

**Pre-time Package 2b** is appropriate for 43244, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

### Comparison to Other RUC-Reviewed Codes with 30 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43244

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty GI Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 46800

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 15,600. 15,600 times 3 considering commercial patients is 46,800

Specialty Gastroenterology Frequency 42120 Percentage 90.00 %

Specialty GI Surgery Frequency 468 Percentage 1.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
 15,600 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
 Please explain the rationale for this estimate. Medicare database for 2011 is approximately 15,600.

Global Period: 000		RUC Recommended RVU: <b>3.18</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with dilation of gastric / duodenal stricture(s) (eg, balloon, bougie)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 67-year old patient with a previous history of gastric surgery and gastro-enteric anastomosis has developed progressive early satiety with nausea and recurrent vomiting. Imaging studies reveal an anastomotic stricture. The patient undergoes esophagogastroduodenoscopy with evaluation of the upper GI tract, and dilation of the stricture.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 70%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 63%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope cannot be advanced beyond pyloric channel because of stenosis. The lesion in need of dilation is identified and assessed. A balloon catheter is selected and inserted under direct vision. The balloon is inflated with saline adjusting position as needed. The balloon is deflated and the effect of dilation

viewed, repeating the inflation of balloon as indicated. The balloon is removed and blood is removed with suction, observing the dilation site while bleeding dissipates. The endoscope is slowly withdrawn re-inspecting the stomach and advanced into the duodenum with circumferential inspection performed after air insufflations. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43245 – Discussion and Recommendation

Code 43245 *Esophagogastroduodenoscopy, flexible, transoral; with dilation of gastric / duodenal stricture(s) (eg, balloon, bougie)* was identified as a family code through the MPC List screen. The 1992 RVW for 43245 was 4.58. This service was reviewed by the RUC twice. In 1993, the RUC reviewed 43245 as part of an overall review of the EGD family in relation to new codes that were created for 1994. In 1993, the RUC recommended maintaining the RVW of 3.48 for 43245. The RUC again reviewed 43245 in 2002 as part of a revision to several EGD codes. The RUC did not accept the specialty recommendation for an increased RVW. Instead, the RUC recommended a reduced RVW to 3.18 (from 3.48) taking into consideration an assessment of incremental of work over the base code. Although the RUC reduced the RVW, it accepted the survey times. The survey in 2002 was conducted prior to the discussion of moderate sedation and pre-time packages. The AGA, ASGE, and SAGES conducted a RUC survey and received 56 responses.

There is no direct esophagoscopy code pair increment that would apply to 43245. Based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the current RVW of 3.18**. This value is below the 1992 Harvard-based RVW of 3.58, even though the survey times are similar to Harvard data.

**Pre-time Package 2b** is appropriate for 43245, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

## Comparison to Key Ref 52342

Key reference code was reviewed by the RUC in 2008 as a site of service anomaly. The RUC did not accept the specialty recommendation for an increased RVW to 8.64. Instead the RUC determined work had not changed and subtracted RVUs related to a deleted hospital visit (99231). Although the RUC did not accept the specialty survey-based RVW recommendation, the RUC did accept the new survey data. Therefore, there is a disconnect between the survey data and the RVW. Give the time and RVW difference, key reference code 52342 is not a good comparator to 43245, but was likely chosen by survey respondents because of the similarity in service description.

## Comparison to MPC and Other RUC-Reviewed Codes with ~20 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43245

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty GI Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 37800

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 12,600. 12,600 times 3 considering commercial patients is 37,800

Specialty Gastroenterology Frequency 25326 Percentage 67.00 %

Specialty GI Surgery Frequency 7560 Percentage 20.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
 12,605 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
 Please explain the rationale for this estimate. Medicare database for 2011 is 12605.

Specialty Gastroenterology	Frequency 8442	Percentage 67.00 %
----------------------------	----------------	--------------------

Specialty GI Surgery	Frequency 2520	Percentage 20.00 %
----------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43245

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code:43246	Tracking Number I12	Original Specialty Recommended RVU: <b>4.32</b>

Global Period: 000		RUC Recommended RVU: <b>4.32</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with directed placement of percutaneous gastrostomy tube

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75 year old patient presents with a massive CVA and inability to take oral nutrition. The patient is malnourished and needs enteral nutritional support. A swallowing evaluation is performed confirming aspiration. The decision is made to proceed with esophagogastroduodenoscopy for evaluation of the upper GI tract, with placement of a percutaneous endoscopic gastrostomy tube for nutritional support.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 60%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 54%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. The stomach is insufflated with air until trans-illumination allows external

visualization on the upper abdominal wall of the endoscope light. The abdomen site is prepped with bactericidal solution. A finger is pressed on the abdominal wall site to endoscopically confirm apposition of the stomach against the abdominal wall. Local anesthetic is infiltrated into the subcutaneous and intramuscular portions of the abdomen site, and a scalpel is used to make an incision in the abdominal wall. A gastrostomy introducer catheter is introduced through the incision into the stomach. A snare is introduced through the endoscope and looped around the catheter. The catheter introducer needle is withdrawn and a guide wire is passed externally through the introducer into the stomach. The snare is tightened around the guide wire, and the endoscope, snare and guidewire are withdrawn through the mouth. The guide wire is removed from the endoscope. A percutaneous gastrostomy is secured to the guide wire through the mouth and pushed or pulled until it exits through the abdominal wall incision. The gastrostomy is gently pulled until resistance is felt. The endoscope is introduced through the mouth into the stomach to confirm positioning of the internal bolster of the gastrostomy against the stomach wall. An external bolster is slipped over the guidewire and introducer to position the gastrostomy in place. The tube is shortened to the appropriate length, an outer clamp is slid over the tube, and a connector with cap is inserted into the end of the tube. The abdominal site is cleaned, bandaged and dressed. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current

practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

A survey was conducted and data presented to the RUC at the January 2013 meeting. The RUC reviewed the survey data for 43246 and agreed with the specialty societies that a median intra-service time of 23 minutes grossly underestimates the time it takes to perform this procedure. An eight minute time differential between the base code, 15 minutes, and this code, 23 minutes, does not accurately account for the additional work in placing the percutaneous gastrostomy tube. Therefore, the RUC recommends that CPT code 43246 be re-surveyed for presentation at the April 2013 RUC meeting.

#### 43246 – Discussion and Recommendation

Code 43246 *Esophagogastroduodenoscopy, flexible, transoral; with directed placement of percutaneous gastrostomy tube* was identified as a family code through the MPC List screen. The 1992 RVW for 43246 was 4.57. This service was reviewed by the RUC three times. In 1993, the RUC reviewed it as part of an overall review of the EGD family in relation to new codes that were created for 1994 and recommended maintaining the existing RVW. The RUC again reviewed 43246 in 1995 as part of the first 5YR and recommended maintaining the value. In 2005, the RUC reviewed 43246 again. The RUC agreed with the specialties that there had not been a change in work and recommended maintaining the RVW. It should be noted that the code has devalued for budget neutrality reasons resulting in the current value of 4.32. With respect to intraservice time, the RUC reviewed 43259 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum and/or jejunum as appropriate* and believed the typical intra-service time of 43246 is approximately 38 minutes instead of the median survey time of 30 minutes. The survey in 2005 was conducted prior to the discussion of moderate sedation and pre-time packages. A new RUC survey was conducted by the ACG, AGA, ASGE, and SAGES and 57 responses were received.

There is no direct esophagoscopy code pair increment that would apply to 43246. The panel noted that the current survey IS time of 30 minutes is the same as the survey time in 2005. The panel also noted that the 25<sup>th</sup> percentile survey RVW (4.30) is approximately the same as the current value. **We recommend maintaining the current value of 4.32.**

**Pre-time Package 2b** is appropriate for 43246 with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

#### Comparison to Key Ref 31600

Key Reference code 31600 clinically is similar to 43246. Both procedures are an elective insertion of a tube in a critically ill patient.

#### Comparison To Other RUC-Reviewed Codes with similar IWPUT

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
- 

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43246

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Commonly

Specialty General Surgery                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 366000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 122,000. (122,000 \* 3 = 366,000)

Specialty Gastroenterology	Frequency 241560	Percentage 66.00 %
----------------------------	------------------	--------------------

Specialty General Surgery	Frequency 84180	Percentage 23.00 %
---------------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 122,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 122,000

Specialty Gastroenterology	Frequency 80520	Percentage 66.00 %
----------------------------	-----------------	--------------------

Specialty General Surgery	Frequency 28060	Percentage 23.00 %
---------------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

---

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43247      Tracking Number I13      Original Specialty Recommended RVU: **3.38**  
 Presented Recommended RVU: **3.38**  
 Global Period: 000      RUC Recommended RVU: **3.27**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with removal of foreign body

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69 year old patient with schizophrenia presents with abdominal discomfort. Imaging study reveals a foreign body in the stomach. Therapeutic esophagogastroduodenoscopy with examination of the upper GI tract and removal of the foreign body is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 78%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 77%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 79%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. The foreign body is identified in the stomach and assessed for endoscopic removal. The endoscope is withdrawn through the mouth, and a retrieval hood or overtube is affixed to the tip of the endoscope. The endoscope is then inserted through the mouth into the oropharynx and advanced through the esophagus to the area of the

foreign body. Using a retrieval device advanced through the biopsy channel of the endoscope, the foreign body is grasped, and pulled to the tip of the endoscope. The endoscope and foreign body are withdrawn through the mouth. The foreign body is removed and the endoscope is reinserted through the mouth into the oropharynx and advanced through the esophagus into the stomach. The procedure is repeated until the foreign body is completely removed. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope with any affixed device(s) is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43247 – Discussion and Recommendation

Code 43247 *Esophagogastroduodenoscopy, flexible, transoral; with removal of foreign body* was identified as a family code through the MPC List screen. This service was reviewed by the RUC twice. In 1993, the RUC reviewed 43247 as part of an overall review of the EGD family in relation to new codes that were created for 1994. The RUC again reviewed 43246 in 2000 as part of the second 5YR. The RUC agreed that there had been an increase in both time and intensity based on a survey of valuing the increment, however the RUC did not agree with the specialty survey-based incremental RVW. Instead, the RUC chose to use the increment between the esophagoscopy base and esophagoscopy FBR code pair (43200 / 43215) added to the base EGD code. This resulted in a recommendation significantly below the survey. CMS did not accept the RUC recommendation and instead maintained the current RVW for 43247. Therefore, the current RVW is not related to either the survey data or the RUC recommendation and has caused a discordant work intensity calculation. The AGA, ASGE, and SAGES conducted a RUC survey and received 68 responses. The current survey time is similar to the Harvard time – which the current RVW is based on.

Based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the current RVW of 3.38**. This value is only slightly different than valuing the increment [43235 + (43215-43200)] or [2.35 + (2.60-1.59)] = 3.36.

**Pre-time Package 2b** is appropriate for 43247, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

### Comparison to Key Ref 31638

Key Reference code 31638 requires lower intensity fluoroscopic guidance which increases the intra-service time. The difference in RVW compared with 43247 accounts for longer total time, but at lower intensity.

### Comparison to Other RUC-Reviewed Codes with 30 Minutes Intra-time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43247

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty GI Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 82800

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 27,600. 27,600 times 3 considering commercial patients is 82800

Specialty Gastroenterology Frequency 66240 Percentage 80.00 %

Specialty GI Surgery Frequency 9108 Percentage 11.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
 28,306 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
 Please explain the rationale for this estimate. Medicare database for 2011 is 28306.

Specialty Gastroenterology	Frequency 22080	Percentage 80.00 %
----------------------------	-----------------	--------------------

Specialty GI Surgery	Frequency 3036	Percentage 11.00 %
----------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43247

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code:43248	Tracking Number I14	Original Specialty Recommended RVU: <b>3.15</b>
		Presented Recommended RVU: <b>3.15</b>
Global Period: 000		RUC Recommended RVU: <b>3.01</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 73-year-old patient with dysphagia and weight loss undergoes imaging studies revealing the presence of a stricture lesion in the distal esophagus. The patient is referred for therapeutic esophagogastroduodenoscopy for evaluation of the upper GI tract, and dilation of the stricture.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 75%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 79%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment

for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The lesion to be dilated is identified and assessed. A guidewire is placed through the endoscope into the esophagus and advanced into the stomach, beyond the area to be dilated. The endoscope is withdrawn through the mouth while visually confirming proper positioning of the guidewire. A dilator is advanced over the guidewire through the mouth into the esophagus past the area to be dilated, while the endoscopist monitors the patient for signs of pain or discomfort. The level of sedation of the patient is reassessed and additional medication is administered as needed. The initial dilator is withdrawn, and dilators of increasing diameter are passed sequentially over the guide wire through the mouth into the esophagus and passed distally to an appropriate extent in a similar manner. At the conclusion of the sequential dilations, the guidewire is withdrawn and the endoscope is inserted through the mouth into the esophagus and sufficiently distal to assess the site of dilation for bleeding, trauma and/or injury. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43248 – Discussion and Recommendation

Code 43248 *Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire* was identified as a family code through the MPC List screen. In 1993, the RUC reviewed 43244 as a new code for 1994. The RUC RVW recommendation was based on the method of valuing the increment. The RUC database includes physician time that indicates "do not use to value physician work."

The AGA, ASGE, and SAGES conducted a RUC survey and received 50 responses. The consensus panel agrees that physician work for this service has not changed, however, the panel believes the increment of 0.75 established by the RUC in October 2012 for the esophagoscopy code pair 43200/43226 should apply to the EGD code pair 43235/43248.

Based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the current RVW of 3.15**. This value is only slightly different than valuing the increment  $[43235 + (43226-43200)]$  or  $[2.39 + (2.34-1.59)] = 3.14$ .

**Pre-time Package 2b** is appropriate for 43248, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation. The difference in RVW compared with 43248 accounts for longer total time, but at lower intensity.

### Comparison to MPC and Other RUC-Reviewed Codes with ~20 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43248

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty GI Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 312000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 104,000. 104,000 times 3 considering commercial patients is 312,000

Specialty Gastroenterology Frequency 280800 Percentage 90.00 %

Specialty GI Surgery Frequency 6240 Percentage 2.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 102,871 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is 102871.

Specialty Gastroenterology Frequency 93600 Percentage 90.00 %

Specialty GI Surgery	Frequency 2080	Percentage 2.00 %
----------------------	----------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? Yes

---

### Professional Liability Insurance Information (PLI)

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43249      Tracking Number I15      Original Specialty Recommended RVU: **2.90**  
 Presented Recommended RVU: **2.90**  
 Global Period: 000      RUC Recommended RVU: **2.77**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic balloon dilation of esophagus (less than 30 mm diameter)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 67-year-old patient with dysphagia, weight loss and abdominal pain unresponsive to pharmacological therapy undergoes imaging studies revealing a stricture in the distal esophagus. The patient is referred for esophagogastroduodenoscopy with evaluation of the upper GI tract, and dilation of the stricture.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 71%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 56%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment

for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. The stricture to be dilated is identified and assessed. The endoscope is positioned. A through-the-scope fixed wire balloon catheter is advanced through the endoscope, positioned across the stricture, and inflated to a diameter of approximately 15 mm. The balloon catheter is deflated and the stricture is observed. The level of sedation of the patient is reassessed and additional medication is administered as needed. If necessary, the balloon dilator is removed and subsequent balloon catheters of larger diameter are inserted through the endoscope, positioned across the stricture, and inflated. The balloon catheter is then deflated, and the stricture is observed to confirm adequate dilation of the stricture. When dilation is adequate, the balloon catheter is removed. Following dilation, the area is observed for bleeding. If inspection of stomach and duodenum described above were not feasible prior to dilation, this inspection is completed after dilation. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

RUC Meeting Date (mm/yyyy)		01/2013				
Presenter(s):	Drs. Brill, Nickl, Bentley, and Selzer					
Specialty(s):	AGA, ASGE, SAGES					
CPT Code:	43249					
Sample Size:	1907	Resp N:	56	Response: 2.9 %		
Description of Sample:	The AGA and ASGE conducted a random sample of member gastroenterologists as approved by the Research Subcommittee. The sampling methodology was a random sample with the addition of survey volunteers who responded to educational articles and identified themselves as performers of therapeutic endoscopic services. SAGES conducted a random sample of their members.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43249 – Discussion and Recommendation

Code 43249 *Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic balloon dilation of esophagus (less than 30 mm diameter)* was identified as a family code through the MPC List screen. This service was reviewed by the RUC twice. In 1993, the RUC reviewed 43249 as part of an overall review of the EGD family in relation to new codes that were created for 1994. The RUC again reviewed 43249 in 2000 as part of the second 5YR. The RUC agreed that there had been an increase in both time and intensity based on a survey of valuing the increment, however the RUC did not agree with the specialty recommended RVW increase based on time. Instead, the RUC chose to recommend the increment survey median RVW of 3.35. CMS did not accept the RUC recommendation and instead maintained the current RVW for 43249. Therefore, the current RVW is not related to either the survey data or the RUC recommendation and has caused a discordant work intensity calculation. The AGA, ASGE, and SAGES conducted a RUC survey and received 56 responses.

**We recommend the current RVW of 2.90.** This value is equal to valuing the increment  $[(43235 + (43220-43200)) \text{ or } (2.39 + 0.51)]$ .

**Pre-time Package 1b** is appropriate for 43249, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31625

Key Reference code 31625 was surveyed and presented to the RUC in 2003 prior to the discussion of pre-time packages and moderate sedation work. The RUC agreed that the CPT change was editorial and that work had not changed. The RVW was maintained and the survey data was accepted. The recommended RVW of 2.90 for 43249 compares favorably with the RVW for 31625.

### Comparison to EGD Base Code 43235

*Estimating time in 5 minute increments.* As discussed in the compelling evidence, respondents for the EGD surveys reported intra-time in increments of 5 minutes. The median of 15 minutes for 43235 and 20 minutes for 43249 mask slight differences of +/- a few minutes that would be shown using time and motion studies.

*Establishment of increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between and within families were key to maintaining relativity. The consensus panel reviewing this family of codes believes the increment of 0.51 established for the esophagoscopy pair 43200/43220 by the RUC in October 2012 is correct for the similar EGD pair 43235/43249.

#### Comparison To MPC And Other RUC-Reviewed Codes with 20 Minutes Intra-Service Time

#### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

#### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43249

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty GI Surgery How often? Sometimes

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 276000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 92,000. 92,000 times 3 considering commercial patients is 276,000

Specialty Gastroenterology	Frequency 234600	Percentage 85.00 %
----------------------------	------------------	--------------------

 Global Period: 000      RUC Recommended RVU: **4.45**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69-year-old patient with malnutrition, abdominal discomfort and increasing inability to swallow liquids undergoes imaging studies revealing a tapered, "bird's beak" appearance of the distal esophagus. Esophageal motility studies confirm findings consistent with achalasia. The patient is referred for esophagogastroduodenoscopy with evaluation of the upper GI tract, and large diameter balloon dilation of the lower esophageal sphincter.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 63%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 60%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-

inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. The gastroesophageal junction is identified and assessed. A guidewire is inserted through the biopsy channel of the endoscope into the stomach and the endoscope is withdrawn maintaining the position of the guidewire. A greater than 30 cm balloon catheter is advanced over the guidewire and positioned across the lower esophageal sphincter using fluoroscopy and/or a reinserted endoscope to confirm the position. The balloon is inflated to a diameter of greater than 30 mm. The balloon catheter is deflated and the stricture is observed. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Post procedure radiologic tests are ordered and reviewed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-

43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43233 *Esophagogastroduodenoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)* is a new code for 2014. The AGA and ASGE conducted a RUC survey and received 35 responses.

**We recommend an RVW of 4.26.** This value is less than the 25<sup>th</sup> percentile and is based on: 1) the sum of to-be-deleted code 43458 plus 0.5 x the base EGD (43235); and 2) multiple procedure payment policy.

Code 43458 *Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia* has a 000-global period and does not include endoscopy work. The new code will bundle 43458 with 43235 (EGD base) which also has a 000-global period. Payment for this bundled work would be based on the multiple procedure payment rule (100%x43458 plus 50%x43235) or  $3.06 + 0.5 \times 2.39 = 4.26$ .

**Pre-time Package 2b** is appropriate for 43233, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

### Comparison to Key Ref 31638

Key Reference code 31638 requires lower intensity fluoroscopic guidance which increases the intra-service time. The difference in RVW compared with 43233 accounts for longer total time, but at lower intensity.

### Comparison To Other RUC-Reviewed Codes with 30 Minutes Intra-Service Time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43458 + 74360

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 3600

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 data for 43458 (Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia) is approximately 1,600. Approximately 80% of the volume for 43458 will be reported with 43233 (~1,200) multiplied by 3 = ~4,000.

Specialty Gastroenterology Frequency 2200 Percentage 61.11 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 781

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 data for 43458 (Dilation of esophagus with balloon (30 mm diameter or larger) for achalasia) is 1,561. Approximately 50% of the volume for 43458 will be reported with 43233 = 781.

Specialty Gastroenterology Frequency 730 Percentage 60.83 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43271

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 43250	Tracking Number I17	Original Specialty Recommended RVU: <b>3.20</b>
		Presented Recommended RVU: <b>3.20</b>
Global Period: 000		RUC Recommended RVU: <b>3.07</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66-year-old patient with persistent dyspepsia unresponsive to pharmacological therapy is referred for endoscopic examination. Esophagogastroduodenoscopy of the upper GI tract reveals a polypoid lesion in the gastric fundus; a hot biopsy forceps is used to remove the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 73%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 88%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. The lesion to be removed is identified and assessed. The identified lesion is removed with hot biopsy forceps until there is no residual. The area is assessed for bleeding. After suctioning air to deflate

the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology and pathology forms are completed; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

## 43250 – Discussion and Recommendation

Code 43250 *Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery* was identified as a family code through the MPC List screen. In 1993, the RUC reviewed 43250 as a new code for 1994. The RUC RVW recommendation was based on the method of valuing the increment. In addition, the RUC took into consideration the weighted average of the different specialties reviewing the new code. The AGA, ASGE, and SAGES conducted a RUC survey and received 59 responses.

The consensus panel agrees that physician work for this service has not changed. **We recommend the current RVW of 3.20.** This recommended RVW is the same as the value of the base code plus the increment of 0.75 established by the RUC in October 2012 for the comparable esophagoscopy code pair 43200/43216 and is below the survey 25th percentile RVW.

**Pre-time Package 1b** is appropriate for 43250, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

### Comparison to Key Ref 31625

Key Reference code 31625 was surveyed and presented to the RUC in 2003 prior to the discussion of pre-time packages and moderate sedation work. The RUC agreed that the CPT change was editorial and that work had not changed. The RVW was maintained and the survey data was accepted. The recommended RVW of 3.20 for 43250 compares favorably with the RVW for 31625.

### Comparison to EGD Base Code 43235

*Estimating time in 5 minute increments.* As discussed in the compelling evidence, respondents for the EGD surveys reported intra-time in increments of 5 minutes. The median of 15 minutes for 43235 and 20 minutes for 43250 mask slight differences of +/- a few minutes that would be shown using time and motion studies.

*Establishment of increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between and within families were key to maintaining relativity. The

consensus panel reviewing this family of codes believes the increment of 0.75 established for the esophagoscopy pair 43200/43216 by the RUC in October 2012 is correct for the similar EGD pair 43235/43250.

#### Comparison To MPC And Other RUC-Reviewed Codes with 20 Minutes Intra-Service Time

#### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

#### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43250

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Sometimes

Specialty GI Surgery

How often? Sometimes

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 19500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is approximately 6,500. 6,500 times 3 considering commercial patients is 19,500

Specialty Gastroenterology

Frequency 12090

Percentage 62.00 %

Specialty GI Surgery	Frequency 5265	Percentage 27.00 %
----------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 6,514  
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database for 2011 is 6514.

Specialty Gastroenterology	Frequency 4030	Percentage 62.00 %
----------------------------	----------------	--------------------

Specialty GI Surgery	Frequency 1755	Percentage 27.00 %
----------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

---

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43250

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43251      Tracking Number I18      Original Specialty Recommended RVU: **3.57**  
 Presented Recommended RVU: **3.57**  
 Global Period: 000      RUC Recommended RVU: **3.57**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69-year-old patient with chronic dyspepsia unresponsive to pharmacological therapy is referred for endoscopic examination. Esophagogastroduodenoscopy of the upper GI tract reveals a sessile polypoid lesion in the stomach; snare removal of the lesion is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 76%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 59%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. A polypoid lesion is identified and assessed. A snare is passed through the endoscope and looped around the lesion. As the snare is tightened, electrocautery is applied in a controlled manner and the

identified lesion is removed. The snare is withdrawn, and a retrieval device is inserted through the endoscope to capture the polyp. The retrieval device and polyp are withdrawn to the tip of the endoscope. The endoscope with the device and polyp are withdrawn through the mouth. The lesion is placed in a biopsy container. The endoscope is reinserted through the mouth to the area of the lesion. The base of the lesion is examined; if there is residual tissue the snare technique is repeated until there is no residual. The area is observed for bleeding. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology and pathology forms are completed; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current

practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

A survey was conducted and data presented to the RUC at the January 2013 meeting. The RUC reviewed the survey data for 43251 and agreed with the specialty societies that a median intra-service time of 20 minutes grossly underestimates the time it takes to perform this procedure. A five minute time differential between the base code, 15 minutes, and this code, 20 minutes, does not accurately account for the additional work in removing a lesion by snare technique. Additionally, the esophagoscopy equivalent codes had a time differential of 15 minutes. Therefore, the RUC recommends that CPT code 43251 be re-surveyed for presentation at the April 2013 RUC meeting.

### 43251 – Discussion and Recommendation

Code 43251 *Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique* was identified as a family code through the MPC List screen. In 1993, the RUC reviewed 43251 as a new code for 1994. The RUC RVW recommendation was based on the method of valuing the increment. In addition, the RUC took into consideration the weighted average of the different specialties reviewing the new code. A new RUC survey was conducted by the ACG, AGA and ASGE and 39 responses were received.

The panel noted that the survey time is again 20 minutes. The panel continues to believe that this time is anomalous compared to the base code time of 15 minutes. The analogous code for esophageal snare polypectomy is 43217; the incremental intraservice time above the base code 43200, both surveyed in 2012; was 15 minutes. The panel felt that snare polypectomy in the stomach or duodenum is not less complex or time consuming than in the esophagus. The panel recommends intraservice time of 20 minutes but cautions that this time and the resulting IWPUT should not be used for comparison purposes.

The consensus panel agrees that physician work for this service compared to the based code has not changed. **We recommend an RVW of 3.57.** This recommended RVW is less than the current value and equal to the base code 43235 (2.26 RVW approved at January 2013 meeting) plus the increment of 1.31 established by the RUC in October 2012 for the comparable esophagoscopy code pair 43200/43217. This value maintains relativity within the code family and is between the 25<sup>th</sup> and median survey values.

**Pre-time Package 2b** is appropriate for 43251, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

#### Comparison to Key Ref 31625

Key Reference code 31625 was surveyed and presented to the RUC in 2003 prior to the discussion of pre-time packages and moderate sedation work. The RUC agreed that the CPT change was editorial and that work had not changed. The RVW was maintained and the survey data was accepted.

#### Comparison to EGD Base Code 43235

*Establishment of increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between and within families were key to maintaining relativity. The consensus panel reviewing this family of codes believes the increment of 1.31 established for the esophagoscopy pair 43200/43217 by the RUC in October 2012 is correct for the similar EGD pair 43235/43251.

#### Comparison To Other RUC-Reviewed Codes with similar IWPUT and time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43251

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 81000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 27,000 (27,000 \* 3 = 81,000)

Specialty Gastroenterology Frequency 68040 Percentage 84.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
 27,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
 Please explain the rationale for this estimate. Medicare 2011 ~ 27,000

Specialty Gastroenterology	Frequency 22680	Percentage 84.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43251

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43252      Tracking Number I19      Original Specialty Recommended RVU: **3.19**  
 Presented Recommended RVU: **3.19**  
 Global Period: 000      RUC Recommended RVU: **3.06**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with optical endomicroscopy

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 66-year-old patient with weight loss, dyspepsia and chronic reflux symptoms unresponsive to pharmacological therapy is referred for evaluation. On diagnostic esophagogastroduodenoscopy, the patient is found to have an area of Barrett's esophagus with mucosal irregularity in the distal esophagus. Optical endomicroscopy with cellular level examination of abnormal mucosa is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 77%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 71%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment

for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Abnormal tissue in the distal esophagus suspicious for Barrett's esophagus is identified. An optical endomicroscopy probe is passed through the endoscope to examine the abnormal tissue. Real-time images are reviewed by the endoscopist, identifying areas that are suspicious for pre-malignant and/or malignant tissue, facilitating performance of biopsy (separate procedure). Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43252 *Esophagogastroduodenoscopy, flexible, transoral; with optical endomicroscopy* is a new code for 2013. The AGA and ASGE conducted a RUC survey and received 26 responses; all from physicians with experience and no financial conflict.

**We recommend an RVW of 3.19.** This value is less than the survey 25<sup>th</sup> percentile and equal to the base EGD code (43235) plus the RVW increment (0.80) approved by the RUC in October 2012 for the comparable esophagoscopy code pair (43206/43200).

**Pre-time Package 1b** is appropriate for 43252, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 91110

Key Reference code 91110 was surveyed and presented to the RUC in 2003 as a new code for 2004. Code 91110 requires more time than 43252 for lower intensity review of reports. This service is non-invasive and does not include moderate sedation.

### Comparison to EGD Base Code 43235

*Establishment of increments.* Harvard conducted an extensive review of the endoscopy families prior to the publication of the first PFS. The increments established between and within families were key to maintaining relativity. The consensus panel reviewing this family of codes believes the increment of 0.80 established for the esophagoscopy pair 43200/43206 by the RUC in October 2012 is correct for the similar EGD pair 43235/43252.

### Comparison To MPC and Other RUC-Reviewed Codes with 30 Minutes Intra-service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43200 + 43499 unlisted procedure, esophagus

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 5200

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 4,500 cases per year for the first year with an 8% year increase each year for the next 2 years.

Specialty Gastroenterology                      Frequency 5000                      Percentage 96.15 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 700

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 700 cases per year for the first year with an 8%/year increase each year for the next 2 years.

Specialty Gastroenterolog                      Frequency 680                      Percentage 97.14 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43253	Tracking Number I20	Original Specialty Recommended RVU: <b>5.41</b>
		Presented Recommended RVU: <b>5.39</b>
Global Period: 000		RUC Recommended RVU: <b>5.39</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided transmural injection of diagnostic or therapeutic substance(s) (eg, anesthetic, neurolytic agent) or fiducial marker(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 68-year-old patient with chronic pancreatitis, weight loss, and recurrent abdominal pain requiring chronic pharmacologic pain management is referred for esophagogastroduodenoscopy with evaluation of the upper GI tract, endoscopic ultrasound evaluation, and injection of neurolytic agent into the celiac plexus under ultrasound guidance.

Percentage of Survey Respondents who found Vignette to be Typical: 88%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 63%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 29%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. The pharmaceuticals / fiducial markers to be injected / inserted are reviewed. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

**Description of Intra-Service Work:** The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach. Residual fluid is removed from the stomach. The endoscope is advanced through the pylorus into the duodenal bulb, and then around the bulb apex to the second portion of the duodenum. Examination is conducted of the duodenum, the entire stomach including the gastric cardia in a retroflexed scope position, and the entire esophagus, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the linear-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach and to the duodenum or jejunum. Echoendoscopic evaluation is conducted of all abnormalities identified, correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the GI tract wall as well as vascular and other structures of the mediastinum or abdomen / retroperitoneum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated including identification of vascular structures in the anticipated track of the biopsy needle. A determination of risk and benefit to the planned injection is performed. The needle aspiration (FNA) device is prepared by loading the pharmaceuticals or fiducial. The FNA needle is inserted into the endoscope. Under continuous endoscopic and ultrasound guidance the FNA needle tip is advanced intramurally or transmurally into the correct location, taking care to avoid vascular structures and using Doppler imaging as needed to identify such structures. The FNA needle is inserted into the area and the pharmaceutical or fiducial is injected / inserted, taking care during the injection / insertion to maintain correct needle position. The FNA needle is withdrawn, an additional pharmaceutical or fiducial is loaded, and the injection / insertion is repeated as appropriate. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

**Description of Post-Service Work:** The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. A focused abdominal exam is conducted to evaluate for evidence of pseudocyst leakage or bleeding, and for effective cyst decompression. Post procedure orders are completed and discussed with staff. Photographs are reviewed and labeled. Radiographic images are reviewed with the technologist for entry into the image storing system. Cytology and/or pathology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications and follow-up plans or further treatments, specifically including stent removal plans. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	4.11	3.78
Intra-Service intensity/complexity	3.56	3.89
Post-Service intensity/complexity	4.00	3.33

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**43253 – Discussion and Recommendation**

Code 43253 *Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided transmural injection of diagnostic or therapeutic substance(s) (eg, anesthetic, neurolytic agent) or fiducial marker(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)* is a new code for 2013. A survey was conducted and 34 responses were received, with almost all respondents familiar with the procedure.

The expert panel noted that the work of 43253 is similar to but slightly greater than existing 43242 in that endoscopic ultrasound guidance is used to position a needle in a desired extraluminal location, but that 43253 includes injection or insertion of a substance or device while 43242 includes aspiration of a biopsy specimen. The panel felt that the work of these two codes should be comparable, but notes that the 25th percentile and median survey RVWs were, respectively, 4.44 and 5.77 while 43242 has a recommended value of 5.39. Noting that the FNA biopsy increments for code pairs 43231/43232, 43247/43238, and 43259/43242 are, respectively, 0.65, 0.67, and 0.65 the panel recommends adding the increment of 0.67 to the value of 43259 (4.74) to yield 5.41 RVU. The panel notes that the slightly higher increment of 0.67 is justified by the slightly higher intensity of injection/insertion compared to aspiration. **We recommend 5.39 RVU.**

#### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation which has been included in the pre-service work at a low intensity for code 43253. The additional work of injecting a neurolytic agent into the celiac plexus results in increased intensity and complexity for 43253 compared with 31631.

#### 43253 Comparison To Other RUC-Reviewed Codes with 40-50 Minutes Intra-Service Time

#### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43242, 43259, 64680, 43499, 44799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4200

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. 64530 (celiac plexus block) Medicare 2011 data ~ 2,000 claims, of which 70% are for pancreatic / abdominal symptoms / pain. The expert panel estimates that 70% of 64530 will be replaced by 43253 ~ 1,400. Commercial: 1,400\*3 = 4,200

Specialty Gastroenterology                      Frequency 3900                      Percentage 92.85 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 349  
If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 43259 Medicare 2011 data ~ 34,919 claims, of which 1% will be reported by this new bundled code.

Specialty Gastroenterology                      Frequency 320                      Percentage 91.69 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43242

SUMMARY OF RECOMMENDATION**

CPT Code: 43254      Tracking Number I21

Original Specialty Recommended RVU: **5.42**

Global Period: 000

Presented Recommended RVU: **5.42**RUC Recommended RVU: **5.25**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with endoscopic mucosal resection

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65-year-old patient with abdominal discomfort unresponsive to pharmacological therapy is referred for evaluation. On esophagogastroduodenoscopy, evaluation of the upper GI tract reveals a sessile neoplastic appearing mass lesion in the body of the stomach. Endoscopic mucosal resection of the lesion is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 95%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 58%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 38%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. The lesion to be resected is identified and

assessed. The endoscope may be withdrawn and a cap placed on the endoscope tip for cap assisted resection or a band ligation device is fitted on the endoscope tip. Cautery marks are then applied to the borders of the lesion. Submucosal injection assisted EMR of saline with epinephrine and dilute methylene blue is performed circumferentially at the base of the lesion. The lesion is resected with appropriate cutting devices inserted through the biopsy channel. If a cap assisted EMR technique is used, the lesion is suctioned into the cap and then resected using a cutting device inserted through the biopsy channel. If band ligation EMR technique is used, the target is suctioned into the cap and a band is deployed to capture the lesion. The lesion is then resected with appropriate cutting devices inserted through the biopsy channel. Hemostasis is accomplished with electrocautery, clips, or other devices as appropriate. Mucosal defects are closed with endoscopically placed clips. The lesion is retrieved with a retrieval device and placed in a specimen container. The endoscope is reinserted to the point of mucosal resection and the area is observed for bleeding and assessed for perforation. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Pathology forms are completed; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. Post procedure radiographic studies are ordered and reviewed. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	01/2013				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE)				
<b>Specialty(s):</b>	AGA, ASGE				
<b>CPT Code:</b>	43254				
<b>Sample Size:</b>	1455	<b>Resp N:</b>	43	<b>Response:</b> 2.9 %	
<b>Description of Sample:</b>	The AGA and ASGE received permission from the Research Subcommittee to administer surveys for the specialized and less frequently performed EGD and esophagoscopy procedures, including 4325X4 to an expert panel. The expert panel included physicians recommended from Industry and members of ASGE Special Interest Groups (SIG) who perform specific procedures (e.g. stent placement, ablation, etc.).

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43254 Esophagogastroduodenoscopy, flexible, transoral; with endoscopic mucosal resection is a new code for 2014. The AGA and ASGE conducted a RUC survey and received 43 responses.

**We recommend an RVW of 5.41.** This value is between the survey 25<sup>th</sup> percentile and median and is based: 1) on payment policy for multiple endoscopy work; and 2) increments approved by the RUC for esophagoscopy codes at the October 2012 meeting.

Code 43254 includes the work of snaring, banding, and injection. This incremental work would be added to the base EGD code 43235. To develop the incremental work, we used the RVW increment approved for the esophagoscopy code pairs (total RVW increment = 3.02) plus the RVW for 43235 (2.39). This equals 5.41.

		Rec RVW	Base 43200	RVW increment
43217	Snare	2.90	1.59	1.31
43205	Band	3.00	1.59	1.41
43201	Inject	1.89	1.59	0.30
				<b>3.02</b>

**Pre-time Package 2b** is appropriate for 43254, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation. In addition, the recommended evaluation time matches the survey median which is lower than the package time.

### Comparison to Key Ref 58561

Many different codes were chosen by survey respondents for this new service. Code 58561 was chosen most often. This code was surveyed and presented to the RUC in 1997. The RUC agreed with the specialty median RVW. Because of the significant difference in time and RVW, this is not a good comparator code.

### Comparison To Other RUC-Reviewed Codes with 45 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43251, 43236, 43244, and/or 43999

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 21000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Approximately 25% of 43251 (Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique) will be billed using 43254. Code 43251 Medicare 2011 volume is ~ 27,000. 25% of 27,000 is approximately 7,000 multiplied by 3 = ~21,000.

Specialty Gastroenterology Frequency 21000 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 443

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Approximately 1.5% of the services previously reported with base code 43251.

Specialty Gastroenterology Frequency 443 Percentage 100.00 %

Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency 0	Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43251

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43255      Tracking Number I22      Original Specialty Recommended RVU: **4.20**  
 Presented Recommended RVU: **4.20**  
 Global Period: 000      RUC Recommended RVU: **4.20**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with control of bleeding, any method

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 67-year-old patient taking over-the-counter pharmacological therapy for arthritic symptoms presents with melena and hematemesis. Esophagogastroduodenoscopy of the upper GI tract is performed, revealing an ulcer in the duodenal bulb with an adherent clot and bleeding from the ulcer base. Control of bleeding is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 82%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 80%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents and blood. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. The bleeding lesion is identified and assessed. A bipolar cautery probe is inserted through the endoscope and positioned on the bleeding lesion; therapy is applied to control the bleeding. When indicated, epinephrine is injected submucosally and/or endoclips are placed. Once the bleeding is controlled, the area is assessed and

observed for further bleeding. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43255 *Esophagogastroduodenoscopy, flexible, transoral; with control of bleeding, any method* was identified as a family code through the MPC List screen. The 1992 RVW for 43255 was 4.64. This service was reviewed by the RUC twice. In 1993, the RUC reviewed 43255 as part of an overall review of the EGD family in relation to new codes that were created for 1994. In 1993, the RUC recommended maintaining the RVW for 43255. The RUC again reviewed 43255 in 2000 as part of the second 5YR and determined that complexity had increased because of technology and a new survey using a value the increment. The RUC recommended an increased RVW of 4.82. The AGA, ASGE, and SAGES conducted a RUC survey and received 82 responses.

The expert panel determined that direct application of the esophagoscopy code pair (43200/43227) to EGD work was not appropriate for 43255 because the presence of pooled blood and clot in the stomach requires additional work to achieve adequate gastroduodenal visualization which is not a factor in examination confined to the esophagus alone. We do not believe the work has changed, however, based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the 25<sup>th</sup> percentile RVW of 4.20**. This value is below current RVW.

**Pre-time Package 2b** is appropriate for 43255 with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31638

Key Reference code 31638 requires lower intensity fluoroscopic guidance which increases the intra-service time. The difference in RVW compared with 43255 accounts for longer total time, but at lower intensity.

### Comparison To Other RUC-Reviewed Codes with 30 Minutes Intra-Service Time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43255

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Commonly

Specialty General Surgery How often? Rarely

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 157500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data 2011 = 52500.  $(52500 \times 3) = \sim 157,500$

Specialty Gastroenterology Frequency 141750 Percentage 90.00 %

Specialty General Surgery Frequency 3150 Percentage 2.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

54,055 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data 2011 = 54055

Specialty Gastroenterology Frequency 47250 Percentage 90.00 %

Specialty General Surgery Frequency 1050 Percentage 2.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43255

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43266      Tracking Number I23

Original Specialty Recommended RVU: **4.34**Presented Recommended RVU: **4.34**

Global Period: 000

RUC Recommended RVU: **4.40**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70-year-old patient with progressive dysphagia and weight loss is found to have an obstructing, concentric mass lesion in the mid-esophagus that is not amenable to surgical resection. The patient is referred for esophagogastroduodenoscopy for evaluation of the upper GI tract, and placement of an esophageal stent.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 61%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 38%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced to an obstructing, concentric tumor which prohibits passage of the standard endoscope. The endoscope is withdrawn and a thin caliber flexible endoscope is inserted through the mouth into the esophagus. The endoscope is passed to the tumor. When necessary, a balloon dilating catheter is positioned through the tumor using endoscopic and fluoroscopic guidance and inflated to allow passage of the endoscope.

through the tumor, confirming its extent. The endoscope is withdrawn, allowing measurement of the tumor and marking the distal and proximal margins for stent placement. The endoscope is reinserted to 2 cm past the distal end of the tumor and a guidewire is inserted through the endoscope. Using fluoroscopic and endoscopic guidance, the expandable wire stent is advanced over the guidewire and positioned across the tumor. If necessary, contrast is inserted under fluoroscopic guidance to confirm positioning of the stent. Fluoroscopic imaging is obtained and spot digital images are taken. The stent is slowly deployed across the tumor under fluoroscopic guidance, with repositioning if necessary. Once the stent is placed, the guidewire and introducing device are withdrawn through the mouth and the thin caliber endoscope is reinserted through the mouth to confirm proper positioning of the stent. The thin caliber endoscope is withdrawn through the mouth and the standard caliber endoscope is reinserted through the mouth into the esophagus, confirming that the endoscope can be passed through the stented area without difficulty. Contrast is injected through the endoscope to assess placement and patency. As needed, deployment of balloon dilating catheter is utilized to expand the stent to sufficient lumen size. The area is observed to confirm absence of active bleeding. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	01/2013				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE)

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

## Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43266 *Esophagogastroduodenoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)* is a new/revised code for 2014 that adds "post-dilation and passage of guidewire" to the CPT descriptor of to-be-deleted code 43256 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with transendoscopic stent placement (includes predilation)*. The AGA and ASGE conducted a RUC survey and received 51 responses.

**We recommend an RVW of 4.34.** This is less than the 25<sup>th</sup> percentile and is the current RVW for to-be-deleted code 43256. This recommendation is conservative in that it does not include the additional work related to post-dilation and passage of guidewire.

**Pre-time Package 2b** is appropriate for 43266, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

## Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation. Code 31631, which is also an endoscopic stent placement code compares well with the recommendation for 43266.

## Comparison To MPC Other RUC-Reviewed Codes with ~40 Minutes Intra-Service Time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43256

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 12000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43256 (Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with transendoscopic stent placement (includes predilation)) multiplied by 3 ( $4,000 \times 3$ ) = ~12,000, which will be deleted from CPT and replaced by 43266

Specialty Gastroenterology Frequency 9500 Percentage 79.16 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,958

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43256 = 3958

Specialty Gastroenterology Frequency 3200 Percentage 80.00 %

Specialty Frequency 0 Percentage 0.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? No

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43256

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43257      Tracking Number    I24

Original Specialty Recommended RVU: **4.25**Presented Recommended RVU: **4.25**

Global Period: 000

RUC Recommended RVU: **4.25**

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with delivery of thermal energy to the muscle of lower esophageal sphincter and/or gastric cardia, for treatment of gastroesophageal reflux disease

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 66-year-old patient has over 6 months of dyspepsia, heartburn and regurgitation symptoms occurring three times or more per week that has not responded to lifestyle management strategies and intensive daily pharmacologic therapy. Diagnostic workup includes esophageal motility and pH studies. The patient is referred for esophagogastroduodenoscopy with evaluation of the upper GI tract, followed by delivery of thermal energy to the lower esophageal sphincter for management of the patient's reflux symptoms.

Percentage of Survey Respondents who found Vignette to be Typical: 84%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 61%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 50%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-

inspecting the stomach and duodenum. The upper endoscope is then positioned in the gastric antrum, and a guide-wire is passed through the endoscope into the duodenum or gastric antrum. The endoscope is withdrawn while noting the distance from the incisors to the gastroesophageal junction. The thermal catheter is passed over the guide-wire and positioned 1 cm proximal to the squamocolumnar junction. The thermal catheter balloon is inflated to 2.5 psi, needle electrodes (4) deployed, and RF energy delivery commenced. This treatment is repeated after rotating the catheter 45 degrees and then again by advancing it 5 mm (4 treatments thus far). The catheter is then advanced into the stomach. An endoscope is re-introduced per-oral and passed alongside the catheter to confirm accurate positioning of the first 2 rings. The endoscope is then withdrawn. Third and fourth rings, comprised of eight lesions per ring, are then placed in 5 mm increments distal to the second ring, adjusting the measurements according to the endoscopic findings. The catheter is then advanced into the stomach, fully inflated to 25 cc of air, and withdrawn into the gastric cardia. Three such deployments and lesion sets are created, totaling 12 lesions in the distal cardia. This is repeated with a balloon inflated to 22cc, creating 12 lesions in the proximal cardia. A third EGD is performed to confirm lesion placement. The catheter is then withdrawn. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>	01/2013				
<b>Presenter(s):</b>	Joel V. Brill, MD (AGA), Nicholas Nickl, MD (ASGE), Edward S. Bentley, MD (ASGE)				
<b>Specialty(s):</b>	AGA, ASGE				
<b>CPT Code:</b>	43257				
<b>Sample Size:</b>	1720	<b>Resp N:</b>	25	<b>Response:</b> 1.4 %	
<b>Description of Sample:</b>	The AGA and ASGE received permission from the Research Subcommittee to administer surveys for the specialized and less frequently performed EGD and esophagoscopy procedures, including 4320X5 to an expert panel. The expert panel included physicians recommended from Industry and members of ASGE Special Interest Groups (SIG) who perform specific procedures (e.g. stent placement, ablation, etc.).

Intra-Service intensity/complexity	4.29	4.14
Post-Service intensity/complexity	3.43	3.43

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

### Background

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD codeset.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43257 *Esophagogastroduodenoscopy, flexible, transoral; with delivery of thermal energy to the muscle of lower esophageal sphincter and/or gastric cardia, for treatment of gastroesophageal reflux disease* was identified as a family code through the MPC List screen. This code was surveyed in 2003 as a new CPT code for 2005. The RUC compared this new code to 43262 (ERCP) and recommended the survey 25<sup>th</sup> percentile. The AGA and ASGE conducted a RUC survey and received 25 responses. This is a very low volume code.

There is no direct esophagoscopy code pair increment that would apply to 43257. We do not believe the work has changed for this service, however, based on our consensus panel determination to recommend the lower of the current value or 25<sup>th</sup> percentile for existing codes, **we recommend the 25<sup>th</sup> percentile RVW of 4.25.**

**Pre-time Package 2b** is appropriate for 43257, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 31631

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation.

### Comparison To MPC and Other RUC-Reviewed Codes with 45 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43257

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43257

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 43270	Tracking Number I25	Original Specialty Recommended RVU: <b>5.05</b>
		Presented Recommended RVU: <b>5.05</b>
Global Period: 000		RUC Recommended RVU: <b>4.39</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 74-year-old patient with reflux symptoms and dyspepsia unresponsive to pharmacological therapy is found to have Barrett's esophagus with dysplasia. The patient undergoes esophagogastroduodenoscopy for evaluation of the upper GI tract, and thermal ablation of the dysplastic tissue.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 62%

Is moderate sedation inherent to this procedure in the office setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the office setting? 33%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's x-rays and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic equipment is available and operational and appropriate computer entries are made. The patient is positioned on the examination table. The endoscopic and moderate sedation monitoring equipment is positioned to provide access for the procedure. A time out is performed. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible upper endoscope is inserted through the mouth into the oropharynx and advanced through the esophagus into the proximal stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. The endoscope is slowly withdrawn re-inspecting the stomach and duodenum. After suctioning air to deflate the stomach, the endoscope is withdrawn into the esophagus, allowing measurement of the squamocolumnar and gastro-esophageal junction from the incisors, assessment

for presence of a hiatal hernia, and examination of the esophageal mucosa. When indicated, brushings or washings are obtained of suspicious abnormalities. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Abnormal tissue in the esophagus is identified, which has previously been confirmed as consistent with Barrett's esophagus, high grade dysplasia. Under endoscopic visualization, a guidewire is passed through the endoscope beyond the gastroesophageal junction, and the endoscope is withdrawn. The endoscope is reinserted through the mouth into the distal esophagus, and a sizing balloon catheter is placed through the endoscope into the esophagus to straddle the region of abnormality to be ablated. The sizing balloon is inflated to ascertain the luminal diameter to be treated. The sizing balloon is removed and an ablation catheter of appropriate caliber is passed over the guidewire into the esophagus. The level of sedation of the patient is reassessed and additional medication is administered as needed. The endoscope is withdrawn into the mid-esophagus and radiofrequency ablation of the lesion proceeds under direct visualization. The catheter is deflated and the endoscope is advanced to inspect the esophageal mucosa for extent of coagulation effect. The ablation process is repeated. If inadequately treated regions remain, the endoscope is removed. A cap device with spot ablation capability is fitted on the tip of the endoscope. The endoscope is passed through the mouth into the esophagus to the level of lesion to be treated, and further ablation applied under direct visualization. At the conclusion of the ablation procedure, the area is observed for bleeding. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. Post procedure orders are completed. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to referral source and other appropriate parties. Data is entered into procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others. Necessary prescriptions, follow-up tests and appointments are provided to the patient.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Several EGD codes were identified through CMS and RUC screens as potentially misvalued, including: MPC list screen; high expenditures screen; and fastest growing screen. The specialties agreed to survey the entire family of codes (43235-43259). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In October 2012, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the EGD code set.

### Overview of EGD Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of EGD codes, comparing the data and values with the esophagoscopy codes (43200-43228) that were approved by the RUC at the October 2012 RUC meeting. The compelling arguments from the esophagoscopy review are the same as for the EGD codes, with the additional fact that the times for codes built on increments from the base code (43235) would require adjustment.

After reviewing the survey data, the consensus panel determined that for the EGD codeset, the incremental value above the base code for EGD (43235) should be similar where possible to the analogous incremental value above the esophagoscopy base code (43200) previously approved. For the existing codes, the RVW recommendations are based on the lower of the current value or the EGD base+increment from the esophagoscopy pair (ie, valuing the increment). Where there was no exact match for existing codes, the RVW recommendation is the lower of the current RVW or the 25<sup>th</sup> percentile RVW. For all new codes that bundle multiple codes and/or deleted codes, the RVW recommendation is based on endoscopy multiple procedure payment policy or surgical multiple procedure payment policy, as applicable. For this last set of codes, all but two recommendations are less than the survey 25<sup>th</sup> percentile. For the two exceptions, the recommendation is between the 25<sup>th</sup> and median survey RVW.

Code 43270 *Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)* is a new/revised code for 2014 that adds dilation and passage of guidewire to the work of to-be-deleted code 43258 *Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with ablation of tumor(s), polyp(s), or other lesion(s) not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique*. The AGA and ASGE conducted a RUC survey and received 49 responses.

**We recommend an RVW of 5.05.** This value is between the survey 25<sup>th</sup> percentile and median and is based: 1) on payment policy for multiple endoscopy work; and 2) increments approved by the RUC for esophagoscopy codes at the October 2012 meeting.

Code 43270 includes the work of balloon dilation and ablation. To develop the incremental work, we used the RVW increment approved for the esophagoscopy code pair 43200/43220 (0.51) plus the RVW for 43258 (4.54). This equals 5.05. The RVW of 5.05 ranks 43270 correctly with other EGD services.

**Pre-time Package 2b** is appropriate for 43270, with an additional 2 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to induction of moderate sedation.

### Comparison to Key Ref 52342

Many different codes were chosen by survey respondents for this new service. Code 52342 was chosen most often. This code was surveyed and presented to the RUC in 2010. Because of the difference in time and RVW, this is not a good comparator code.

### Comparison To Other RUC-Reviewed Codes with 45 Minutes Intra-Service Time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43258

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 51000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43258 (Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate; with ablation of tumor(s), polyp(s), or other lesion(s) not amenable to removal by hot biopsy forceps, bipolar cautery or snare technique) multiplied by 3 (17,000\*3) = ~51,000, which will be deleted from CPT and replaced by 43270

Specialty Gastroenterology                      Frequency 46000                      Percentage 90.19 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 16,695 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 volume for 43258 = 16695

Specialty Gastroenterology                      Frequency 15500                      Percentage 91.17 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

---

### **Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43258

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 43259	Tracking Number I27	Original Specialty Recommended RVU: <b>4.74</b>
		Presented Recommended RVU: <b>4.74</b>
Global Period: 000		RUC Recommended RVU: <b>4.74</b>

CPT Descriptor: Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 71-year-old patient with abdominal and back discomfort and weight loss develops painless jaundice. Imaging studies reveal dilation of the pancreatic and bile ducts; a discrete mass lesion is not identified. The patient is referred for esophagogastroduodenoscopy with evaluation of the upper GI tract, with endoscopic ultrasound to identify if a mass lesion is present and, if so, to then stage the tumor and determine operability.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 68%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 56%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and moderate sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and echoendoscopy imaging and image capture equipment is available, operational and appropriate imaging settings and computer entries are made, with special attention to the transducer balloon sheath. A time out is performed. The patient is positioned on the procedure table. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire is applied and verification that all others in the suite are properly protected including the patient. Intravenous access is started and moderate sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. Topical anesthesia is applied to the throat. A bite block is placed in the mouth.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard upper endoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach. Residual

fluid is removed from the stomach. The endoscope is advanced through the pylorus into the duodenal bulb, and then around the bulb apex to the second portion of the duodenum. Examination is conducted of the duodenum, the entire stomach including the gastric cardia in a retroflexed scope position, and the entire esophagus, noting the abnormal area(s) to be evaluated by echoendoscopy and location as well as any other abnormalities present. The standard upper endoscope is withdrawn; the radial-view or linear-view echoendoscope is inserted into the mouth and the oropharynx and advanced through the esophagus into the stomach and to the duodenum or jejunum. Echoendoscopic evaluation is conducted of all abnormalities identified, correlating the endoscopic and ultrasonographic images. The locations of the findings are noted, as is the relationship of abnormalities to adjoining normal and abnormal structures including the GI tract wall as well as vascular and other structures of the mediastinum or abdomen/retroperitoneum. Multiple transducer frequencies are utilized as needed to fully visualize the area of interest. Doppler imaging of appropriate areas is completed when indicated. A determination of risk and benefit to sample (e.g. biopsy) the lesion is performed. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. Supervision of the level of sedation and vital signs is performed during the procedure with additional measures taken to maintain an appropriate level of sedation, vital signs, airway and oxygenation as indicated. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Post procedure orders are completed and discussed with staff. Photographs are reviewed and labeled. Radiographic images are reviewed with the technologist for entry into the image storing system. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications and follow-up plans or further treatments. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

Post-Service intensity/complexity	3.80	3.20
-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**43259 – Discussion and Recommendation**

Code 43259 *Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis* was identified as a family code through the MPC List screen. This service has been reviewed by the RUC three times. In 1993, the RUC reviewed the new code and recommended an RVW of 6.11 with survey intra-time of 55 minutes. CMS disagreed with this recommendation and assigned an RVW of 3.95 (a 35% reduction). Refinement resulted in an increase in 1995 to 4.89 (a 20% reduction from the RUC recommendation. The RUC again reviewed the code in 2000 during the second five-year-review and approved an RVW of 8.59 based on a calculated increment and 69 minutes of intra-service time. CMS disagreed and maintain the RVW of 4.89. The third review of 43259 occurred in 2003 in conjunction with creation of new ultrasound codes. At this review, the RUC determined that the CMS assigned RVW of 4.89 presented a rank order anomaly. The RUC crosswalked their recommendation to 45385 (5.30 RVU) with a slight reduction for reduced intensity and work neutrality within the family of new codes, resulting in a recommended RVU of 5.19. CMS accepted this RUC recommendation.

A survey was conducted and received 36 respondents. The expert panel noted that the median intraservice time was 45 minutes, which is 30 minutes above the IS time for the family base code, 43235, of 15 minutes. The 25th percentile survey RVW of 4.74 provides incremental work over the base code (43235, 2.36 RVU) of 2.48; this is appropriately comparable to the increment for 43237 / 43235 of 1.59, representing the additional work of endoscopic ultrasound of the entire esophagus, stomach, and duodenum compared to the esophagus alone. **We recommend the 25<sup>th</sup> percentile RVW of 4.74 which is less than the current value of 5.19.**

**Comparison to Key Ref 31631**

Key Reference code 31631 was surveyed and presented to the RUC in 2004. The RUC agreed with the specialty presentation that the work had not changed and maintained the RVW and accepted the survey times. Code 31631 does not include the additional work/intensity of physician administered moderate sedation. Code 43259 compares favorably with 31631; the additional work, intensity and time for moderate sedation is reflected in the difference in RVWs.

**43259 Comparison To MPC and Other RUC-Reviewed Codes with 40-45 Minutes Intra-Service Time**

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.

- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43259

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 105000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 35,000

Specialty Gastroenterology                      Frequency 96600                      Percentage 92.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare 2011 ~ 35,000

Specialty Gastroenterology                      Frequency 32200                      Percentage 92.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43259

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

<b>Rationale</b>	25th pctl
------------------	-----------

Code	Description	Current RVW	RUC Rec	Survey RVW Median	Survey 25%	Pre Pack	Pre	Intra	Post	Total	IWPUT	RUC Valuation Methodology
43235	Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with collection of specimen(s) by brushing or washing, when performed	2.39	2.26	3.00	2.59	1b	27	15	12	54	0.097	Direct crosswalk to CPT code 31579 Laryngoscopy, flexible or rigid fiberoptic, with stroboscopy (work RVU= 2.26, 15/15/15)
43236	Esophagogastroduodenoscopy, flexible, transoral; with directed submucosal injection(s), any substance	2.92	2.57	3.62	3.21	1b	27	20	15	62	0.085	43235 (2.26) + increment of 43201-43200 (0.31)
43237	Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination limited to the esophagus	3.98	3.85	4.20	3.85	2b	38	35	20	93	0.075	25th percentile. 3.98 current RVW - 0.13 (decrease in 43235 EGD base code (2.39 - 2.26 = 0.13) = 3.85 RVW
43238	Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s), esophagus (includes endoscopic ultrasound examination limited to the esophagus)	5.02	4.50	5.03	4.50	2b	38	45	20	104	0.073	25th percentile. 5.02 current RVW - 0.13 (decrease in 43235 EGD base code (2.39 - 2.26 = 0.13) = 4.89, which supports the 25th percentile 4.50 RVW. Increment for FNA between 43237 and 43238 is 0.65, which compares to code 76942, US guidance for needle placement, RVW = 0.67)
43239	Esophagogastroduodenoscopy, flexible, transoral; with biopsy, single or multiple	2.87	2.56	3.36	3.00	1b	27	15	12	54	0.117	43235 (2.26) + increment of 43202-43200 (0.30)
43240	Esophagogastroduodenoscopy, flexible, transoral; with transmural drainage of pseudocyst (includes placement of transmural drainage catheter[s]/stent[s], when performed, and endoscopic ultrasound, when performed)	6.85	7.25	8.50	7.25	2b	41	70	30	153	0.082	25th percentile. Preserves rank order among the EGD EUS codes and within the EGD family
43241	Esophagogastroduodenoscopy, flexible, transoral; with insertion of intraluminal tube, or catheter	2.59	2.59	4.25	3.50	2b	33	30	15	78	0.053	No Esophagoscopy equivalent: the current value of 2.59 is recommended
43242	Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided intramural or transmural fine needle aspiration/biopsy(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)	7.30	5.39	6.65	5.04	2b	41	50	23	124	0.081	Building block: 4.74 recommended RVW for 43259 + 0.65 (Increment for FNA between 43237 and 43238 is 0.65, which compares to code 76942, US guidance for needle placement) = 5.39, which is greater than the survey 25th percentile but less than the current RVW. It maintains rank order in the EGD EUS procedures.
43243	Esophagogastroduodenoscopy, flexible, transoral; with injection sclerosis of esophageal / gastric varices	4.56	4.37	4.89	4.37	2b	41	30	20	91	0.103	No Esophagoscopy equivalent: the 25th percentile of 4.37 is recommended
43244	Esophagogastroduodenoscopy, flexible, transoral; with band ligation of esophageal / gastric varices	5.04	4.50	4.90	4.50	2b	41	30	20	91	0.107	No Esophagoscopy equivalent: the 25th percentile of 4.50 is recommended
43245	Esophagogastroduodenoscopy, flexible, transoral; with dilation of gastric / duodenal stricture(s) (eg, balloon, bougie)	3.18	3.18	4.13	3.58	2b	33	23	15	71	0.097	No Esophagoscopy equivalent: the current value of 3.18 is recommended
43246	Esophagogastroduodenoscopy, flexible, transoral; with directed placement of percutaneous gastrostomy tube	4.32	4.32	5.12	4.30	2b	41	30	15	86	0.105	Current
43247	Esophagogastroduodenoscopy, flexible, transoral; with removal of foreign body	3.38	3.27	4.50	3.98	2b	23	30	15	68	0.082	43235 (2.26)+ increment of 43215-43200 (1.01)
43248	Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire	3.15	3.01	4.10	3.64	1b	27	20	15	62	0.107	43235 (2.26) + increment of 43226-43200 (0.75)
43249	Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic balloon dilation of esophagus (less than 30 mm diameter)	2.90	2.77	4.07	3.36	1b	27	20	15	62	0.095	43235 (2.26) + increment of 43220-43200 (0.51)
43233	Esophagogastroduodenoscopy, flexible, transoral; with dilation of esophagus with balloon (30 mm diameter or larger) (includes fluoroscopic guidance, when performed)	NEW	4.45	4.98	4.45	2b	38	30	20	88	0.099	25th percentile work RVU of 4.45
43250	Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery	3.20	3.07	3.50	3.25	1b	24	20	14	58	0.115	43235 (2.26) + increment of 43216-43200 (0.81)
43251	Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique	3.69	3.57	3.80	3.36	2b	33	20	10	63	0.134	Increment: 43235 (2.26) + established incr. of esoph snare for EGD and Esoph (1.31) = 3.57
43252	Esophagogastroduodenoscopy, flexible, transoral; with optical endomicroscopy	NEW	3.06	4.00	3.66	1b	27	30	20	77	0.069	43235 (2.26) + increment of 431X1-43200 (0.80)
43253	Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic ultrasound-guided transmural injection of diagnostic or therapeutic substance(s) (eg, anesthetic, neurolytic agent) or fiducial marker(s) (includes endoscopic ultrasound examination of the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)	NEW	5.39	5.77	4.44	2b	41	40	23	111	0.101	Increment: 4.74 recommended RVW for 43259 + 0.65 (Increment for FNA between 43237 and 43238), which is greater than the survey 25th percentile but less than the median RVW. It maintains rank order in the EGD EUS procedures. This is slightly higher than 43242 because the work of injection is higher than the work of FNA aspiration (43242).
43254	Esophagogastroduodenoscopy, flexible, transoral; with endoscopic mucosal resection	NEW	5.25	6.90	5.25	2b	38	45	20	103	0.090	25th percentile work RVU of 5.25
43255	Esophagogastroduodenoscopy, flexible, transoral; with control of bleeding, any method	4.81	4.20	4.93	4.20	2b	41	30	20	91	0.097	No Esophagoscopy equivalent: the 25th percentile of 4.20 is recommended
43266	Esophagogastroduodenoscopy, flexible, transoral; with placement of endoscopic stent (includes pre- and post-dilation and guide wire passage, when performed)	NEW	4.40	5.20	4.40	2b	41	40	20	101	0.078	25th percentile work RVU= 4.40
43257	Esophagogastroduodenoscopy, flexible, transoral; with delivery of thermal energy to the muscle of lower esophageal sphincter and/or gastric cardia, for treatment of gastroesophageal reflux disease	5.50	4.25	5.10	4.25	2b	41	45	15	101	0.068	No Esophagoscopy equivalent: the 25th percentile of 4.25 is recommended
43270	Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)	NEW	4.39	5.75	4.39	2b	41	45	15	101	0.071	25th percentile work RVU= 4.39
43259	Esophagogastroduodenoscopy, flexible, transoral; with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum or a surgically altered stomach where the jejunum is examined distal to the anastomosis)	5.19	4.74	5.45	4.74	2b	41	45	20	111	0.077	25th percentile. 43259 involves more work than 43237 (EGD with EUS limited to esoph = 3.85 RVW) because there is more to examine (stomach and either duodenum or surgically altered stomach). The 25th percentile RVW 4.74 maintains relativity to the other EGD with EUS codes

Donald Selzer, MD, RUC Advisor, SAGES

Subject: Compelling Evidence for Practice Expense for Tab 8

---

The American Gastroenterological Association (AGA), American Society for Gastrointestinal Endoscopy (ASGE), and Society of American Gastrointestinal and Endoscopic Surgeons (SAGES) are pleased to submit recommendations to the RUC regarding practice expense for Esophagogastroduodenoscopy (EGD) codes 43235-43270, tab 8, for discussion at the January 2013 RUC meeting.

We present the following arguments for compelling evidence for the procedures in tab 8:

- Changes in technology
- Changes in site of service
- Errors/omissions in previous valuation

When the Practice Expense Subcommittee reviewed tab 10, the esophagoscopy codes 43200-43232 in October 2012, they accepted that there was compelling evidence to review, change and update the practice expense staff, supplies and equipment inputs for all of the codes in the family since they were last evaluated for practice expense, based on changes in technology, site of service migration for several services not previously valued in the non-facility setting, changes in patient safety requirements, and the absence of scope cleaning supplies in non-facility setting.

The practice expense inputs being presented for the existing EGD codes in tab 8 correspond directly to the practice expense inputs that were approved for the similar esophagoscopy codes that the RUC approved in October 2012.

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non-Facility Direct Inputs**

**TAB 8 - CPT Code / Long Descriptor:**

<b>43235</b>	Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with collection of specimen(s) by brushing or washing, when performed
<b>43236</b>	Esophagogastroduodenoscopy, flexible, transoral; with directed submucosal injection(s), any substance
<b>43239</b>	Esophagogastroduodenoscopy, flexible, transoral; with biopsy, single or multiple
<b>43241</b>	N/A – FACILITY ONLY
<b>43243</b>	N/A – FACILITY ONLY
<b>43244</b>	N/A – FACILITY ONLY
<b>43245</b>	Esophagogastroduodenoscopy, flexible, transoral; with dilation of gastric / duodenal stricture(s) (eg, balloon, bougie)
<b>43246</b>	N/A – FACILITY ONLY
<b>43247</b>	Esophagogastroduodenoscopy, flexible, transoral; with removal of foreign body
<b>43248</b>	Esophagogastroduodenoscopy, flexible, transoral; with insertion of guide wire followed by dilation of passage of dilator(s) through esophagus over guide wire
<b>43249</b>	Esophagogastroduodenoscopy, flexible, transoral; with transendoscopic balloon dilation of esophagus (less than 30 mm diameter)
<b>43250</b>	Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by hot biopsy forceps or bipolar cautery
<b>43251</b>	Esophagogastroduodenoscopy, flexible, transoral; with removal of tumor(s), polyp(s), or other lesion(s) by snare technique
<b>43252</b>	Esophagogastroduodenoscopy, flexible, transoral; with optical endomicroscopy
<b>43255</b>	Esophagogastroduodenoscopy, flexible, transoral; with control of bleeding, any method
<b>43257</b>	N/A – FACILITY ONLY
<b>43254</b>	N/A – FACILITY ONLY
<b>43233</b>	N/A – FACILITY ONLY
<b>43266</b>	N/A – FACILITY ONLY
<b>43270</b>	Esophagogastroduodenoscopy, flexible, transoral; with ablation of tumor(s), polyp(s), or other lesion(s) (includes pre- and post-dilation and guide wire passage, when performed)

**Global Period: 000**

**Meeting Date: January 2013**

**1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

The AGA, ASGE, and SAGES convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform these services. The committee served as the consensus panel to develop PE recommendations.

**2. You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

For codes previously priced in the office setting, the current PE times are shown, along with another crosswalk reference code for the matching esophagoscopy service - just reviewed by the PE Subcommittee in October 2012. For codes that were previously not priced in the office setting, reference codes were chosen that matched where possible to the similar service for esophagoscopy. All crosswalk reference codes were just reviewed and approved by the PE Subcommittee in October 2012.

43248	PEAC-02	0	0	0	43226	RUC-12	9	83	3	43248	9	88	3
43249	PEAC-02	0	0	0	43220	RUC-12	9	78	3	43249	9	78	3
43250	PEAC-02	0	0	0	43216	RUC-12	9	80	3	43250	9	78	3
43251	PEAC-02	0	0	0	43217	RUC-12	9	88	3	43251	9	78	3
43252	NEW-13	--	--	--	43206	RUC-12	9	88	3	43252	9	88	3
43255	PEAC-02	0	0	0	43227		9	88	3	43255	9	88	3
					43228	RUC-12	9	93	3	43270	9	103	3

\* Note: RN time will be equal to 2 minutes (standard for sedate apply MS) PLUS 100% physician time for scope-in-scope out PLUS 15 minutes to monitor the patient after scope out during anesthesia reversal

**3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

For codes previously priced in the office:

- time was added to set up scope and to clean scope – both of these activities were not assigned time in the early PE review 2002
- time to obtain vitals was increased from 3 minutes to 5 minutes to account for 4-6 vitals taken before administration of moderate sedation

For codes NOT previously priced in the office, the recommended times are consistent with recently reviewed esophagoscopy codes.

**4. Please describe in detail the clinical activities of your staff:**

Pre-Service Clinical Labor Activities:

Three minutes to complete pre-service diagnostic and referral forms.  
Five minutes to coordinate pre-surgery services with other qualified healthcare providers  
Three minutes for pre-op prescriptions

Intra-Service Clinical Labor Activities:

Three minutes: Greet patient, provide gowning, ensure appropriate medical records are available  
Five minutes: 4-6 vitals  
Three minutes: Provide pre-service education/obtain consent  
Two minutes: Prepare room, equipment, supplies  
Five minutes: Setup scope (non facility setting only)  
Two minutes: Prepare and position patient/ monitor patient/ set up IV  
Minutes vary with procedure – 100% MD time to assist physician in performing procedure  
Three minutes: Clean room/equipment by physician staff  
Thirty minutes: Clean flexible scope  
Ten minutes: Clean Surgical Instrument Package (only code 43248)  
Two minutes: Complete diagnostic forms, lab & X-ray requisitions  
Three minutes: Check dressings & wound/ home care instructions /coordinate office visits /prescriptions

Post-Service Clinical Labor Activities: Three minutes for a follow-up phone call to patient

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence:

We present the following arguments for compelling evidence for 43251:

- Changes in technology
- Changes in site of service
- Errors/omissions in previous valuation

When the Practice Expense Subcommittee reviewed the esophagoscopy codes 43200-43232 (Tab 10) in October 2012, they accepted that there was compelling evidence to review, change and update the practice expense staff, supplies and equipment inputs for all of the codes in the family since they were last evaluated for practice expense, based on changes in technology, site of service migration for several services not previously valued in the non-facility setting, changes in patient safety requirements, and the absence of scope cleaning supplies in non-facility setting.

The practice expense inputs being presented for 43251 correspond directly to the practice expense inputs that were approved for the similar esophagoscopy code 43217 that the RUC approved in October 2012.

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

For all codes shown above:

- Three minutes to complete pre-service diagnostic and referral forms.
- Five minutes to coordinate pre-surgery services with other qualified healthcare providers

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*MPC List Screen*

April 2013

**Endoscopic Retrograde Cholangiopancreatography (ERCP)**

In September 2011, several ERCP codes were identified by CMS through the MPC List screen. In February 2013, the CPT Editorial Panel revised the entire ERCP section to include: 1) deletion of 5 codes; 2) establishment of 5 new codes; 3) new guidelines and coding instruction; and 4) revisions to ERCP, small intestine and stomal endoscopy codes. After survey of these procedures, the specialty societies noted that these ERCP procedures are not inherently performed with moderate sedation by the same physician. However, due to CMS' consistent position, at the April meeting and in multiple Medicare Physician Payment Rules, that the Agency is looking for larger bundling of services, not unbundling of services, the moderate sedation for these services will remain bundled. Therefore, the ERCP family of services will remain on Appendix G in the CPT codebook.

During the CPT 2014 cycle, the RUC reviewed all the esophagoscopy, EGD and ERCP families of codes. This provided a unique opportunity for the RUC and specialty societies to review relativity across the board for these endoscopy series of codes. As with any large review, the RUC placed the highest importance on relativity both within the immediate family and throughout the larger family of these endoscopic services. In January 2013, the RUC approved several new codes, which now bundle physician work components previously reported by separate codes into one code. These recommendations were valued using an incremental methodology. The RUC noted that this methodology was necessary for three reasons. First, given that an entire genre of services is being reviewed over two years, relativity amongst the family is critical. The potential for rank order anomalies is high considering the large amount of codes reviewed in succession. Second, CMS (then HCFA) used the incremental approach in their initial valuation of these services in 1992 and 1993. According to CMS commentary in the Federal Register for those years, the Agency established a hierarchy of work from the least to the most difficult endoscopic procedure. Following this, fixed increments were added to the base procedure. For example, "with biopsy" was valued at an increment of 0.32 RVUs and "removal of a foreign body" was valued at an increment of 1.07 RVUs. Therefore, the RUC determined that these new codes should be valued the same way endoscopic services were initially valued at the creation of the RBRVS. Finally, the RUC has established valuation of physician work through incremental intra-service work as an approved, viable alternate methodology. Apropos to this rationale, endoscopy is listed as an example of this methodology in the RUC's instructions for specialty societies developing work value recommendations.

***43260 Endoscopic retrograde cholangiopancreatography (ERCP); diagnostic, with collection of specimen(s) by brushing or washing when performed***

The RUC reviewed the survey results from 66 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 48 minutes and post-service time= 25 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it is too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC agreed with the specialty societies that the physician work has not changed since the last RUC valuation. Therefore, the RUC recommends the survey 25<sup>th</sup> percentile, the current value, of 5.95 work RVUs. To justify this value, the RUC compared the surveyed code to CPT codes 93458 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with left heart catheterization including intraprocedural injection(s) for left ventriculography, when performed* (work RVU= 5.85, intra time= 45 minutes) and 36223 *Selective catheter placement, common carotid or innominate artery, unilateral, any approach, with angiography of the ipsilateral intracranial carotid circulation and all associated radiological supervision and interpretation, includes angiography of the extracranial carotid and cervicocerebral arch, when performed* (work RVU= 6.00, intra time= 45 minutes) and noted that both reference codes have almost identical physician time components as the surveyed code. Therefore, the RUC agreed that the current work value of 5.95 for 43260 is accurately valued between these two reference codes. **The RUC recommends a work RVU of 5.95 for CPT code 43260.**

***43261 Endoscopic retrograde cholangiopancreatography (ERCP); with biopsy, single or multiple***

The RUC reviewed the survey results from 57 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 55 minutes and post-service time= 23 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it is too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents slightly overestimated the value of this code at the median level. Consistent with the previously RUC approved esophagoscopy and EGD RUC recommendations for CPT 2014, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (RUC recommended work RVU= 1.59), and the biopsy code, 43202 (RUC recommended work RVU= 1.89), should be maintained in this biopsy ERCP code. Therefore, the established increment for the physician work related to the biopsy, 0.30 work RVUs, was added to the base ERCP diagnostic code, 43260 (recommended work RVU= 5.95), for a recommended work RVU of 6.25 for 43261. The RUC noted that while this recommended value is almost identical to the current value of 6.26, the Committee agreed to accept the incremental value to ensure consistency is maintained with the other families of endoscopic codes reviewed in the CPT 2014 cycle. To validate this value across the RBRVS, the RUC compared the surveyed code to CPT codes 58563 *Hysteroscopy, surgical;*

with endometrial ablation (eg, endometrial resection, electrosurgical ablation, thermoablation) (work RVU= 6.16, intra time= 60 minutes) and 36247 Selective catheter placement, arterial system; initial third order or more selective abdominal, pelvic, or lower extremity artery branch, within a vascular family (work RVU= 6.29, intra time= 60 minutes) and noted that both reference codes have almost identical physician time components as the surveyed code. Therefore, the RUC agreed that the recommended work value of 6.25 for 43261 is accurately valued between these two reference codes. **The RUC recommends a work RVU of 6.25 for CPT code 43261.**

**43262 Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy**

The RUC reviewed the survey results from 58 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 60 minutes and post-service time= 30 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC agreed with the specialty societies that the current work value of 7.38 overstates the work involved in this procedure. To determine a more appropriate value, the RUC noted that there has previously not been an equivalent increment established for sphincterotomy in either the esophagoscopy or EGD family of services reviewed in the last two meetings. Therefore, the RUC accepted the specialty societies' recommendation of the survey 25<sup>th</sup> percentile work RVU of 6.60. To justify this value, the RUC compared 43262 to the key reference service 58560 Hysteroscopy, surgical; with division or resection of intrauterine septum (any method) (work RVU= 6.99) and agreed that with identical intra-service times, 60 minutes, and analogous total time, the two services should be valued similarly. Additionally, the RUC reviewed CPT code 52343 Cystourethroscopy; with treatment of intra-renal stricture (eg, balloon dilation, laser, electrocautery, and incision) (work RVU= 6.55) and noted that since both services have identical intra-service time and analogous physician work, the two should be valued similarly. **The RUC recommends a work RVU of 6.60 for CPT code 43262.**

**43263 Endoscopic retrograde cholangiopancreatography (ERCP); with pressure measurement of sphincter of Oddi**

The RUC reviewed the survey results from 43 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 60 minutes and post-service time= 30 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC agreed with the specialty societies that the physician work involved in 43263 has not changed since the last RUC review in 2000 and should remain valued at 7.28 work RVUs. To justify this work value, the RUC compared the surveyed code to CPT codes 37212 Transcatheter therapy, venous infusion for thrombolysis, any method, including radiological supervision and interpretation, initial treatment day (work RVU= 7.06, intra time= 60 minutes) and 52240 Cystourethroscopy, with fulguration (including cryosurgery or laser surgery) and/or resection of;

*LARGE bladder tumor(s)* (work RVU= 7.50, intra time= 60 minutes) and noted that both reference codes have almost identical physician time components as the surveyed code. Therefore, the RUC agreed that the recommended work value of 7.28 for 43263 is accurately valued between these two reference codes. Finally, the RUC noted that this service has almost identical physician time compared to 43262 and 43264, but higher work RVUs than both. The specialties noted that 43263 is a more intense procedure than these two referenced services. Since the sphincter cannot be paralyzed, it is being threaded with the cannula while moving back and forth. **The RUC recommends a work RVU of 7.28 for CPT code 43263.**

***43264 Endoscopic retrograde cholangiopancreatography (ERCP); with removal of calculi/debris from biliary/pancreatic duct(s)***

The RUC reviewed the survey results from 54 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 60 minutes and post-service time= 28 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC agreed with the specialty societies that the current work value of 8.89 overstates the work involved in this procedure. To determine a more appropriate value, the RUC first noted that there is currently no equivalent established increment in either the esophagoscopy or EGD families of services for this procedure. Therefore, the RUC agreed that the 25<sup>th</sup> percentile work RVU of 6.73 accurately values the physician work involved in 43264. To justify this value, the RUC compared the surveyed code to CPT codes 37197 *Transcatheter retrieval, percutaneous, of intravascular foreign body (eg, fractured venous or arterial catheter), includes radiological supervision and interpretation, and imaging guidance (ultrasound or fluoroscopy), when performed* (work RVU= 6.29, intra time= 60 minutes) and 52343 *Cystourethroscopy; with treatment of intra-renal stricture (eg, balloon dilation, laser, electrocautery, and incision)* (work RVU= 6.55, intra time= 60 minutes) and agreed that since both references codes have identical intra-service time and comparable total times to the surveyed, the recommended value of 6.73 for CPT code 43264 is relative to these similar services. **The RUC recommends a work RVU of 6.73 for CPT code 43264.**

***43265 Endoscopic retrograde cholangiopancreatography (ERCP); with destruction of calculi, any method (eg, mechanical, electrohydraulic, lithotripsy)***

The RUC reviewed the survey results from 52 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 78 minutes and post-service time= 28 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC agreed with the specialty societies that the current work value of 10.00 overstates the work involved in this procedure. To determine a more appropriate value, the RUC first noted that there is currently no equivalent established increment in either the esophagoscopy or EGD families of services for this procedure. Therefore, the RUC agreed that the 25<sup>th</sup> percentile work RVU of 8.03 accurately values the physician work involved in 43265. To justify this value, the RUC compared the surveyed code to CPT code 37183 *Revision of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recanalization/dilatation, stent placement and all associated imaging guidance and documentation)* (work RVU= 7.99, intra time= 77.5 minutes) and agreed that while the two services nearly identical intra-service time, 43265 has greater total time compared to the reference code and is correctly valued higher. Additionally, CPT code 37224 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with transluminal angioplasty* (work RVU= 9.00) was reviewed and the Committee noted that the reference code has two additional minutes of intra-service time and is slightly more intense than 43265 and should therefore be valued higher. **The RUC recommends a work RVU of 8.03 for CPT code 43265.**

***43274 Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent***

The RUC reviewed the survey results from 50 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 68 minutes and post-service time= 23 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the median value of 10.00 work RVUs overestimates the physician work involved in this service. To determine an appropriate value, the RUC agreed to apply the incremental methodology to ensure this new, bundled service is correctly valued in comparison to the individual components codes previously valued in the equivalent endoscopic families.

The RUC noted that 43274 now bundles in the physician work to perform sphincterotomy and placement of an endoscopic stent. Therefore, the incremental methodology for this procedure consists of adding the following elements:

- The base ERCP code (43260, RUC recommended work RVU= 5.95)
- The established increment of a sphincterotomy = 0.65 (43262, RUC recommended work RVU= 6.60 – 43260, RUC recommended work RVU= 5.95) = 0.65
- The established increment of placement of an endoscopic stent = 2.14 (4320X4, RUC recommended work RVU= 3.73 – 43200, RUC recommended work RVU= 1.59) = 2.14

Taking the above work RVUs, as laid out, the RUC determined a work RVU of 8.74 ( $5.95 + 0.65 + 2.14$ ) accurately values the work of this bundled service relative to the individual component endoscopic codes, previously valued by the RUC. To validate this work RVU, the RUC compared the surveyed code to CPT codes 36254 *Superselective catheter placement (one or more second order or higher renal artery branches) renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture, catheterization, fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; bilateral* (work RVU= 8.15, intra time= 68 minutes) 58561 *Hysteroscopy, surgical; with removal of leiomyomata* (work RVU= 9.99, intra time= 75 minutes) and agreed that with similar intra-service time and comparable physician work, 43274 is accurately valued between these reference codes. **The RUC recommends a work RVU of 8.74 for CPT code 43274.**

**43275 Endoscopic retrograde cholangiopancreatography (ERCP); with removal of foreign body(s) or stent(s) from biliary/pancreatic duct(s)**

The RUC reviewed the survey results from 49 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 50 minutes and post-service time= 20 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC reviewed the estimated work values and agreed with the specialty societies that the survey respondents slightly overestimated the value of this code at the median level. Consistent with the esophagoscopy and EGD RUC recommendations for CPT 2014, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (RUC recommended work RVU= 1.59), and the foreign body removal code, 43215 (RUC recommended work RVU= 2.60), should be maintained in this foreign body removal ERCP code. Therefore, the established increment for the physician work related to the biopsy, 1.01 work RVUs, was added to the base ERCP diagnostic code, 43260 (recommended work RVU= 5.95), for a recommended work RVU of 6.96 for 43275. To validate this work value across the RBRVS, the RUC compared the surveyed code to CPT codes 93457 *Catheter placement in coronary artery(s) for coronary angiography, including intraprocedural injection(s) for coronary angiography, imaging supervision and interpretation; with catheter placement(s) in bypass graft(s) (internal mammary, free arterial, venous grafts) including intraprocedural injection(s) for bypass graft angiography and right heart catheterization* (work RVU= 6.89, intra time= 50 minutes) and 36252 *Selective catheter placement (first-order), main renal artery and any accessory renal artery(s) for renal angiography, including arterial puncture and catheter placement(s), fluoroscopy, contrast injection(s), image postprocessing, permanent recording of images, and radiological supervision and interpretation, including pressure gradient measurements when performed, and flush aortogram when performed; bilateral* (work RVU= 6.99, intra time= 53 minutes) and agreed that with similar intra-service time and comparable physician work, 43275 is accurately valued in between these reference codes. **The RUC recommends a work RVU of 6.96 for CPT code 43275.**

***43276 Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged***

The RUC reviewed the survey results from 48 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 60 minutes and post-service time= 25 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the median value of 9.88 work RVUs overestimates the physician work involved in this service. To determine an appropriate value, the RUC agreed to apply the incremental methodology to ensure this new, bundled service is correctly valued in comparison to the individual components codes previously valued in the equivalent endoscopic families.

The RUC noted that 43276 now bundles in the physician work to perform removal of a foreign body and placement of a stent. Therefore, the incremental methodology for this procedure consists of adding the following elements:

- The base ERCP code (43260, RUC recommended work RVU= 5.95);
- The established increment of a removal of foreign body = 1.01 (43215, RUC recommended work RVU= 2.60 – 43200, RUC recommended work RVU= 1.59) = 1.01
- The established increment of placement of an endoscopic stent = 2.14 (4320X4, RUC recommended work RVU= 3.73 – 43200, RUC recommended work RVU= 1.59) = 2.14

Taking the above work RVUs, as laid out, the RUC determined a work RVU of 9.10 (5.95 + 1.01 + 2.14) accurately values the work of this bundled service relative to the individual component endoscopic codes, previously valued by the RUC. The specialty societies noted that the physician work of performing the sphincterotomy is not included because it is typically performed during the initial stent placement and during the subsequent removal or exchange. To validate this work RVU, the RUC compared the surveyed code to CPT codes 52346 *Cystourethroscopy with ureteroscopy; with treatment of intra-renal stricture (eg, balloon dilation, laser, electrocautery, and incision)* (work RVU= 8.58, intra time= 60 minutes) and 92920 *Percutaneous transluminal coronary angioplasty; single major coronary artery or branch* (work RVU= 10.10, intra time= 68 minutes) and agreed that with similar intra-service time and comparable physician work, 43276 is accurately valued in between these reference codes. Finally, the RUC discussed whether or not there is overlap in the work taking out and replacing the stent. The specialties explained that the work is truly sequential for both procedures and there is no overlap when done concomitantly. There is also no concern that the work of finding the ampulla is captured in both procedures, as the ampulla is found immediately. **The RUC recommends a work RVU of 9.10 for CPT code 43276.**

***43277 Endoscopic retrograde cholangiopancreatography (ERCP); with trans-endoscopic balloon dilation of biliary/pancreatic duct(s) or of ampulla (sphincteroplasty), including sphincterotomy, when performed, each duct***

The RUC reviewed the survey results from 47 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 70 minutes and post-service time= 25 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the median value of 10.00 work RVUs overestimates the physician work involved in this service. To determine an appropriate value, the RUC agreed to apply the incremental methodology to ensure this new, bundled service is correctly valued in comparison to the individual components codes previously valued in the equivalent endoscopic families.

The RUC noted that 43277 now bundles in the physician work to perform balloon dilation and a sphincterotomy. Therefore, the incremental methodology for this procedure consists of adding the following elements:

- The base ERCP code (43260, RUC recommended work RVU= 5.95);
- The established increment of balloon dilation = 0.51 (43220, RUC recommended work RVU= 2.10 – 43200, RUC recommended work RVU= 1.59) = 0.51
- The established increment of a sphincterotomy = 0.65 (43262, RUC recommended work RVU= 6.60 – 43260, RUC recommended work RVU= 5.95) = 0.65

Taking the above work RVUs, as laid out, the RUC determined a work RVU of 7.11 (5.95 + 0.51 + 0.65) accurately values the work of this bundled service relative to the individual component endoscopic codes, previously valued by the RUC. To validate this work RVU, the RUC compared the surveyed code to CPT codes 20555 *Placement of needles or catheters into muscle and/or soft tissue for subsequent interstitial radioelement application (at the time of or subsequent to the procedure)* (work RVU= 6.00, intra time= 70 minutes) and 31276 *Nasal/sinus endoscopy, surgical with frontal sinus exploration, with or without removal of tissue from frontal sinus* (work RVU= 8.84, intra time= 75 minutes) and agreed that with similar intra-service time and comparable physician work, 43277 is accurately valued in between these reference codes. **The RUC recommends a work RVU of 7.11 for CPT code 43277.**

***43278 Endoscopic retrograde cholangiopancreatography (ERCP); with ablation of tumor(s), polyp(s), or other lesion(s), including pre- and post-dilation and guide wire passage, when performed***

The RUC reviewed the survey results from 40 gastroenterologists and recommends the following physician time components: pre-service time= 48 minutes, intra-service time= 75 minutes and post-service time= 30 minutes. The RUC agreed with the specialty societies that an additional 9 minutes of pre-service positioning is warranted. Patients will receive sedation next to the gantry because it's too narrow. Patients are then rolled over onto the fluoroscopic table and placed into the semi-prone position. Additionally, time is needed to strap the patient down and move equipment into place after the patient is properly positioned.

The RUC reviewed the survey respondents' estimated physician work values and agreed with the specialty societies that the 25<sup>th</sup> percentile value of 8.38 work RVUs overestimates the physician work involved in this service. To determine an appropriate value, the RUC agreed to apply the incremental methodology to ensure this new, bundled service is correctly valued in comparison to the individual components codes previously valued in the equivalent endoscopic families. Consistent with the esophagoscopy and EGD RUC recommendations for CPT 2014, the RUC noted that the identical increment between the esophagoscopy base code, 43200 (recommended work RVU= 1.59), and the ablation code, 4320X5 (recommended work RVU= 3.72), should be maintained in this foreign body removal ERCP code. Therefore, the established increment for the physician work related to the ablation, 2.13 work RVUs, was added to the base ERCP diagnostic code, 43260 (recommended work RVU= 5.95), for a recommended work RVU of 8.08 for 43278. To validate this work value across the RBRVS, the RUC compared the surveyed code to CPT codes 37183 *Revision of transvenous intrahepatic portosystemic shunt(s) (TIPS) (includes venous access, hepatic and portal vein catheterization, portography with hemodynamic evaluation, intrahepatic tract recanalization/dilatation, stent placement and all associated imaging guidance and documentation)* (work RVU= 7.99, intra time= 77.5 minutes) and 31276 *Nasal/sinus endoscopy, surgical with frontal sinus exploration, with or without removal of tissue from frontal sinus* (work RVU= 8.84, intra time= 75 minutes) and agreed that with similar intra-service time and comparable physician work, 43278 is accurately valued in between these reference codes. **The RUC recommends a work RVU of 8.08 for CPT code 43278.**

***43273 Endoscopic cannulation of papilla with direct visualization of pancreatic/common bile duct(s)***

The RUC reviewed the survey results from 47 gastroenterologists and recommends 30 minutes of intra-service time for this add-on code. The RUC agreed with the specialty societies that the physician work for this service has not changed. The RUC recommends the current work RVU of 2.24 for 43273, which is below the survey 25<sup>th</sup> percentile. To validate this work value, the RUC compared the surveyed code to add-on codes 43338 *Esophageal lengthening procedure* (eg, Collis gastroplasty or wedge gastroplasty) (work RVU= 2.21) and 49327 *Laparoscopy, surgical; with placement of interstitial device(s) for radiation therapy guidance* (eg, fiducial markers, dosimeter), intra-abdominal, intrapelvic, and/or retroperitoneum, including imaging guidance, if performed, single or multiple (work RVU= 2.38) and noted that all three codes have identical intra-service time, 30 minutes, and comparable physician work. Therefore, the RUC agreed that the recommended work value, in between these two services, is appropriate for CPT code 43273. Finally, the RUC noted that when this code was last reviewed as a new code in 2009, the median intra-service time was 45 minutes. However, review of the recommendation at that time reveals that the survey produced a much higher work RVU for this procedure. Since pre and post time were inadvertently collected in the ZZZ global survey, the RUC reduced the work value to

account for the removal of pre- and post-service minutes. The survey results were also complicated by the fact that 000-day global codes were included on the reference list and this was followed by the RUC using a 000-day reference code for a diagnostic esophagoscopy as comparison for the calculated value. Given the history of the previous valuation, the median intra-service time of 30 minutes is a more accurate depiction of this procedure compared to the previous survey. **The RUC recommends a work RVU of 2.24 for CPT code 43273.**

#### Practice Expense:

The RUC recommends the direct practice expense for these facility-based procedures as submitted by the specialty societies and approved by the Practice Expense Subcommittee.

#### Work Neutrality:

The RUC's recommendation for these codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Category I</b> <b>Surgery</b> <b>Digestive System</b> <b>Esophagus</b> <b>Endoscopy</b>  For endoscopic procedures, code appropriate endoscopy of each anatomic site examined. Surgical endoscopy always includes diagnostic endoscopy.  ◎ ▲ 43235 <del>Upper gastrointestinal endoscopy including esophagus, stomach, and either the duodenum and/or jejunum as appropriate</del> Esophagogastroduodenoscopy, flexible, transoral; diagnostic, with <del>or without</del> collection of specimen(s) by brushing or washing, when performed ( <del>separate procedure</del> )  ◎ ▲ 43259      with endoscopic ultrasound examination, including the esophagus, stomach, and either the duodenum <del>/or jejunum as appropriate</del> or a surgically altered stomach where the jejunum is examined distal to the anastomosis				

Report the appropriate code(s) for each service performed. Therapeutic ERCP (43261, 43262, 43263, 43264, 43265, 43274, 43275, 43276, 43277, 43278) includes diagnostic ERCP (43260). ERCP includes guide wire passage when performed. An ERCP is considered complete if one or more of the ductal system(s), (pancreatic/biliary), is/are visualized. To report ERCP attempted but with unsuccessful cannulation of any ductal system, see 43235-43259.

Codes 43274, 43275, 43276, and 43277 describe ERCP with stent placement, removal or exchange (replacement) of stent(s), and balloon dilation within the pancreatico-biliary system. For reporting purposes, ducts that may be reported as stented or subject to stent replacement (exchange) or to balloon dilation include:

**Pancreas:** major and minor ducts

**Biliary tree:** common bile duct, right hepatic duct, left hepatic duct, cystic duct/gallbladder

ERCP with stent placement includes any balloon dilation performed in that duct. ERCP with more than one stent placement (eg, different ducts or side by side in the same duct) performed during the same day/session may be reported with 43274 more than once with modifier 59 appended to the subsequent procedure(s). For ERCP with more than one stent exchanged during the same day/session, 43276 may be reported for the initial stent exchange, and 43276 with modifier 59 for each additional stent exchange. ERCP with balloon dilation of more than one duct during the same day/session may be reported with modifier 59 appended to the subsequent procedure(s). Sphincteroplasty, which is balloon dilation of the ampulla (sphincter of Oddi), is reported with 43277, and includes sphincterotomy (43262) when performed.

To report ERCP via altered postoperative anatomy, see 43260, 43262, 43263, 43264, 43265, 43274, 43275, 43276, 43277, 43278, 43273 for Billroth II gastroenterostomy. See 47999 (Unlisted procedure, biliary tract), or 48999 (Unlisted procedure, pancreas) for ERCP via gastrostomy (laparoscopic or open) or via Roux-en-Y anatomy (eg, post-bariatric gastric bypass, post-total gastrectomy).

To report optical endomicroscopy of the biliary tract, use 47999. To report optical endomicroscopy of the pancreas, use 48999. Optical endomicroscopy may be reported not more than once per session.

Stone destruction includes any stone removal in the same ductal system (biliary/pancreatic). Code 43277 may be separately reported if sphincteroplasty or dilation of a ductal stricture is required before proceeding to remove stones/debris from the duct during the same session. Dilation that is incidental to the passage of an instrument to clear stones or debris is not separately reported.

(Do not report 43277 for use of a balloon catheter to clear stones/debris from a duct. Any dilation of the duct that may occur during this maneuver is considered inherent to the work of 43264 and 43265)

(For radiological supervision and interpretation, see 74328, 74329, 74330)

⊕▲ 43260	EE1	Endoscopic retrograde cholangiopancreatography (ERCP); diagnostic, with <del>or without</del> collection of specimen(s) by brushing or washing ( <del>separate procedure</del> ) if <u>when performed</u>  ( <del>For radiological supervision and interpretation, see 74328, 74329, 74330</del> )	000	5.95  (No Change)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43260      Tracking Number   EE1

Original Specialty Recommended RVU: **5.95**Presented Recommended RVU: **5.95**

Global Period: 000

RUC Recommended RVU: **5.95**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); diagnostic, with collection of specimen(s) by brushing or washing when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70-year-old patient with a history of abdominal pain and unexplained pancreatitis is referred for evaluation. Imaging studies with MRCP are equivocal. Diagnostic ERCP is performed to evaluate the pancreatic and biliary ducts.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 52%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 30%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient.. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb.

Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>		04/2012			
<b>Presenter(s):</b>	Dr. Nicholas Nickl (ASGE), Dr. Edward Bentley (ASGE), Dr. Joel Brill (AGA), Dr. Shivan Mehta, MD (AGA), Dr. Bruce Cameron (ACG)				
<b>Specialty(s):</b>	Gastroenterology				
<b>CPT Code:</b>	43260				
<b>Sample Size:</b>	947	<b>Resp N:</b>	66	<b>Response:</b> 6.9 %	
<b>Description of Sample:</b>	The ACG, AGA and ASGE conducted an enhanced random sample as approved by the Research Subcommittee. The sampling methodology was a random sample of member gastroenterologists with the addition of physicians identified by industry as performers of ERCP procedures and survey volunteers who responded to educational articles and identified themselves as ERCP performers.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43260** Endoscopic retrograde cholangiopancreatography (ERCP); diagnostic, with collection of specimen(s) by brushing or washing when performed

**We recommend the current RVW of 5.95.** The work performing this procedure has not changed. The survey data support the current value.

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 52342

Both 43260 and key reference code 52342 *Cystourethroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)* are performed under anesthesia (general, MAC, spinal). Although 52342 survey data from 2000 indicates more intra-time, the intensity of 43260 is higher as the patient has unexplained pancreatitis, compared with the 52342 patient that has a diagnosed stricture that will be dilated.

### Comparison To Other RUC-Reviewed Codes with 40-55 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43260

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43261      Tracking Number   EE2

Original Specialty Recommended RVU: **6.25**Presented Recommended RVU: **6.25**

Global Period: 000

RUC Recommended RVU: **6.25**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with biopsy, single or multiple

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 72-year-old patient with weight loss, abdominal pain, and elevated laboratory tests (AST, ALT, amylase, alkaline phosphatase) is referred for evaluation. Biliary dilation is identified on imaging studies. A diagnostic ERCP is performed where a mass at the ampulla of Vater is identified; biopsies are obtained.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 55%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 22%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the

second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. Endoscopically directed biopsies are taken of tissue in the ducts, GI lumen or papilla. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

**Description of Post-Service Work:** The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology and pathology forms are completed; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43261** Endoscopic retrograde cholangiopancreatography (ERCP); with biopsy, single or multiple

**We recommend an RVW of 6.25.** This value is less than the current RVW and is equal to the recommendation for the ERCP base 43260 plus an increment of 0.30 (43201-43200) (ie, valuing the increment) approved by the RUC in October 2012 for endoscopic biopsies.

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 52342

Both 43261 and key reference code 52342 *Cystourethroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)* are performed under anesthesia (general, MAC, spinal). The survey data for 52342 from 2000 is comparable to current survey data for 43261, however we believe the intensity and complexity of 43261 is higher to evaluate the biliary tree and identify and biopsy the mass.

### Comparison To Other RUC-Reviewed Codes with 40-60 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 49%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 20%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and moderate sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the

second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. Under direct visualization, the sphincterotome is properly positioned across the sphincter. The sphincter is incised using electrocautery current in the appropriate orientation until the sphincter muscle fibers are divided and the opening is appropriately sized. Contrast material is injected into the sphincterotome. Another cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities such as leak from sphincterotomy. The sphincterotome is withdrawn through the endoscope. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Background**

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

### Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

### Discussion and Recommendation

**43262** Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy

**We recommend an RVW of 6.60.** The value is the 25% of the current survey and less than the current value. The incremental difference of 0.65 RVUs over the base code is less than the incremental difference in work between 47610 (open chole) and 47620 (open chole, w-sphincterotomy) (RVW diff = 2.15).

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

#### Comparison to Key Ref 58560

Anesthesia is similar for both 43262 and 58560 *Hysteroscopy, surgical; with division or resection of intrauterine septum (any method)*. The survey data for 58560 from 1997 is comparable to current survey data for 43262.

#### Comparison To Other RUC-Reviewed Codes with 50-60 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43262

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Sometimes

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 175000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 57,878 in 2011 (57,878\*3 ~ 175,000)

Specialty Gastroenterology	Frequency 160000	Percentage 91.42 %
----------------------------	------------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
22,525 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
Please explain the rationale for this estimate. Medicare data base 57,878 in 2011 - utilization going to 4327X7 and savings from (43268 & 43269)

Specialty Gastroenterology	Frequency 53000	Percentage 91.37 %
----------------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43262

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor:

52356X Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double J type)

Global Period: 000

Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AUA expert panel consists of ten urologists who represent urological practices, both academic and private settings, from across the United States. They represent the states of Washington, Illinois, New York, Kentucky, and Florida. The panel reviews current RUC practice expense information, requests input for supplies and equipment from several urology practices, reviews the information, makes recommendations and submits them to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

This new code 52356 is a combination of two existing CPT codes 52353 and 52332 as required by RUC and CMS through the two codes reported during the same encounter over 75% of the time.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms

Coordinate pre-service surgery services

Schedule space and equipment in facility

Provide pre-service education/obtain consent

Intra-Service Clinical Labor Activities:

None

Post-Service Clinical Labor Activities:

Follow-up phone calls and prescriptions

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43264      Tracking Number   EE5

Original Specialty Recommended RVU: **6.73**Presented Recommended RVU: **6.73**

Global Period: 000

RUC Recommended RVU: **6.73**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with removal of calculi/debris from biliary/pancreatic duct(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 68 year old patient presents with abdominal pain and abnormal laboratory tests (AST, ALT, alkaline phosphatase, total bilirubin, amylase). Imaging studies show an apparent retained common bile duct stone. Therapeutic ERCP with stone removal is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 52%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 29%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. . A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb.

Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. The cannulating catheter is withdrawn through the endoscope while maintaining counter-pressure on the guidewire to ensure stable positioning. A therapeutic retrieval balloon is passed over the guidewire and through the endoscope. Under direct visualization, the retrieval balloon is passed into the duct. The retrieval balloon is advanced into the proximal duct, inflated, and then pulled distally to sweep the duct of calculi or debris. The balloon is deflated. Balloon advancement, inflation, and sweep of the duct are repeated as necessary until no further material is delivered into the duodenum. Alternatively a stone retrieval basket may be used to capture the stone and remove it from the duct. Contrast material is injected into the balloon catheter. Another cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. The balloon and guidewire are withdrawn through the endoscope. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43264** Endoscopic retrograde cholangiopancreatography (ERCP); with removal of calculi/debris from biliary/pancreatic duct(s)

**We recommend an RVW of 6.73.** The value is the 25% of the current survey and less than the current value.

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 58561

Anesthesia is similar for both 43264 and 58561 *Hysteroscopy, surgical; with removal of leiomyomata*). The intra-service time for 58561 from 1997 is slightly greater and accounted for by a higher RVW.

### Comparison To Other RUC-Reviewed Codes with ~60 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43264

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 138000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 45,885 in 2011 (45,885\*3 ~ 138,000)

Specialty Gastroenterology	Frequency 125000	Percentage 90.57 %
----------------------------	------------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
46,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
Please explain the rationale for this estimate. Medicare data base 45,885 in 2011

Specialty Gastroenterology	Frequency 42000	Percentage 91.30 %
----------------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43264

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43265      Tracking Number   EE6

Original Specialty Recommended RVU: **8.03**Presented Recommended RVU: **8.03**

Global Period: 000

RUC Recommended RVU: **8.03**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with destruction of calculi, any method (eg, mechanical, electrohydraulic, lithotripsy)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 75 year old patient with recurrent right upper quadrant pain, abnormal laboratory tests (AST, ALT, alkaline phosphatase, total bilirubin, amylase), and jaundice is referred for evaluation. Imaging studies including MRCP reveal a dilated common bile duct with several common bile duct stones  $\geq$  2cm in diameter. Therapeutic ERCP with mechanical lithotripsy and clearing of stones from the common bile duct is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 48%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 11%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in

the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. The cannulating catheter is withdrawn through the endoscope while maintaining counter-pressure on the guidewire to ensure stable positioning. A lithotripter device is passed over the guidewire through the endoscope. Under direct visualization, the lithotripter device is positioned into the duct. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and the lithotripter is positioned over the calculi. The stone(s) is crushed with the device until sufficiently small enough fragments are formed for clearance. The lithotripter device is withdrawn through the endoscope while maintaining counter-pressure on the guidewire to ensure stable positioning. A therapeutic retrieval balloon is passed over the guidewire and through the endoscope. Under direct visualization, the retrieval balloon is passed into the duct. The retrieval balloon is advanced into the duct, inflated, and then pulled distally to sweep the duct of calculi or debris. The balloon is deflated. Balloon advancement, inflation, and sweep of the duct is repeated as necessary until no further stone material is delivered into the duodenum. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance to confirm that the calculi have been crushed and removed. Radiographic images are reviewed. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43265** Endoscopic retrograde cholangiopancreatography (ERCP); with destruction of calculi, any method (eg, mechanical, electrohydraulic, lithotripsy)

**We recommend an RVW of 8.03.** The value is the 25% of the current survey and less than the current value.

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 52342

Both 43265 and key reference code 52342 *Cystourethroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)* are performed under anesthesia (general, MAC, spinal). The intensity of 43265 is higher because of the large size of the stones and the additional risk of pancreatitis and bile duct perforation associated with 43265.

### Comparison To Other RUC-Reviewed Codes with ~78 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43265

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Rarely

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8500

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 2786 in 2011 (2,786\*3 ~ 8,500)

Specialty Gastroenterology	Frequency 7800	Percentage 91.76 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,800

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 2786 in 2011

Specialty Gastroenterology	Frequency 2600	Percentage 92.85 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43265

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43274      Tracking Number   EE7

Original Specialty Recommended RVU: **8.74**Presented Recommended RVU: **8.74**

Global Period: 000

RUC Recommended RVU: **8.74**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 72-year-old patient presents with abdominal and back pain, weight loss, abnormal laboratory tests (AST, ALT, alkaline phosphatase, total bilirubin, amylase) and jaundice. Imaging studies show dilation of the common bile duct with a lesion suspicious for pancreatic cancer. Therapeutic ERCP with sphincterotomy is performed, followed by placement of stent across the biliary obstruction, is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 50%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 29%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. Additional sedation is administered as required to maintain adequate sedation throughout the procedure. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. If needed, a sphincterotome is properly positioned across the sphincter. The sphincter is incised using electrocautery current in the appropriate orientation until the sphincter muscle fibers are divided and the opening is appropriately sized. The sphincterotome is withdrawn and the guiding catheter is then exchanged over the guidewire to bypass the obstruction. Bile samples can be aspirated for culture and cytology. The length of the stricture is determined on cholangiography with the help of radiopaque ring markers. A suitable length stent is chosen so that the proximal flap of the stent lies about 1 cm above the obstruction; if necessary the guidewire is retracted between the two points and the distance traveled on the outside of the catheter is measured. The stricture may be dilated prior to stent insertion with graded dilators or pneumatic balloon dilators inserted over the guidewire. The stent is directed over the guidewire and then positioned through the obstruction. The stent is deployed using endoscopic and fluoroscopic guidance. Bile is seen draining through the stent into the duodenum. The guidewire and introducer are removed. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, bleeding and fever. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications including recognizing and managing stent occlusion. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>		04/2012			
<b>Presenter(s):</b>	Dr. Nicholas Nickl (ASGE), Dr. Edward Bentley (ASGE), Dr. Joel Brill (AGA), Dr. Shivan Mehta (AGA), Dr. Bruce Cameron (ACG)

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43274** Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent

**We recommend an RVW of 8.74** for new code 43274.

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 37221

Key reference code 37221 Revascularization, endovascular, open or percutaneous, iliac artery, unilateral, initial vessel; with transluminal stent placement(s), includes angioplasty within the same vessel, when performed although performed under moderate sedation, includes stent placement and balloon angioplasty and is therefore very similar to code 43274. Code 37221 may take more time intraoperatively because the work includes lower intensity imaging.

### Comparison To Other RUC-Reviewed Codes with ~68 Minutes Intra-Service Time

	CPT	DESC	RVW	IWPUT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43274 = stent (43268) + sphincterotomy (43262) + 43271

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Sometimes

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 180000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database 2011 stent (43268) = 36,493 + sphincterotomy (43262) = 40% \* 57,878 = 23,151 - TOTAL ~ 60,000 \* 3 = 180,000

Specialty Gastroenterology

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43268

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64616	Tracking Number S2	Original Specialty Recommended RVU: <b>1.85</b>
		Presented Recommended RVU: <b>1.79</b>
Global Period: 000		RUC Recommended RVU: <b>1.79</b>

CPT Descriptor: Chemodenervation of muscle(s); neck muscle(s), excluding muscles of the larynx, unilateral (eg, for cervical dystonia, spasmodic torticollis)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60-year-old female presents with a history of progressive involuntary head turn to the right associated with right tilt. The symptom is worse with certain activities and better if she touches her chin. She has significant neck and shoulder pain that interfere with her functioning and sleep. The exam is consistent with torticollis. Chemodenervation is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: The medication is brought to room temperature and reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The drug is drawn into a syringe. The injection sites are cleaned using alcohol swabs and the neck is positioned for optimal medication delivery to the first injection site. The physician reviews the patient history, takes an interval history, reviews the patient's medications and allergies. The effect (e.g., benefit, duration of effect, any side effects) of any prior treatment is reviewed. To determine the muscles involved, a focused physical examination is performed. The patient is observed both at rest and walking to determine the pattern of torticollis (presence of anterocollis, tilt, turn and retrocollis along with any associated shoulder movements). Active and passive movements while palpating affected muscles are also used to determine injection sites. Optimal injection sites are determined and marked. Patient questions are answered and informed consent is obtained. The duration of expected treatment effect is discussed. A "time-out" is performed. The physician cleans the injection sites using alcohol swabs and puts on gloves

Description of Intra-Service Work: The toxin is injected. Injections are performed. Following the injection, pressure is held briefly to control any bleeding. The patients is then repositioned for each subsequent injection.

Description of Post-Service Work: Bandages are placed over injection sites. The expected results and follow-up plans are discussed with the patient. Drug accounting is completed. The procedure report is generated, reviewed, and signed

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The existing code 64613 describes multiple uses of the procedure (for treatment of spasmodic dysphonia and spasmodic torticollis). We believe these two uses are separate and distinct and involve different levels of work and intensity when injecting the neck muscle versus injecting the larynx.

The new code that will primarily be reported by neurology is 64616: Chemodenervation of muscle(s); neck muscle(s), excluding muscles of the larynx, unilateral (eg, for cervical dystonia, spasmodic torticollis). Otolaryngology will primarily report code 64617. Previously one unit of 64613 was reported regardless of the number of sites that were injected. The new code will be reported the same way.

This was a strong survey with 80 responses and 99% agreement with the vignette. The median work RVU of 2.25 is higher than the existing RVU and the societies felt a slightly lower value would be appropriate. The societies recommend pre-service evaluation time of 10 minutes and 5 minutes of positioning time. The time required to mix the toxin and position the patient support the time beyond the standard 7 minutes in the selected pre-service package. Respondents rated 64616 as requiring more technical skill, physical effort and psychological stress than the key reference service 99244.

The societies recommend a work RVU of 1.85 for new CPT code 64616 which falls between the existing RVU of 2.01 and above the survey's 25<sup>th</sup> percentile for a physician work value of 1.79. Our recommended times are 15/15/5. We believe this recommendation is supported by the crosswalk code, 64615 which has a work RVU of 1.85 and the same times. 64615 is part of the same chemodenervation family and was valued in April of 2012.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64613

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty PMR                              How often? Sometimes

Specialty                                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 174519

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64613, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology	Frequency 139615	Percentage 79.99 %
---------------------	------------------	--------------------

Specialty PMR	Frequency 20942	Percentage 11.99 %
---------------	-----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 58,173 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We used 2011 Medicare claims data for 64613 to develop the following estimates; taking into consideration Otolaryngology will not report the new code, rather use 64613XX.

Specialty Neurology	Frequency 46538	Percentage 79.99 %
---------------------	-----------------	--------------------

Specialty Physical Medicine and Rehabilitation	Frequency 6900	Percentage 11.86 %
--	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64613

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43276      Tracking Number   EE9

Original Specialty Recommended RVU: **9.10**Presented Recommended RVU: **9.10**

Global Period: 000

RUC Recommended RVU: **9.10**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70 year old patient with a history of biliary obstruction due to pancreatic carcinoma had undergone ERCP with placement of a 10Fr biliary stent 4 months prior. The patient now presents with pain, fever, abnormal laboratory tests (AST, ALT, alkaline phosphatase, total bilirubin, amylase) and jaundice. Imaging studies reveal dilation of the biliary duct. Therapeutic ERCP with removal of the previous stent and insertion of an expandable metallic stent is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 53%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 29%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater with the stent is identified and examined. The endoscope is positioned for stent retrieval. If required, antiperistaltic medications are administered intravenously. A stent retrieval device is placed through the endoscope and under direct vision is used to grasp the stent. The stent is brought out through the endoscope channel or with the endoscope which is withdrawn through the mouth, extracting the stent from the patient requiring the side viewing endoscope be inserted. The endoscope is positioned for cannulation of the ampulla. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. If indicated, a sphincterotome is properly positioned across the sphincter. The sphincter is incised using electrocautery current in the appropriate orientation until the sphincter muscle fibers are divided and the opening is appropriately sized. Contrast material is injected into the sphincterotome. Another cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. The sphincterotome is withdrawn through the endoscope. The stricture may be dilated prior to stent insertion with graded dilators or pneumatic balloon dilators inserted over the guidewire. A suitable length stent is chosen so that the proximal flap of the stent lies about 1 cm above the obstruction; if necessary the guidewire is retracted between the two points and the distance traveled on the outside of the catheter is measured. The stent is directed over the guidewire and then positioned through the obstruction. The stent is deployed using endoscopic and fluoroscopic guidance. Bile is seen draining through the stent into the duodenum. The guidewire and introducer are removed. Contrast material is injected. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance to confirm positioning. Radiographic images are reviewed. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and fever. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data is entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications including recognizing and managing stent occlusion. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43276** Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged

**We recommend an RVW of 9.10.** This value is equal to the increment of 2.14 approved by the RUC for endoscopic stent with pre- and post-dilation for esophagoscopy code pair 43200/43204 and EGD code pair 43235/43268 plus the recommendation for ERCP stent removal (43275) ( $6.96+2.14=9.10$ ) (ie, valuing the increment).

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 31638

Key Reference code 31638 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)* includes lower intensity fluoroscopic guidance which increases the intra-service time, but at lower intensity.

### Comparison To Other RUC-Reviewed Codes with ~60 Minutes Intra-Service Time

	CPT	DESC	RVW	IWP/UT	TOTAL TIME	EVAL	POSIT	SDW	INTRA	POST

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43269 + 43262 + 43271

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Sometimes

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 75000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database 2011 stent (43269) 20,375 \*65% + sphincterotomy (43262) = 20% \* 57,878 = 11,576 - TOTAL ~ 25,000 \* 3 = 75,000

Specialty Gastroenterology

Frequency 69000

Percentage 92.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,150  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare database 2011 stent (43269) 20,375 \*40% other components go to savings

Specialty Gastroenterology	Frequency 23000	Percentage 92.00 %
----------------------------	-----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States?

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43269

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code:43277      Tracking Number   EE10

Original Specialty Recommended RVU: **7.11**Presented Recommended RVU: **7.11**

Global Period: 000

RUC Recommended RVU: **7.11**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with trans-endoscopic balloon dilation of biliary/pancreatic duct(s) or of ampulla (sphincteroplasty), including sphincterotomy, when performed, each duct

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70-year-old presents with abdominal pain, abnormal laboratory tests (AST, ALT, alkaline phosphatase, total bilirubin, amylase) and jaundice. Imaging studies reveal dilation of the biliary duct and a large common bile duct stone. Therapeutic ERCP with sphincterotomy and sphincteroplasty and removal of the stone (reported separately with 43264) is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 50%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, imaging and sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus

into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. Additional sedation is administered as required to maintain adequate sedation throughout the procedure. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. Under direct visualization, a sphincterotome is properly positioned across the sphincter. The sphincter is incised using electrocautery current in the appropriate orientation until the sphincter muscle fibers are divided and the opening is appropriately sized. Contrast material is injected into the sphincterotome. Another cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. The sphincterotome is withdrawn through the endoscope. A dilating balloon is passed over the guidewire and through the endoscope. Under direct visualization, the balloon is passed into the duct. The dilating balloon is positioned so that the stricture lies at the midpoint of the balloon; radiopaque markers are viewed under fluoroscopy to position the balloon. The balloon is then inflated with dilute (10%) contrast and the pressure adjusted according to the type of balloon and manufacturer's recommendation. The dilation is performed under fluoroscopy and a waist is seen at the midpoint of the balloon upon inflating the balloon. Effective dilation is achieved when the waist disappears. The balloon is kept inflated for 30–60 sec and then deflated. The balloon is then re-inflated, noting the opening pressure when the waist disappears on the balloon. With successful dilation the opening pressure should be lower with repeat dilation. The balloon is then completely deflated, the guidewire removed and contrast injected while the balloon catheter is pulled back to assess the effect of dilation. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance to confirm dilation of the stricture. Radiographic images are reviewed. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

**Description of Post-Service Work:** The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43277** Endoscopic retrograde cholangiopancreatography (ERCP); with trans-endoscopic balloon dilation of biliary/pancreatic duct(s) or of ampulla (sphincteroplasty), including sphincterotomy, when performed, each duct

**We recommend an RVW of 7.11.** This value is equal to the increment of 0.51 approved by the RUC for balloon dilation for esophagoscopy code pair 43200/43220 and EGD code pair 43235/43249 plus the recommendation for ERCP with sphincterotomy 43262 ( $6.60 + 0.51 = 7.11$ ).

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 31638

Key Reference code 31638 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with revision of tracheal or bronchial stent inserted at previous session (includes tracheal/bronchial dilation as required)* includes lower intensity fluoroscopic guidance which increases the intra-service time, but at lower intensity.

### Comparison To Other RUC-Reviewed Codes with 50-60 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43262 + 43271

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Sometimes

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 54000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 2011, 43271 = 12,486 + sphincterotomy (43262) = 10% \* 57,878 = 5,788 - TOTAL ~ 18,000 \* 3 = 54,000

Specialty Gastroenterology	Frequency 51000	Percentage 94.44 %
----------------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,788

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 2011, 43262 = 57,878 \*10%

Specialty Gastroenterology	Frequency 5500	Percentage 95.02 %
----------------------------	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States?

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 43271

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43278      Tracking Number   EE11

Original Specialty Recommended RVU: **8.08**Presented Recommended RVU: **8.08**

Global Period: 000

RUC Recommended RVU: **8.08**

CPT Descriptor: Endoscopic retrograde cholangiopancreatography (ERCP); with ablation of tumor(s), polyp(s), or other lesion(s), including pre- and post-dilation and guide wire passage, when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70-year-old patient presents with a history of recurrent pancreatitis and abnormal laboratory tests (AST, ALT, alkaline phosphatase, amylase). Imaging studies are suggestive of a lesion at the ampulla of Vater. Therapeutic ERCP with ablation of the ampullary mass is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 50%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review with the patient any symptoms including dysphagia and sleep apnea. The patient's history is reviewed to assess past problems with sedation and the need for and timing of pre-procedure antibiotics or contrast allergy prophylaxis. A review of the patient's allergies and medications is done specifically noting usage of antiplatelet or anticoagulation medications. A pre-anesthetic exam with airway assessment, Mallampati score, and cardiopulmonary and abdominal evaluation is performed; an ASA physical status classification is assigned. The patient's laboratory studies as they relate to coagulation status and the platelet count are reviewed. The patient's imaging studies and other diagnostic tests are reviewed. The pre-service review is documented. The risks and benefits of the procedure and sedation are reviewed with the patient; informed consent for both the procedure and sedation is obtained. The physician verifies all endoscopic, ablation and imaging equipment is available, operational and appropriate imaging settings and computer entries are made. A time out is performed. The patient is positioned on the procedure table in the supine position. A patient support pad is positioned on the fluoroscopy table and the patient's positioning is adjusted. The endoscopic, ablation, imaging and sedation monitoring equipment is positioned to provide access for the procedure. Appropriate protective attire and shielding are applied and verification that all others in the suite are properly protected including the patient. The patient is rolled to the left side and sedation is administered to the patient while continuously monitoring pulse oximetry, carbon dioxide when indicated, and sequential non-invasive blood pressure measurements. A bite block is placed in the mouth. The patient is repositioned in the prone position.

Description of Intra-Service Work: The level of sedation is assessed prior to inserting the endoscope. A standard flexible side viewing upper endoscope is inserted into the mouth into the oropharynx and blindly advanced through the esophagus

into the stomach. The stomach is insufflated with air after suctioning liquid contents. Examination of the entire stomach in the forward and retroflexed positions is performed. The endoscope is advanced through the pylorus into the duodenal bulb. Circumferential inspection of the duodenum is performed after air insufflation. Next the instrument is advanced into the second portion of the duodenum. The ampulla of Vater is identified and examined. The endoscope is positioned for cannulation of the ampulla. If required, antiperistaltic medications are administered intravenously. The ampulla is cannulated, and the catheter is directed into the duct(s) of clinical interest (common bile duct and/or pancreatic duct). Contrast material is injected into the cannula. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance and reviewed for abnormalities. If indicated, washing or brushings of suspicious abnormalities in the common bile duct and/or pancreatic duct are obtained. A guidewire is introduced into the cannulating catheter through the endoscope and into the duct. If necessary, the appropriate area may be dilated with graded dilators or pneumatic balloon dilators inserted over the guidewire. A therapeutic ablation catheter is passed into the endoscope to the abnormal area. Ablation of the lesion proceeds under direct visualization. The process is repeated until the lesion has been ablated. A cholangiogram and/or pancreatogram is obtained under fluoroscopic guidance. Radiographic images are reviewed. The endoscope is withdrawn into the stomach to allow examination of the gastric fundus and the remainder of the gastric mucosa. Photodocumentation of appropriate normal landmarks and abnormalities is obtained. At the conclusion of the procedure, the endoscope is withdrawn.

Description of Post-Service Work: The patient's condition including post-procedure vital signs is assessed. When the patient has reached a suitable level of consciousness, the patient is transferred to the observation area. The patient is assessed for physical signs and symptoms suggestive of complications, including abdominal pain, nausea/vomiting, respiratory distress, and bleeding. Radiographic images are reviewed with the technologist for entry into the image storing system. Post procedure orders are completed and discussed with staff. Cytology forms are completed if pertinent; post procedure specimen verification and documentation and reporting for quality purposes are completed. Photographs are reviewed and labeled. A procedure report is generated and forwarded to the referral source and other appropriate parties. Data are entered into the procedure registry. The patient is assessed for suitability to discharge from the recovery suite relative to established discharge criteria. When stable for discharge, the findings and recommendations are reviewed with the patient and pertinent others including a discussion regarding potential procedure complications. Restrictions, prescriptions, follow-up tests, instructions and appointments are provided to the patient and pertinent others.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43278** Endoscopic retrograde cholangiopancreatography (ERCP); with ablation of tumor(s), polyp(s), or other lesion(s), including pre- and post-dilation and guide wire passage, when performed

**We recommend an RVW of 8.08.** This value is equal to the increment of 2.13 approved by the RUC for ablation for the esophagoscopy code pair 43200/432X5 plus the recommendation for ERCP 43260 (5.95 + 2.13= 8.08).

**Pre-time Package 2b** is appropriate, with an additional 9 minutes for positioning the patient, endoscopy equipment/monitor, and anesthesia lines/equipment prior to and after induction MAC. The procedure is performed in the prone position on a fluoroscopy table. In addition, the recommended scrub, dress, wait time matches the survey median.

### Comparison to Key Ref 37225

Key Reference code 37225 *Revascularization, endovascular, open or percutaneous, femoral, popliteal artery(s), unilateral; with atherectomy, includes angioplasty within the same vessel, when performed* was chosen most often, but only 8 times, and does not compare well with 4327X8. Several other reference codes were also chosen often and this is reflected in the wide variation of work estimate.

### Comparison To Other RUC-Reviewed Codes with ~70 Minutes Intra-Service Time

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.  
☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.  
☐ Multiple codes allow flexibility to describe exactly what components the procedure included.  
☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43271+ 43272

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology How often? Rarely

Specialty How often?

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 900

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 302 in 2011

Specialty Gastroenterology Frequency 880 Percentage 97.77 %

Specialty Frequency 0 Percentage 0.00 %

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 300  
 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base for 2011 for CPT code 43271 = 12,486 \* 25%, 43272 goes to savings

Specialty Gastroenterology	Frequency 290	Percentage 96.66 %
----------------------------	---------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States?

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43272

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 43273      Tracking Number   EE12

Original Specialty Recommended RVU: **2.24**Presented Recommended RVU: **2.24**

Global Period: ZZZ

RUC Recommended RVU: **2.24**

CPT Descriptor: Endoscopic cannulation of papilla with direct visualization of pancreatic/common bile duct(s) (List separately in addition to code(s) for primary procedure)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 72-year-old patient presents with abdominal pain, jaundice and abnormal laboratory tests (AST, ALT, alkaline phosphatase, total bilirubin, amylase). Imaging studies reveal the presence of a stricture in the common hepatic duct with proximal dilation, suggestive of a cholangiocarcinoma. After diagnostic ERCP is performed, direct pancreato-choledochoscopy is performed to visualize and evaluate the lesion.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 47%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The cholangioscope is passed through the duodenoscope and into the biliary tree. Direct visualization is performed with careful inspection of the biliary and pancreatic epithelium. Multiple biopsies are taken of any suspicious lesions. The right and left intrahepatic biliary tree, common hepatic duct and common bile duct are all viewed. The cholangioscope is then withdrawn and passed into the pancreatic duct. The pancreatic duct is viewed. When clinically indicated, biopsy(ies) and/or cytology samples are taken from appropriate areas.

At conclusion of the procedure, the cholangioscope is withdrawn. The physician proceeds with the remainder of the ERCP procedure.

Description of Post-Service Work: N/A

## Background

Code 43262 was identified for the Fourth Five-Year Review through CMS and RUC screens as potentially misvalued through the Harvard valued utilization over 30,000 frequency screen. The code was presented to the RUC at the October 2010 meeting. The RUC reviewed the service and believed that the GI specialties did not provide compelling evidence to change the current value of the service. Therefore, the RUC recommended maintaining the current work RVU of 7.38 for CPT code 43262. CMS maintained the current work RVU of 7.38 and the current physician time for CPT code 43262 for CY 2012. However, CMS requested that the RUC undertake a comprehensive review of the entire family of ERCP codes, including the base CPT code 43260, and provide CMS with work RVU recommendations.

The specialties agreed to survey the entire family of codes (43260-43273). In review of this family of codes prior to survey, the specialties determined that the coding nomenclature required revisions and new codes were needed so that the set of codes reflected current practice. In January 2013, the CPT Editorial Panel approved revised guidelines along with revision, addition, and deletion of codes within the ERCP code set.

## Overview of ERCP Family RVW Recommendations

The specialty consensus panel spent a significant amount of time reviewing the survey data for the current set of ERCP codes, comparing the data and values with the esophagoscopy codes (43200-43228) and EGD codes (43235-43259) that were approved by the RUC at the October 2012 and January 2013 RUC meetings. After reviewing the survey data, the consensus panel determined that for the ERCP code set, the incremental value above the base code for ERCP (43260) should be similar where possible to the analogous incremental value above the base codes for esophagoscopy and EGD previously approved.

## Discussion and Recommendation

**43273** Endoscopic cannulation of papilla with direct visualization of pancreatic/common bile duct(s) (List separately in addition to code(s) for primary procedure)

**We recommend maintaining the current RVW of 2.24.** When code 43273 was reviewed in 2008, the RUC subtracted RVUs from the median RVW to account for pre- and post-time that was collected on the ZZZ survey. There was no evidence that the survey respondents included this time in their work estimation. The survey results were also complicated by the fact that 0-day global codes were included on the reference list and this was followed by the RUC using a 0-day reference code for a diagnostic esophagoscopy as comparison for the calculated value. The current survey did not include global codes on the reference list.

### Comparison to Key Ref 31627

Key Reference code 31627 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with computer-assisted, image-guided navigation (List separately in addition to code for primary procedure[s])* is basically an add-on code for using the computer to assist with a procedure. This work would be more time consuming, but not more intense than 43273 add-on to ERCP procedures.

### Comparison To ZZZ Add-on Codes Reviewed by the RUC since 2010

As shown in the table below, the current RVW of 2.24 compares well with other services that are performed under MAC or general anesthesia.

### Comparison To ZZZ Add-on Codes Reviewed by the RUC since 2010

As shown in the table below, the current RVW of 2.24 compares well with other services that are performed under MAC or general anesthesia.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 43273

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Gastroenterology

How often? Rarely

Specialty

How often?

Specialty

How often?

Estimate the number of times this service might be provided nationally in a one-year period? 12000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 4,025 in 2011 (4,25\*3 ~ 12,000)

Specialty Gastroenterology	Frequency 10800	Percentage 90.00 %
----------------------------	-----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,000

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Medicare data base 4,025 in 2011

Specialty Gastroenterology	Frequency 3600	Percentage 90.00 %
----------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 43273

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

CPT Long Descriptor:

43260	Endoscopic retrograde cholangiopancreatography (ERCP); diagnostic, with collection of specimen(s) by brushing or washing when performed
43261	Endoscopic retrograde cholangiopancreatography (ERCP); with biopsy, single or multiple
43262	Endoscopic retrograde cholangiopancreatography (ERCP); with sphincterotomy/papillotomy
43263	Endoscopic retrograde cholangiopancreatography (ERCP); with pressure measurement of sphincter of Oddi
43264	Endoscopic retrograde cholangiopancreatography (ERCP); with removal of calculi/debris from biliary/pancreatic duct(s)
43265	Endoscopic retrograde cholangiopancreatography (ERCP); with destruction of calculi, any method (eg, mechanical, electrohydraulic, lithotripsy)
43274	Endoscopic retrograde cholangiopancreatography (ERCP); with placement of endoscopic stent into biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent
43275	Endoscopic retrograde cholangiopancreatography (ERCP); with removal of foreign body(s) or stent(s) from biliary/pancreatic duct(s)
43276	Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged
43277	Endoscopic retrograde cholangiopancreatography (ERCP); with trans-endoscopic balloon dilation of biliary/pancreatic duct(s) or of ampulla (sphincteroplasty), including sphincterotomy, when performed, each duct
43278	Endoscopic retrograde cholangiopancreatography (ERCP); with ablation of tumor(s), polyp(s), or other lesion(s), including pre- and post-dilation and guide wire passage, when performed
43273	Endoscopic cannulation of papilla with direct visualization of pancreatic/common bile duct(s) (List separately in addition to code(s) for primary procedure)

Global Period: 000

Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The ACG, AGA and ASGE convened a group from a broad range of geographic locations with differing practice circumstances and settings - community, academic, teaching, and public; urban, suburban and rural; single and multi-specialty group; independent and employed - who typically perform these services. The committee served as the consensus panel to develop PE recommendations.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

**CPT Code: Tab 12 (ERCP)**  
**Specialty Society('s) ACG, AGA, ASGE**

Current Time data					Survey Code Recommendation			
CPT	Source	Pre	Intra	Post	CPT	Pre	Intra	Post
43260	PEAC-03	19	0	3	43260	19	0	3
43261	PEAC-03	19	0	3	43261	19	0	3
43262	RUC-10	19	0	3	43262	19	0	3
43263	PEAC-03	19	0	3	43263	19	0	3
43264	PEAC-03	19	0	3	43264	19	0	3
43265	PEAC-03	19	0	3	43265	19	0	3
43274	NEW	NA	NA	NA	43274	19	0	3
43275	NEW	NA	NA	NA	43275	19	0	3
43276	NEW	NA	NA	NA	43276	19	0	3
43277	NEW	NA	NA	NA	43277	19	0	3
43278	NEW	NA	NA	NA	43278	19	0	3
43273	NEW	NA	NA	NA	43273	0	0	0

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: NA

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: NA

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

For all codes shown above, EXCEPT 43273:

- Three minutes to complete pre-service diagnostic and referral forms.
- Five minutes to coordinate pre-surgery services with other qualified healthcare providers
- Three minutes for scheduling space and equipment in facility
- Five minutes to perform pre-service education/ obtain consent
- Three minutes for pre-op prescriptions

Intra-Service Clinical Labor Activities:

NA

Post-Service Clinical Labor Activities:

For all codes shown above, EXCEPT 43273:

- Three minutes for a follow-up phone call to patient

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*Codes Reported Together 75% or More screen*

April 2013

**Cystourethroscopy**

In September 2011, the Relativity Assessment Workgroup identified CPT codes 52353 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)* and 52332 *Cystourethroscopy, with insertion of indwelling ureteral stent (eg, Gibbons or double-J type)* as part of the Codes Reported Together 75% or More screen and recommended a bundled code solution. In February 2013, the CPT Editorial Panel established a bundled code, 52356 *Cystourethroscopy, with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type)* to combine the services described by CPT codes 52353 and 52332.

***52332 Cystourethroscopy, with insertion of indwelling ureteral stent (eg, Gibbons or double-J type)***

The RUC reviewed the recommendations from April 2010 for CPT code 52332 and agreed to reaffirm the current value, as it maintains relativity for this family of services. In April 2010, the RUC reviewed the survey responses from 39 urologists for code 52332 and agreed with the specialty society that there is no compelling evidence that the work for this service has changed. For additional support, the RUC also compared this service to CPT codes 49452 *Replacement of gastro-jejunostomy tube, percutaneous, under fluoroscopic guidance including contrast injection(s), image documentation and report* (work RVU = 2.86 and 30 minutes pre-service time, 20 minutes intra-service time and 10 minutes immediate post-service time) and 51102 *Aspiration of bladder; with insertion of suprapubic catheter* (work RVU = 2.70 and 25 minutes pre-service time, 20 minutes intra-service time and 15 minutes immediate post-service time) which require similar physician time, intensity and complexity. **The RUC recommends reaffirming the current work RVU of 2.82 for CPT code 52332.**

***52353 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)***

The RUC reviewed the recommendations from October 2011 for CPT code 52353 and agreed to reaffirm the current value, as it maintains relativity for this family of services. In October 2011, the RUC reviewed the survey results from 86 urologists for CPT code 52353 and agreed that the survey respondents accurately estimated the physician work. The RUC noted that for the 2012 Physician Fee Schedule, CMS reduced the RVU from 7.88 to 7.50 work RVUs. **The RUC recommends reaffirming the current work RVU of 7.50 for CPT code 52353.**

**52356 Cystourethroscopy, with lithotripsy including insertion if indwelling ureteral stent (eg, Gibbons or double-J type)**

The RUC reviewed the survey results from 153 urologists and determined that a work RVU of 8.00, the survey 25<sup>th</sup> percentile appropriately accounts for the physician work to perform this service. The RUC noted that this service is not separately reported with fluoroscopy. . There was consensus among the RUC that the following physician time components are appropriate: pre-time of 53 minutes, intra service time of 60 minutes and post service time of 20 minutes. The RUC also agreed that an additional 2 minutes is appropriate to place the patient in a dorsal lithotomy position. The committee reviewed key reference code 52352 *Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)* (work RVU=6.75) and agreed that 52356 requires more physician time, 45 minutes and 60 minutes intra-service time, respectively, and was rated higher by the survey respondents on all intensity and complexity measures. Therefore, 52356 requires more physician work than 52352. The RUC also reviewed 52346 *Cystourethroscopy with ureteroscopy; with treatment of intra-renal stricture (eg, balloon dilation, laser, electrocautery, and incision)* (work RVU=8.58) and noted that although these two services require similar physician work, the intensity of 52346 is greater. **The RUC recommends a work RVU of 8.00, the survey 25<sup>th</sup> percentile for CPT code 52356.**

**Practice Expense:**

The RUC accepted the direct PE inputs with minor modifications as recommended by the PE Subcommittee.

**Work Neutrality**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Category I</b> <b>Surgery</b> <b>Urinary System</b> <b>Kidney</b> <b>Other Procedures</b>				
50590		Lithotripsy, extracorporeal shock wave		
<b>Ureter</b> <b>Incision</b>				
50610		Ureterolithotomy; upper one-third of ureter		
50620		middle one-third of ureter		
50630		lower one-third of ureter (For laparoscopic approach, use 50945) (For transvesical ureterolithotomy, use 51060) (For cystotomy with stone basket extraction of ureteral calculus, use 51065) (For endoscopic extraction or manipulation of ureteral calculus, see 50080, 50081, 50561, 50961, 50980, 52320-52330, 52352, 52353, 52356)		

**Bladder****Endoscopy-Cystoscopy, Urethroscopy,  
Cystourethroscopy**

52001            Cystourethroscopy with irrigation and evacuation of multiple obstructing clots  
(Do not report 52001 in conjunction with 52000)

**Coding Tips****Restrictions for Reporting Temporary Catheter Insertion and Removal with Cystourethroscopy**

The insertion and removal of a temporary ureteral catheter (52005) during diagnostic or therapeutic cystourethroscopic with ureteroscopy and/or pyeloscopy is included in 52320-~~52355~~ 52356 and should not be reported separately.

*CPT Coding Guidelines, Urinary System, Bladder Transurethral Surgery, Ureter and Pelvis*

Therapeutic cystourethroscopy always includes diagnostic cystourethroscopy. To report a diagnostic cystourethroscopy, use **52000**.

Therapeutic cystourethroscopy with ureteroscopy and/or pyeloscopy always includes diagnostic cystourethroscopy with ureteroscopy and/or pyeloscopy. To report a diagnostic cystourethroscopy with ureteroscopy and/or pyeloscopy, use 52351.

Do not report **52000** in conjunction with **52320- 52343**, 52356 .

Do not report 52351 in conjunction with **52344- 52346** , **52352- 52356 ~~52355~~** .

The insertion and removal of a temporary ureteral catheter ( **52005**) during diagnostic or therapeutic cystourethroscopic with ureteroscopy and/or pyeloscopy is included in **52320- 52356 ~~52355~~** and should not be reported separately.

To report insertion of a self-retaining, indwelling stent performed during diagnostic or therapeutic cystourethroscopy with ureteroscopy and/or pyeloscopy, report 52332 in addition to primary procedure(s) performed (**52320-52330**, **52334-52352**, 52354, **52355**), and append modifier 51. Code 52332 is used to report a unilateral procedure unless otherwise specified.

For bilateral insertion of self-retaining, indwelling ureteral stents, use code 52332, and append modifier **50**.

To report cystourethroscopic removal of a self-retaining, indwelling ureteral stent, see 52310, 52315, and append modifier **58**, if appropriate.

52320            Cystourethroscopy (including ureteral catheterization); with removal of ureteral calculus

52325            with fragmentation of ureteral calculus (eg, ultrasonic or electro-hydraulic technique)

52327            with subureteric injection of implant

52330 with manipulation, without removal of ureteral calculus				
52332	Z1	Cystourethroscopy, with insertion of indwelling ureteral stent (eg, Gibbons or double-J type) <u>(Do not report 52332 in conjunction with 52353, 52356)</u>	000	2.82 (No Change) (Request to reaffirm RUC Recommendation April 2010)
52334	Cystourethroscopy with insertion of ureteral guide wire through kidney to establish a percutaneous nephrostomy, retrograde (For percutaneous nephrostolithotomy, see 50080, 50081; for establishment of nephrostomy tract only, use 50395) (For cystourethroscopy, with ureteroscopy and/or pyeloscopy, see 52351- <u>52356</u> <del>52355</del> ) (For cystourethroscopy with incision, fulguration, or resection of congenital posterior urethral valves or obstructive hypertrophic mucosal folds, use 52400)			
52341	Cystourethroscopy; with treatment of ureteral stricture (eg, balloon dilation, laser, electrocautery, and incision)			
52351	Cystourethroscopy, with ureteroscopy and/or pyeloscopy; diagnostic (For radiological supervision and interpretation, use 74485) (Do not report 52351 in conjunction with 52341-52346, 52352- <u>52356</u> <del>52355</del> )			
52352	with removal or manipulation of calculus (ureteral catheterization is included)			
52353	Z2	with lithotripsy (ureteral catheterization is included) <u>(Do not report 52353 in conjunction with 52332, 52356 when performed together on the same side)</u>	000	7.50 (No Change) (Request to reaffirm RUC Recommendation October 2011)

#●52356	Z3	with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double-J type) <u>(Do not report 52356 in conjunction with 52332, 52353 when performed together on the same side)</u>	000	8.00
52354	with biopsy and/or fulguration of ureteral or renal pelvic lesion			
52355	with resection of ureteral or renal pelvic tumor			
#52356	Code is out of numerical sequence. See 52320-52355.			
<b>Radiology</b> <b>Diagnostic Radiology (Diagnostic Imaging)</b> <b>Urinary Tract</b>				
74480	Introduction of ureteral catheter or stent into ureter through renal pelvis for drainage and/or injection, percutaneous, radiological supervision and interpretation  (For transurethral surgery [ureter and pelvis], see 52320- <del>52355</del> -52356)			

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 52332  
Global Period: 000

Tracking Number

Specialty Society Recommended RVU: **2.83**  
RUC Recommended RVU: **2.82**

CPT Descriptor: Cystourethroscopy, with insertion of indwelling ureteral stent (eg, Gibbons or double-J type)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 42 year old female presents to the Emergency Room with severe right flank pain for 24 hours. Urinalysis shows blood. A non-contrast CT shows an 8 mm stone at the right ureteropelvic junction with severe hydronephrosis. It is elected to place an indwelling J stent to relieve the hydronephrosis and pain.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Kept overnight (less than 24 hours) 0% , Admitted (more than 24 hours) 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 72%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 38%

Is moderate sedation inherent in your reference code (Office setting)? No

Is moderate sedation inherent in your reference code (Hospital/ASC setting)? Yes

Description of Pre-Service Work: Includes services provided from the day before the surgery or diagnostic procedure until the time of the procedure and may include: (1) obtaining and reviewing records or previous history, laboratory studies and urologic x-rays before the procedure; (2) communicating with other health professionals (e.g. family physician, anesthesiologist); (3) communicating with the patient to explain the procedure, operative risks and benefits and to obtain informed consent; (4) dressing for surgery, waiting for anesthesia, positioning, prepping and draping the patient, and scrubbing; (5) preparing and checking needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite. Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work: The patient is placed in the lithotomy position and her perineum is prepped and draped. A 21 French cystoscope is placed at the meatus and passed into the bladder. Inspection of the bladder with the 30 & 70 degree lenses show a normal trigone and bladder wall with no stone debris in the bladder lumen. Under direct vision, an angle-tipped catheter is placed in the right orifice and a .035 guidewire passed through the catheter and up the ureter to the level of the stone. The guidewire is then carefully manipulated around the stone and into the right renal pelvis under fluoroscopy. Once the guidewire's position beyond the stone is confirmed, the angle-tipped catheter is removed leaving the guidewire in place. Under fluoroscopy, a 6 French by 26 cm open-ended J stent is then passed over the guidewire through the cystoscope and up the right ureter. At the level of the stone, the J stent is manipulated into the right renal pelvis being careful not to perforate the ureter. Once it is confirmed that the distal end of the J stent is in the renal pelvis and the proximized end is in the bladder, the guidewire is removed. Fluoroscopy is again used to make certain the J stent is coiled in the right renal pelvis and in the bladder thereby securing it in place and bypassing the obstructing stone. If the J

stent is not perfectly positioned, a grasping forcep is utilized to manipulate the distal end of the J stent and achieve the correct positioning. The bladder is then emptied and the cystoscope removed and a foley catheter is placed.

Description of Post-Service Work: Some of the following may apply: (1) all post procedure care on the day of the procedure and if applicable patient stabilization, post-operative orders, communication with the patient and/or family and referring physician (including written and telephone reports), and other non "skin-to-skin" work in the procedure suite; (2) other follow-up care and prescriptions, if applicable.

-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

According to RUC presumptions, the current work values of all CPT codes are correct. The AUA survey results reflect an increase in work RVU for the median (3.51) and the 25<sup>th</sup> percentile (3.20). Since there is no compelling evidence to support an increase in the work value, the AUA expert panel supports the current work RVU of 2.83.

**SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 52332

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 280000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Educated estimate.

Specialty Urology                      Frequency 275940                      Percentage 98.55 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

124,420 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2008 Medicare data.

Specialty Urology                      Frequency 122615                      Percentage 98.54 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

**Professional Liability Insurance Information (PLI)**

Does the reference CPT code selected for physician work serve as a reasonable reference for PLI crosswalk? (ie. similar work RVU, and specialty) No

If no, please select another crosswalk and provide a brief rationale. 52332

Indicate what risk factor the new/revised code should be assigned to determine PLI relative value. Surgical

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 52353	Tracking Number	Original Specialty Recommended RVU: <b>7.88</b>
		Presented Recommended RVU: <b>7.88</b>
Global Period: 000		RUC Recommended RVU: <b>7.50</b>

CPT Descriptor: Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 57-year-old male presents to the emergency room with acute right flank pain, nausea and vomiting. A CT scan demonstrates a 6 millimeter right ureteral calculus impacted at the level of the iliac vessels with marked hydroureteronephrosis. After appropriate pre-operative preparation, he is taken to the operating room, where under general anesthesia, ureteroscopy with lithotripsy is performed.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 7%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

**Description of Pre-Service Work:**

Preservice Description of Work: Includes services provided from the day of the surgery or diagnostic procedure until the time of the procedure and may include:

- Obtain and review records and previous history, laboratory studies and all imaging studies before the procedure;
- Communicate with other health professionals (e.g. family physician, anesthesiologist);
- Communicate with the patient and family to explain the procedure, operative risks and benefits and to obtain informed consent;
- Dress for surgery, sign the final form in prep area, wait for administration of anesthesia, mark the side of the patient, the patient is first placed in the dorsal lithotomy position; the elbows and shoulders are then padded and the table is then tilted into Trendelenberg (with the head down), prep and drape the patient, and scrub;
- Prepare and check needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite;
- Adjust video and fluoroscopic equipment, "white balancing scopes";
- Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

**Description of Intra-Service Work:**

First, cystourethroscopy is performed with a rigid cystoscope. The bladder and ureteral orifices are inspected. The right ureteral orifice is visualized and a guide wire is manipulated past the stone to the kidney, a dilator is then passed over the wire enlarging the ureteral orifice. A second guidewire is placed in the ureter. The flexible ureteroscope is passed through the urethra into the bladder over the second guide wire. A ureteral access sheath is then placed into the ureter. The right

ureteral orifice is entered and the stone is visualized. The laser fiber is passed, laser power settings are adjusted as appropriate, the stone is fragmented. The basket is then passed through the ureteroscope and stone fragments are manipulated into the basket. The basket is closed and the ureteroscope and basket are withdrawn together. A second look is then performed within the ureter with the ureteroscope. If more stone fragments are seen they are similarly removed with the basket. The ureteroscope is removed. The wire is removed and the bladder drained. A Foley catheter may be placed.

Description of Post-Service Work:

- Accompany patient to post anesthesia recovery room
- Write post operative orders and prescriptions
- Communication with the patient's family; communication with other physicians as appropriate
- Dictate operative report
- Write further orders depending on the status of the patient: outpatient dismissal same day as surgery, 23 hour admission, outpatient admission, inpatient admission

Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	3.58	3.61
Intra-Service intensity/complexity	4.23	4.00
Post-Service intensity/complexity	3.39	3.39

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This code was identified through the Harvard screen and is now being reviewed by the RUC. CPT code 52353 Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included) is currently valued at 7.96 work RVUs.

The AUA expert panel believes that the ureteroscopy codes meet the compelling evidence argument that the technology used during this procedure has changed physician work. An additional letter for compelling evidence is attached for all five ureteroscopy codes under RUC review for this meeting.

For current Harvard valued codes, there are instances when the minutes allowed for each of the pre, intra, and post service times may differ, however, the AUA requests that the AUA recommended times be accepted. In addition, prior to 2008 there were no pre-service packages assigned by the RUC to CPT codes.

	CPT Code	Descriptor	Pre-service Time	Intra-service Time	Post-service Time	Total Time	Work RVU
<b>Current Harvard</b>	<b>52353</b>	Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)	52	111	20	183	7.96
<b>AUA Recommendation</b>	52353	Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy (ureteral catheterization is included)	53	60	20	133	7.88
<b>Key Reference Code RUC Reviewed April 2008</b>	52345	Cystourethroscopy with ureteroscopy; with treatment of ureteropelvic junction stricture (eg, balloon dilation, laser, electrocautery, and incision)	70	45	20	135	7.55

The current procedure does not resemble the original Harvard procedure in either work or intensity. In spite of fewer intra-service minutes for this procedure than original Harvard time, there is considerably more intensity in the current ureteroscopy codes, which allow the ability to view the entire collecting system including the renal pelvis and renal calyx than the original Harvard ureteroscopy codes.

The AUA RUC expert panel recommends a total of five minutes positioning time for the safe placement of the patient in the dorsal lithotomy position (3 minutes pre-service package plus two additional minutes – straightforward patient/difficult procedure). This precedent was granted by the RUC during its October 2010 meeting.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 52353

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 43953

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The majority of these patients are Medicare beneficiaries and the non-Medicare population comprises approximately 25% of the total population. There is no utilization data available on non-Medicare population to support an accurate estimate.

Specialty Urology                      Frequency 43610                      Percentage 99.21 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 35,163 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Based on 2010 RUC database information.

Specialty Urology                      Frequency 34948                      Percentage 99.38 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 52353

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Includes services provided from the day of the surgery or diagnostic procedure until the time of the procedure and may include:

- Obtain and review records and previous history, laboratory studies and all imaging studies before the procedure;
- Communicate with other health professionals (e.g. family physician, anesthesiologist);
- Communicate with the patient and family to explain the procedure, operative risks and benefits and to obtain informed consent;
- Dress for surgery, sign the final form in prep area, wait for administration of anesthesia, mark the side of the patient, the patient is first placed in the dorsal lithotomy position; the elbows and shoulders are then padded and the table is then tilted into Trendelenberg (with the head down), prep and drape the patient, and scrub;
- Prepare and check needed equipment for surgery or procedure and any other non "skin-to-skin" work in the operating room or procedure suite;
- Adjust video and fluoroscopic equipment, "white balancing scopes";
- Does not include: The consultation or evaluation at which time the decision to provide the procedure is made.

Description of Intra-Service Work: Ureteroscopic lithotripsy: First, cystourethroscopy is performed with a rigid cystoscope. The bladder and ureteral orifices are inspected. The right ureteral orifice is visualized and a guide wire is manipulated past the stone to the kidney, a dilator is then passed over the wire enlarging the ureteral orifice. A second guidewire is placed in the ureter. A ureteral access sheath is then placed into the ureter. The flexible ureteroscope is passed through the urethra into the bladder over the second guide wire. The right ureteral orifice is entered and the stone is visualized. The laser fiber is passed, laser power settings are adjusted as appropriate, and the stone is fragmented. The basket is then passed through

the ureteroscope and stone fragments are manipulated into the basket. The basket is closed and the ureteroscope and basket are withdrawn together. A second look is then performed within the ureter with the ureteroscope. If more stone fragments are seen they are similarly removed with the basket. The ureteroscope is removed.

Stent placement: The previously placed guidewire is removed and replaced if damaged. If the guidewire is not damaged it is left in place. A ureteral catheter is passed over the guide wire and the guidewire is removed. Contrast is injected to opacify the collecting system under fluoroscopy. The guidewire is replaced and then back-loaded through a rigid cystoscope sheath, a 30 degree lens is placed and the rigid cystoscope is inserted into the bladder. An appropriate size (length and diameter) double J ureteral stent is selected. Under fluoroscopy the stent is then passed over the guidewire through the cystoscope and up the right ureter. Once it is confirmed that the distal end of the J stent is in the renal pelvis, and the proximal end is in the bladder, the guidewire is removed. Fluoroscopy is again used to make certain the J stent is coiled in the renal pelvis and in the bladder appropriately. If the double J stent is not perfectly positioned, a grasping forceps is utilized to manipulate the distal end of the J stent and achieve correct positioning. The bladder is then emptied and the cystoscope removed. A Foley catheter is placed, and the patient is taken to the recovery room.

#### Description of Post-Service Work:

- Accompany patient to post anesthesia recovery room
- Write post operative orders and prescriptions
- Communication with the patient's family; communication with other physicians as appropriate
- Dictate operative report
- Write further orders depending on the status of the patient: outpatient dismissal same day as surgery, 23 hour admission, outpatient admission, inpatient admission

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
52352	000	6.75	RUC Time

CPT Descriptor Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with removal or manipulation of calculus (ureteral catheterization is included)

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
15004	000	4.58	RUC Time	20,050

CPT Descriptor 1 Surgical preparation or creation of recipient site by excision of open wounds, burn eschar, or scar (including subcutaneous tissues), or incisional release of scar contracture, face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet and/or multiple digits; first 100 sq cm or 1% of body area of infants and children

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
		0.00		

CPT Descriptor 2 See Additional Rationale

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
52346	000	8.58	RUC Time

CPT Descriptor Cystourethroscopy with ureteroscopy; with treatment of intra-renal stricture (eg, balloon dilation, laser, electrocautery, and incision)

**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 59      % of respondents: 38.5 %

**TIME ESTIMATES (Median)**

	CPT Code: 52356	Key Reference CPT Code: 52352	Source of Time RUC Time
Median Pre-Service Time	53.00	53.00

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Additional Rationale and Comments 52356**

The AUA requested a random sampling of email addresses from our membership database. The identified members were sent a “do you do and will you complete” email asking for participation in the RUC survey process. The individuals who responded affirmatively were sent the survey instrument and password access. The survey data was reviewed by our RUC expert panel and the Summary of Recommendations was completed using this data.

Preservice time package “3” assigns three minutes for patient positioning. AUA added two additional minutes, for a total of five minutes as per previous RUC policy which assigns five minutes for positioning in the “dorsal lithotomy” position.

A search of the RUC MPC Database indicates there are 36 “000” global procedures ranging from a low of 0.39 RVW to a high of 4.58 RVW. In the past three years a number of “000” global procedures have been reviewed by the RUC. AUA selected recently reviewed procedures from the RUC Database to compile the table below to show where 52356 fits in relation not only to urologic procedures but also to cross specialty procedures.

Code	Code Descriptor	Pre service Pkg.	RVU	Pre Service Eval	Position time	Scrub, Dress & Wait	Intra service	Post service	Total Time	IWPUT	RUC Reviewed

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 52353 and 52332

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Urology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 60000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Estimated utilization of commercial insurers

Specialty Urology                      Frequency 59642                      Percentage 99.40 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 30,000 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CMS Utilization from RUC Database

Specialty Urology                      Frequency 29826                      Percentage 99.42 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

---

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 52353

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor:

52356X Cystourethroscopy, with ureteroscopy and/or pyeloscopy; with lithotripsy including insertion of indwelling ureteral stent (eg, Gibbons or double J type)

Global Period: 000

Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AUA expert panel consists of ten urologists who represent urological practices, both academic and private settings, from across the United States. They represent the states of Washington, Illinois, New York, Kentucky, and Florida. The panel reviews current RUC practice expense information, requests input for supplies and equipment from several urology practices, reviews the information, makes recommendations and submits them to the AMA.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

This new code 52356 is a combination of two existing CPT codes 52353 and 52332 as required by RUC and CMS through the two codes reported during the same encounter over 75% of the time.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: N/A

4. If you are requesting an increase over the current inputs in clinical staff time, supplies or equipment you must provide compelling evidence: N/A

5. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Complete pre-service diagnostic and referral forms

Coordinate pre-service surgery services

Schedule space and equipment in facility

Provide pre-service education/obtain consent

Intra-Service Clinical Labor Activities:

None

Post-Service Clinical Labor Activities:

Follow-up phone calls and prescriptions

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2013

### Chemodenervation of Neck Muscles

In February 2012, the CPT Editorial Panel created one CPT code 64615 to describe a new injection paradigm for treatment of chronic migraine as current codes did not describe the totality of the work performed. In April 2012, the RUC reviewed the chemodenervation family of codes and 64613 was referred to the CPT Editorial panel to create two codes, one to describe chemodenervation for spasmodic torticollis and another to describe chemodenervation for spasmodic dysphonia. The panel determined that injecting the neck muscle versus injecting the larynx involves different levels of work and intensity and the code was divided into two separate codes.

#### **64616 Chemodenervation of muscle(s); neck muscle(s), excluding muscles of the larynx, unilateral (eg, for cervical dystonia, spasmodic torticollis)**

The RUC reviewed survey results from 80 neurologists and determined that the specialty recommended work RVU of 1.85 is not appropriate for this service. The specialty recommended this value based on a crosswalk to CPT code 64615 *Chemodenervation of muscle(s); muscle(s) innervated by facial, trigeminal, cervical spinal and accessory nerves, bilateral (eg, for chronic migraine)* (work RVU=1.85, 15 minutes pre-service, 15 minutes intra-service, and 5 minutes post-service) because 64615 requires the same physician time, is part of the chemodenervation family and was recently valued in April of 2012. However, the work RVU for CPT code 64615 is currently considered an interim value by CMS and involves 31 injections rather than the 8-10 that are typically required for the surveyed service. The RUC noted that this service will primarily be reported by neurology. The RUC agreed with the specialty recommended pre-service package 5 (Procedure without sedation/anesthesia care), with the addition of 3 minutes of pre-service time for mixing the toxin. The Physician work times are 15 minutes pre-service, 15 minutes intra-service and 5 minutes post-service. The RUC determined that the survey 25<sup>th</sup> percentile work RVU of 1.79 is an appropriate value for this service. The RUC compared 64616 to similar services CPT code 53855 *Insertion of a temporary prostatic urethral stent, including urethral measurement* (work RVU = 1.64, 15 minutes intra-service time) and 64425 *Injection, anesthetic agent; ilioinguinal, iliohypogastric nerves* (work RVU = 1.75, 15 minutes intra-service time) which both require the same intra-service physician work to perform. **The RUC recommends a work RVU of 1.79 and for CPT code 64616.**

#### **64617 Chemodenervation of muscle(s); larynx, unilateral, percutaneous (eg, for spasmodic dysphonia), includes guidance by needle electromyography, when performed**

The RUC reviewed survey results from 60 Otolaryngologists that perform this service and determined that the specialty recommended work RVU of 2.19 is not appropriate for this service and that a work RVU of 2.06, a direct crosswalk to CPT code 69801 *Labyrinthotomy, with perfusion of vestibuloactive drug(s); transcanal* (RVU = 2.06, 15 minutes intra, 43 total) is appropriate for this service. CPT code 64617 requires slightly less

total time, but the same intra-service time and it is a more intense service to perform. The RUC agreed that a work RVU of 1.82, the 25<sup>th</sup> percentile of the survey, does not appropriately account for the level of complexity and risk associated with this service. The RUC noted that this service will primarily be reported by otolaryngology. The RUC approved an adjustment to the intra-service time removing 5 minutes of scrub dress and wait time and adding 5 minutes to the intra-service time. Anesthesia related to this service is more appropriately placed in the intra-service time because the anesthesia is injected directly into the larynx, which can cause significant reaction. The physicians must stay at the bedside during this time. The RUC agreed with the specialty recommended pre-service package 6 (Procedure with sedation/anesthesia care), with an adjustment to the pre-service evaluation time of 2 minutes less resulting in 15 total minutes of pre-service evaluation time. The RUC recommends 16 minutes pre-service, 15 minutes intra-service and 5 minutes post-service time for a total time of 36 minutes. For additional support, the RUC compared 64617 to MPC code 57452 *Colposcopy of the cervix including upper/adjacent vagina*; (work RVU = 1.50, 15 minutes pre-service, 15 minutes intra-service, 10 minutes post-service), which requires the same intra-service time, but is less intense to perform and MPC code 52000 *Cystourethroscopy (separate procedure)* (work RVU=2.23, 17 minutes pre-service, 15 minutes intra-service, 10 minutes post-service), which requires the same intra-service time but is more intense to perform. **The RUC recommends a work RVU of 2.06 for CPT code 64617.**

#### Practice Expense:

The RUC accepted the direct practice expense inputs for both codes with the appropriate adjustments to reflect altered intra-service time and equipment time for CPT code 64617.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
64612	S1	<u>Chemodenervation of muscle(s); muscle(s) innervated by facial nerve (eg, for blepharospasm, hemifacial spasm)</u>	010	1.41  (Request to Reaffirm RUC Recommendation April 2012)
D64613		<del>Chemodenervation of muscle(s); neck muscle(s), (eg, for spasmodic torticollis)</del>  <u>(64613 has been deleted. To report, use 64616)</u>	010	N/A

●64616	S2	<p>Chemodenervation of muscle(s); neck muscle(s), excluding muscles of the larynx, unilateral (eg, for cervical dystonia, spasmodic torticollis)</p> <p><u>-(To report a bilateral procedure, use modifier 50)</u></p> <p><u>(For chemodenervation guided by needle electromyography or muscle electrical stimulation, see 95873, 95874)</u></p>	000	1.79

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64616	Tracking Number S2	Original Specialty Recommended RVU: <b>1.85</b>
		Presented Recommended RVU: <b>1.79</b>
Global Period: 000		RUC Recommended RVU: <b>1.79</b>

CPT Descriptor: Chemodenervation of muscle(s); neck muscle(s), excluding muscles of the larynx, unilateral (eg, for cervical dystonia, spasmodic torticollis)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 60-year-old female presents with a history of progressive involuntary head turn to the right associated with right tilt. The symptom is worse with certain activities and better if she touches her chin. She has significant neck and shoulder pain that interfere with her functioning and sleep. The exam is consistent with torticollis. Chemodenervation is recommended.

Percentage of Survey Respondents who found Vignette to be Typical: 99%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: The medication is brought to room temperature and reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The drug is drawn into a syringe. The injection sites are cleaned using alcohol swabs and the neck is positioned for optimal medication delivery to the first injection site. The physician reviews the patient history, takes an interval history, reviews the patient's medications and allergies. The effect (e.g., benefit, duration of effect, any side effects) of any prior treatment is reviewed. To determine the muscles involved, a focused physical examination is performed. The patient is observed both at rest and walking to determine the pattern of torticollis (presence of anterocollis, tilt, turn and retrocollis along with any associated shoulder movements). Active and passive movements while palpating affected muscles are also used to determine injection sites. Optimal injection sites are determined and marked. Patient questions are answered and informed consent is obtained. The duration of expected treatment effect is discussed. A "time-out" is performed. The physician cleans the injection sites using alcohol swabs and puts on gloves

Description of Intra-Service Work: The toxin is injected. Injections are performed. Following the injection, pressure is held briefly to control any bleeding. The patients is then repositioned for each subsequent injection.

Description of Post-Service Work: Bandages are placed over injection sites. The expected results and follow-up plans are discussed with the patient. Drug accounting is completed. The procedure report is generated, reviewed, and signed

**SURVEY DATA**

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99244	XXX	3.02	RUC Time

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
92004	XXX	1.82	RUC Time	2,151,572

CPT Descriptor 1 Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
64483	000	1.90	RUC Time	853,509

CPT Descriptor 2 Injection, anesthetic agent and/or steroid, transforaminal epidural, with imaging guidance (fluoroscopy or CT); lumbar or sacral, single level

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
		0.00	

CPT Descriptor**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

Number of respondents who choose Key Reference Code: 20      % of respondents: 25.0 %

**TIME ESTIMATES (Median)**

	<u>CPT Code:</u> 64616	<u>Key Reference CPT Code:</u> 99244	<u>Source of Time</u> RUC Time
Median Pre-Service Time	15.00	10.00	
Median Intra-Service Time	15.00	40.00	
Median Immediate Post-service Time	5.00	15.00	
Median Critical Care Time	0.0	0.00	

Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
<b>Median Total Time</b>	<b>35.00</b>	<b>65.00</b>
<b>Other time if appropriate</b>		

**INTENSITY/COMPLEXITY MEASURES (Mean)**(of those that selected Key  
Reference code)**Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered	4.00	4.20
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	3.90	4.30
Urgency of medical decision making	3.60	3.90

**Technical Skill/Physical Effort (Mean)**

Technical skill required	4.85	4.15
Physical effort required	4.30	3.70

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	4.65	3.85
Outcome depends on the skill and judgment of physician	4.75	4.60
Estimated risk of malpractice suit with poor outcome	4.35	4.05

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference  
Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	3.25	2.95
Intra-Service intensity/complexity	4.55	4.30
Post-Service intensity/complexity	2.75	3.10

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The existing code 64613 describes multiple uses of the procedure (for treatment of spasmodic dysphonia and spasmodic torticollis). We believe these two uses are separate and distinct and involve different levels of work and intensity when injecting the neck muscle versus injecting the larynx.

The new code that will primarily be reported by neurology is 64616: Chemodenervation of muscle(s); neck muscle(s), excluding muscles of the larynx, unilateral (eg, for cervical dystonia, spasmodic torticollis). Otolaryngology will primarily report code 64617. Previously one unit of 64613 was reported regardless of the number of sites that were injected. The new code will be reported the same way.

This was a strong survey with 80 responses and 99% agreement with the vignette. The median work RVU of 2.25 is higher than the existing RVU and the societies felt a slightly lower value would be appropriate. The societies recommend pre-service evaluation time of 10 minutes and 5 minutes of positioning time. The time required to mix the toxin and position the patient support the time beyond the standard 7 minutes in the selected pre-service package. Respondents rated 64616 as requiring more technical skill, physical effort and psychological stress than the key reference service 99244.

The societies recommend a work RVU of 1.85 for new CPT code 64616 which falls between the existing RVU of 2.01 and above the survey's 25<sup>th</sup> percentile for a physician work value of 1.79. Our recommended times are 15/15/5. We believe this recommendation is supported by the crosswalk code, 64615 which has a work RVU of 1.85 and the same times. 64615 is part of the same chemodenervation family and was valued in April of 2012.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64613

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology

How often? Sometimes

Specialty PMR                      How often? Sometimes

Specialty                              How often?

Estimate the number of times this service might be provided nationally in a one-year period? 174519

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64613, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology	Frequency 139615	Percentage 79.99 %
---------------------	------------------	--------------------

Specialty PMR	Frequency 20942	Percentage 11.99 %
---------------	-----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 58,173 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We used 2011 Medicare claims data for 64613 to develop the following estimates; taking into consideration Otolaryngology will not report the new code, rather use 64613XX.

Specialty Neurology	Frequency 46538	Percentage 79.99 %
---------------------	-----------------	--------------------

Specialty Physical Medicine and Rehabilitation	Frequency 6900	Percentage 11.86 %
--	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64613

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64617	Tracking Number S3	Original Specialty Recommended RVU: <b>2.19</b>
		Presented Recommended RVU: <b>2.19</b>
Global Period: 000		RUC Recommended RVU: <b>2.06</b>

CPT Descriptor: Chemodenervation of muscle(s); larynx, unilateral, percutaneous (eg, for spasmodic dysphonia), includes guidance by needle electromyography, when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65 year old woman with spasmodic dysphonia presents with deterioration of vocal quality. She finds that her voice makes it difficult to communicate with those around her and interferes with her normal acts of daily living. Anesthesia is provided, as needed, and chemodenervation of laryngeal musculature on one side is performed by percutaneous injection. Needle electromyography is used for guidance.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 7%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Informed consent is obtained and the patient is positioned for laryngeal injection. The neck is prepared and topical anesthetic is injected into the skin and subcutaneous tissue overlying the planned injection site, and directly into the airway (laryngeal and tracheal); time is allotted for it to take effect. EMG grounding leads are placed and the appropriate dilution of botulinum toxin is prepared.

Description of Intra-Service Work: A hollow EMG needle is directed into the intended muscle and when correctly positioned the botulinum toxin is injected. The EMG signal is observed for the appropriate responses as the needle is positioned into the target muscle.

Description of Post-Service Work: The patient is observed for hemoptysis, hematoma, airway obstruction, and aspiration. A clinical note is documented in their file. The patient is counseled on post-procedure care and a follow up appointment is scheduled.

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

The chemodenervation of neck muscle(s) family of codes (64612-64615) was originally brought forward to the CPT Editorial Panel during the February 2012 meeting by the American Academy of Neurology, the American Academy of Ophthalmology, the American Academy of Physical Medicine and Rehabilitation, and the American Society of Ophthalmic Plastic and Reconstructive Surgery. During that meeting they submitted a code change proposal requesting the creation of a new code (now CPT 64615) as well as the addition of instructional parentheticals to the other codes in this family. These modifications were accepted by the CPT Editorial Panel and the family of codes was referred for the RUC for survey for the April 2012 meeting. CPT 64613, chemodenervation of neck muscle(s) (eg, for spasmodic torticollis, spasmodic dysphonia) was then jointly surveyed by Neurology, Otolaryngology, AAPMR, and ASIPP. Upon conclusion of this survey, it was apparent that responses from AAO-HNS members were markedly different, in work and intensity, than those received from AAN, ASIPP, and AAPMR. The expert panel felt that this was due to the parenthetical for CPT 64613 which reflected two uses for the code, one for torticollis and one for dysphonia. Specifically, an Otolaryngologist is injecting the larynx whereas the other specialties are injecting a muscle in the neck. Therefore, expert panel agreed that injecting the larynx was substantially different work than injecting the neck muscle; and a letter was submitted to Dr. Levy, Chair of the RUC, requesting that CPT 64613 be removed from the April 2012 meeting agenda and referred to CPT for the October 2012 meeting to develop two separate codes for these distinct procedures. The RUC approved this request and new codes, 64617 and 64616, were approved by the CPT Editorial Panel at the October 2012 meeting. These new codes are now being brought back to the RUC for valuation during the January 2013 meeting.

### **Description of random survey**

The physician time and work recommendations were derived by conducting a random survey of our Membership using a slightly modified 000 global survey instrument. The Research Subcommittee approved a slight modification to the standard 000 global survey instrument to include a sentence in the pre-service instructions which indicated that respondents should include time for the application of anesthesia in the pre-service time. Surveys were sent to just over 2000 Otolaryngologists and Laryngologists, including the Academy's leadership and key committees, such as the Airway and Swallowing and Voice committees, which contain clinical who are most likely to be familiar with the service under review. 60 responses were received, the data for which is discussed below.

### **Pre Time**

Regarding physician time, our expert panel recommends that pre-service package 6 (Non-facility procedure with sedation/anesthesia care). Our expert panel felt this package was most appropriate given that the service is predominantly provided in the physician office and local anesthesia is injected to anesthetize the larynx. We recommend reducing the pre-service evaluation time from 17 minutes down to 15 minutes to maintain consistency with our survey data.

### **Intra Time and Post Time**

Our expert panel agreed with the median survey intra time of 10 minutes and post time of 5 minutes.

### **Physician Work**

**We recommend a physician work RVU of 2.19 for new CPT code 64617 which is between the 25<sup>th</sup> percentile and the median survey response.** This value was derived by taking the survey's 25<sup>th</sup> percentile value (1.82 RVUs) and adding in the work for the EMG guidance (i.e. 1.82 (survey 25<sup>th</sup> percentile) + 0.37 (95873 or 95874 existing value) = 2.19 RVUs. This results in a recommended total work value which is less than the existing value of the code combinations 64613 and 95873 or 95874 (2.01 and 0.37 RVUs, respectively) which totals 2.38 RVUs. We believe the above recommendation is supported by the key reference code, 64479, which has a higher RVW of 2.29, more intra service time of 15 minutes, and more total time of 49 minutes. The difference in time results in new code, 64617, having a slightly higher IWPUP than the key reference code which is consistent with survey respondents' comments that the new code was more intense and complex than the key reference code. We are also providing the following reference tables which include recently reviewed services which support our requested values for physician time and work for CPT 64617.

### **Comparison to key reference code**

<b><u>CPT Code</u></b>	<b><u>RVW</u></b>	<b><u>IWPUP</u></b>	<b><u>Total Time</u></b>	<b><u>Eval</u></b>	<b><u>Posit</u></b>	<b><u>SDW</u></b>	<b><u>INTRA</u></b>	<b><u>Post</u></b>
<b>64617</b>	2.19	0.1679	36	15	1	5	10	5
<b>64479</b>	2.29	0.1076	49	13	5	6	15	10

### **Comparison to MPC codes**

<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>57452</b>	Colposcopy of the cervix including upper/adjacent vagina;	1.50	0.0627	40	15	0	0	15	10
<b>64617</b>	Chemodenervation of muscle(s); larynx, unilateral, percutaneous (eg, for spasmodic dysphonia), includes guidance by needle electromyography, when performed	2.19	0.1679	36	15	1	5	10	5
<b>52000</b>	Cystourethroscopy (separate procedure)	2.23	0.1131	42	10	2	5	15	10

The table below compares the surveyed code to other RUC reviewed codes of similar time and work, providing further support that the recommended value for 6461XX is appropriate.

<u>RUC Reviewed</u>	<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>

2007	<b>93503</b>	Insertion and placement of flow directed catheter (eg, Swan-Ganz) for monitoring purposes	2.91	0.1659	37	5	2	5	15	10

## SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was previously reporting by CPT codes 64613 and either 95873 or 95874. These services have now been bundled into the new CPT code 64617.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology                      How often? Sometimes

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 21570

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This is three times the 2011 medicare volume which we believe is a resonable estimate for national volume in a one year period.

Specialty Otolaryngology                      Frequency 21570                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 7,190

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The current CPT code 64613 is reported 11% of the time by Otolaryngologists based on the AMA RUC database. Therefore, took 11% of the existing volume for CPT 64613, which was reported 65,363 times in 2011, and used that value to estimate the expected medicare volume for new CPT code 64617.

Specialty Otolaryngology                      Frequency 7190                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 31513

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: Chemodenervation of muscle(s); larynx, unilateral, percutaneous (eg, for spasmodic dysphonia), includes guidance by needle electromyography, when performed.

Global Period: 000 Meeting Date: January 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our society convened an expert panel comprised of our RUC Advisors and members of our Physician Payment Policy (3P) workgroup who are familiar with this service, to derive recommendations for the direct practice expense inputs and clinical staff time for CPT 64617 Chemodenervation of neck muscle(s); larynx.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We selected CPT codes 64613 and 95873 as our reference codes when determining our recommendations for practice expense for the new bundled code 64617, and used the existing inputs for the two former codes now represented by 64617 (64613 and 95873) for comparison.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are recommending 2 minutes of pre-service time, which is above the PEAC standard of 0 minutes pre-service time for 000 globals. This recommendation is based on the need for clinical staff to write an order to the pharmacy requesting the botulinum toxin (botox) required for the procedure. We are also recommending 3 minutes for the staff to schedule space and equipment in the facility for this procedure. 5 minutes was previously assigned by the PEAC for scheduling, however, we believe 3 minutes is sufficient for this activity recognizing that the standard for 000 globals is 0 for this activity.

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The pre-service work in facility setting for CPT 64617 includes 2 minutes for the clinical staff to write an order to the pharmacy requesting the botox required for the procedure as well as 3 minutes, reduced from the 5 minutes previously assigned for this activity by the PEAC, to schedule space and equipment in the facility.

Intra-Service Clinical Labor Activities:

The only intra service clinical labor time required in the facility for CPT 64617 is 6 minutes for discharge management.

Post-Service Clinical Labor Activities:

There are no post-service clinical labor activities for CPT 64617.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor: Chemodenervation of muscle(s); larynx, unilateral, percutaneous (eg, for spasmodic dysphonia), includes guidance by needle electromyography, when performed.

Global Period: 000 Meeting Date: January 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our society convened an expert panel comprised of our RUC Advisors and members of our Physician Payment Policy (3P) workgroup who are familiar with this service, to derive recommendations for the direct practice expense inputs and clinical staff time for CPT 64617 Chemodenervation of neck muscle(s); larynx.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We selected CPT codes 64613 and 95873 as our reference codes when determining our recommendations for practice expense for the new bundled code 64617, and used the existing inputs for the two former codes now represented by 64617 (64613 and 95873) for comparison.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are recommending 2 minutes of pre-service time, which is above the PEAC standard of 0 minutes pre-service time for 000 globals. This recommendation is based on the need for clinical staff to write an order to the pharmacy requesting the botulinum toxin (botox) required for the procedure.

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

The only pre-service work in office setting for CPT 64617 is 2 minutes for the clinical staff to write an order to the pharmacy requesting the botox required for the procedure.

Intra-Service Clinical Labor Activities:

During the intra-service period, the clinical labor performed includes: greeting and gowning the patient, ensuring appropriate medical recodes are available, obtaining 1-3 vital signs, providing pre-service education and obtaining consent, preparing the room equipment, and supplies, positioning the patient for the procedure, assisting the physician with the application of the local anesthesia, assisting the physician in performing the procedure, and cleaning the room and equipment.

Post-Service Clinical Labor Activities:

There is no post-service clinical labor time in the office setting for CPT 64617.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2013

### Chemodenervation of Extremity and Trunk Muscles

In October 2012, the CPT Editorial Panel established six new codes and instructional guidelines to more accurately describe and report chemodenervation of extremity and trunk muscles.

#### **64642 Chemodenervation of one extremity; 1-4 muscle(s)**

The RUC reviewed the survey results from 44 physicians for 64642 and determined that the specialty recommended work RVU of 1.85 between the survey 25<sup>th</sup> percentile and median is not appropriate for this service. The Physician work times are 15 minutes pre-service, 20 minutes intra-service and 5 minutes post-service. The specialty recommended a work RVU of 1.85 based on a crosswalk to CPT code 64615 *Chemodenervation of muscle(s); muscle(s) innervated by facial, trigeminal, cervical spinal and accessory nerves, bilateral (eg, for chronic migraine)* (work RVU=1.85, and 15 minutes pre-service, 15 minutes intra-service, and 5 minutes immediate post-service) because 64615 has the same time, is part of the chemodenervation family and was valued in April of 2012, however this code is still a CMS interim value and involves 31 injections rather than the 8-10 that are typical in this service. The RUC determined that a work RVU of 1.65, the survey 25<sup>th</sup> percentile is appropriate. The RUC compared 64642 to CPT codes 16025 *Dressings and/or debridement of partial-thickness burns, initial or subsequent; medium (eg, whole face or whole extremity, or 5% to 10% total body surface area)* (work RVU = 1.74, 15 minutes pre-service, 20 minutes intra-service, 3 minutes post-service) and 51784 *Dressings and/or debridement of partial-thickness burns, initial or subsequent; medium (eg, whole face or whole extremity, or 5% to 10% total body surface area)* (work RVU = 1.53 and 10 minutes pre-service, 20 minutes intra-service, 10 minutes post-service) and agreed that the time and intensity components were similar. **The RUC recommends a work RVU of 1.65 for CPT code 64642.**

#### **64643 Chemodenervation of one extremity; each additional extremity, 1-4 muscle(s) (List separately in addition to code for primary procedure)**

The RUC approved an adjustment to the pre-service positioning time to include 1 minute. Although this is an add-on code there is positioning time associated with an additional extremity that was not accounted for in the specialty recommendation. The RUC reviewed the survey results from 44 physicians for 64643 and determined that the specialty recommended work RVU of 1.43 is not appropriate for this service. The Physician work times are 1 minutes pre-service and 20 minutes intra-service. The RUC discussed the survey 25<sup>th</sup> percentile of 1.00, however this value does not account for the work of additional muscles associated with performing this service. The RUC determined that a direct crosswalk to CPT code 31633 *Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; with transbronchial needle aspiration biopsy(s), each additional lobe (List separately in addition to code for primary procedure)* (RVU = 1.32, 20 minutes intra-service) is appropriate for this service. The RUC noted that these two services have the same intra-service time. For additional support the RUC compared 64643 to CPT code 49412 *Placement of interstitial device(s) for radiation therapy guidance (eg, fiducial markers, dosimeter), open, intra-abdominal, intrapelvic, and/or retroperitoneum, including image guidance, if performed, single or multiple (List separately in addition to code for primary procedure)* (work

RVU = 1.50, 20 minutes intra-service) and CPT code 11046 *Debridement, muscle and/or fascia (includes epidermis, dermis, and subcutaneous tissue, if performed); each additional 20 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 1.03, 20 minutes intra-service) and determined that the time and complexity were similar. **The RUC recommends a work RVU of 1.32 for CPT code 64643.**

**64644 Chemodenervation of one extremity; 5 or more muscle(s)**

The RUC reviewed the survey results from 44 physicians for 64644, and determined that, the specialty recommended work RVU of 2.20 between the survey 25<sup>th</sup> and median is not appropriate for this service. The Physician work times are 15 minutes pre-service, 25 minutes intra-service and 5 minutes post-service. The RUC determined that the survey 25<sup>th</sup> percentile work RVU of 1.82 is appropriate for this service relative to other similar services. The RUC compared 64644 to CPT code 12005 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 12.6 cm to 20.0 cm* (work RVU = 1.97, 11 minutes pre-service, 25 minutes intra-service and 5 minutes post-service) and CPT code 60100 *Biopsy thyroid, percutaneous core needle* (work RVU = 1.56, 15 minutes pre-service, 25 minutes intra-service, 10 minutes post-service) and determined that the time and complexity components were similar. **The RUC recommends a work RVU of 1.82 for CPT code 64644.**

**64645 Chemodenervation of one extremity; each additional extremity, 5 or more muscle(s) (List separately in addition to code for primary procedure)**

The RUC approved an adjustment to the pre-service positioning time to include 1 minute. Although this is an add-on code there is positioning time associated with an additional extremity that was not accounted for in the specialty recommendation. The RUC also approved an adjustment to the intra-service time to add 5 minutes to be consistent with the base code reported with the add-on code. The RUC reviewed the survey results from 43 physicians for 64645 and determined that the specialty recommended work RVU of 1.70 is not appropriate for this service. The Physician times are 1 minute pre-service, and 25 minutes intra-service. There was consensus among the RUC that a work RVU of 1.20, the survey 25<sup>th</sup> percentile does not appropriately account for the work of additional extremities associated with performing this service. The RUC determined that the increment of 0.20, which corresponds with the increment between the survey 25<sup>th</sup> percentile of 64643 and the survey 25<sup>th</sup> percentile of 64645, can be applied to this code to account for the intensity and work of additional extremities. The work RVU was determined by starting with the RUC recommended value of 64643, work RVU of 1.32 and adding the increment of 0.20 for a total work RVU of 1.52. For additional support, the RUC referenced codes 12005 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 12.6 cm to 20.0 cm* (work RVU = 1.97, 11 minutes pre-service, 25 minutes intra-service and 5 minutes post-service) and CPT code 60100 *Biopsy thyroid, percutaneous core needle* (work RVU = 1.56, 15 minutes pre-service, 25 minutes intra-service and 10 minutes post-service). **The RUC recommends a work RVU of 1.52 for CPT code 64645.**

**64646 Chemodenervation of trunk muscle(s); 1-5 muscle(s)**

The RUC reviewed the survey results from 32 physicians for 64646 and determined that the specialty recommended work RVU of 1.80, the survey 25<sup>th</sup> percentile is appropriate for this service. The Physician times are 15 minutes pre-service, 20 minutes intra-service and 5 minutes post-service. The RUC compared 64646 to CPT code 56820 *Colposcopy of the vulva*; (work RVU = 1.05, 15 minutes pre-service, 15 minutes intra-service, 10 minutes post-service) and CPT code 51784 *Electromyography studies (EMG) of anal or urethral sphincter, other than needle, any technique* (work RVU = 1.53, 10 pre-service, 20 intra-service, 10 post-service) and determined that these services require similar physician work to perform. **The RUC recommends a work RVU of 1.80 for CPT code 64646.**

**64647 Chemodenervation of trunk muscle(s); 6 or more muscle(s)**

The RUC reviewed the survey results from 31 physicians for 64647 and approved times of 15 minutes pre-service, 25 minutes intra-service and 5 minutes post-service time. The RUC determined that the survey 25<sup>th</sup> percentile work RVU of 2.11 appropriately accounts for the physician work required to perform this service. The RUC compared 64647 to CPT code 12005 *Simple repair of superficial wounds of scalp, neck, axillae, external genitalia, trunk and/or extremities (including hands and feet); 12.6 cm to 20.0 cm* (work RVU = 1.97, 11 minutes pre-service, 25 minutes intra-service and 5 minutes post-service) and CPT code 57460 *Colposcopy of the cervix including upper/adjacent vagina; with loop electrode biopsy(s) of the cervix* (work RVU = 2.83, 15 minutes pre-service, 25 minutes intra-service and 10 minutes post-service) and determined that the recommended work RVU of 2.11 is appropriate relative to other similar services. **The RUC recommends a work RVU of 2.11 for CPT code 64647.**

**Practice Expense:**

The RUC accepted the direct practice expense inputs with minor modifications as approved by the Practice Expense Subcommittee.

**Work Neutrality:**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Front Matter</b> <b>Procedural Illustrations</b> <b>Surgery</b> <b>Digestive System</b> <b>Anus</b> <b>Introduction</b>  46505 Chemodenervation of internal anal sphincter (For chemodenervation of other muscles, see 64612, <del>64613</del> , <u>64616</u> , <del>64614</del> <del>64617</del> , 64642, 64643, 64644, 64645, 64646, <u>64647</u> . D64614		<del>Chemodenervation of muscle(s); extremity and/or trunk muscle(s) (eg, for dystonia, cerebral palsy, multiple sclerosis)</del> <del>(Report 61614 only once per session)</del>	010	N/A
64615	R1	muscle(s) innervated by facial, trigeminal, cervical spinal and accessory nerves, bilateral (eg, for chronic migraine) <u>(Report 64615 only once per session)</u> (Do not report 64615 in conjunction with 64612, <del>64613</del> , <u>64616</u> , <del>64614</del> <del>64642</del> , <del>64643</del> , <del>64644</del> , <del>64645</del> , <del>64646</del> , <del>64647</del> )	010	1.85 (Request to reaffirm RUC Recommendation April 2012)

Report 64642, 64643, 64644, 64645 once per extremity. Codes 64642, 64643, 64644, 64645 can be reported together up to a combined total of four units of service per patient when all four extremities are injected. Report only one base code (64642 or 64644) per session. Report one or more units of additional extremity code(s) (64643 or 64645) for each additional extremity injected

Report 64646 or 64647 for chemodenervation of muscles of the trunk.

Trunk muscles include the erector spinae and paraspinal muscles, rectus abdominus and obliques. All other somatic muscles are extremity muscles, head muscles, or neck muscles

(For chemodenervation guided by needle electromyography or muscle electrical stimulation, see 95873, 95874. Do not report more than one guidance code for each corresponding chemodenervation of extremity or trunk code)

(Do not report modifier 50 in conjunction with 64642, 64643, 64644, 64645, 64646, 64647)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64642	Tracking Number R1	Original Specialty Recommended RVU: <b>2.13</b>
		Presented Recommended RVU: <b>1.85</b>
Global Period: 000		RUC Recommended RVU: <b>1.65</b>

CPT Descriptor: Chemodenervation of one extremity; 1-4 muscle(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient has marked flexion at the left elbow and at the left wrist after a stroke. This interferes with activities of daily living. The patient failed medical management and chemodenervation is performed to treat affected muscles. Injections are made to 1-4 muscle(s) in the left arm.

Percentage of Survey Respondents who found Vignette to be Typical: 89%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 5%

Description of Pre-Service Work: The physician reviews the patient history, takes an interval history, reviews the patient's medications and allergies. The effect (e.g., benefit, duration of effect, any side effects) of any prior treatment is reviewed. To determine the muscles involved, a focused physical examination of the involved extremity(ies) is performed using active and passive movements while palpating the affected muscles. Optimal injection sites are determined and marked. Patient questions are answered and informed consent is obtained. The duration of expected treatment effect is discussed. A "time-out" is performed. The physician cleans the injection sites using alcohol swabs and puts on gloves. The medication is brought to room temperature and reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The drug is drawn into the syringe. The injection sites are cleaned using alcohol swabs and the limb is positioned and for optimal medication delivery to the first injection site.

Description of Intra-Service Work: The toxin is injected. Following the injection, pressure is held briefly to control any bleeding. The limb is then repositioned for each subsequent injection.

Description of Post-Service Work: Bandages are placed over injection sites. The expected results and follow-up plans are discussed with the patient. Drug accounting is completed. The procedure report is generated, reviewed, and signed.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99215	XXX	2.11	RUC Time

CPT Descriptor Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A comprehensive history; A comprehensive examination; Medical decision making of high complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 40 minutes face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
92004	XXX	1.82	RUC Time	2,151,572

CPT Descriptor 1 Ophthalmological services: medical examination and evaluation with initiation of diagnostic and treatment program; comprehensive, new patient, 1 or more visits

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AMA requested the society establish a new chemodenervation code for the treatment of chronic migraine. At the CPT Editorial Panel several additional changes were made to parentheses for the other codes within the family. This led to the existing coding proposals to clarify all of the different work captured in 64614.

Code 64614 (chemodenervation of extremity and/or trunk muscles) is being broken out into 6 new codes 64642-64647. Previously one unit of 64614 was reported regardless of the number of injections performed, with a modifier 50 reported for bilateral procedures. The new coding structure separates the codes into extremity-specific and trunk-specific codes. For extremity-specific codes, two base codes (64642, 64644) were created to separate work by the number of injections to the extremity (64642 for  $\leq 4$  injections, 64644 for  $\geq 5$  injections). “Add-on” codes (64643, 64645) were also created to account for cases of injections in multiple extremities. For trunk-specific codes (64646, 64647), two codes were similarly created to separate work by the number of injections (64646 for  $\leq 5$  injections, 64647 for  $\geq 6$  injections).

This new coding structure is expected to better account for the significant difference in work that is currently performed using only the 64614 code.

We surveyed the codes in two groups: the extremity codes (64642-64645) in one group and trunk codes (64646-64647) in a second group. Many of the names provided by the pharmaceutical company were also members of the surveying societies. Of the 44 survey responses, 1 response came from the names provided by the manufacturer.

An expert panel of representatives from the AAN, AANEM and AAPMR reviewed the survey results and developed the following recommendations.

**64642:** The societies recommend that the survey median value of 2.13 be accepted. The survey has a total of 44 respondents. The 25<sup>th</sup> percentile value of 1.65 is not accurate because it would create a rank order anomaly within the chemodenervation code family. Chemodenervation for chronic migraine (64615, RVU 1.85) was RUC valued in 2012 and is a less intense procedure than 64642. Compared to 64615, the muscles injected in 64642 are deeper and less easily identified and isolated for injection (e.g. hand muscles). In addition, the potential for adverse effects of injections are greater for 64642 than for 64615. Finally, 64615 injections have a defined injection pattern and dose. Conversely, extremity injections of 64642 are different for each patient and frequently change from one injection session to the next. This requires deciding on the muscles to be injected and the dose in each muscle during the procedure. Frequently the doses and patterns from two or three previous injections are also reviewed. A thorough search for a crosswalk code was completed by the surveying societies without a reasonable match. We recommend the survey median times of 10/20/5 be accepted. The pre-service evaluation time of 10 minutes exceeds the standard 7 minutes in our selected pre-service package, as does the 5 minutes of positioning time; however the additional minutes are necessary to allow for the time to mix the toxin and for positioning the patient.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain )

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64614

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty PMR                              How often? Sometimes

Specialty                                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 75024

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64614, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology                      Frequency 35261                      Percentage 46.99 %

Specialty PMR                              Frequency 33760                      Percentage 44.99 %

Specialty                                      Frequency                                      Percentage                                      %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 25,008 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 45% of the existing utilization of 64614 (55,574) will now be billed by 64642

Specialty Neurology                      Frequency 11754                      Percentage 47.00 %

Specialty PMR                              Frequency 11254                      Percentage 45.00 %

Specialty                                      Frequency                                      Percentage                                      %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64614

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64643	Tracking Number R2	Original Specialty Recommended RVU: <b>1.68</b>
		Presented Recommended RVU: <b>1.43</b>
Global Period: ZZZ		RUC Recommended RVU: <b>1.32</b>

CPT Descriptor: Chemodenervation of one extremity; each additional extremity, 1-4 muscle(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient presents with distal left sided spasticity after a stroke. This limits gait and activities of daily living. The patient failed medical management and chemodenervation is performed to treat the spasticity of the left arm (coded using 64642). Additional chemodenervation is now performed to treat the affected muscles in an additional limb, the left leg. Injections are made to 1-4 muscle(s) in the left leg.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: The patient is repositioned for injection in the additional limb.

Description of Intra-Service Work: Examination of the additional limb is performed to determine the optimal injection sites, which are then marked. The injection sites are cleaned using alcohol swabs and the limb is positioned for optimal medication delivery to the first injection site. The toxin is injected. Following the injection, pressure is held briefly to control any bleeding. The limb is then repositioned for each subsequent injection. Bandages are placed over injection sites.

Description of Post-Service Work:

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AMA requested the society establish a new chemodenervation code for the treatment of chronic migraine. At the CPT Editorial Panel several additional changes were made to parentheses for the other codes within the family. This led to the existing coding proposals to clarify all of the different work captured in 64614.

Code 64614 (chemodenervation of extremity and/or trunk muscles) is being broken out into 6 new codes 64642-64647. Previously one unit of 64614 was reported regardless of the number of injections performed, with a modifier 50 reported for bilateral procedures. The new coding structure separates the codes into extremity-specific and trunk-specific codes. For extremity-specific codes, two base codes (64642, 64644) were created to separate work by the number of injections to the extremity (64642 for  $\leq 4$  injections, 64644 for  $\geq 5$  injections). "Add-on" codes (64643, 64645) were also created to account for cases of injections in multiple extremities. For trunk-specific codes (64646, 64647), two codes were similarly created to separate work by the number of injections (64646 for  $\leq 5$  injections, 64647 for  $\geq 6$  injections).

This new coding structure is expected to better account for the significant difference in work that is currently performed using only the 64614 code.

We surveyed the codes in two groups: the extremity codes (64642-64645) in one group and trunk codes (64646-64647) in a second group. Many of the names provided by the pharmaceutical company were also members of the surveying societies. Of the 44 survey responses, 1 response came from the names provided by the manufacturer.

An expert panel of representatives from the AAN, AANEM and AAPMR reviewed the survey results and developed the following recommendations.

**64643:** The societies recommend a value of 1.68 for this code which was calculated by using the same intra service RVU for the base code 64642 and subtracting the RVU of the pre and post intra service. There are no efficiencies gained when performing this service on multiple extremities. The physician must spend time in between the base code injections and the add-on code injections to reposition the patient. In patients with spasticity, positioning of the limb to make the injection site available is difficult and time consuming. Further, due to the short shelf life of botox, providers frequently need to reconstitute additional toxin and prepare syringes in between the base code injections and the add-on code injections. We recommend the survey median time 20 minutes be accepted.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached reference table 1

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64614

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
 If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty AAPM&R                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 25008

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64614, which we feel accurately represents the national reporting of this code for one year

Specialty Neurology                      Frequency 11754                      Percentage 47.00 %

Specialty PMR                      Frequency 11254                      Percentage 45.00 %

Specialty                      Frequency                      Percentage                      %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 8,336

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 15% of the existing utilization of 64614 (55,574) will now be billed by 64643

Specialty Neurology                      Frequency 3918                      Percentage 47.00 %

Specialty PMR                      Frequency 3751                      Percentage 44.99 %

Specialty                      Frequency                      Percentage                      %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64614

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64644	Tracking Number R3	Original Specialty Recommended RVU: <b>2.55</b>
		Presented Recommended RVU: <b>2.20</b>
Global Period: 000		RUC Recommended RVU: <b>1.82</b>

CPT Descriptor: Chemodenervation of one extremity; 5 or more muscle(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient presents with disabling cramping of right wrist, fingers and thumb while writing, typing and holding a fork. The patient failed medical management and chemodenervation is performed to treat affected muscles in one limb, the right arm. Injections are made to 5 or more muscles in the right arm.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 2%

Description of Pre-Service Work: The physician reviews the patient history, takes an interval history, reviews the patient's medications and allergies. The effect (e.g., benefit, duration of effect, any side effects) of any prior treatment is reviewed. To determine the muscles involved, a focused physical examination of the involved extremity(ies) is performed using active and passive movements while palpating the affected muscles. Optimal injection sites are determined and marked. Patient questions are answered and informed consent is obtained. The duration of expected treatment effect is discussed. A "time-out" is performed. The physician cleans the injection sites using alcohol swabs and puts on gloves. The medication is brought to room temperature and reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The drug is drawn into a syringe. The injection sites are cleaned using alcohol swabs and the limb is positioned for optimal medication delivery to the first injection site.

Description of Intra-Service Work: The toxin is injected. Following the injection, pressure is held briefly to control any bleeding. The limb is then repositioned for each subsequent injection.

Description of Post-Service Work: Bandages are placed over injection sites. The expected results and follow-up plans are discussed with the patient. Drug accounting is completed. The procedure report is generated, reviewed, and signed.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99244	XXX	3.02	RUC Time

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
36556	000	2.50	RUC Time	499,821

CPT Descriptor 1 Insertion of non-tunneled centrally inserted central venous catheter; age 5 years or older

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AMA requested the society establish a new chemodenervation code for the treatment of chronic migraine. At the CPT Editorial Panel several additional changes were made to parentheses for the other codes within the family. This led to the existing coding proposals to clarify all of the different work captured in 64614.

Code 64614 (chemodenervation of extremity and/or trunk muscles) is being broken out into 6 new codes 64642-64647. Previously one unit of 64614 was reported regardless of the number of injections performed, with a modifier 50 reported for bilateral procedures. The new coding structure separates the codes into extremity-specific and trunk-specific codes. For extremity-specific codes, two base codes (64642, 64644) were created to separate work by the number of injections to the extremity (64642 for  $\leq 4$  injections, 64644 for  $\geq 5$  injections). "Add-on" codes (64643, 64645) were also created to account for cases of injections in multiple extremities. For trunk-specific codes (64646, 64647), two codes were similarly created to separate work by the number of injections (64646 for  $\leq 5$  injections, 64647 for  $\geq 6$  injections).

This new coding structure is expected to better account for the significant difference in work that is currently performed using only the 64614 code.

We surveyed the codes in two groups: the extremity codes (64642-64645) in one group and trunk codes (64646-64647) in a second group. Many of the names provided by the pharmaceutical company were also members of the surveying societies. Of the 44 survey responses, 1 response came from the names provided by the manufacturer.

An expert panel of representatives from the AAN, AANEM and AAPMR reviewed the survey results and developed the following recommendations.

**64644:** The societies recommend a value of 2.55 for this code. Our recommended times are 10/25/5. It was expected that breaking 64614 into 6 codes would result in some codes of lower values and some of higher values. These differences in time and intensity were not incorporated into the original code of 64614. Since the 64614 code was first developed and RUC valued in 2000, the technique and patient populations for Botox injections in the limbs has expanded substantially. Botox injections were initially used in a few large muscles for post-stroke spasticity in one limb. Over time the populations treated has expanded to patients with writer's cramp, musician's dystonia, spasticity from multiple sclerosis, cerebral palsy, generalized dystonia, etc. Injections are used in smaller, difficult to inject muscles. In addition, experience with higher dosages has also lead to the ability to treat more than one limb at a time. Thus for the reasons of technique, patient population, and increased physician time, there is compelling evidence that 64644 differs substantially from the original 64614 code. The recommended value of 2.55 was based on the additional 5 minutes of intra-service work in 64644 compared with 64642. We believe that the survey median intra-service time of 20 minutes was erroneous because the respondents 64644 requires more time than 64642 and the survey respondents indicated 25 minutes as the intra-service time for the corresponding add-on code (64645).

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64614

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty PMR                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 33345

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64614, which we feel accurately represents the national reporting of this code for one year

Specialty Neurology                      Frequency 15672                      Percentage 46.99 %

Specialty PMR                      Frequency 15005                      Percentage 44.99 %

Specialty                      Frequency                      Percentage                      %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 11,115 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 20% of the existing utilization of 64614 (55,574) will now be billed by 64644

Specialty Neurology                      Frequency 5224                      Percentage 46.99 %

Specialty PMR                      Frequency 5002                      Percentage 45.00 %

Specialty                      Frequency                      Percentage                      %

Do many physicians perform this service across the United States? Yes

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64614

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AMA requested the society establish a new chemodenervation code for the treatment of chronic migraine. At the CPT Editorial Panel several additional changes were made to parentheses for the other codes within the family. This led to the existing coding proposals to clarify all of the different work captured in 64614.

Code 64614 (chemodenervation of extremity and/or trunk muscles) is being broken out into 6 new codes 64642-64647. Previously one unit of 64614 was reported regardless of the number of injections performed, with a modifier 50 reported for bilateral procedures. The new coding structure separates the codes into extremity-specific and trunk-specific codes. For extremity-specific codes, two base codes (64642, 64644) were created to separate work by the number of injections to the extremity (64642 for  $\leq 4$  injections, 64644 for  $\geq 5$  injections). "Add-on" codes (64643, 64645) were also created to account for cases of injections in multiple extremities. For trunk-specific codes (64646, 64647), two codes were similarly created to separate work by the number of injections (64646 for  $\leq 5$  injections, 64647 for  $\geq 6$  injections).

This new coding structure is expected to better account for the significant difference in work that is currently performed using only the 64614 code.

We surveyed the codes in two groups: the extremity codes (64642-64645) in one group and trunk codes (64646-64647) in a second group. Many of the names provided by the pharmaceutical company were also members of the surveying societies. Of the 44 survey responses, 0 responses came from the names provided by the manufacturer.

An expert panel of representatives from the AAN, AANEM and AAPMR reviewed the survey results and developed the following recommendations.

**64645:** The societies recommend a value of 2.10 for this code which was calculated by using the same intra service RVU for the base code 64644 and subtracting the RVU of the pre and post intra service. We recommend the survey median times of 25 be accepted. There are no efficiencies gained when performing this service on multiple extremities. The physician must spend time in between the base code injections and the add-on code injections to reposition the patient. In patients with spasticity, positioning of the limb to make the injection site available is difficult and time consuming. Further, due to the short shelf life of Botox, providers frequently need to reconstitute additional toxin and prepare syringes in between the base code injections and the add-on code injections.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. See attached Reference table 2

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64614

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty AAPM&R                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 16671

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64614, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology                      Frequency 7835                      Percentage 46.99 %

Specialty PMR                      Frequency 7502                      Percentage 45.00 %

Specialty                      Frequency                      Percentage                      %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 5,557

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 10% of the existing utilization of 64614 (55,574) will now be billed by 64645

Specialty Neurology                      Frequency 2612                      Percentage 47.00 %

Specialty PMR                      Frequency 2501                      Percentage 45.00 %

Specialty                      Frequency                      Percentage                      %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64614

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64646	Tracking Number R5	Original Specialty Recommended RVU: <b>2.11</b>
		Presented Recommended RVU: <b>1.80</b>
Global Period: 000		RUC Recommended RVU: <b>1.80</b>

CPT Descriptor: Chemodenervation of trunk muscle(s); 1-5 muscle(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient presents with trunk dystonia caused by multiple sclerosis. The patient failed medical management and chemodenervation is performed to treat the affected trunk muscles. Injections are made to 1-5 muscle(s) in the trunk.

Percentage of Survey Respondents who found Vignette to be Typical: 94%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician reviews the patient history, takes an interval history, reviews the patient's medications and allergies. The effect (e.g., benefit, duration of effect, any side effects) of any prior treatment is reviewed. To determine the muscles involved, a focused physical examination is performed while palpating the affected muscles. Optimal injection sites are determined and marked. Patient questions are answered and informed consent is obtained. The duration of expected treatment effect is discussed. A "time-out" is performed. The physician cleans the injection sites using alcohol swabs and puts on gloves. The medication is brought to room temperature and reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The drug is drawn into a syringe. The injection sites are cleaned using alcohol swabs and the patient is positioned for optimal medication delivery to the first injection site.

Description of Intra-Service Work: The toxin is injected. Following the injection, pressure is held briefly to control any bleeding. The patient is then repositioned for each subsequent injection.

Description of Post-Service Work: Bandages are placed over injection sites. The expected results and follow-up plans are discussed with the patient. Drug accounting is completed. The procedure report is generated, reviewed, and signed.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The AMA requested the society establish a new chemodenervation code for the treatment of chronic migraine. At the CPT Editorial Panel several additional changes were made to parentheses for the other codes within the family. This led to the existing coding proposals to clarify all of the different work captured in 64614.

Code 64614 (chemodenervation of extremity and/or trunk muscles) is being broken out into 6 new codes 64642-64647. Previously one unit of 64614 was reported regardless of the number of injections performed, with a modifier 50 reported for bilateral procedures. The new coding structure separates the codes into extremity-specific and trunk-specific codes. For extremity-specific codes, two base codes (64642, 64644) were created to separate work by the number of injections to the extremity (64642 for  $\leq 4$  injections, 64644 for  $\geq 5$  injections). "Add-on" codes (64643, 64645) were also created to account for cases of injections in multiple extremities. For trunk-specific codes (64646, 64647), two codes were similarly created to separate work by the number of injections (64646 for  $\leq 5$  injections, 64647 for  $\geq 6$  injections).

This new coding structure is expected to better account for the significant difference in work that is currently performed using only the 64614 code. Many of the names provided by the pharmaceutical company were also members of the surveying societies. Of the 31 survey responses, 2 response came from the names provided by the manufacturer.

We surveyed the codes in two groups: the extremity codes (64642-64645) in one group and trunk codes (64646-64647) in a second group.

An expert panel of representatives from the AAN, AANEM and AAPMR reviewed the survey results and developed the following recommendations.

**64646:** The societies recommend a value of 2.11 for this code, which is the survey median. We recommend the survey median times of 15/20/5 be accepted. The pre-service evaluation time of 15 minutes exceeds the standard 7 minutes in our selected pre-service package, as does the 5 minutes of positioning time; however the additional minutes are necessary to allow for time to mix the toxin and position the patient.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64614

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty AAPM&R                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8337

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64614, which we feel accurately represents the national reporting of this code for one year

Specialty Neurology	Frequency 1251	Percentage 15.00 %
---------------------	----------------	--------------------

Specialty PMR	Frequency 6253	Percentage 75.00 %
---------------	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,779

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 5% of the existing utilization of 64614 (55,574) will now be billed by 64646

Specialty Neurology	Frequency 417	Percentage 15.00 %
---------------------	---------------	--------------------

Specialty PMR	Frequency 2084	Percentage 74.99 %
---------------	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64614

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 64647	Tracking Number R6	Original Specialty Recommended RVU: <b>2.64</b>
		Presented Recommended RVU: <b>2.11</b>
Global Period: 000		RUC Recommended RVU: <b>2.11</b>

CPT Descriptor: Chemodenervation of trunk muscle(s); 6 or more muscle(s)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A patient with cerebral palsy presents with generalized idiopathic dystonia mainly involving bilateral trunk muscles. The patient has failed medical management and chemodenervation is performed to treat the affected trunk muscles. Injections are made to 6 or more muscles in the trunk.

Percentage of Survey Respondents who found Vignette to be Typical: 100%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The physician reviews the patient history, takes an interval history, reviews the patient's medications and allergies. The effect (e.g., benefit, duration of effect, any side effects) of any prior treatment is reviewed. To determine the muscles involved, a focused physical examination is performed while palpating the affected muscles. Optimal injection sites are determined and marked. Patient questions are answered and informed consent is obtained. The duration of expected treatment effect is discussed. A "time-out" is performed. The physician cleans the injection sites using alcohol swabs and puts on gloves. The medication is brought to room temperature and reconstituted with sterile saline by slowly injecting the diluents into the vial. The physician then gently mixes the toxin by rotating the vial. The drug is drawn into a syringe. The injection sites are cleaned using alcohol swabs and the patient is positioned for optimal medication delivery to the first injection site.

Description of Intra-Service Work: The toxin is injected. Following the injection, pressure is held briefly to control any bleeding. The patient is then repositioned for each subsequent injection.

Description of Post-Service Work: Bandages are placed over injection sites. The expected results and follow-up plans are discussed with the patient. Drug accounting is completed. The procedure report is generated, reviewed, and signed.

**SURVEY DATA**

<b>RUC Meeting Date (mm/yyyy)</b>		01/2013				
<b>Presenter(s):</b>	Kevin Kerber, MD; Wayne Cornblath, MD; Janice Massey,MD; Barry Smith, MD

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99244	XXX	3.02	RUC Time

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A comprehensive history; A comprehensive examination; and Medical decision making of moderate complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of moderate to high severity. Physicians typically spend 60 minutes face-to-face with the patient and/or family.

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
95810	XXX	2.50	RUC Time	308,438

CPT Descriptor 1 Polysomnography; sleep staging with 4 or more additional parameters of sleep, attended by a technologist

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
31622	000	2.78	RUC Time	83,622

CPT Descriptor 2 Bronchoscopy, rigid or flexible, including fluoroscopic guidance, when performed; diagnostic, with cell washing, when performed (separate procedure)

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
		0.00	

CPT Descriptor**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Key Reference Code: 12      % of respondents: 38.7 %**

**TIME ESTIMATES (Median)**

	<u>CPT Code:</u> <b>64647</b>	<u>Key Reference CPT Code:</u> <u>99244</u>	<u>Source of Time</u> <u>RUC Time</u>
Median Pre-Service Time	15.00	10.00

Median Critical Care Time	0.0	0.00	

Median Other Hospital Visit Time	0.0	0.00
Median Discharge Day Management Time	0.0	0.00
Median Office Visit Time	0.0	0.00
Prolonged Services Time	0.0	0.00
Median Subsequent Observation Care Time	0.0	0.00
<b>Median Total Time</b>	<b>45.00</b>	<b>65.00</b>
<b>Other time if appropriate</b>		

**INTENSITY/COMPLEXITY MEASURES (Mean)****(of those that selected Key  
Reference code)****Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered	4.00	4.42
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.33	4.58
Urgency of medical decision making	3.92	4.08

**Technical Skill/Physical Effort (Mean)**

Technical skill required	5.00	4.25
Physical effort required	4.75	3.75

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	4.33	4.25
Outcome depends on the skill and judgment of physician	4.83	4.58
Estimated risk of malpractice suit with poor outcome	4.00	3.83

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference  
Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	3.92	3.92
Intra-Service intensity/complexity	4.83	4.50
Post-Service intensity/complexity	3.67	4.00

---

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 64614 (chemodenervation of extremity and/or trunk muscles) is being broken out into 6 new codes 64642-64647. Previously one unit of 64614 was reported regardless of the number of injections performed, with a modifier 50 reported for bilateral procedures. The new coding structure separates the codes into extremity-specific and trunk-specific codes. For extremity-specific codes, two base codes (64642, 64643) were created to separate work by the number of injections to the extremity (64642 for  $\leq 4$  injections, 64644 for  $\geq 5$  injections). "Add-on" codes (64643, 64645) were also created to account for cases of injections in multiple extremities. For trunk-specific codes (64646, 64647), two codes were similarly created to separate work by the number of injections (64646 for  $\leq 5$  injections, 64647 for  $\geq 6$  injections).

This new coding structure is expected to better account for the significant difference in work that is currently performed using only the 64614 code.

We surveyed the codes in two groups: the extremity codes (64642-64645) in one group and trunk codes (64646-64647) in a second group. Many of the names provided by the pharmaceutical company were also members of the surveying societies. Of the 31 survey responses, 1 response came from the names provided by the manufacturer.

An expert panel of representatives from the AAN, AANEM and AAPMR reviewed the survey results and developed the following recommendations.

**64647:** The societies recommended a value of 2.64 for this code. Our recommended times are 10/25/5. As stated in the rationale for the recommended value for 64644, it was expected that breaking 64614 into 6 codes would result in some codes of lower values and some of higher values. These differences in time and intensity were not incorporated into the original code of 64614. Since the 64614 code was first developed and RUC valued in 2000, the technique and patient populations for Botox injections has expanded substantially. It is now clear that there is a patient population that requires more injections and time represented by this code. Thus for the reasons of technique, patient population, and increased physician time, there is compelling evidence that 64644 differs substantially from the prior standard 64614 code. The recommended value for 64647 was calculated by adding an additional 5 minutes of intra-service work to the RVU value of 64646.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 64614

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Neurology                      How often? Sometimes

Specialty AAPM&R                      How often? Sometimes

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 8337

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. This number is three times the 2011 medicare claims reporting data for 64614, which we feel accurately represents the national reporting of this code for one year.

Specialty Neurology	Frequency 1251	Percentage 15.00 %
---------------------	----------------	--------------------

Specialty PMR	Frequency 6253	Percentage 75.00 %
---------------	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 2,779

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. We estimate 5% of the existing utilization of 64614 (55,574) will now be billed by 64647

Specialty Neurology	Frequency 417	Percentage 15.00 %
---------------------	---------------	--------------------

Specialty PMR	Frequency 2084	Percentage 74.99 %
---------------	----------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 64614

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

Chemodenervation of one extremity; 1-4 muscle(s)

Global Period: .000 Meeting Date: January 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

**The AAN, AAPM&R and AANEM convened a consensus panel via telephone and email to develop the inputs for this code.**

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

**We used the existing PE inputs for 64614 from 2005 as a starting point and made updates to reflect new time standards and changes in technology.**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

**A number of insurances require preauthorization for Botox. This time accounts for the additional minutes to complete pre service forms. (line 12)**

**This service is performed in a procedure room or EMG lab and needs to be booked which accounts for the additional minutes to schedule space and equipment in facility. (line 14)**

**The patient needs to be counseled before procedure on the need for someone else to accompany them to procedure which accounts for the additional minutes to provide pre service education / obtain consent. (line 15)**

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Order necessary labs and phone in preoperative medications. Counsel patient re: logistics. Consent documents reviewed and signed. Advise patient re: anticipated outcomes and possible side effects. Make phone call(s) to answer last minute questions and confirm understanding.

Intra-Service Clinical Labor Activities:

Greet and gown. Check vital signs. Prepare room. Position patient. Assist doctor during procedure (including stabilization of the extremity to protect against injury to vital structures in the neck during multiple needle passes). Assist patient with dressing and wheelchair (if necessary), escort to the waiting room. Clean room and instruments.

**CPT Code: 64642**  
**Specialty Society('s) AAN, AAPM&R, AANEM**

Post-Service Clinical Labor Activities:

As part of the post-op service: prepare prescriptions forms; instructions and counseling; make necessary telephone calls; check supplies; coordinate home or outpatient care.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

Chemodenervation of one extremity; each additional extremity, 1-4 muscle(s)

Global Period: ZZZ Meeting Date: January 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

**The AAN, AAPM&R and AANEM convened a consensus panel via telephone and email to develop the inputs for this code.**

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

**We used the existing PE inputs for 64614 from 2005 as a starting point and made updates to reflect new time standards and changes in technology.**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Intra-Service Clinical Labor Activities:

Greet and gown. Check vital signs. Prepare room. Position patient. Assist doctor during procedure (including stabilization of the extremity(ies) to protect against injury to vital structures in the neck during multiple needle passes). Assist patient with dressing and wheelchair (if necessary), escort to the waiting room. Clean room and instruments.

Post-Service Clinical Labor Activities:

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor: Chemodenervation of one extremity; 5 or more muscle(s)

Global Period: \_000\_ Meeting Date: \_January 2013\_

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

**The AAN, AAPM&R and AANEM convened a consensus panel via telephone and email to develop the inputs for this code.**

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

**We used the existing PE inputs for 64614 from 2005 as a starting point and made updates to reflect new time standards and changes in technology.**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

**A number of insurances require preauthorization for Botox. This time accounts for the additional minutes to complete pre service forms. (line 12)**

**This service is performed in a procedure room or EMG lab and needs to be booked which accounts for the additional minutes to schedule space and equipment in facility. (line 14)**

**The patient needs to be counseled before procedure on the need for someone else to accompany them to procedure which accounts for the additional minutes to provide pre service education / obtain consent. (line 15)**

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Order necessary labs and phone in preoperative medications. Counsel patient re: logistics. Consent documents reviewed and signed. Advise patient re: anticipated outcomes and possible side effects. Make phone call(s) to answer last minute questions and confirm understanding.

Intra-Service Clinical Labor Activities:

Greet and gown. Check vital signs. Prepare room. Position patient. Assist doctor during procedure (including stabilization of the extremity to protect against injury to vital structures in the neck during multiple needle passes). Assist patient with dressing and wheelchair (if necessary), escort to the waiting room. Clean room and instruments.

Post-Service Clinical Labor Activities:

**CPT Code: 64644**  
**Specialty Society('s) AAN, AAPM&R, AANEM**

As part of the post-op service: prepare prescriptions forms; instructions and counseling; make necessary telephone calls; check supplies; coordinate home or outpatient care.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January/April 2013

### Insertion of Anterior Segment Device

In October 2012, the CPT Editorial Panel approved to convert category III code, 0192T *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach* to a category I code, 66183 due to widespread use and adequate published peer reviewed articles supporting the safety and effectiveness of the procedure.

#### **66183 *Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach***

In January 2013, the RUC recommended postponement until the April 2013 RUC meeting to allow the specialty society sufficient time to ensure that the post-operative visits were appropriately estimated. At the April 2013 RUC meeting, it was confirmed that post-operative visits were accurately calculated and that 70% of the physician work is captured in the post-operative visits. The RUC noted that patients with glaucoma undergoing this procedure require intense care for the entire 090-day global period, above any other ophthalmological service. The patient is in danger of further visual loss due to the intraocular pressure which the physician must frequently monitor. In addition, this procedure creates a fistula which must remain open after healing is complete. Closure of the fistula can occur throughout the entire 090-day global period and requires constant management of the patient. The RUC had a robust discussion regarding number of post-operative office visits and agreed that 8 visits: (3) 99212 and (5) 99213, the survey mode, rather than 9 visits, the survey median: (3) 99212 and (6) 99213 with the reduction of one office visit is more appropriate. To validate the number of visits, the RUC compared 66183 to CPT code 66174 *Transluminal dilation of aqueous outflow canal; without retention of device or stent* (work RVU=12.85) which was reviewed at the April 2010 RUC meeting and include 6 post-operative visits, (2) 99212 and (4) 99213. The RUC agreed that 66183 is a more intense procedure than 66174 and requires additional monitoring.

The RUC reviewed the survey results from 56 ophthalmologists and determined that a work RVU of 13.20, the survey 25<sup>th</sup> percentile is appropriate. The RUC compared 66183 to key reference code 65756 *Keratoplasty (corneal transplant); endothelial* (work RVU=16.84) and agreed that since 65756 requires 15 minutes more intra-service time, it should be valued higher. The RUC also reviewed 65850 *Trabeculotomy ab externo* (work RVU=11.39) and determined that the 66183 requires less intra-service time but is more intense and complex to perform. **The RUC recommends a work RVU of 13.20, the survey 25<sup>th</sup> percentile for CPT code 66183.**

#### **Practice Expense:**

The RUC approved the practice expense inputs as reviewed and approved by the PE Subcommittee.

**New Technology**

CPT code 66183 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
0191T		Insertion of anterior segment aqueous drainage device, without extraocular reservoir; internal approach, into the trabecular meshwork	XXX	N/A

●66183	J1	Insertion of anterior segment aqueous drainage device, without extraocular reservoir, external approach	090	13.20

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 66183      Tracking Number J1      Original Specialty Recommended RVU: **13.20**  
 Presented Recommended RVU: **13.20**  
 Global Period: 090      RUC Recommended RVU: **13.20**

CPT Descriptor: Insertion of anterior segment aqueous drainage device, without extraocular reservoir; external approach

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 62 year old male presents with chronic open angle glaucoma and intraocular pressure that is uncontrolled in the right eye with current treatment.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 34% , In the ASC 66%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 100% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 46%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 3%

Description of Pre-Service Work: Review is conducted of past surgical history, medical history, and the surgical plan. Required paperwork is completed. The patient is positioned in preparation for local anesthetic block anesthesia, the surgical eye is confirmed with the patient, surgical and anesthesia team, and the forehead is marked to indicate the operative eye. A local anesthetic block is performed while the patient is monitored with pulse oximetry and electrocardiography.

Description of Intra-Service Work: The operative eye is confirmed by the surgeon. A lid speculum is placed. A partial thickness corneal traction suture is placed and secured to the drape for superior conjunctival exposure. A limbal- or fornix-based conjunctival incision for 5-6 mm is performed followed by deep subconjunctival dissection into the superior temporal and superior nasal fornices to free Tenon's capsule from its attachments to the underlying sclera. Bleeding is controlled with cautery. Next, a 3 mm by 3 mm partial-thickness scleral flap is created with a base at the limbus. An antifibrotic agent is applied to the sclera and the conjunctiva is draped over the applicator sponges for 2-5 minutes. The surgical area is rinsed copiously with balanced salt solution and dried with sponges. A paracentesis is created through temporal clear cornea and the anterior chamber is inflated with balanced salt solution. A 27 gauge needle is bent to allow for easier maneuverability, the needle is placed posterior to the blue line underneath the scleral flap and advanced through the tissue into the anterior chamber while avoiding contact with cornea or iris. The aqueous drainage device is implanted through this needle-entry sclerostomy site under the scleral flap in order to maintain the aqueous flow out of the eye. The device is rotated and confirmed to be stable in the proper orientation and position, and the inserter is released. The scleral flap is reapproximated over the external flange of the device and secured with interrupted 10-0 nylon sutures. The anterior chamber is reinflated with balanced salt solution through the paracentesis and the aqueous flow beneath the scleral flap is observed. If necessary, additional 10-0 nylon sutures are placed in the scleral flap. The conjunctiva is reapproximated and carefully sutured to create a water-tight seal. The conjunctival wound is then tested for integrity by inspecting with fluorescein dye. Injections of antibiotics and steroids are performed. The traction suture and lid speculum are removed.

Description of Post-Service Work: The eye is dressed with topical ointment, patched and a shield is placed. The patient is given detailed postoperative care instructions. The IV is removed. Postoperative pain control is reviewed. An operative report is generated, and required paperwork completed.

Postoperative visits begin on the first postoperative day and continue regularly throughout the postoperative period to assess vision, wound integrity, aqueous flow through the drainage device into the subconjunctival filtration bleb, optic nerve appearance, extraocular and intraocular inflammation, edema of the cornea and/or retina, and intraocular pressure control. Anti-inflammatory and glaucoma medications are adjusted at each post-operative visit based on the clinical appearance. Suture removal either by releasing temporary sutures or laser lysis is performed as needed throughout the post-operative period to modulate flow of aqueous from the eye to titrate intraocular pressure.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An issue was raised at the January meeting about the number of postoperative visits for this code. The society recognizes that the number is higher than typical for many surgical procedures. Patients with

glaucoma severe enough for surgical intervention require intense care for the entire 90-day global period, more so than for any other ophthalmological procedure. The patient is in danger of further visual loss from the intraocular pressure being either too high or too low postoperatively. In addition, this procedure creates a fistula which must remain open after healing is complete for the procedure to be successful.

### **Post-operative Care**

The aqueous drainage device is covered by a layer of sclera that must be tightly closed to prevent the immediate postoperative pressure from being too low. Because this device has no external reservoir, it is then covered by a layer of conjunctiva. The aqueous drains from the eye via the device, percolates between the edges of the scleral flap and is then captured under the conjunctival bleb. The thin conjunctiva overlying the bleb can retract or develop weak areas that leak. The scleral flap is closed with several sutures that are sequentially released (usually by releasing a temporary suture) depending on the pressure. These sutures have to be specially placed because the conjunctiva overlying them cannot be opened or the bleb will leak. These are typically 2-3 in number and are released on sequential office visits so that the pressure can be titrated.

Failure of the fistula to remain open due to scarring can occur at the device, the margins of the scleral flap and the conjunctiva reservoir. Careful and frequent examinations are needed to monitor for this issue which would result in failure of the surgery and persistent elevation of the pressure. The fistula is at risk of closure throughout the entire 90-day global period. Treatment at the postoperative examination includes special contact lenses if the pressure becomes too low or the bleb leaks. Massage of the eye, suture release, needling of the scleral flap and/or the conjunctiva is performed if the pressure is too high. In addition topical medications for both pressure control and postoperative inflammation need careful management. Timing of the interventions is critical and evaluations must be performed frequently to prevent irreversible scarring and failure of the procedure with resultant elevated intraocular pressure. Unlike most surgical procedures where the intensity of the postoperative care decreases as time passes, the care for this procedure remains complex for the duration of the global period.

Canaloplasty with or without a stent was recently (2010) reviewed by the RUC (CPT 66175 and 66174, respectively). Six postoperative visits were approved for both procedures. Neither procedure creates an external fistula that has to be monitored; the primary care for these frequent visits to monitor pressure and adjust medications. Postoperative care for this procedure is much more intense and needs more frequent visits. There are orthopedic procedures, such as CPT 24300 (elbow) and 25259(wrist)) which deal with joint contractures and have six visits the global period because continued monitoring and therapy is needed to prevent recurrence of the "frozen" joint.

### **CPT 66183 Survey Analysis**

The AAO survey produced 56 responses. The vignette was felt to be typical by 91% of the respondents. The 25<sup>th</sup> percentile for WRVU was 13.2 and the median 15.01. Median IST was 45 minutes. Pre-service package 1B was recommended with slight modification. The survey indicated that there were six 99213 and three 99212 postoperative visits reflecting the frequent monitoring of pressure and optic nerve appearance that is needed in glaucoma patients to detect pressure elevation from shunt obstruction. The key reference service *CPT 65765 Keratoplasty (corneal transplant); endothelial* was valued by the RUC in 2008. It has a WRVU of 16.84. Survey respondents consistently valued the intensity and complexity of the surveyed code as being greater than or equal to the reference code which has an IST of 60 minutes. The survey respondents felt that the surveyed coded was greater in intensity and complexity than the reference code for all categories.

### **CPT 66183 Recommendation**

The expert panel of the AAO Health Policy Committee aided by representatives of the American Glaucoma Society reviewed the survey results. All participants were familiar with the RUC process. The panel felt that the survey results were strong and accurately reflected the physician work of the procedure. The key reference service has a longer IST but the respondents felt that the intensity and complexity were less than the surveyed code. With that in mind, the expert panel believes that the 25<sup>th</sup> percentile WRVU accurately reflected these differences and the society is recommending that value of 13.2 WRVU for this procedure.

The specialty is aware that this WRVU is significantly higher than other codes with 45 minutes of IST. However the total time for this procedure is significantly greater than for most of those procedures. In

addition, ophthalmology procedures, in general, have this relationship between WRVU and time because of the nature of the surgical approach. There is no time spent in getting to the operative site. The higher intensity work of the procedure (as opposed to lower-intensity work of obtaining access to be able to begin the procedure) starts immediately. This concentrates high intensity work in a shorter period of time and the RUC has recognized this in the past. If this 25<sup>th</sup> percentile WRVU is accepted, the IWPUT will be 0.102. In April 2010 the RUC accepted IWPUTs in this range for two other glaucoma operations: CPT 66174 (IWPUT = 0.131) and 66175 (0.127). In addition, these codes have WRVU of 12.85 and 13.6 respectively with fewer, lower intensity postoperative visits. Another glaucoma invasive procedure CPT 65850 *Trabeculotomy ab externo* has an IWPUT of 0.111. It also requires less postoperative work than the surveyed code. Laser surgery for glaucoma (CPT 65855 (*Trabeculoplasty by laser surgery, 1 or more sessions (defined treatment series)*) is a 10 day global period and has an IWPUT of 0.13.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 0192T

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Ophthalmology

How often? Sometimes

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor: 66183 Insertion of anterior segment drainage device

Global Period: 090                      Meeting Date: 4/2013

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The Academy convenes a Consensus subcommittee utilizing the appropriate subspecialty representatives who sit on our Health Policy Committee that oversees our activities at RUC and CPT. Additionally we use other physicians who have the appropriate expertise. The consensus committee considered the survey data and PE details in order to determine clinical time and applicable standard packages were also applied. The physicians on the consensus panel familiar with the service provided input on the supplies and equipment needed.

If you have provided any comparison practice expense inputs on your spreadsheet, please provide a rationale for the selection of codes. Comparison Code Rationale:

This code is a new code in the glaucoma shunt family.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Standard 90-day global times to: Complete pre-service diagnostic & referral forms; Coordinate pre-surgery services; Schedule space and equipment in facility; Provide pre-service education/obtain consent, and follow-up phone calls & prescriptions.

Intra-Service Clinical Labor Activities:

Standard 6 minutes for discharge day management coordination.

Post-Service Clinical Labor Activities:

Standard times for 9 post-operative office visits at the appropriate levels.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS High Expenditure Screen*

January 2013

**Removal of Cerumen**

This code was identified through the CMS High Expenditure Screen within the Proposed Rule for the 2012 Medicare Fee Schedule. In response, the American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS) submitted an action plan during the January 2012 RUC meeting indicating they would perform a survey of CPT 69210 for the April 2012 RUC meeting. During its review of the action plan, the Relativity Assessment Workgroup (RAW) questioned whether the existing value for 69210 represented payment for the physician work for one or both ears and noted that the descriptor, in its current state, was unclear in this regard. The AAO-HNS responded to the RAW's concern by submitting a code change proposal (CCP) to the CPT Editorial Panel, for its October 2012 meeting, which revised the code to more accurately describe the removal of cerumen with instrumentation and to specify that it should be reported as unilateral. The revised CPT code 69210 was surveyed for the April 2013 RUC meeting.

***69210 Removal impacted cerumen requiring instrumentation, unilateral***

The RUC reviewed the survey data from 312 otolaryngologists and family physicians and recommends the following physician time components: pre-service time of 5 minutes, intra-service time of 10 minutes and post-service time of 2 minutes.

The RUC noted that this procedure was previously billed as either unilateral or bilateral and has now been revised to report only unilateral. Therefore, since there is no compelling evidence that this procedure is currently misvalued, the RUC recommends applying work neutrality to CPT code 69210. To determine work neutrality, the specialty society discussed that it is anticipated that 10% of the current utilization is billed as bilateral. Given these assumptions, the RUC recommends a work neutral work RVU of 0.58. To validate this value, the RUC compared the surveyed code to CPT code 11000 *Debridement of extensive eczematous or infected skin; up to 10% of body surface* (work RVU= 0.60) and agreed that both codes have identical intra-service time, 10 minutes, and comparable physician work; therefore, the two codes should be valued similarly. The RUC also reviewed CPT code 29580 *Strapping; Unna boot* (work RVU= 0.55) and noted that, while the reference code has two additional minutes of intra-service time compared to the surveyed code, the two codes should be valued similarly since 69210 is a slightly more intense procedure. **The RUC recommends a work RVU of 0.58 for CPT code 69210.**

**Practice Expense:**

The RUC reviewed and accepted the modifications to the equipment, which were deemed indirect, as recommended by the Practice Expense Subcommittee.

**Work Neutrality:**

Under current reporting, CPT code 69210 cannot be billed with the bilateral modifier (52). Therefore, there is no available claims data to substantiate accurate reporting. The RUC will review one year of Medicare claims data, once available, to determine if the 10% bilateral usage assumption is accurate.

▲69210	L1	Removal impacted cerumen <u>requiring instrumentations</u> ( <del>separate procedure</del> ), <del>1 or both ears</del> <u>unilateral</u> <u>(To report bilateral procedure, report 69210 with modifier 50)</u> <u>(For cerumen removal that is not impacted or does not require instrumentations, eg, by irrigation only, see E/M service code, which may include new or established patient office or other outpatient services (99201-99215), hospital observation services (99217-99220, 99224-99226), hospital care (99221-99223, 99231-99233), consultations (99241-99255), emergency department services (99281-99285), nursing facility services (99304-99318), domiciliary, rest home, or custodial care services (99324-99337), home services(99341-99350), or preventive medicine services (99381-99429)</u>	000	0.58

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 69210	Tracking Number L1	Original Specialty Recommended RVU: <b>0.60</b>
		Presented Recommended RVU: <b>0.58</b>
Global Period: 000		RUC Recommended RVU: <b>0.58</b>

CPT Descriptor: Removal impacted cerumen requiring instrumentation, unilateral

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 69 year old male presents with a recent worsening of hearing in the left ear over a several day period. He is found to have a cerumen impaction filling the entire external auditory canal. The physician physically removes the cerumen from the canal with instrumentation and magnification.

Percentage of Survey Respondents who found Vignette to be Typical: 81%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 11%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 1%

Description of Pre-Service Work: The patient's records are reviewed, particularly any medications that might promote bleeding. The patient is questioned, noting any history of abnormality of the pinna, external auditory canals, tympanic membranes, balance and hearing. The procedure is explained and questions of the patient and/or family are answered. The patient is positioned, instrumentation checked and hands cleaned.

Description of Intra-Service Work: The pinna and external auditory canal are examined. The pinna is grasped and the external auditory canal exposed and opened. The instrument of magnification is positioned. The cerumen is removed using a variety of instrumentation including cerumen curettes, spoons, suctions and micro forceps. Occasionally concurrent irrigations are required along with the suction. Care is taken not to injure the external auditory canal or tympanic membrane. After the removal is completed, the external auditory canal and tympanic membranes are examined, status noted, and hearing grossly assessed.

Description of Post-Service Work: The patient is counseled regarding future cerumen management strategies and given instructions regarding what to do in the event of repeated impaction. Any necessary medications are given. The appropriate procedure note and referral letter is dictated.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**Why is this code being reviewed?**

This code was captured by the CMS “high expenditure procedural codes” screen within the 2012 Medicare Physician Fee Schedule final rule. In response, the American Academy of Otolaryngology-Head and Neck Surgery (AAO-HNS) submitted an action plan during the January 2012 RUC meeting indicating they would perform a survey of CPT 69210 for the April 2013 RUC meeting. During its review of the action plan, the RAW questioned whether the existing value for 69210 represented reimbursement for the work of one or both ears and noted that the descriptor, in its current state, was unclear in this regard. The AAO-HNS responded to the RAW’s concern by submitting a code change proposal to the CPT Editorial Panel, for its October 2012 meeting, which revised the code to more accurately describe the removal of cerumen with instrumentation and to specify that it should be reported as unilateral. The revised 69210 is now being surveyed and presented to the RUC for the January 2013 meeting.

### **Description of random survey sample:**

The physician work RVU recommendations were derived by conducting a random survey of the Otolaryngology and Family Medicine memberships. The standard 000 global survey instrument was distributed to 750 Family Medicine physicians and 4704 Otolaryngologists. The Otolaryngology sample included general Otolaryngologists, pediatric Otolaryngologists, Otologists, Neurotologists, as well as the Academy’s leadership and key committees which contain clinicians who were most likely to be familiar with the service. The Family Medicine sample was a straight random sample of all Active AAFP members and excluded students, residents, and certain miscellaneous membership categories (e.g. international and retired members). The survey’s total sample size included 5454 physicians. Survey responses were primarily provided by Otolaryngologists, accounting for 303 of the 312 responses.

### **Physician Time**

#### **Pre-Time**

Following a review of the pre-time survey data, our expert panel determined that preservice package 5 (Non-facility procedure without sedation/anesthesia care) was most appropriate. The expert panel reviewed the survey pre times and determined that the pre-service evaluation time of 5 minutes was excessive given that this procedure is performed following an evaluation and management (E/M) visit 70 percent of the time. The panel, therefore, recommends a reduction in the pre-service evaluation time from 7 minutes down to 3 minutes. In contrast, the expert panel felt that although the preservice package does not assign time for positioning, that 2 minutes of positioning time are necessary for this procedure. During this time the physician typically must ask the patient to move to a new exam room which contains the appropriate equipment. They must also position the patient in a supine position on the exam table and ensure that the microscope, or other magnification equipment, is functional before performing the procedure. Therefore, our panel felt 2 minutes of positioning time was justified.

#### **Intra Time**

Our expert panel agreed with our survey respondents regarding the time for intra service work and are recommending the survey’s median time of 10 minutes for intra service work.

#### **Post Time**

Similarly, our experts felt the survey respondents’ assignment of 2 minutes for post service work was appropriate for this service. While we recognize the policy of the RUC to reduce both pre service and post service time when a procedure is billed with an E/M visit, we believe such a reduction is not appropriate here as 2 minutes is necessary to counsel the patient regarding what they should do in the event their ear becomes impacted, and how to prevent future wax impaction. Thus, our expert panel believes 2 minutes of post service work is necessary for this procedure and is not duplicative of the work performed during the E/M visit.

### **Physician Work**

Our expert panel reviewed the results of the survey for CPT 69210 and felt the survey’s 25<sup>th</sup> percentile, 0.60 RVUs, for physician work was the most appropriate value for this service. While the survey respondents provided a median RVW of 0.85, our expert panel did not believe there was compelling evidence to justify an increase in physician work RVUs for this service. The 0.60 RVU value is also justified by the fact that this service was surveyed in 2005 by Otolaryngology using virtually the same vignette. In fact, the 2005 survey produced a nearly identical median physician work RVU and the exact same physician time as the 2012 survey. This reinforces the validity of the existing value and confirms that 0.60 is an appropriate value for this service. **We therefore, recommend a work RVU of 0.60 for CPT 69210 which is consistent with the survey’s 25<sup>th</sup> percentile.**

Our recommendation is supported by the key reference code CPT 11100 which survey respondents said required more mental effort and judgment than CPT 69210. In addition, the key reference service includes more intra and post time, and

therefore, has a slightly higher RVW of 0.81. We are also providing the following reference tables which include recently reviewed services that support our requested values for physician time and work for CPT 69210.

#### Comparison to key reference code

<u>CPT Code</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>11100</b>	0.81	0.0488	22	5	0	0	12	5
<b>69210</b>	0.60	0.0443	17	3	2	0	10	2

#### Comparison to MPC codes

<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
<b>46600</b>	Anoscopy; diagnostic, with or without collection of specimen(s) by brushing or washing (separate procedure)	0.55	0.0338	22	2	5	0	5	10
<b>69210</b>	Removal impacted cerumen requiring instrumentation, unilateral	0.60	0.0443	17	3	2	0	10	2
<b>20553</b>	Injection(s); single or multiple trigger point(s), 3 or more muscle(s)	0.75	0.0481	22	7	0	0	10	5

The table below compares the surveyed code to other RUC reviewed codes of similar time and work, providing further support that the recommended value for 69210 is appropriate.

<u>RUC Reviewed</u>	<u>CPT Code</u>	<u>Descriptor</u>	<u>RVW</u>	<u>IWPUT</u>	<u>Total Time</u>	<u>Eval</u>	<u>Posit</u>	<u>SDW</u>	<u>INTRA</u>	<u>Post</u>
2011	<b>98925</b>	Osteopathic manipulative treatment (OMT); 1-2 body regions involved	0.46	0.0370	14	5	1	1	10	2
2010	<b>11900</b>	Injection, intralesional; up to and including 7 lesions	0.52	0.0454	15	5	0	0	8	2
1995	<b>11305</b>	Shaving of epidermal or dermal lesion, single lesion, scalp, neck, hands, feet, genitalia; lesion diameter 0.5 cm or less	0.67	0.0372	22	5	0	0	12	5
2010	<b>69220</b>	Debridement, mastoidectomy cavity, simple (eg, routine cleaning)	0.83	0.0651	18	5	1	0	10	2
2010	<b>30901</b>	Control of nasal hemorrhage	1.10	0.0813	26	6	0	5	10	5

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.

☒ Other reason (please explain) This service is typically billed with an E/M code (70% of the time based on 2011 data). The patient is typically seen for evaluation of otolaryngologic symptoms which may include decreased hearing or is found to have cerumen impaction obscuring the view of the tympanic membrane during routine physical examination. The physician will typically provide an E/M visit to fully evaluate the patient and upon diagnosis of the problem as impacted cerumen, proceeds with removal of cerumen constituting a separately reportable service.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. Typically billed with one of the following E/M codes 99201-99205 or 99212-99215.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 69210

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Otolaryngology                      How often? Commonly

Specialty Family Medicine                      How often? Commonly

Specialty Internal Medicine                      How often? Commonly

Estimate the number of times this service might be provided nationally in a one-year period? 5974908

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Given that this service is not age specific, we estimate that the national volume for a one year period will be approximately four times greater than the Medicare volume.

Specialty Otolaryngology	Frequency 2748458	Percentage 46.00 %
--------------------------	-------------------	--------------------

Specialty Family Medicine	Frequency 1254731	Percentage 21.00 %
---------------------------	-------------------	--------------------

Specialty Internal Medicine	Frequency 1135233	Percentage 19.00 %
-----------------------------	-------------------	--------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

1,620,808 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. This is based on the 2011 volume from the RUC database plus the additional 10% that will now be billed as bilateral.

Specialty Otolaryngology	Frequency 687114	Percentage 45.99 %
--------------------------	------------------	--------------------

Specialty Family Medicine	Frequency 313682	Percentage 20.99 %
---------------------------	------------------	--------------------

Specialty Internal Medicine	Frequency 283808	Percentage 18.99 %
-----------------------------	------------------	--------------------

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 69210

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

Global Period: 000 Meeting Date: January 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Our societies convened an expert panel comprised of our RUC Advisors and Alternate Advisors, all of which are familiar with this service, to derive recommendations for the direct practice expense inputs and clinical staff time for CPT 69210 removal impacted cerumen.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

We selected 69210 as our reference code when determining our recommendations for practice expense for the revised 69210, and used the existing inputs as for comparison.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

We are requesting the addition of 4 intra service minutes of clinical staff time above the PEAC's previously approved 2001 clinical staff time for CPT 69210. Despite the fact that we are backing out 11 minutes of intraservice staff time, we are adding minutes for several clinical activities that typically take place when providing this service which were not previously reflected in the practice expense for this code. Specifically, we are requesting new staff minutes for staff to provide pre-service education and obtain consent for the procedure (requesting the PEAC 000 global standard 3 minutes for this activity), we are requesting 2 minutes for staff to prepare and position the patient for the procedure (standard 2 minutes for 000 globals), and we are requesting 10 minutes for cleaning the basic surgical instrument package necessary to perform this procedure (PEAC standard cleaning time for the basic instrument pack).

As is noted in the SOR, this service is performed with an E/M service 70% of the time. Therefore, the staff must educate the patient regarding this separate procedure once the decision has been made, during the E/M, to perform the removal of cerumen procedure. Consent must also be obtained for this separate procedure. Likewise, the patient must be positioned for the removal of cerumen procedure and moved from their position during the E/M (i.e. sitting upright) into the proper position for the cerumen procedure. Finally, the cleaning time is necessary because the code descriptor was changed by CPT to include the language "requiring instrumentation" which has led to our request to add surgical instruments, such as specula and forceps to the list of equipment for this CPT code. These are non-disposable pieces of equipment which must be cleaned prior to reuse by the physician office, and therefore, we have incorporated time for that cleaning in our non-facility PE recommendations for this code.

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

There are no pre-service clinical labor activities in the office setting for CPT 69210.

Intra-Service Clinical Labor Activities:

During the intra-service period, the clinical labor performed includes: providing pre-service education and obtaining consent, preparing the room equipment, and supplies, positioning the patient for the procedure, assisting the physician in performing the procedure, cleaning the room and equipment, and cleaning the basic surgical instrument package.

Post-Service Clinical Labor Activities:

There is no post-service clinical labor time in the office setting for CPT 69210.

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*Harvard Valued - Utilization over 30,000 / PE Services with Stand-Alone Procedure Time Screens*

January 2013

**Respiratory Motion Management Simulation**

These services were identified as part of two CMS screens, the Harvard Valued - Utilization over 30,000 CMS screen as well as the Services with Stand-Alone PE Procedure Time screen. In September 2011, the RUC recommended that the specialty societies survey work and review PE for January 2012. In January 2012 the specialties requested referral to the CPT Editorial Panel and in October 2012 the panel revised CPT codes 77280, 77285, 77290 and 77295 to more accurately describe radiotherapy simulation and established an add-on code to describe respiratory motion management simulation.

***77280 Therapeutic radiology simulation-aided field setting; simple***

The RUC reviewed the survey results from 74 radiation oncologists for CPT code 77280 and recognized that there is a technical component performed by a radiation therapist concurrently with the physician work. The RUC determined that the specialty recommended current work RVU of 0.70 is appropriate for this service. The RUC recommends 7 minutes pre-service, 25 minutes intra-service and 5 minutes post-service. The RUC compared 77280 to similar service 77300 *Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician* (work RVU=0.62, 15 minutes intra-service) and noted that 77280 requires more time to perform, accounting for the higher work value. For additional support, the RUC compared 77280 to CPT code 92579 *Visual reinforcement audiometry (VRA)* (work RVU=0.70, 4 minutes pre-service, 25 minutes intra-service and 5 minutes post-service), and noted that both codes have the same work value and the same intra-service time. **The RUC recommends a work RVU of 0.70 for CPT code 77280.**

***77285 Therapeutic radiology simulation-aided field setting; intermediate***

The RUC reviewed the survey results from 57 radiation oncologists for CPT code 77285 and recognized that there is a technical component performed by a radiation therapist concurrently with the physician work. The RUC determined that the specialty recommended current work RVU of 1.05 is appropriate for this service. The RUC recommends 7 minutes pre-service, 40 minutes intra-service and 5 minutes post-service. The RUC compared 77285 to similar service 77331 *Special dosimetry (eg, TLD, microdosimetry) (specify), only when prescribed by the treating physician* (work RVU=0.87, 30 minutes intra-service) and noted that 77285 requires more time to perform, accounting for the higher work value. For additional support, the RUC compared 77285 to CPT code 88361 *Morphometric analysis, tumor immunohistochemistry (eg, Her-2/neu, estrogen receptor/progesterone receptor), quantitative or semiquantitative, each antibody; using computer-assisted technology* (work RVU=1.18, 40 minutes intra-service), and noted that the codes have the same intra-service time, but 88361 is more intense to perform, accounting for the higher work value. **The RUC recommends a work RVU of 1.05 for CPT code 77285.**

#### **77290 Therapeutic radiology simulation-aided field setting; complex**

The RUC reviewed the survey results from 66 radiation oncologists for CPT code 77290 and discussed that there is a technical component performed by a radiation therapist concurrently with the physician work. The RUC determined that the specialty recommended current work RVU of 1.56 is appropriate for this service. The RUC recommends 7 minutes pre-service, 60 minutes intra-service and 10 minutes post-service. The RUC questioned the additional 5 minutes of post-service in relation to 77285, when the work appears to be identical. The specialty clarified that there are 4 separate fields for the complex service, which all have to be recorded, requiring more time than the intermediate code. The RUC compared 77280 to similar service 77315 *Teletherapy, isodose plan (whether hand or computer calculated); complex (mantle or inverted Y, tangential ports, the use of wedges, compensators, complex blocking, rotational beam, or special beam considerations)* (work RVU=1.56, 45 minutes intra-service), with identical work values. For additional support, the RUC compared 77290 to CPT code 88321 *Consultation and report on referred slides prepared elsewhere* (work RVU=1.63, 50 minutes intra-service), and noted that 88321 requires less time, but is more intense to perform, accounting for the higher work value. **The RUC recommends a work RVU of 1.56 for CPT code 77290.**

#### **77293 Respiratory motion management simulation**

The RUC reviewed the survey results from 49 radiation oncologists for CPT code new add-on CPT code 77293 and discussed the division of work between the medical physicist and the physicians. The specialty clarified that there is a large amount of patient training that the physician must perform for this service. The medical physicist will not be able to provide this training as it is the physician who will determine the physical limitations of the patient. The RUC determined that the survey 25th percentile work RVU of 2.00 and 45 minutes intra-service time are appropriate for this service. The RUC compared 77293 to similar service 77470 *Special treatment procedure (eg, total body irradiation, hemibody radiation, per oral or endocavitary irradiation)* (work RVU=2.09, 55 minutes intra-service) and noted that 77470 requires more time to perform accounting for the higher work value. For additional support, the RUC compared 77293 to CPT code 48400 *Injection procedure for intraoperative pancreatography (List separately in addition to code for primary procedure)* (work RVU=1.95, 45 minutes intra-service), and noted that both services have identical intra-service time and 77293 is slightly more intense to perform, accounting for the higher work value. **The RUC recommends a work RVU of 2.00 for CPT code 77293.**

#### **77295 Therapeutic radiology simulation-aided field setting; 3-dimensional**

The RUC reviewed the survey results from 67 radiation oncologists for CPT code 77295 and determined that the specialty recommended current work RVU of 4.56 was not appropriate for this service. The RUC recommends 7 minutes pre-service, 90 minutes intra-service and 15 minutes post-service. The RUC compared 77295 to 77338 *Multi-leaf collimator (MLC) device(s) for intensity modulated radiation therapy (IMRT), design and construction per IMRT plan* (work RVU = 4.29, 0 minutes pre-service, 115 minutes intra-service and 0 minutes post-service), which requires the same physician work to perform. The code is also in a similar family of codes and both are radiation treatment dosimetry. The RUC determined that 77338 is an appropriate crosswalk and determined that a work RVU of 4.29 appropriately accounts the physician work required to perform 77295. For additional support, the RUC compared 77295 to similar services 77787 *Remote after loading high dose rate radionuclide brachytherapy; over 12 channels* (work RVU = 4.89, 20 minutes pre-service, 90 minutes intra-service, 20 minutes post-service) and MPC code

90966 *End-stage renal disease (ESRD) related services for home dialysis per full month, for patients 20 years of age and older* (work RVU = 4.26, 75 minutes intra-service). **The RUC recommends a work RVU of 4.29 for CPT code 77295.**

**Practice Expense:**

The PE Subcommittee discussed this code in great detail and requested that the specialty revise the spreadsheet and represent to the Subcommittee. The updated spreadsheet addressed the Subcommittee's concerns. The RUC accepted the direct practice expense inputs with minor modifications as approved by the Practice Expense Subcommittee.

**New Technology:**

CPT code 77293 will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

**Work Neutrality:**

The RUC's recommendations for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

<b>Category I</b> <b>Radiology</b> <b>Radiation Oncology</b> <b>Clinical Treatment Planning</b> <b>(External and Internal Sources)</b>				
77261		Therapeutic radiology treatment planning; simple		
77262		intermediate		
77263		complex		
<u>Simulation is the process of defining relevant normal and abnormal target anatomy, and acquiring the images and data necessary to develop the optimal radiation treatment process for the patient. A simulation is defined as complex if any of these criteria are met: particle, rotation or arc therapy, complex or custom blocking, brachytherapy simulation, hyperthermia probe verification, or any use of contrast material. If a simulation does not meet any of these criteria, the complexity is defined by the number of treatment areas: one treatment area is simple, two treatment areas are intermediate and three or more treatment areas are complex.</u>				

**Definitions**

**Simple** simulation of a single treatment area. ~~with either a single port or parallel opposed ports. Simple or no blocking.~~

**Intermediate** ~~simulation of three or more converging ports, two separate treatment areas. multiple blocks.~~

**Complex** ~~simulation of tangential portals, three or more treatment areas, or any number of treatment areas if any of the following are involved: particle, rotation or arc therapy, complex blocking, custom shielding blocks, brachytherapy simulation source verification, hyperthermia probe verification, any use of contrast materials.~~

**Three-dimensional (3D)** ~~computer-generated 3D reconstruction of tumor volume and surrounding critical normal tissue structures from direct CT scans and/or MRI data in preparation for non-coplanar or coplanar therapy. The simulation uses documented 3D beam's eye view volume dose displays of multiple or moving beams. Documentation with 3D volume reconstruction and dose distribution is required.~~

~~Simulation may be carried out on a dedicated simulator, a radiation therapy treatment unit, or diagnostic X ray machine.~~

CPT Descriptor: Therapeutic radiology simulation-aided field setting; simple

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65-year-old man presents with metastatic prostate cancer. He complains of severe pain in the lumbar spine. Bone scan shows multiple metastases, and MRI of the spine shows marrow replacement in several lumbar vertebral bodies. Simulation for radiation therapy to the lumbar spine is scheduled.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review of Bone Scan and MRI scan to confirm disease location and extent of disease. The patient is asked about areas of pain, intensity of pain and pain medications are administered as needed. The simulation process is explained to the patient.

Description of Intra-Service Work: Patient is positioned prone on the CT table/simulation table using a special immobilization prone pillow and aligned using room lasers. The radiation oncologist examines the patient clinically to determine the area of pain and clinically confirms the findings of the bone scan and MRI. Radio-opaque markers are placed on the skin to identify symptomatic areas, as well as sites of prior radiotherapy and any relevant surgical scars or avoidance structures. The radiation oncologist views the area of interest on CT PA view scout image in the simulation room directing the simulation therapist to open scan field borders to include the lower thoracic, lumbar and upper sacral vertebrae in the superoinferior directions. Field of view is set laterally. The radiation oncologist reviews the scout image(s) to confirm that the patient is well aligned. If the patient cannot tolerate the prone position and/or it is felt that the prone position may bring in other organs (e.g. kidneys, bowel) closer to the metastatic site; or cannot maintain good alignment, he is repositioned in the supine position and the process repeated. The radiation oncologist and therapist ensure the proper treatment position and that the patient will pass safely through the CT bore without collision or the loss of any soft tissues on images. The radiation oncologist directs the choice of CT slice thickness, based on the anticipated planning needs and a therapeutic planning CT scan is obtained. After reconstruction, the therapeutic planning CT images are reviewed for completeness and inclusion of all relevant targets, organs at risk, and markers.

The planning CT data set is then transferred to a work station where virtual fields are applied to the selected vertebral bodies and reviewed on digitally reconstructed radiographs (DRR). Upper and lower field borders are set to cover the selected levels. Vertebral levels are counted and reviewed on scout images, axial images, and any DRR. The field borders

are reviewed to insure that there is no overlap with prior radiation portals, especially at the spinal cord. Lateral field edges are similarly reviewed and modified. Virtual simulation shows the beam lateral borders in relation to the kidneys for a lumbar spine field and this is adjusted to minimize exit through these organs. The field center is finalized by the physician and an opposed field applied and the above process is repeated. The field center and alignment marks are placed by tattoo by the therapist on the patient and the field borders are outlined by marking pen and approved by the physician. The patient is then taken off the table.

Description of Post-Service Work: The set up parameters are documented by the therapist and reviewed by the physician for accuracy and reproducibility. The physician documents and signs the simulation process and approved images. The images are reviewed with the patient (and also family if present).

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 77280 Therapeutic radiology simulation – aided field setting; simple, is a therapeutic radiation simulation code, which has PC and TC. The PC describes the physician work associated with the simulation process – transferring what exists in the radiation oncologist’s prescription into something that will allow the daily treatment to be delivered. This is not a treatment, but by simulating the treatment, all the decisions are made to allow a therapist to comfortably, safely and accurately position the patient for treatment. The level of simulation is dependent on the number of treatment areas, contrast material, complex or custom blocking, etc., and is coded with CPT codes 77280-77290. In this family of simulation codes, 77280 is classified as a “simple simulation”.

ASTRO conducted a survey, with a 1180 sample size, and collected 74 random surveys (6.2% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current RVU of 0.70 for CPT code 77280.

Our rationale for that recommendation is based on multiple factors and is described below.

#### Vignette

Currently the most reported diagnosis for this code is metastatic prostate cancer. Therefore, we used the vignette of a patient with prostate cancer with metastases to the lumbar spine in this survey and 96 % of our survey respondents felt the vignette was typical.

#### Codes Reported on the Same Day

The data in the “Same Day Billings from CMS” file shows that no codes are billed frequently with 77280.

#### Time

Our current surveyed total time is 40 minutes (10, 25, 5). ASTRO is recommending the median survey times for intra and post, and Preservice package 5 (7 minutes), for a total recommended time of 37 minutes (7, 25, 5). The surveyed time clearly supports the recommended 25 minutes of intraservice time.

#### IWPUT

The surveyed code 77280 will have an IWPUT of 0.017, when using the median times and RVU. While this is an inappropriately low IWPUT, the relationship within the family of codes maintains rank order.

CPT	IWPUT
77280	0.017
77285	0.020
77290	0.020

#### Comparison to the Key Reference Services

The key reference service code was CPT code 77300, Basic radiation dosimetry calculation, central axis depth dose calculation, TDF, NSD, gap calculation, off axis factor, tissue inhomogeneity factors, calculation of non-ionizing radiation surface and depth dose, as required during course of treatment, only when prescribed by the treating physician. This key reference code was most often selected by the survey respondents. It has a total intra-service time of 15 minutes, an IWPUT of 0.041 and a wRVU of 0.62. The surveyed code has more time and RVUs than the reference code, both codes have clinical and technical similarities and the work is well understood by our members. We believe that this was an appropriate selection by our survey respondents and fits nicely with our survey data.

#### Relativity

Our recommendation maintains relativity compared to the reference code, the other simulation codes, and codes within the radiation family. Simple simulation (77280) is the typical code used when simulating a metastatic lesion. When two lesions are simulated, 77285 is used. Our survey data nicely correlates with a 50% adjustment in RVW when two separate lesions are simulated (0.70 and 1.05 respectively).

#### Recommendations:

We are recommending the current RVU of 0.70, with pre-service: 7 minutes, median intra time of 25 minutes and post service times of 5 minutes, for a total time of 37 minutes. The expert panel believes that our survey supports our recommendations.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77280

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty                      How often?

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national estimate is not available.

Specialty	Frequency 0	Percentage 0.00 %
Specialty	Frequency	Percentage %
Specialty	Frequency	Percentage %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

283,421 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Radiation Oncology	Frequency 266416	Percentage 94.00 %
Specialty	Frequency	Percentage %
Specialty	Frequency	Percentage %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 77280

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review of diagnostic imaging to confirm disease location and extent of disease to ensure that this corresponds to area of patient's symptoms. The patient is asked about areas of pain, intensity of pain and pain medications are administered as needed. The simulation process is explained to the patient.

Description of Intra-Service Work: If there is no contraindication such as vertebral body stability issues, the patient is positioned prone on the CT simulation table using a special immobilization prone pillow and aligned using a laser targeting system. The radiation oncologist examines the patient clinically to confirm the clinical areas of pain correspond to the bone scan and MRI findings. The radiation oncologist places radio-opaque markers on the skin to identify symptomatic areas, as well as sites of prior radiotherapy and any relevant surgical scars or avoidance structures. If the patient cannot tolerate the prone position and maintain good alignment, she is repositioned in the supine position and the process repeated. The radiation oncologist and therapist ensure that in the correct position, the patient will pass safely through the CT bore without collision or loss of any soft tissues images. The radiation oncologist views the area of interest on CT PA scout images in the simulation room directing the simulation therapist to open field borders to include the cervical vertebral bodies and another field border to include the right hip region in the superoinferior directions. Field of view is set laterally for each region. The radiation oncologist reviews the scout images to confirm that the patient is well aligned. The radiation oncologist now determines the appropriate CT slice thickness so as to minimize artifacts based on analysis of the scout image and ensures that the field of view will encompass all normal organs at risk. The CT data set is acquired for the first treatment region using the specifications given by the radiation oncologist, which are based on spatial resolution and image parameters needed to visualize the tumor location and target volumes unique to the patient's habitus.

The therapeutic planning CT data set is then transferred to a work station. After reconstruction, the therapeutic planning CT images are reviewed by the radiation oncologist for completeness and inclusion of all relevant targets, organs at risk

and markers. Virtual fields are applied to the cervical spine region. The cervical vertebral bodies are counted and reviewed on scout images, axial images, and any DRR. Field borders are set by the radiation oncologist; including lateral field edges. For each field targeting this treatment site, the projection of the field edges are reviewed on the virtual reconstruction of the patient's skin. Inclusion (or exclusion) of all relevant skin markers is ensured. Any possible flash is reviewed. The radiation oncologist sets the cervical spine field isocenter.

The final measurements are relayed to the therapist who discusses with the radiation oncologist where the tattoos and other temporary skin marks (identifying field centers and field borders) should be placed so as to align the four directional alignment lasers for reproducibility on a daily basis and the patient is tattooed by the therapist. The measurement numbers from the CT simulator treatment couch indexing system are carefully recorded with the image dataset and other patient positioning parameters.

Simulation of the second site is then performed. The patient is repositioned supine on the scanner in feet-first orientation to scan the hip. The entire process of scanning, virtual simulation, and skin marking described above is repeated.

The patient is then taken off the table.

Description of Post-Service Work: The set up parameters are documented by the therapist and reviewed by the physician for accuracy and reproducibility. The physician documents and signs the simulation process for both areas of interest and approves the images. The images are reviewed with the patient (and also family if present).

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 77285, Therapeutic radiology simulation-aided field setting; intermediate, is a therapeutic radiation simulation code, which has PC and TC. The PC describes the physician work associated with the simulation process – transferring what exists in the radiation oncologist’s prescription into something that will allow the daily treatment to be delivered. This is not a treatment, but by simulating the treatment, all the decisions are made to allow a therapist to comfortably, safely and accurately position the patient for treatment. The level of simulation is dependent on the number of treatment areas, contrast material, complex or custom blocking, etc., and is coded with CPT codes 77280-77290. In this family of simulation codes, 77285 is classified as an “intermediate simulation”, given that two separate areas of the body require treatment.

ASTRO conducted a survey, with a 1180 sample size, and collected 57 random surveys (4.8% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current RVU of 1.05 for CPT code 77285

Our rationale for that recommendation is based on multiple factors and is described below.

#### Vignette

We used the vignette of a patient with metastatic breast cancer to two separate sites (cervical spine and right femoral neck) in this survey. 98 % of our survey respondents felt the vignette was typical.

#### Codes Reported on the Same Day

The data in the “Same Day Billings from CMS” file shows that no codes are billed frequently with 77285.

#### Time

Our current surveyed total time is 55 minutes (10, 40, 5). ASTRO is recommending the median survey times for intra and post, and Preservice package 5 (7 minutes) for a total recommended time of 52 minutes (7, 40, 5). The surveyed intra time is slightly less than the current intra-service time of 46 minutes. The surveyed time clearly supports the recommended 40 minutes of intraservice time.

#### IWPUT

The surveyed code 77285 will have an IWPUT of 0.02, when using the median times and RVU. While this is an inappropriately low IWPUT, the relationship within the family of codes maintains rank order.

CPT	IWPUT
77280	0.017
77285	0.020
77290	0.020

#### Comparison to the Key Reference Services

CPT code 77331, Special dosimetry (eg. TLD, microdosimetry), only when prescribed by the treating physician, was the key reference code and was most often selected by the survey respondents. The key reference service code has a total intra-service time of 30 minutes, an IWPUT of 0.029 and wRVU of 0.87. The surveyed code has slightly higher time and RVUs than the reference code. There is similarity in the work of the two codes in the degree of clinical correlation, and technical skill needed. We believe that this was an appropriate selection by our survey respondents and fits nicely with our survey data.

#### Relativity

Our recommendation will maintain relativity compared to the reference code, the other simulation codes, and codes within the radiation family, Simple simulation - 77280 (by definition, includes one lesion) has an w RVU of 0.70. Intermediate simulation - 77285 (by definition includes 2 separate lesions), has a wRVU of 1.05, that correlates nicely with the added effort and time.

#### Recommendations

We are recommending the current RVUw of 1.05, with pre-service: 7 minutes, median intra time of 40 minutes and post service times of 5 minutes, for a total time of 52 minutes. The expert panel believes our survey supports our recommendations

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.

- ☐ Multiple codes are used to maintain consistency with similar codes.  
☐ Historical precedents.  
☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77285

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? A national estimate is not available.

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,336

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty Radiation Oncology	Frequency 4163	Percentage 96.01 %
------------------------------	----------------	--------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 77285

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 77290	Tracking Number T3	Original Specialty Recommended RVU: <b>1.56</b>
		Presented Recommended RVU: <b>1.56</b>
Global Period: XXX		RUC Recommended RVU: <b>1.56</b>

CPT Descriptor: Therapeutic radiology simulation-aided field setting; complex

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 70-year-old woman with a BMI of 35 presents with a breast mass. Lumpectomy and nodal dissection show a 3cm infiltrating ductal carcinoma (with negative margins), and 6 of 14 axillary nodes showing cancer. Simulation for breast and nodal irradiation is scheduled.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Review patient chart, surgical notes, pathology report, mammogram and other imaging studies. Discuss procedure with patient.

Description of Intra-Service Work: The radiation oncologist chooses the patient position for simulation, based on knowledge of the physical capabilities of the treatment machine and the technical limitations on delivering radiation to the patient's unique body shape, tumor location , patient limitations, patient comfort to achieve reproducibility. The patient is positioned after selecting the appropriate breast board and arm position both ipsilateral and contralateral. The radiation oncologist palpates and outlines the breast tissue to determine the upper, lower, medial and lateral field edges as defined by the clinical findings correlating to the mammogram and/or MRI imaging. The entire position is then checked again and adjustments made by the radiation oncologist to determine if there are any patient and tumor anatomical issues that would be necessary to incorporate into simulation (e.g. bolus, different angle, skin folds, steps to avoid the exit beam etc.).

Once this is satisfactorily set, the radiation oncologist marks the breast contour, corners of the field and surgical scars with radio-opaque wires and markers. The radiation oncologist will then check to ensure that palpable/ imaged abnormalities in the tumor bed and scars are encompassed within the borders. He will make sure that the patient in the simulation position passes through the CT bore without collision or loss of soft tissue images. This typically involves adjustments including the ipsilateral and contralateral positions while taking care to ensure reproducibility of the radiation fields. The patient is brought out of the CT bore and the four directional laser targeting system is utilized based on the radio-opaque marks placed by the physician. The initial simulation isocenter is determined by the physician based on the patient's anatomy, contour of the anterior chest wall, breast tissue and lateral chest wall along with reproducibility issues. CT scout images are obtained which are reviewed by the radiation oncologist to ensure that the area of interest is covered and that there is no clip, staple or soft tissue image artifacts and that the Hounsfield units are appropriate. The radiation oncologist now

determines the appropriate CT slice thickness so as to minimize artifacts based on analysis of the scout image and ensures that the field of view will encompass all normal organs at risk. The CT data set is acquired based on the parameters given by the radiation oncologist based on spatial resolution and image parameters needed to visualize the tumor bed and target volumes unique to the patient's habitus.

The therapeutic planning CT data set is analyzed by the radiation oncologist using a virtual simulation system. The radiation oncologist applies virtual fields to the target areas and adjusts the treatment isocenter. Typically a single isocentric setup is selected for the breast and the regional nodal stations. The process involves setting virtual field borders for the chestwall and similarly setting this up for the supraclavicular nodal regions. A junctional plane is selected for the single isocenter using a virtual half beam technique and the true isocenter is selected. The depth of this isocenter from the skin and reference to fixed bony points such as the sternum is measured and recorded by the physician.

Once the isocenter is established, each of the individual portals are projected on the patient's skin (virtually) and checked against the skin markers to ensure coverage. The path of each field through the patient is reviewed to assess the amount of lung, heart or other normal structures included in the field and adjustments made by the physician. This process is repeated for each of the individual fields simulated (two chest tangents, internal mammary, supraclavicular, and posterior axillary fields). The isocenter is adjusted as necessary during the creation of each field.

The final measurements are relayed to the therapist who discusses with the radiation oncologist where the tattoos and other temporary skin marks should be placed so as to align the four directional alignment lasers for reproducibility on a daily basis and the patient is tattooed by the therapist. The numbers from the CT simulator treatment couch indexing system are carefully recorded with the image dataset and other patient positioning parameters and the patient is then taken off the table.

Description of Post-Service Work: The radiation oncologist verifies that all the appropriate data has been acquired, all the parameters are documented accurately. The physician documents and signs the simulation process and approved images and dictates the simulation note.

Outcome depends on the skill and judgment of physician	4.16	3.51
Estimated risk of malpractice suit with poor outcome	4.09	2.95

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference  
Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	3.26	3.12
Intra-Service intensity/complexity	3.58	3.40
Post-Service intensity/complexity	3.12	3.09

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 77290, Therapeutic radiology simulation – aided field setting; complex, is a therapeutic radiation simulation code, which has PC and TC. The PC describes the physician work associated with the simulation process – transferring what exists in the radiation oncologist’s prescription into something that will allow the daily treatment to be delivered. This is not a treatment, but by simulating the treatment, all the decisions are made to allow a therapist to comfortably, safely and accurately position the patient for treatment. The level of simulation is dependent on the number of treatment areas, contrast material, complex or custom blocking, etc., and is coded with CPT codes 77280-77290. In this family of simulation codes, 77295 is classified as a “complex simulation”.

ASTRO conducted a survey, with a 1180 sample size, and collected 66 random surveys (5.5% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends maintaining a current RVU of 1.56 for CPT code 77290.

Our rationale for that recommendation is based on multiple factors and is described below.

#### Vignette

The vignette is of a patient with breast cancer, requiring simulation for breast and nodal irradiation. Breast cancer is in the top two diagnosis for the use of this code in both the facility and non facility. 98 % of our survey respondents felt the vignette was typical.

#### Time

Our current surveyed total time is 80 minutes (10, 60, 10). ASTRO is recommending the median survey times for intra and post, and Preservice package 5 (7 minutes) for a total recommended time of 77 minutes (7, 60, 10). The survey time clearly supports the recommended 60 minutes of intraservice time.

#### IWPUT

The surveyed code 77290 will have an IWPUT of 0.020. While this is an inappropriately low IWPUT, the relationship within the family of codes maintains rank order.

CPT	IWPUT
77280	0.017
77285	0.020
77290	0.020

#### Comparison to the Key Reference Services

The key reference service code was CPT code 77315, Teletherapy, isodose plan; complex. This key reference code was most often selected (65.1%) by the survey respondents. It has a total intra service time of 45 minutes, an IWPUT of 0.035 and a wRVU of 1.56. The surveyed code has more time than the reference code. Both codes have similarities well understood by the membership, high degree of complex planning, image evaluation and clinical correlation, and technical skill. We believe that this was an appropriate selection by our survey respondents and fits nicely with our survey data.

#### Relativity

Our recommendation will maintain relativity compared to the reference code, the other simulation codes, and codes within the radiation family. Simple simulation (by definition, includes one lesion) has an RVU of 0.70. Intermediate simulation - 77285 (by definition includes 2 separate lesions), has a wRVU of 1.05, that correlates nicely with the added effort and time. Complex simulation (with a wRVU of 1.56), which has multiple field simulations, takes into account the added complexity, time and effort, and correlates nicely with the other two simulation codes.

#### Recommendations

We are recommending the current RVUw of 1.56, pre-service: 7 minutes, median intra time of 60 minutes and post service times of 10 minutes, for a total time of 77 minutes. The expert panel believes that our survey supports our recommendations.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.

☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. A treatment device code (i.e. 77334) is sometimes billed on the same day as this complex simulation code (approximately 62% of the time). CPT code 77334 has an XXX global period, 1.24 work RVUs and 35 minutes of intra time (total time).

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77290

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? A national estimate is not available.

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency	Percentage	%

 (List separately in addition to code for primary procedure)  
 (Use +77293 in conjunction with 77295, 77301)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 65-year-old man with a history of heavy smoking and mild chronic obstructive pulmonary disease is found to have a squamous cancer of the left lower lung with nodal involvement shown on positron emission tomography scanning. Radiation therapy is recommended. Following simulation (reported separately) the patient undergoes motion management simulation.

Percentage of Survey Respondents who found Vignette to be Typical: 96%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

**Description of Pre-Service Work:**

Description of Intra-Service Work: After the initial process of patient setup on the simulator table and immobilization, the radiation oncologist provides detailed instruction for the patient concerning the 4D CT simulation process and coaches the patient on the proper breathing technique (smooth, relaxed, continuous inhalation-exhalation) during image acquisition. The radiation oncologist observes the patient as a reproducible but comfortable breathing pattern is established over several breathing cycles. An external fiducial marker that provides optical and/or other radiofrequency feedback tracing the depth and frequency of breathing is placed near the lower ribcage, and the radiation oncologist then verifies that this motion recognition device (breath cycle sensor) accurately records the patient's breathing cycle, adjusting the sensor's position as needed to achieve an unobstructed and reliable signal transmission from the patient to the ceiling-mounted receiver.

A breathing motion management device (typically a flat plate abdominal compression device or polymer sheet vacuum restraint) is positioned on the patient to minimize diaphragmatic excursion and facilitate breathing pattern regularity. The radiation oncologist verifies proper, reproducible, and comfortable placement of the breathing motion management device. The radiation oncologist then observes the breathing pattern again using the previously placed external respiratory monitoring system to ensure that the motion management device did not disrupt the regularity of the patient's breathing. The radiation oncologist then adjusts the placement of either the motion management device or breathing cycle sensor as needed to achieve a proper signal that indicates a consistent shallow breathing pattern synchronized with the anticipated

tumor motion. Internal fiducial markers may have been previously placed by the thoracic surgeon or pulmonologist but are not considered a necessary part of the process.

Four-dimensional CT images are then obtained. This process involves recording the real-time breathing cycle signal simultaneously while multiple overlapping CT slice images are acquired at high speed as the simulator table moves longitudinally through the scanner. This multi-image technique is known as over-sampling. Because multiple images are obtained for each axial level in the patient, the appearance of each given axial level can be known for any point within the breathing cycle as images are sorted (or “binned”) and assembled into sets that represent the anatomic appearance at discrete phases of the breathing cycle (typically representing 0% -100% inhalation, at 10% increments). Once the image sets are assembled, the radiation oncologist reviews the “cine” (movie-like) playback sequence of image sets in three planes (axial, coronal, sagittal) to verify that the sets faithfully represent the smooth and continuous tumor motion throughout the breathing cycles without unacceptable artifact, for example the so-called “mushrooming” distortion caused by breathing cycle irregularity during image acquisition that yields discontinuities in the diaphragm contour. If the images are unsatisfactory, either because of artifact or excess diaphragmatic excursion, the radiation oncologist adjusts the motion management device if needed and instructs the CT technician to repeat the 4D image acquisition process until a clean representation of tumor motion is obtained and approved by the radiation oncologist.

Once a satisfactory set of 4D images is obtained, the radiation oncologist uses the complete set of 4D images to determine whether it is acceptable to represent the gross tumor volume (GTV) as a static structure or whether (more likely) the net vector motion of the tumor (incorporating magnitude and direction of motion) necessitates the creation of a composite structure known as the internal target volume (ITV) to account for its location throughout the breathing cycle. Typically, this determination is made after the radiation oncologist contours the GTV on several binned image sets (eg full exhalation, mid-cycle, full inhalation), which are then fused to assess total motion-related displacement during the breath cycle. Alternatively, the 4D image sets may be processed into a maximum intensity projection (MIP) image set, which also can be fused with sets representing various phases of the breathing cycle to allow a determination of the extent and direction of tumor motion. This final decision about how best to represent tumor motion allows for the commencement of the treatment planning process.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 77293, *Respiratory motion management simulation (List separately in addition to code for primary procedure)*, was approved at the October 2012 CPT Editorial Panel meeting. This is an add-on code and describes the physician work involved in simulating a patient using motion (respiratory) tracking of a mobile target volume. It has been assigned a ZZZ global period and is typically performed in the facility setting but may be performed in the non-facility setting, as well.

ASTRO conducted a survey and collected 49 surveys for a response rate of 4.1%. ASTRO convened a panel that included experts familiar with this service to evaluate the RUC survey data. The median physician work RVUs was 2.20. ASTRO recommends the 25<sup>th</sup> percentile of 2.00 physician work RVUs for this procedure. Our rationale for that recommendation is based on multiple factors and is described below.

Respiratory motion management simulation represents the separate and distinct work performed in addition to a conventional simulation when there is a need to account for the breathing-related motion of pulmonary or abdominal tumors that will be targeted with radiation therapy. The work involves acquisition and review of multiple additional CT images (frequently >500) that allow for a full accounting of breathing-related tumor motion. The code is, therefore, performed in addition to the base static simulation code. The work represented by respiratory motion management simulation is also distinct from the work of the treatment planning process, which can be either a 3D or IMRT planning process.

The expert panel concluded that while the vast majority of facilities have the technical capability of performing CT simulation, they do not all have the equipment or the technical capability for motion management, and therefore its implementation is limited to a much smaller number of practitioners with a projected penetration of ~12,000 the first year.

#### Vignette

The percentage of survey respondents who found the vignette to be typical was 96%.

#### Survey Time

There is no pre or post survey time for 77293. The median intra time was 45 minutes. ASTRO is recommending this median survey time of 45 minutes.

#### Comparison to Key Reference Services

We have included CPT code 77470, *Special treatment procedure (e.g., total body irradiation, hemibody radiation, per oral or endocavitary irradiation)* as our reference code on the Summary of Recommendation form, because it was most often selected by the survey respondents. 65% of respondents selected 77470 as the Key Reference Service with a work RVU of 2.09 and an XXX global period, very similar to the surveyed code. The members who perform motion management simulation are very familiar with the work of the key reference service code and correctly judged that this captures the extra facility and physician work of motion management.

#### Conclusion

After reviewing the survey data, and other codes in the physician fee schedule, the expert panel recommends a physician work value of 2.00 RVUs and a total time of 45 minutes.

## **SERVICES REPORTED WITH MULTIPLE CPT CODES**

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. This add on code will be billed with 77301 or 77302

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77299 or 77470

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The planning CT scans are uploaded into the treatment planning software. The radiation oncologist first reviews the external anatomy to be sure that all of the tissue is included in the field of view, and evaluates any irregularities in the external contour. The radiation oncologist then reviews the patient's internal anatomy with special attention to the tumor-bearing regions seen on relevant prior diagnostic imaging studies, including the CT /PET scan. The image set is manually adjusted by the physician to ensure accurate matching of fiducial markers (if placed), internal anatomy, and any previously fused imaging studies. This may require the use of more than one fusion set or imaging sequence if there are significant difference in patient position between the diagnostic imaging and the planning CT scan.

Description of Intra-Service Work: The radiation oncologist outlines target volumes on each of the 1.5-3mm thickness axial images of the fused dataset. The gross tumor volume (GTV), representing radiographically evident cancer-containing volume, is expanded into the clinical target volume (CTV), which includes the zone of potential microscopic disease extension. The GTV is the visible tumor seen on CT scan, abnormal nodes and PET active disease. The CTV includes a margin for microscopic extension around the primary lung tumor and mediastinal nodal stations, with special attention to specific anatomic boundaries which may change the extent of the margin. These contours are made slice by slice on the fused scans. These images are initially performed on the axial images, and then reviewed and adjusted on the sagittal and coronal images. The contours are adjusted alternating between lung and mediastinal windows. The initial and boost target volumes (gross and clinical ) are defined. Planning target volumes (PTV) are added to the initial and boost CTV's which accounts for systematic and minor daily set-up variations. The creation of several PTV (eg. PTV1, PTV2, PTV3, etc) is frequently necessary to ensure the maximal dose to tumor while protecting OARs. In a similar fashion to the creation of the GTV, CTV & PTV, important organs at risk eg. heart, esophagus, trachea, spinal cord, contralateral lung, and brachial plexus etc, are also contoured on each 1.5-3 mm planning scan slice and labeled accordingly. A careful review of the target

volumes and normal tissues is then performed in the axial, coronal and sagittal planes to ensure the appropriate delineation for treatment planning.

The intended dose to the initial and final PTVs is then prescribed. Partial dose/volume tolerances for each OARs are also specified. The first version of three-dimensional computer dosimetry is calculated by the dosimetrist and physicist. The physician then evaluates the initial plan to determine whether the intended goal dose to PTVs and dose constraints to OARs have been achieved. The physician then works with the dosimetrist and physicist in an iterative manner to modify the plan to achieve an acceptable dose to the target volumes while respecting the normal tissue tolerance doses. During this process, multiple plans are generated and compared with reference to adequacy of tumor coverage, location of dose “hot spots” and “cold spots”, and risk of normal tissue injury based on the graphical and tabular summaries of dose volume histograms for tumor and critical normal tissues until a properly optimized plan is selected.

Description of Post-Service Work: The radiation oncologist dictates, reviews and signs the report. The radiation oncologist reviews and confirms set-up data has been accurately transferred into record and verify computer. He/she communicates with physicist, dosimetrist, radiation therapist/technician, and referring physician regarding the plan development and coordinates the initiation of treatment.

-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

**CPT code 773X2, 3-dimensional radiotherapy plan, including dose volume histograms,** is a therapeutic radiation planning code, which has PC and TC. This code is replacing CPT 77295, as it fits better within the planning family of codes instead of within the simulation family. The PC describes the physician work associated with the planning process that establishes the correct technical details to properly deliver the desired radiation dose to the target. This code accounts for 3 dimensional planning for dose delivery, with the generation of a dose volume histogram, that is more conformal than 2D plans. This code is not a treatment code. Rather, this planning code allows for 3 dimensional calculations on a specific treatment volume. This code fits within the family of treatment planning codes (2D - simple, intermediate, complex; 3D, and IMRT) and is used once per course of treatment.

ASTRO conducted a survey, with a 1180 sample size, and collected 67 random surveys (5.6% response rate). ASTRO convened a panel that included a number of experts familiar with this service to evaluate the RUC survey data. ASTRO recommends a wRVU of 4.56 for 773X2.

Our rationale for that recommendation is based on multiple factors and is described below.

#### Vignette

The vignette used is of a patient with locally advanced lung cancer, requiring 3D-conformal irradiation. 100 % of our survey respondents felt the vignette was typical.

#### Time

Our current surveyed total time is 120 minutes (15, 90, 15). ASTRO is recommending the median survey times for intra and post, and Preservice package 5 (7 minutes), for a total recommended time of 112 minutes (7, 90, 15). The surveyed time clearly supports the recommended 90 minutes of intraservice time.

#### IWPUT

The current IWPUT for CPT code 77295 is 0.047, and the IWPUT for 773X2 based on the recommended times and RVU is 0.045. This relationship within the family of dosimetric planning codes also maintains rank order with 3 D planning being higher than Complex Isodose Plan, CPT 77315 and lower than IMRT Planning CPT 77301 both in IWPUT and RVU.

CPT	IWPUT	RVU
77315	0.035	1.56
773X2	0.045	4.56
77301	0.050	7.99

#### Comparison to the Key Reference Services

The survey responders chose CPT 77301 (intensity modulated radiotherapy plan including dose volume histograms for target and critical structure partial tolerance specifications) as the reference service code. The key reference service code was most often selected by the survey respondents (67.1%). 773X2 was scored as less intense and complex than the reference service code. We believe our current recommendations supports and maintains the relationship between the surveyed code and the reference service code and stays in line with other radiation oncology IWPUTs.

The key reference service code, 77301, has a total time of 196 minutes, an IWPUT of 0.0499 and a wRVU of 7.99. The surveyed code has a shorter time than the reference code, and less intensity Recommended IWPUT and wRVU are similar to existing code – 77295 that it is replacing. Total time, however has been modified to account for pre and post times. We believe that this reference code was an appropriate selection by our survey respondents and fits nicely with our survey data.

#### Relativity

Our recommendation maintain relativity compared to the reference code, the other simulation codes, and treatment planning codes within the radiation family, summarized in the table below.

CPT	RVU	Time
77300	0.62	15
77280	0.70	37 (7, 25, 5)
77331	0.87	30
77285	1.05	52 (7, 40, 5)
77290	1.56	77 (7, 60, 10)

77315	1.56	45
772X1X	2.00	45 (0, 45, 0)
77470	2.09	55
773X2	4.56	112 (7, 90, 15)
77301	7.99	196

#### Recommendations

We are recommending the current RVUw of 4.56 for existing code 77295, pre-service: 7 minutes, median intra time of 90 minutes and post service times of 15 minutes, for a total time of 112 minutes. The expert panel believes our survey supports our recommendations.

### SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☒ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. A treatment device code (i.e. 77334) is sometimes billed on the same day as this complex simulation code (approximately 62% of the time). CPT code 77334 has an XXX global period, 1.24 work RVUs and 35 minutes of intra time (total time). A basic dosimetry calculation (77300) is typically billed with this planning code. CPT code 77300 has an XXX global period, 0.62 work RVUs and 15 minutes of intra/total time.

### FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 77295

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Radiation Oncology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period?

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. A national estimate is not available.

Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%
Specialty	Frequency	Percentage	%

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?  
 138,610 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.  
 Please explain the rationale for this estimate.

Specialty Radiation Oncology	Frequency 131680	Percentage 95.00 %
------------------------------	------------------	--------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 77295

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**CPT Long Descriptor:**

- 77280 Therapeutic radiology simulation-aided field setting; simple
  - 77285 Therapeutic radiology simulation-aided field setting; intermediate
  - 77290 Therapeutic radiology simulation-aided field setting; complex
  - 77293 Respiratory motion management simulation  
(List separately in addition to code for primary procedure)  
(Use +77293 in conjunction with 77295, 77301)
  - 77295 3-dimensional radiotherapy plan, including dose volume histograms
- 

**Global Period:** 77280, 77285, 77290 & 77295 XXX and 77293 ZZZ

**Meeting Date:** January 2013

**Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:**

ASTRO convened a panel that included a number of experts familiar with these services to evaluate the direct practice expense inputs for these procedures.

**You must provide reference code(s) for comparison on your spreadsheet. If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison. You must provide an explanation for the selection of reference codes. Reference Code Rationale:**

For the four existing codes, ASTRO included the current direct practice expense inputs as well as the recommended inputs for the procedures. We also included the direct practice expense inputs for CPT codes that are sometimes billed with the procedures as a point of reference to ensure there is no double counting. ASTRO included recommendations for the new code. One of the existing codes 77014 can serve as a reference code for this new procedure.

**If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:**

N/A

**Please describe in detail the clinical activities of your staff:**

**Pre Service Clinical Activities**

N/A

**Intra-Service Clinical Labor Activities**

*CPT codes 77280*

The radiation therapist will first prepare the CT room. This will include positioning the CT table at its lowest position, placing any pads on the table and setting the moveable patient positioning lasers at their zero position. The Radiation Therapist will gather and ready any necessary supplies for patient marking.

The radiation therapist will then greet the patient and give them a brief explanation of the simulation procedure and its expected duration. The patient will be led to the changing area and instructed to change into the appropriate exam gown.

After gowning, the radiation therapist will bring the patient into the CT room and verify the patient's identity according to department policy. The therapist will explain the CT procedure in detail, ask if they have any questions or concerns and provide any additional information as necessary. The therapist will then take a face photo of the patient. The therapist will assist the patient onto the CT table and place them into the appropriate position. The patient's arms and legs will then be positioned according to scan protocol and/or patient comfort considerations. Knee wedges, arm straps and other pads may be added as needed to ensure patient comfort and stability. The patient positioning lasers are used to verify patient alignment. Markers are placed on the patient's skin as directed by the radiation oncologist.

After verifying with the radiation oncologist the extent of the area to be scanned, the therapist manually moves the patient into the CT unit bore checking for sufficient clearance between the patient, table and the CT unit. The table is then positioned using the internal CT lasers to the start position for the scanning sequence. The radiation therapist chooses the appropriate scanning parameters at the CT console and takes AP and lateral scout images.

The scout images are shown to the radiation oncologist and reviewed. Adjustments are made to patient position as necessary to improve patient alignment and/or comfort. Scout images are then repeated and the final patient positioning verified. At this point the field of view for the scan, including the superior/inferior scan extent, is set by the therapist. The patient is then scanned and the images are reconstructed.

The scan images are then reviewed by the radiation therapist and radiation oncologist. It is verified that the patient position is acceptable, that the scan extends sufficiently in the superior/inferior directions, and that no part of the patient's skin contour is cut off. The image quality of the scan is also noted, in particular any artifacts that might arise from contrast agents or metallic implants.

The scan images are then sent to the virtual simulation workstation where the radiation oncologist places the treatment fields and sets isocenter. The radiation therapist then generates digitally reconstructed radiographs (DRR's) from the virtual treatment fields.

The therapist then exports the isocenter coordinates to the laser system which projects the isocenter position onto the patient. The therapist tattoos the patient with the projected isocenter position as well as any other ancillary leveling and positioning marks that will be used for patient set up on the treatment unit. The therapist documents these tattoos with photos. The therapist then assists the patient off of the CT table and takes them back to the changing area.

Back in the CT room, the therapist exports the scan images and DRR's to the PACS system and the radiation therapy planning computer and uploads the patient face and tattoo photos into the record and verify system. The therapist then completes the simulation documentation and prepares the patient set up instructions for use at the treatment unit. The pads and other positioning devices are then removed from the CT table. The table and other equipment is then cleaned and disinfected and unused supplies are put away.

#### CPT Code 77285

The radiation therapist will first prepare the CT room. This will include positioning the CT table at its lowest position, installing any immobilization devices or pads on the table and setting the moveable patient positioning lasers at their zero position. The Radiation Therapist will gather and ready any necessary supplies for patient marking.

The radiation therapist will then greet the patient and give them a brief explanation of the simulation procedure and its expected duration. The patient will be led to the changing area and instructed to change into the appropriate exam gown.

After gowning, the radiation therapist will bring the patient into the CT room and verify the patient's identity according to department policy. The therapist will explain the CT procedure in detail, ask if they have any questions or concerns and provide any additional information as necessary. The therapist will then take a face photo of the patient. The therapist will assist the patient onto the CT table and place them into the appropriate position. This may involve placing the patient into immobilization devices such as a mold or mask or other supporting devices as appropriate. The patient's arms and legs will then be positioned according to scan protocol and/or patient comfort considerations. Knee wedges, arm straps and other pads may be added as needed to ensure patient comfort and stability. The patient positioning lasers are used to verify patient alignment. Markers for the first treatment area are placed on the patient's skin as directed by the radiation oncologist.

After verifying with the radiation oncologist the extent of the area to be scanned, the therapist manually moves the patient into the CT unit bore checking for sufficient clearance between the patient, table and immobilization devices and the CT unit. The table is then positioned using the internal CT lasers to the start position for the scanning sequence. The radiation therapist chooses the appropriate scanning parameters at the CT console and takes AP and lateral scout images.

The scout images are shown to the radiation oncologist and reviewed. Adjustments are made to patient position as necessary to improve patient alignment and/or comfort. The scout images may indicate that an alternative patient position would be advantageous in which case the patient

positioning sequence would be repeated. Scout images are then repeated and the final patient positioning verified. At this point the field of view for the scan, including the superior/inferior scan extent, is set by the therapist. The patient is then scanned and the images are reconstructed.

The scan images are then reviewed by the radiation therapist and radiation oncologist. It is verified that the patient position is acceptable, that the scan extends sufficiently in the superior/inferior directions, and that no part of the patient's skin contour is cut off. The image quality of the scan is also noted, in particular any artifacts that might arise from contrast agents or metallic implants.

The patient is then repositioned, as necessary, for scanning of the second treatment area. New markers are placed on the patient's skin, clearances are checked and AP and lateral scout images are obtained as described above. They are reviewed, patient position is adjusted as necessary and scouts are repeated. After approval by the radiation oncologist, the second treatment area of the patient is scanned.

Both sets of scan images are then sent to the virtual simulation workstation where the radiation oncologist places the treatment fields and sets isocenters for both treatment areas. The radiation therapist then generates digitally reconstructed radiographs (DRR's) for both sites from the virtual treatment fields.

The therapist then exports the isocenter coordinates for the first treatment site to the laser system which projects the isocenter position onto the patient. The therapist tattoos the patient with the projected isocenter position as well as any other ancillary leveling and positioning marks that will be used for patient set up on the treatment unit. This process is then repeated for the second treatment area. The therapist documents the tattoos for both sites with photos. The therapist then assists the patient off of the CT table and takes them back to the changing area.

Back in the CT room, the therapist exports the scans and DRR's to the PACS system and the radiation therapy planning computer and uploads the patient face and tattoo photos into the record and verify system. The therapist then completes the simulation documentation and prepares the patient set up instructions for use at the treatment unit. The immobilization equipment and other devices are then removed from the CT table. The table and other equipment is then cleaned and disinfected and unused supplies are put away.

#### CPT Code 77290

The radiation therapist will first prepare the CT room. This will include positioning the CT table at its lowest position, installing the customized immobilization device that was fabricated for the patient and setting the moveable patient positioning lasers at their zero position. The Radiation Therapist will gather and ready any necessary supplies for patient marking.

The radiation therapist will then greet the patient and give them a brief explanation of the simulation procedure and its expected duration. The patient will be led to the changing area and instructed to change into the appropriate exam gown.

After gowning, the radiation therapist will bring the patient into the CT room and verify the patient's identity according to department policy. The therapist will explain the CT procedure in detail, ask if they have any questions or concerns and provide any additional information as

necessary. The therapist will then take a face photo of the patient. The therapist will assist the patient onto the CT table and place them into the immobilization device. This consists of an angled support structure which holds the patient's torso and arms in positions which permit optimum treatment geometry. The support structure incorporates a customized mold for the patient to ensure reproducibility of the patient's position. Treatment of the breast and supraclavicular area require complicated treatment beam geometry and it is vital that the patient be positioned correctly and reproducibly. Extra time is required for such positioning. Knee wedges, straps and other pads may be added as needed to ensure patient comfort and stability. The patient positioning lasers are used to verify patient alignment. Markers are placed on the patient's skin as directed by the radiation oncologist.

After verifying with the radiation oncologist the extent of the area to be scanned, the therapist manually moves the patient into the CT unit bore checking for sufficient clearance between the patient, table and immobilization devices and the CT unit. This must be checked very carefully due to the size of the immobilization device and the position of the patient's arm over her head. The table is then positioned using the internal CT lasers to the start position for the scanning sequence. The radiation therapist chooses the appropriate scanning parameters at the CT console and takes AP and lateral scout images.

The scout images are shown to the radiation oncologist and reviewed. Adjustments are made to patient position as necessary to improve patient alignment and/or comfort. The scout images may indicate that an alternative arm position or angle of the patient's torso would be advantageous in which case the immobilization device would be modified and the patient positioning sequence would be repeated. Scout images are then repeated and the final patient positioning verified. At this point the field of view for the scan, including the superior/inferior scan extent, is set by the therapist. The patient is then scanned and the images are reconstructed.

The scan images are then reviewed by the radiation therapist and radiation oncologist. It is verified that the patient position is acceptable, that the scan extends sufficiently in the superior/inferior directions, and that no part of the patient's skin contour is cut off. The image quality of the scan is also noted, in particular any artifacts that might arise from contrast agents or metallic implants.

The scan images are then sent to the virtual simulation workstation where the radiation oncologist places the treatment fields for both the breast and the nodal areas and sets one or more isocenters for those beams. The radiation therapist then generates digitally reconstructed radiographs (DRR's) from the virtual treatment fields.

The therapist then exports the isocenter coordinates to the laser system which projects the isocenter position onto the patient. The therapist tattoos the patient with the projected isocenter position as well as any other ancillary leveling and positioning marks that will be used for patient set up on the treatment unit. If multiple isocenters will be utilized, each will be exported, projected onto the patient and tattooed. The therapist documents all of the tattoos with photos. The therapist then assists the patient off of the CT table and takes them back to the changing area.

Back in the CT room, the therapist exports the scans and DRR's to the PACS system and the radiation therapy planning computer and uploads the patient face and tattoo photos into the

record and verify system. The therapist then completes the simulation documentation and prepares the patient set up instructions for use at the treatment unit. The immobilization equipment and other devices are then removed from the CT table. The table and other equipment is then cleaned and disinfected and unused supplies are put away.

CPT code 77293 -- ZZZ

The Radiation Therapist (RT) positions the respiratory transducers (infrared reflective device, respiratory sensing belt, active breathing control, etc.) on the patient and verifies connectivity with the 4D CT scanning system and/or respiratory signal processing computer.

The physicist then assists the physician in coaching the patient to achieve an optimal yet natural breathing cycle consistent with minimizing respiratory excursion. The resultant transducer signal is tracked over a length of time similar to what will be necessary to acquire the 4D data set. The respiratory cycle duration is measured. The coaching and tracking process is repeated to assure that the measured respiratory cycle characteristics are reproducible and will be typical of the cycle that will occur when the patient is treated.

In consultation with the physician and physicist, a decision is made as to triggering on phase or amplitude, the computer system is programmed to reflect that choice and a sample trigger data set is run to assure that the respiratory cycle will be properly segmented by the trigger signal. If the segmentation is sub-optimal, the transducer placement – coaching- tracking and triggering analysis is repeated.

Based upon the analysis of the respiratory cycle, appropriate cine and/or pitch parameters are calculated. A set of orthogonal scout images is acquired and the desired scan positions are set. The slice thickness, slice number, pitch/cine time and x-ray output parameters are optimized based on tube heating/cooling characteristics and maximum slice number constraints. The RT then adjusts the scan position parameters to be congruent with the initial CT simulation image data set and acquires the 4D data set. The physicist and physician observe both the progression of the scan acquisition and the integrity of the triggering signal overlaid on the respiratory cycle curve. If significant anomalies in the respiratory cycle curve occur the coaching/positioning/ respiratory cycle confirmation/ scan acquisition process is repeated.

At the conclusion of the raw data acquisition, the physicist adjusts the recorded respiratory trigger signal to account for minor deviations in the respiratory cycle. A 4D reconstruction is then implemented, generally creating a segmented series of 10 image data sets, each imaging 10% of the respiratory cycle. The physicist then reviews the resultant 4D data set in both static and Cine modes with the physician, and if acceptable, creates a Maximum Intensity Projection data Set (MIP) and an average or ungated data set. The RT then transmits the entire series (10 respiratory segments, MIP and Average) to a processing station for the physician to create an ITV or series of GTV's.

CPT Code 77295

The dosimetrist reviews the patient chart and prescription and receives guidance from the physician as to the particular issues related to the development of the 3-D isodose plan. The dosimetrist then enters the patient demographics into the Radiation Therapy Planning (RTP) computer, verifying that the patient name and medical record number are identical across the RTP system, the Record and Verify (RV) system and the CT simulation system.

The dosimetrist then imports the CT simulation image data sets into the RTP system and reviews each data set for completeness and appropriate planning characteristics. The dosimetrist contours the basic 3D organs at risk structures (i.e. skin) and then reviews the contours with the physician, making modifications as directed. As the physician draws the 3-D GTV, CTV and PTV structures, and critical structures, the dosimetrist assists as necessary, and then modifies adjacent or overlapping OAR structures using Boolean operators to avoid over-determined constraints during the development of the 3D isodose plan.

Based upon the contour sets designed/approved by the physician, the dosimetrist positions the isocenter to allow the optimal linac beam configuration, assigns beam energies, initial field sizes, gantry and table angles and beam weights in consultation with the physicist. The collimation of the beams is reviewed with the physician and adjusted as necessary with the aid of beams-eye views overlaid on digitally reconstructed radiographs (DRRs). A 3-D plan is then generated using the beam-modeling algorithm recommended by the physicist. Dose volume histograms are generated from the 3-D dose matrix of the plan, and beam parameters (beam energies, initial field sizes, gantry and table angles and beam weights) are adjusted as necessary. Additional trials (typically 3-4) with modified beam parameters are created and the dose volume histograms and isodose curve displays are compared to assist in plan optimization. The resultant 3-D information is reviewed with the physicist and physician and additional modifications are made as directed.

Once the physician has made a final decision on the 3-D isodose plan, the dosimetrist generates final treatment beam DRR's and orthogonal set-up DRR's, locks and archives the plan, exports it to the RV system, creates and reviews treatment field definitions in the RV system based upon the data imported from the RTP system and creates the treatment delivery notes for the Radiation Therapist to use during the patient treatment.

Lastly, the dosimetrist verifies that the beam delivery parameters transmitted from the RV system are correctly implemented on the linear accelerator delivery computer console.

## Tab 14: Respiratory Motion Management Simulation Revised PE Recommendations

Attached are the updated recommendations for Tab 14. There are three sets of codes in this tab – the first are simulation codes, the second is a planning code and the third is an add-on code for respiratory motion management.

### Simulation

The recommendations for 77280 and 77285 are the same right now as the revised recommendations from yesterday. The changes from the original recommendations are outlined below.

#### CPT Code 77280

- Removed 3 minutes based on the comment yesterday regarding the film to digital workgroup
  - *Line 42: Send images to RTP PACs..... Zeroed out from 1 min (line 69 original)*
  - *Line 50: Take digital face photo...Zeroed out from 1 min (line 44 original)*
  - *Line 59: Take digital pictures of field...Zeroed out from 1 min (line 53 original)*
- Reduced *Prepare and Position* from 4 min to 2 min (line 59 original). We did not reallocate any of those positioning minutes.
- Line 35: *Scan and Recon* Reduced from 6 min to 5 min (line 64 original)
- Line 39: *Mark/Tattoo patient* Reduce from 4 min to 3 min (line 68 original)

#### CPT Code 77285

- Removed 3 minutes based on the comment yesterday regarding the film to digital workgroup
  - *Line 42: Send images to RTP PACs..... Zero out from 1 min (line 69 original)*
  - *Line 50: Take digital face photo...Zeroed out from 1 min (line 44 original)*
  - *Line 59: Take digital pictures of field...Zeroed out from 1 min (line 53 original)*
- Reduced *Prepare and Position* from 8 min to 2 min (line 59 original). We did not reallocate any of those positioning minutes.

As directed by the committee, we further modified the inputs for 77290 and explain those changes below.

#### CPT Code 77290

- Reduced *Prepare Room, equipment and supplies* from 5 to 2
- Removed 3 minutes based on the comment yesterday regarding the film to digital workgroup
  - *Line 42: Send images to RTP PACs..... Zero out from 1 min (line 69 original)*
  - *Line 50: Take digital face photo...Zeroed out from 1 min (line 44 original)*
  - *Line 59: Take digital pictures of field...Zeroed out from 1 min (line 53 original)*
- Reduced *Prepare and Position* from 12 min to 2 min (line 59 original). We reallocated 6 of those 10 minutes. Details below.
  - *Check clearance, mark and take scout images..... was 8 now 10 \*\*\*\*reallocation*
  - *Adjust patient position..... original 4 now 6 \*\*\*\*reallocation*
  - *Set FOV, scan range..... Scan range 1 now 3 \*\*\*\* reallocation*

### Relationship Between the Three Codes

One of the concerns identified by the PE subcommittee was the relationship for these activities between the three codes. We have explained those relationships below.

#### Remains the same for all 3 codes:

The time for the following activity remains the same between all three codes.

	77280	77285	77290
<i>review scan, export to workstation</i>	2	2	2

Step increase between the 3 codes:

For the activities listed below, there are step increases between the three codes based on complexity, number of fields and anatomical information.

	77280	77285	77290
<i>Check clearance mark and take scout images, show to physician</i>	4	8	10
<i>adjust patient position and retake scouts</i>	2	4	6
<i>set FOV, scan range, patient specific x-ray technique</i>	1	2	3
<i>set virtual fields, generate DRR's</i>	1	2	6

Times based on the number of sites:

For the activities listed below, there is a relationship between the three codes based on the number of treatment sites.

	77280	77285	77290
<i>scan and Recon</i>	5	8	6
<i>mark/tattoo patient</i>	3	6	6
<i>Set LAP Laser system and export</i>	2	4	2

**Equipment Times**

We included the following lines/activities in our equipment times (rows/cells 27, 29, 31 and 43):

- 77280 Total equipment times reduced from 38 to 27 min
- 77285 Total equipment times reduced from 58 to 43 min
- 77290 Total equipment times reduced from 66 to 48 min

---

**Planning**

The second code we are presenting is 77295 a radiation dosimetric planning code. This is an existing code that has been resequenced in the CPT book. This code is for the development and planning of a three dimensional conformal plan with dose volume histogram, analysis of the critical structures, and target volumes.

- We deleted *review prescription, charts* 3 min
- We deleted *enter patient demographics into computer* 2 min
- We also deleted the 5 minutes on the record and verify equipment
- The total equipment time will go down from 170 to 165 (rows/cells 31)

---

**Respiratory Motion Management**

The final code is an add-on code 77293. It is an add-on code that describes the work of acquisition, processing, analysis and definition of a four dimensional target (i.e. a tumor that moves through the breathing cycle like some lung cancers).

We reorganized the activities on the spreadsheet to better follow the standard format. The recommended times were maintained. The equipment times were calculated with rows/cells 31, 32 and 45.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2012

### Molecular Pathology Workgroup-Tier 1

The CPT Editorial Panel developed a new coding structure to describe molecular pathology services, based on the efforts and recommendations of the Molecular Pathology Coding Workgroup convened beginning in October 2009. This service is a new category I molecular pathology code and is among the last and lowest volume of the Tier 1 codes developed by the AMA CPT Molecular Pathology Coding Workgroup (MPCW). These services were previously reported with a series of “stacking codes.” The RUC understands that payment for these services is currently based on a mixture of payment methodologies, including the physician fee schedule and the clinical lab fee schedule. CMS requested that the RUC review data provided by the College of American Pathologists to provide the Agency with more information as a policy is developed to determine which payment schedule is appropriate for these services.

At the September 2011 RUC meeting, the Molecular Pathology Tier 2 codes were valued and the specialty society crosswalked the values for low volume Tier 1 Molecular Pathology codes, with inadequate survey data, to the Tier 2 Molecular Pathology codes. This was done by comparing the exons requiring interpretation included in the Tier 2 level codes with the new Tier 1 code. CPT code 81161 *DMD (dystrophin) (eg, Duchenne/Becker muscular dystrophy) deletion analysis, and duplication analysis, if performed* is a new Molecular Pathology Tier 1 code that is also a low volume service. The specialty society gained approval from the Research Subcommittee to base their work value recommendation on a direct crosswalk to a Tier 2 level code. The RUC agrees that this method will maintain relativity and rank order within the molecular pathology family of services.

The specialty society explained, and the RUC agreed, that the work RVU for this service could be best derived from crosswalking it directly to Tier 2 CPT code 81407 *Molecular pathology procedure, Level 8 (eg, analysis of 26-50 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of >50 exons, sequence analysis of multiple genes on one platform) SCN1A (sodium channel, voltage-gated, type 1, alpha subunit) (eg, generalized epilepsy with febrile seizures), full gene sequence* (RUC Recommended work RVU = 1.85) with 60 minutes of intra-service time. Code 81161 involves duplication/deletion analysis of the DMD gene which has 79 exons. Code 81407 also includes the “...analysis of duplication/deletion variants of > 50 exons” and requires 60 minutes of intra-service time. The RUC agreed that the physician time and work required to perform code 81407 should be accurately assimilated to the time and work of 81161. The RUC also compared the surveyed service to 88323 *Consultation and report on referred material requiring preparation of slides* (work RVU=1.83, intra-time=56 minutes), and agreed that the reference code requires similar time to perform as compared to the surveyed code, 56 minutes and 60 minutes, respectively. **The RUC recommends a work RVU of 1.85 for CPT code 81161.**

**New Technology/New Services List**

The RUC noted that CPT code 81161, along with all the Molecular Pathology family of services, are new services and should be placed on the New Technology/New services list.

**Practice Expense**

The RUC reviewed and approved the direct practice expense inputs as submitted by the specialty society and recommended by the Practice Expense Subcommittee.

CPT Code	CPT Descriptor	Global Period	Work RVU Recommendation

Chair  
Research Subcommittee  
RVS Update Committee  
American Medical Association  
515 North State Street  
Chicago, IL 60654

RE: Additional Tier 1 Molecular Pathology CPT Code

Dear Doctor Lewis;

The College of American Pathologists (CAP) will be presenting physician work and practice expense for one new category I molecular pathology code at the October 2012 AMA-RUC meeting. This new service is among the last and lowest volume of the Tier 1 codes developed by the AMA CPT Molecular Pathology Coding Workgroup (MPCW).

After considering our previous survey efforts last year when CAP performed a survey of 68 new molecular pathology services, CAP's RBRVS workgroup believes that a full survey of this code performed by ultra-specialized molecular pathologists would yield much less than the typical minimum number of 30 survey respondents that the RUC typically desires.

At the September 2011 RUC meeting, CAP cross walked the values for low volume Tier 1 Molecular Pathology codes for which we did not receive adequate survey data to the Tier 2 Molecular Pathology level codes. This was done by comparing the exons requiring interpretation included in the Tier 2 level codes with the new Tier 1 code. As this new Tier 1 code under consideration represents another low volume service, we believe that cross walking the new code to Tier 2 level code represents the best option to maintain relativity and rank order within the molecular pathology family. If surveyed, we would anticipate a very low physician work survey response rate for this service.

CAP requests that the RUC's Research Subcommittee accept the following relative value cross walk for our new molecular pathology service to value its professional component for this service. The practice expense subcommittee will separately determine the practice expense recommendations for this code.

**The new molecular pathology service with direct crosswalk code is listed below:**

- 81161 DMD (*dystrophin*) (eg, Duchenne/Becker muscular dystrophy) deletion analysis, and duplication analysis, if performed

# College of American Pathologists

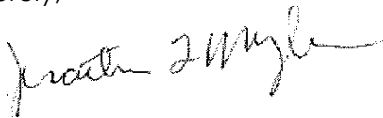

## Physician Work Cross-walk to:

**81407** - Molecular pathology procedure, Level 8 (eg, analysis of 26-50 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of >50 exons, sequence analysis of multiple genes on one platform) SCN1A (sodium channel, voltage-gated, type 1, alpha subunit) (eg, generalized epilepsy with febrile seizures), full gene sequence (**RUC Recommended Work RVU = 1.85, Intra-service Work Time = 60 minutes, IWPOT = 0.031**)

**Rationale:** 81161 involves duplication/deletion analysis of the DMD gene which has 79 exons. Code 81407 is recommended for the crosswalk as it includes the "...analysis of duplication/deletion variants of > 50 exons."

If you have any questions or concerns, please contact, Todd Klemp, Assistant Director of Economic and Regulatory Affairs at (847) 832-7403 or tklemp@cap.org.

Sincerely,

Jonathan L. Myles, MD, FCAP  
RUC Advisor  
College of American Pathologists

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 81161      Tracking Number

Original Specialty Recommended RVU: **1.85**Presented Recommended RVU: **1.85**

Global Period: XXX

RUC Recommended RVU: **1.85**

CPT Descriptor: DMD (dystrophin) (eg, Duchenne/Becker muscular dystrophy) deletion analysis, and duplication analysis, if performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 4-year-old boy presents to his pediatrician with a history of difficulty with climbing stairs and rising from a sitting position. Physical examination reveals proximal lower extremity weakness. Serum creatine kinase is significantly elevated at 50 times the upper limit of the reference range. The patient had a now deceased maternal uncle who was affected with Duchenne muscular dystrophy. An anticoagulated peripheral blood sample is submitted for duplication and deletion analysis to assess the patient's DMD mutation status.

Percentage of Survey Respondents who found Vignette to be Typical: 0%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: None

Description of Intra-Service Work: High quality genomic DNA isolated from whole blood is subjected to multiplex ligation-dependent probe amplification (MLPA), which involves hybridization and ligation of multiple pairs of oligonucleotide probes specific for the 79 exons and alternative exon 1 of the DMD gene to assess dosage of each exon. The pathologist examines peak heights and calculated ratios of individual exons to control gene sequences to determine dosage status for all exons tested in the DMD gene. The pathologist composes a report which specifies the patient's mutation status. The report is edited, signed and the results are communicated to appropriate caregivers.

Description of Post-Service Work: None

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

This new service is among the last and lowest volume of the Tier 1 codes developed by the AMA CPT Molecular Pathology Coding Workgroup (MPCW). Duchenne patients are children, and the average life expectancy is only 25 years. There are only 400 – 600 live male births with DMD (and probably 50 with Becker muscular dystrophy, which is also caused by Dystrophin) in the U.S. per year.

After considering our previous survey efforts last year when CAP performed a survey of 68 new molecular pathology services, CAP's RBRVS workgroup believes that a full survey of this code performed by ultra-specialized molecular pathologists would yield much less than the typical minimum number of 30 survey respondents that the RUC typically desires.

At the September 2011 RUC meeting, CAP cross walked the values for low volume Tier 1 Molecular Pathology codes for which we did not receive adequate survey data to the Tier 2 Molecular Pathology level codes. This was done by comparing the exons requiring interpretation included in the Tier 2 level codes with the new Tier 1 code. As this new Tier 1 code under consideration represents another low volume service, we believe that cross walking the new code to Tier 2 level code represents the best option to maintain relativity and rank order within the molecular pathology family. If surveyed, we would anticipate a very low physician work survey response rate for this service.

CAP recommends the following relative value cross walk for our new molecular pathology service to value its professional component. The practice expense subcommittee will separately determine the practice expense recommendations for this code. The research subcommittee approved this methodology during the summer of 2012.

**The new molecular pathology service with direct crosswalk code is listed below:**

- 81161      *DMD (dystrophin)* (eg, Duchenne/Becker muscular dystrophy) deletion analysis, and duplication analysis, if performed

**Physician Work Cross-walk to:**

**81407** - Molecular pathology procedure, Level 8 (eg, analysis of 26-50 exons by DNA sequence analysis, mutation scanning or duplication/deletion variants of >50 exons, sequence analysis of multiple genes on one platform) SCN1A (sodium channel, voltage-gated, type 1, alpha subunit) (eg, generalized epilepsy with febrile seizures), full gene sequence (**RUC Recommended Work RVU = 1.85, Intra-service Work Time = 60 minutes, IWPUR = 0.031**)

**Rationale:** 81161 involves duplication/deletion analysis of the DMD gene which has 79 exons. Code 81407 is recommended for the crosswalk as it includes the "...analysis of duplication/deletion variants of > 50 exons."

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) The molecular stacking codes are currently used for the TC and 83912 for the PC. CAP can not provide absolute frequency data as the previous reporting of these services was methodology based and not analyte specific. The specialty society estimates that the total number of Tier 1 and Tier 2 professional services will be 407,194 for 2011 based on the most recent Medicare data available of 83912.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 50

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate.

Duchenne patients are children, and the average life expectancy is only 25 years. There are only 400 – 600 live male births with DMD (and probably 50 with Becker muscular dystrophy, which is also caused by Dystrophin) in the U.S. per year. CAP does not anticipate many Duchenne patients will become Medicare beneficiaries.

Carrier testing wouldn't occur in Medicare patients, and CMS wouldn't pay for it anyway because it is not for the benefit of the Medicare patient.

Specialty Pathology                      Frequency 50                      Percentage 100.00 %

Specialty                      Frequency                      Percentage                      %

Specialty                      Frequency                      Percentage                      %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. It would be extremely rare to test a Medicare patient, Duchenne patients are children.

Specialty                      Frequency                      Percentage                      %

Specialty                      Frequency                      Percentage                      %

Specialty                      Frequency                      Percentage                      %

Do many physicians perform this service across the United States?

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 81407

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS-Other - Utilization over 500,000 and CMS High Expenditure Procedural Codes screens*

October 2012

**Immunohistochemistry**

In April 2011, the Relativity Assessment Workgroup (RAW) identified CPT code 88342 as a “CMS/Other” valued service with Medicare utilization of 500,000 or more. In addition, the code was identified by CMS as a High Expenditure Procedural code and in January 2012, the specialty society submitted an Action Plan to the RAW stating that referral to the CPT Editorial Panel was necessary. When CPT code 88342 was valued in 2003, the pathologist viewed one antibody per slide. However, since that review multiple antibodies can now be viewed per slide and the service was being reported for multiple units during the same session. Therefore, the College of American Pathologists (CAP) requested a CPT code change proposal to provide proper clarity to the service through a better definition of code 88342 and the establishment of a new add-on code 88343. The base code will now be reported once for the first separately identifiable antibody and the add-on service will be billed for each additional separately identifiable antibody thereafter.

**88342 Immunohistochemistry or immunocyto-chemistry, each separately identifiable antibody per block, cytologic preparation, or hematologic smear; first separately identifiable antibody per slide**

The RUC reviewed the survey results from 198 pathologists and agreed with the specialty society that 20 minutes of intra-service time accurately accounts for the physician work involved in this service. The RUC then reviewed the survey respondents’ estimated work RVUs and agreed with the specialty that a work RVU of 0.60, the survey 25<sup>th</sup> percentile and less than the current work RVU of 0.80, is appropriate for CPT code 88342. To justify this value, the RUC reviewed the key reference service and MPC code 88305 *Level IV - Surgical pathology, gross and microscopic examination* (work RVU= 0.75) and agreed that the reference code should be valued higher than 88342 because it has 5 additional minutes of intra-service time, with similar intensity and complexity. In addition, the RUC compared the surveyed code to CPT code 88387 *Macroscopic examination, dissection, and preparation of tissue for non-microscopic analytical studies (eg, nucleic acid-based molecular studies); each tissue preparation (eg, a single lymph node)* (work RVU= 0.62) and agreed that since both codes have identical intra-service time, 20 minutes, they should be valued similarly. **The RUC recommends a work RVU of 0.60 for CPT code 88342.**

**88343 Immunohistochemistry or immunocytochemistry, each separately identifiable antibody per block, cytologic preparation, or hematologic smear; each additional separately identifiable antibody per slide**

The RUC reviewed the survey results from 133 pathologists and agreed with the specialty society that 10 minutes of intra-service time accurately accounts for the physician work involved in this service. The RUC then reviewed the survey respondents’ estimated work RVUs and agreed with the specialty that the respondents’ 25<sup>th</sup> percentile work RVU of 0.56 is too similar to the work RVU, 0.60, of the base code. To determine an appropriate value for 88343, the RUC reviewed CPT code 88313 *Special stain including interpretation and report; Group II, all other (eg, iron, trichrome), except stain for microorganisms, stains for enzyme constituents, or immunocytochemistry and immunohistochemistry* (work RVU= 0.24) and agreed that both services have similar physician work and intra-service time, 10 minutes and 13 minutes, respectively. Therefore, the RUC agreed that 88343 should be directly crosswalked to the CPT code 88313, with a work RVU of 0.24, and the understanding that 88343 is a more intense and complex service. The RUC also compared the surveyed code to CPT code 36405 *Venipuncture, younger than age 3 years*,

*necessitating physician's skill, not to be used for routine venipuncture; scalp vein* (work RVU= 0.31) and agreed that while both services have identical intra-service time, 10 minutes, the reference code has some pre and post time and should be valued higher than 88343. Finally, the RUC compared 88343 to the base code 88342 and agreed that with half the intra-service time, 10 minutes compared to 20 minutes, 88343 is appropriately valued at a work RVU of 0.24. **The RUC recommends a work RVU of 0.24 for CPT code 88343.**

#### **Practice Expense:**

The RUC accepted the direct practice expense inputs for all three CPT codes in the family as submitted by the specialty and approved by the Practice Expense Subcommittee.

#### **Work Neutrality:**

The RUC discussed the work neutrality impact of the new reporting structure. It is anticipated that the add-on service 88343 will be billed 10% of the time with 88342. Since the typical scenario in which multiple antibodies would be reviewed in the same session involves the prostate, the specialty estimated 10% of immunohistochemistry services are reported concerning the prostate. Therefore, when providers previously billed multiple units of 88342 the resultant work RVU was 1.70 (0.85 x 2). Under the new reporting structure, this same service will receive 0.84 work RVUs (0.60 + 0.24). The RUC's recommendation for this code will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

<b>CPT Code</b>	<b>Tracking Number</b>	<b>CPT Descriptor</b>	<b>Global Period</b>	<b>Work RVU Recommendation</b>
▲ 88342	B1	Immunohistochemistry <u>or immunocytochemistry, each separately identifiable antibody per block, cytologic preparation, or hematologic smear (including tissue immunoperoxidase); first separately identifiable each antibody per slide</u>	XXX	0.60
● 88343	B2	each additional separately identifiable antibody per slide (List separately in addition to code for primary procedure)  (Use 88343 in conjunction with 88342)  (When multiple antibodies are applied to the same slide, use one unit of 88342 for the first separately identifiable antibody and one unit of 88343 for each additional separately identifiable antibody)	XXX	0.24

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 88342	Tracking Number	Original Specialty Recommended RVU: <b>0.60</b>
		Presented Recommended RVU: <b>0.60</b>
Global Period: XXX		RUC Recommended RVU: <b>0.60</b>

CPT Descriptor: Immunohisto-chemistry or immunocyto-chemistry, each separately identifiable antibody per block, cytologic preparation, or hematologic smear; first separately identifiable antibody per slide

(When multiple antibodies are applied to the same slide, use one unit of 88342 for the first separately identifiable antibody and one unit of 8834XX for each additional separately identifiable antibody)

(Do not report 88342 in conjunction with 88360 or 88361 for the same antibody)

(For quantitative or semiquantitative immunohistochemistry, see 88360, 88361)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: Microscopic examination of a CD15 immunohistochemical antibody stain performed on a lymph node of a 25-year-old male with suspected Hodgkin lymphoma.

Percentage of Survey Respondents who found Vignette to be Typical: 97%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: N/A

Description of Intra-Service Work: The pathologist examines positive control tissue known to contain cells which express CD15 to verify that the procedure is working and the stain is optimized. The pathologist also examines the negative control to check for nonspecific binding and false positive staining. The patient sample is then microscopically examined. The pathologist interprets the staining pattern and determines its significance in its histologic and cellular location. The findings are correlated with the corresponding H&E stained slide, clinical history, previous tissue samples and laboratory tests, and are reported.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 88342 was identified by the AMA RUC Relativity Assessment Workgroup (RAW) as a "CMS/Other"-valued code with Medicare utilization 500,000 or more. Upon review of the 88342 code, it became evident

there is confusion regarding the appropriate units of service for this code. The College of American Pathologists requested a CPT change to provide proper clarity to the service through a better definition of code 88342 and the establishment of a new add-on code 8834XX. CAP's expert panel reviewed the survey and developed its recommendations. The expert panel included CAP's CPT/RUC Workgroup, and representatives from general and academic pathology practice settings. The expert panel reviewed the survey results from 198 respondents and compared the recommended RVW, time and intensity/complexity of 88342 to the key reference service (88305) and other pathology codes such as 88387.

The median RVW was 0.75 and a survey median time of 20 minutes. The expert panel felt the survey respondents appropriately estimated the physician time, however the physician work was slightly overestimated. Panel members agreed that the median RVW was too high in comparison to the intensity and work of the key reference service, CPT code 88305 (Work RVU = 0.75, 25 minutes total time). The panel also reviewed the work and intensities of 88172, 88312, and 88387. They agreed that the intensity of 88342 is identical to that of 88305. The expert panel concluded that the survey's 25<sup>th</sup> percentile work RVU of 0.60 was appropriate and provides proper rank order amongst these services.

**CAP recommends the RVW value of 0.60, and 20 minutes of intra-service time.**

---

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.
- 

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88342

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Commonly

Specialty Clinical Laboratory                      How often? Commonly

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 6883445

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Approximately 50% of the patients are Medicare beneficiaries. There are 3,824,136 estimated claims listed in the RUC database for 2011. This number multiplied by 2 equals 7,648,272. 90% of these are estimated for 88342 under the new coding structure, which results in an estimate of 6,883,445.

Specialty Clinical Laboratory	Frequency 4276684	Percentage 62.12 %
Specialty Pathology	Frequency 2310084	Percentage 33.55 %
Specialty Dermatology	Frequency 196178	Percentage 2.84 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 3,441,722 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. 90% Estimated 2011 global and 26 Medicare claims data from 2012 V2 RUC Database.

Specialty Clinical Laboratory	Frequency 2138342	Percentage 62.13 %
Specialty Pathology	Frequency 1155042	Percentage 33.56 %
Specialty Dermatology	Frequency 98089	Percentage 2.84 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 88342

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 88343	Tracking Number	Original Specialty Recommended RVU: <b>0.24</b>
		Presented Recommended RVU: <b>0.24</b>
Global Period: XXX		RUC Recommended RVU: <b>0.24</b>

CPT Descriptor: Immunohisto-chemistry or immunocyto-chemistry, each separately identifiable antibody per block, cytologic preparation, or hematologic smear; each additional separately identifiable antibody per slide

(Use 88343 in conjunction with 88342)

(When multiple antibodies are applied to the same slide, use one unit of 88342 for the first separately identifiable antibody and one unit of 88343 for each additional separately identifiable antibody)

(Do not report 88342 in conjunction with 88360 or 88361 for the same antibody)

(For quantitative or semiquantitative immunohistochemistry, see 88360, 88361)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: Microscopic examination of an immunohistochemical P504S antibody stain after examination of the first antibody, HMWK (34βE12) in a cocktail of P504S and HMWK (34βE12) performed on a prostate needle core biopsy from a 66 year-old male with elevated PSA.

Percentage of Survey Respondents who found Vignette to be Typical: 93%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: NA

Description of Intra-Service Work: After examination of the first antibody, HMWK (34βE12), the pathologist examines positive control tissue known to contain cells which express the second antibody in the cocktail, P504S, to verify that the procedure is working and the stain is optimized for the second antibody. The patient sample is then microscopically examined. The pathologist interprets the staining pattern and determines its significance in its histologic and cellular location. The findings are correlated with the staining pattern of the 34βE12 antibody staining and reported.

Description of Post-Service Work: NA

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

CPT code 88342 was identified by the AMA RUC Relativity Assessment Workgroup (RAW) as a "CMS/Other"-valued code with Medicare utilization 500,000 or more. Upon review of the 88342 code, it became evident there is confusion regarding the appropriate units of service for this code. The College of American Pathologists requested a CPT change to provide proper clarity to the service through a better definition of code 88342 and the establishment of a new add-on code 88343. The creation of add on code 88343 separates the physician work of each additional separately identifiable antibody per slide. CAP's expert panel reviewed the survey and developed its recommendations. The expert panel included CAP's CPT/RUC Workgroup, and representatives from general and academic pathology practice settings. The expert panel reviewed the survey results from 133 respondents and compared the recommended RVW, time and intensity/complexity of 88342 to the key reference service (88305) and other pathology codes such as 88313.

The survey had a response rate of 133 out of 2060 surveyed. The median RVW was 0.75 and a survey median time of 15 minutes. The expert panel felt the survey respondents overestimated the physician time and work for this add-on service. Panel members agreed that the median RVW was too high in comparison to the intensity and work of the key reference service, CPT code 88305 (Work RVU = 0.75, 25 minutes total time). The panel also reviewed the work and intensities of other codes on the reference service list and agreed that the intensity of 88343 is lower than that of 88305. Therefore, CAP's expert panel agreed that the survey's median time and 25<sup>th</sup> percentile work RVU of 0.54 were too high. The Panel agreed that a crosswalk recommendation was more appropriate for this service as a recommendation below the 25<sup>th</sup> percentile was being made. They agreed that the overall work of 88343 is similar to that of 88313 which has a similar total time of 13 minutes with a Work RVU of 0.24.

The work of 88313 and 88343 is comparable. 88313 involves the microscopic examination of a histologic special stain and the add-on service 88343 involves Microscopic examination of an immunohistochemical P504S antibody stain after examination of the first antibody. They are both ancillary studies and both involve stains performed on a biopsy specimen. CAP's expert panel concluded that the work of 88343 is more intense than 88313 and requires slightly less time, therefore the survey's 25<sup>th</sup> percentile physician time of 10 minutes was considered typical rather than the 50<sup>th</sup> percentile. **CAP recommends that physician work of 88313 be cross-walked to new CPT code 88343 for a relative physician work value of 0.24, and 10 minutes of intra-service time.**

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88342

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Clinical Laboratory                      How often? Commonly

Specialty Pathology                      How often? Commonly

Specialty Dermatology                      How often? Sometimes

Estimate the number of times this service might be provided nationally in a one-year period? 764827

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. CAP estimates that utilization of this code will be 10% of the current 88342 utilization. 88342 Medicare volume represents approximately 50% of the claims. These numbers are estimated from Medicare estimates for 2011 from the RUC Database 2012 v2.

Specialty Clinical Laboratory	Frequency 475187	Percentage 62.12 %
-------------------------------	------------------	--------------------

Specialty Pathology	Frequency 256676	Percentage 33.56 %
---------------------	------------------	--------------------

Specialty Dermatology	Frequency 21798	Percentage 2.85 %
-----------------------	-----------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 382,414 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. CAP estimates that utilization of this code will be 10% of the current 88342 utilization. 88342 Medicare volume represents approximately 50% of the claims. These numbers are estimated from Medicare estimates for 2011 from the RUC Database 2012 v2

Specialty Clinical Laboratory	Frequency 237594	Percentage 62.13 %
-------------------------------	------------------	--------------------

Specialty Pathology	Frequency 128338	Percentage 33.55 %
---------------------	------------------	--------------------

Specialty Dermatology	Frequency 10899	Percentage 2.85 %
-----------------------	-----------------	-------------------

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 88342

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

Individuals with expertise in this service were consulted through a series of conference calls in order to develop the typical practice expense inputs. CAP's expert panel reviewed and compiled PE inputs and made adjustments to the clinical labor, supplies, and equipment. These inputs were further refined with individual pathologists who perform this service.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale: 88342 is the service being revised.

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Initially, the immunohistochemistry stain order is verified and accessioned into the laboratory information system. Control blocks have been previously embedded in paraffin as per routine histology procedures and are specific for each immunohistochemical antibody used. The histotechnologist pulls and verifies the patient tissue block and the correct control block and carefully cuts the positive control tissue on the microtome per routine histology procedures. The patient tissue block is then cut on the microtome and placed on the same slide with the positive control tissue. The patient tissue block is then again cut on the microtome and placed on a separate slide for the negative control.

The slides then are placed in the isotemp oven, incubated for 60 minutes, and removed.

Patient data is entered into the Ventana Ultra system with the specific antibodies to be used. Slide barcode labels are generated and placed on slides.

The histotechnologist typically then removes the detection kit and antibodies from refrigerator, loads the antibody, detection kit dispensers and required reagents onto the reagent tray and places the tray on the automated slide stainer. The slides are loaded onto the automated slide stainer, and the equipment is started. The slides are removed from the instrument after they are stained, placed in a slide holder, and rinsed in soapy water so that the coverslip material is removed. Slides are then dehydrated, cleared, and coverslipped by hand with permanent mounting media.

Positive and negative control slides are reviewed. Workload recordings are logged, and the slides and paperwork are collated. Slides and paperwork are then delivered to the pathologist.

Service Clinical Labor Activities:

None.

Post-Service Clinical Labor Activities:

Typically, the histotechnologist then re-files the block, unloads and stores the antibody, the detection kit and reagents. The lab technician cleans the equipment and work station in the histology lab. The lab technician then disposes the hazardous waste material and specimens.

101	* The RUC submitted recommendation from August 2001 indicated a total of 84 minutes in the detailed steps, However the summarization totaled 74 minutes, and that is what AMA Specialty Society was taken out of the service period time. 100% Histotechnologist time.								

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*MPC List Screen*

January 2013

**Optical Endomicroscopy**

In the 2012 Medicare Physician Fee Schedule (MFS) Final Rule the Centers for Medicare and Medicaid Services (CMS) requested that the RUC review CPT codes 43235 and 45378. At the February 2012 CPT Editorial Panel meeting, the specialty societies presented two new endoscopic procedures for optical endomicroscopy: 43206 and 43252 as well as one new pathology procedure for optical endomicroscopy: 88375 *Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session*. In the final rule, CMS stated that if new codes are introduced within a family, the entire family should be reviewed in order to maintain relativity and avoid separate valuations of codes within a specific family. Because the existing family of codes were scheduled for review at either the October 2012 or January 2013 RUC meetings, the RUC agreed with the specialty societies that survey and review of the family of codes should be delayed in order to maintain relativity and meet CMS standards. CPT code 88375 was surveyed and presented at the January 2013 RUC meeting.

**88375 *Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session***

Prior to reviewing the survey results, the RUC reviewed the survey methodology, as approved by the Research Subcommittee, used by the specialty society to ascertain responses to this low volume procedure. The survey results consisted of a random survey of College of American Pathologists (CAP) members combined with outreach to pathologists identified by a specific vendor. The RUC reviewed the survey results from practicing pathologists and recommend the following physician time components: pre-service time of 5 minutes and intra-service time of 25 minutes.

The RUC agreed with the specialty society that the survey 25<sup>th</sup> percentile work RVU of 1.08 is an accurate measure of the physician work involved in this service. To validate this value, the RUC compared the surveyed code to key reference service 88331 *Pathology consultation during surgery; first tissue block, with frozen section(s), single specimen* (work RVU= 1.19) and agreed that although the pathologist will review more images (in real time) during an optical endomicroscopy session, the intensity and urgency of reviewing frozen sections during surgery accounts for the greater physician work in the reference code. The RUC also reviewed CPT codes 11311 *Shaving of epidermal or dermal lesion, single lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 0.6 to 1.0 cm* (work RVU= 1.10) and 88121 *Cytopathology, in situ hybridization (eg, FISH), urinary tract specimen with morphometric analysis, 3-5 molecular probes, each specimen; using computer-assisted technology* (work RVU= 1.00) and noted that both codes have identical intra-service time, 25 minutes, as the surveyed code and justifies the recommended work value for 88375. **The RUC recommends a work RVU of 1.08 for CPT code 88375.**

**Practice Expense:**

The RUC reviewed and approved the direct practice expense inputs as modified by the Practice Expense Subcommittee.

**New Technology:**

This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

<b>CPT Code (•New)</b>	<b>Tracking Number</b>	<b>CPT Descriptor</b>	<b>Global Period</b>	<b>Work RVU Recommendation</b>
88375	NN39	Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session <u>(Do not report 88375 in conjunction with 43206 or 43252)</u> <u>(For biopsy specimen pathology use 88305)</u>	XXX	1.08

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 88375      Tracking Number   NN39

Original Specialty Recommended RVU: **1.08**Presented Recommended RVU: **1.08**

Global Period: XXX

RUC Recommended RVU: **1.08**

CPT Descriptor: Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session

(Do not report 88375 in conjunction with 43206 or 43252)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 57-year-old female with reflux symptoms unresponsive to pharmacologic therapy undergoes EGD. A suspicious 3 cm segment in the distal esophagus is identified and endoscopic biopsies are taken with real-time interpretive assessment of the optical endomicroscopy images by a pathologist to identify the areas of highest yield for biopsy for subsequent anatomic pathology examination.

Percentage of Survey Respondents who found Vignette to be Typical: 85%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting?

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The pathologist reviews the clinical history and referral information.

Description of Intra-Service Work: The pathologist reviews the optical endomicroscopy images in real-time, and informs and guides the endoscopist through concurrent verbal, electronic or telephone communication regarding the need for, and topography from which to obtain, specimens. The pathologist issues a report of the interpretation of the image(s) and any recommendations made.

Description of Post-Service Work: N/A

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The College of American Pathologists (CAP) conducted 3 separate survey efforts to obtain physician work data on CPT code 88375 - Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session.

Each survey was identical. The first survey effort was a random survey of 3,063 CAP members for which we received 9 respondents. The second survey effort was to 5 pathologists who were identified by one of the equipment vendors, and we received 2 respondents. The third survey effort was to 179 pathologists identified from a list of medical centers that had contact with the same vendor. There were 9 respondents from this third survey effort. There were a total of 20 respondents from the three surveys. In collating the data, CAP assumed that the second and third survey efforts were non-random and the first survey effort to be random. The random and non-random method of data collection was previously approved by the RUC's Research Subcommittee. Below are the survey results of the random, non-random, and combined data:

	Non Random	Random	Combined	Combined		
				Pre Time	Intra- Time	Post Time
Low	0.75	0.70	0.70	2	10	2
25th percentile	1.29	0.75	1.08	10	20	5
Median	1.50	1.10	1.40	10	25	8
75th percentile	2.50	1.50	1.83	10	34	10
High	4.00	2.60	4.00	20	60	30

CAP convened an expert panel composed of its Economic Affairs Committee, the Economic Affairs Committee CPT/RUC Workgroup, and representative members of academic and community practice. The expert panel reviewed the survey results and compared the physician work to previously RUC valued services which include:

- 1) 88331- Pathology consultation during surgery; first tissue block, with frozen section(s), single specimen (Work RVU = 1.19, 25 minutes intra time, IWPUT = 0.0476, RUC Reviewed October 2010).
- 2) 88333 - Pathology consultation during surgery; cytologic examination (eg, touch prep, squash prep), initial site (Work RVU = 1.20, 25 minutes intra time, IWPUT = 0.048, RUC Reviewed April 2005, MPC listed).
- 3) 88173 - Cytopathology, evaluation of fine needle aspirate; interpretation and report (Work RVU = 1.39, 15 minutes pre-service, 25 minutes intra, 10 minutes post, IWPUT = 0.0332, RUC Reviewed April 2010, MPC listed).
- 4) 95819 - Electroencephalogram (EEG); including recording awake and asleep (Work RVU = 1.08, 5 minutes pre time, 15 minutes intra time, 10 minutes post, IWPUT = 0.0496, RUC Reviewed August 2005, MPC listed)
- 5) 99213 - Office or other outpatient visit for the evaluation and management of an established patient, (Work RVU = 0.97, 3 minutes pre-service, 15 minutes intra service, 5 minute post, IWPUT = 0.0527, RUC reviewed February 2006, MPC listed).

CAP believes the combined survey data provides the best assistance in the valuation of 88375. Including all of the survey data from all survey sources allows a sufficient number of respondents to make meaningful recommendations; each individual survey did not contain sufficient response rates to make conclusive recommendations. Although our survey respondents indicated there is 10 minutes of pre-service time, the expert panel felt a pre-service evaluation time of 5 minutes was more appropriate. In addition, consulted experts indicated the intra-service time has ranged from greater than 60 minutes to as low as 10 minutes, however typically the intra-service time is 25 minutes. The expert panel felt that there is no post-service time and therefore CAP is not recommending any post-service time. **CAP recommends a physician work relative value of 1.08, pre-service time of 5 minutes, and an intra-service time of 25 minutes.** The recommended work RVU of 1.08 provides an IWPUT of 0.0387.

CAP's experts and economic panel compared the physician work of new service 88375 to its key reference service 88331 and understood that although the pathologist will review more images (in real time) during an optical endomicroscopy session, the intensity and urgency of reviewing frozen sections during surgery accounts for the greater physician work in 88331. **CAP believes the 25<sup>th</sup> percentile survey physician work RVU of 1.08, 5 minutes of pre-service, and the survey's median 25 minute intra-service time, properly rank this new service amongst similar pathology services and other services listed on the RUC's MPC listing.**

---

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario. N/A

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 88399 - Unlisted surgical pathology procedure

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pathology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 1000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Optical endomicroscopy procedures are now performed approximately 2,000 times per year and pathologist interpretation is not typically necessary. The CAP believes 1,000 is a maximum estimate based on the current total number of optical endomicroscopy procedures of 2,000 per year.

Specialty Pathology                      Frequency 1000                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 25 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The CAP believes 50% of the typical patients are and will be Medicare beneficiaries.

Specialty Pathology                      Frequency 500                      Percentage 100.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? No

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 86335

Practice Expense Summary of Recommendation  
Facility Direct Inputs**

CPT Long Descriptor:

Optical endomicroscopic image(s), interpretation and report, real-time or referred, each endoscopic session

(Do not report 88375 in conjunction with 43206 or 43252)

Global Period: \_XXX

Meeting Date: \_\_January 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

CAP convened an expert panel composed of its Economic Affairs Executive Committee, the Economic Affairs Committee CPT/RUC Workgroup, and representative members of academic and community practice as well as technical experts in the field.

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:  
88331 was chosen as the key reference code for the physician work survey. Code 88375 is similar to code 88331 in that each code requires a time sensitive interpretation and significant interaction between the procedural physician and pathologist.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: No additional time beyond standards recommended

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

Clinical labor staff typically coordinates the scheduling of the pathologist work with the endoscopist and the initial review/entering of patient information into the LIS system.

Intra-Service Clinical Labor Activities:

N/A

Post-Service Clinical Labor Activities:

N/A

88331 was chosen as the key reference code for the physician work survey. Code 88375 is similar to code 88331 in that each code requires a time sensitive interpretation and significant interaction between the procedural physician and pathologist.

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: No additional time beyond standards recommended

4. Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities: Clinical labor staff typically coordinates the scheduling of the pathologist work with the endoscopist and the initial review/entering of patient information into the LIS system.

Intra-Service Clinical Labor Activities: Clinical labor staff sets up the optical endomicroscopy equipment and assures that all items and records are accessible to the pathologist. Setting the equipment and monitors in place, and making sure all are in working order as it is critical for the real time image review.

After the images are reviewed, all equipment is properly shut down, necessary maintenance functions are performed, cleaned, and stored.

Additional patient findings/images and information are entered and images are transferred and stored in the laboratory.

**CPT Code: \_\_88375**  
**Specialty Society('s)\_College of American Pathologists**

Post-Service Clinical Labor Activities:

None typically at this time.

AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2012

**Breath Hydrogen Methane Test-PE Only**

In May 2012, this CPT code 91065 *Breath hydrogen test (eg, for detection of lactase deficiency, fructose intolerance, bacterial overgrowth, or oro-cecal gastrointestinal transit)* (RVU = 0.20) was editorially revised by the CPT Editorial Panel to include measurement for hydrogen and methane levels. The CPT modification did not alter the physician work related to the interpretation. The majority, but not all of the population produce hydrogen gas. Approximately 15% of patients are methane producers rather than hydrogen producers, therefore each breath specimens must be measured for both hydrogen and methane levels. The RUC reviewed the specialty societies recommended direct practice expense inputs and revised the clinical staff time, medical supplies, and equipment to match standards established by the PE Subcommittee. **The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲91065	H1	<p>Breath hydrogen <u>or methane</u> test (eg, for detection of lactase deficiency, fructose intolerance, bacterial overgrowth, or oro-cecal gastrointestinal transit)</p> <p><u>(Report 91065 once for each administered challenge)</u></p> <p>(For H. pylori breath test analysis, use 83013 for non-radioactive [C-13] isotope or 78268 for radioactive [C-14] isotope)</p> <p>(91100 has been deleted)</p>	000	<p>0.20</p> <p>(No Change)</p>

**AMA/Specialty Society Update Process**  
**Practice Expense Summary of Recommendation**  
**Non Facility Direct Inputs**

CPT Long Descriptor:

Breath hydrogen or methane test (eg, for detection of lactase deficiency, fructose intolerance, bacterial overgrowth, or oro-cecal gastrointestinal transit)

Global Period: 000 Meeting Date: 10/2012

Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

The AGA and ASGE surveyed physicians from a broad range of geographic locations with differing practice circumstances and settings - academic, public and community; solo, small/medium/large single- and multi-specialty groups - who typically perform this service. A committee comprised of representatives from AGA and ASGE served as the consensus panel to review and finalize these recommendations.

A reference code must be provided for comparison to the practice expense inputs on your spreadsheet. Please provide a rationale for the selection of reference codes. Comparison Code Rationale:

Please describe in detail the clinical activities of your staff:

Pre-Service Clinical Labor Activities:

- Complete pre-service diagnostic and referral forms
- Coordinate pre-surgery services
- Follow-up phone calls & prescriptions

Service Clinical Labor Activities:

- Greet patient, provide gowning, ensure appropriate medical records are available
- Obtain vital signs
- Provide pre-service education/ obtain consent
- Prepare room, equipment and supplies
- Prepare and position patient/ monitor patient/ set up IV
- Sedate/apply anesthesia
- Assist physician in performing procedure
- Clean room/equipment by physician staff
- Complete diagnostic forms, lab and x-ray requisitions
- Check dressing and wound/home care instructions/ coordinate office visits/prescriptions

Post-Service Clinical Labor Activities:

- Conduct phone calls /call in prescriptions

AMA/Specialty Society RVS Update RUC Summary of Recommendations  
*Codes Reported Together 75% or More Screen*

January 2013

**Percutaneous Closure Patent Ductus Arteriosus**

In October 2012, the CPT Editorial Panel established new code 93582 *Percutaneous transcatheter closure of patent ductus arteriosus* with moderate sedation inherent to report percutaneous transcatheter closure of patent ductus arteriosus and editorially revised the parenthetical note following three codes (93462, 93561 and 93562) for proper reporting of these services.

The RUC reviewed the survey results from 41 cardiologists for 93582 and determined that the survey 25<sup>th</sup> percentile work RVU of 14.00 and median intra-service time of 60 minutes appropriately accounts for the physician work and time required to perform this service. The RUC compared the surveyed service to code 92941 *Percutaneous transluminal revascularization of acute total/subtotal occlusion during acute myocardial infarction, coronary artery or coronary artery bypass graft, any combination of intracoronary stent, atherectomy and angioplasty, including aspiration thrombectomy when performed, single vessel* (RUC recommended work RVU of 12.32 and 70 minutes intra-service time). The RUC reviewed the intra-service description for 93582 and determined that although the surveyed service requires 10 minutes less intra-service time it is more intense compared to the reference code. The specialty societies noted that the physicians who perform this service 20 or more times a year indicated a higher intra-service time of 75 minutes, which supports the comparison to 92941. The RUC agreed that the surveyed service is a rare procedure, therefore the physicians who are more familiar with performing it, more appropriately assessed the time required. Lastly, the RUC noted that 92941 is typically performed on an adult, whereas 93582 is performed on an infant and the work intensity difference between these two services is appropriate.

To gauge the work value differential between performing the same service on a child versus an adult the RUC compared 93530 *Right heart catheterization, for congenital cardiac anomalies* (work RVU=4.22) to 93451 *Right heart catheterization including measurement(s) of oxygen saturation and cardiac output, when performed* (work RVU = 2.72). The differential is 55% between these two services. The RUC reviewed 59076 *Fetal shunt placement, including ultrasound guidance* (work RVU = 8.99) and multiplied it by the observed child/adult work differential ( $8.99 \times 1.55 = 13.95$ ), which results in a work RVU approximately the same as the survey 25<sup>th</sup> percentile work RVU. **The RUC recommends a work RVU of 14.00 for CPT code 93582.**

**RUC Database Flag**

The RUC recommends flagging this code in the RUC database as not to use to validate physician work because the median survey intra-time may not reflect the appropriate intra-service time compared to those who frequently perform this service.

**Practice Expense**

There are no direct practice expense inputs recommended for this service.

CPT Descriptor: Percutaneous transcatheter closure of patent ductus arteriosus

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 10-month old presents for evaluation of a continuous heart murmur and is discovered to have a hemodynamically significant patent ductus arteriosus (PDA) by transthoracic echocardiography. The child is asymptomatic with good growth and appetite, yet has moderate left heart enlargement due to chronic left-to-right shunting via the PDA. Due to concern for the long-term effects of this volume overload the child is referred for catheter based intervention.

Percentage of Survey Respondents who found Vignette to be Typical: 71%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 44%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. This may include review of the echocardiographic or other imaging studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study. A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered for those patients who have not required general anesthesia.

Description of Intra-Service Work: Percutaneous venous access is obtained, typically through the femoral vein. A thin-walled needle is inserted percutaneously into the vein through which a flexible guide wire is inserted into the vein. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and sidearm of the sheath is flushed to remove any clot or air. A pulmonary artery catheter is inserted through the sheath, a balloon on the tip of the catheter is inflated, and congenital right heart catheterization is performed. The catheter is passed through to the inferior vena cava, superior vena cava, right atrium, right ventricle and into the pulmonary artery. As the catheter tip passes through the heart into the lungs, pressure measurements are obtained within each cardiac chamber or major vessel. The catheter may be advanced further to a point that the balloon tip occludes the pulmonary artery. The pressure transduced from the tip of the catheter in this position represents a pulmonary wedge pressure, an indirect measurement of left atrial and left ventricular end diastolic pressure. Oxygen saturation measurements are obtained to assess for intracardiac shunts and to assess cardiac output. Blood gas measurements may also be performed. Measurements of cardiac output may be obtained. The shunt fraction is calculated. Serial injections may be performed through the catheter to measure thermodilution cardiac output.

A thin-walled needle is inserted percutaneously into a peripheral artery, through which a flexible guide wire is inserted into the artery. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. An appropriate catheter is inserted over the wire through the sheath into the arterial system under fluoroscopic guidance. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. Pressure is measured in the aortic root. The catheter is then used to cross the aortic valve retrograde into the left ventricle. Left ventricular pressure is measured. The catheter is carefully pulled back across the aortic valve to assess for an aortic valve gradient. The catheter is then pulled back across the aortic arch and then into the descending aorta to assess for coarctation of the aorta.

The pigtail catheter is withdrawn to the level of the patent ductus arteriosus and biplane thoracic aortography is performed to visualize the ductus. More than one aortogram may be required to assess the ductus. Quantitative angiographic measurements are performed on the PDA. The length of the PDA and the diameters of the aortic end, pulmonary end, and body of the PDA are calculated.

Appropriate anticoagulation is administered to therapeutic levels. A catheter is advanced from the femoral artery and placed in the aorta and directed toward the patent ductus arteriosus. Another catheter is advanced into the left pulmonary artery (LPA) at the level of the PDA. A guide wire is advanced through the aortic catheter and attempts are initiated to cross the PDA from the aorta into the LPA. Frequently this requires several different catheters to find the best shape to direct the wire into the PDA. This requires several catheter exchanges over a guide wire to position the different catheters in the aorta at the level of the PDA. Multiple repositioning of the catheter(s) and multiple attempts to cross the PDA are generally required. This frequently also requires multiple angulations of the camera to help direct the wire across. Once the wire is across the PDA marking its location, a separate wire is advanced through the catheter in the LPA and a similar approach is used to try to direct a wire from the LPA across the PDA into the aorta. If this is not successful (as the wire is working against flow from the aorta through the ODA to the LPA), a loop snare is advanced through the PA catheter and positioned in the LPA at the position of the PDA entry site. The snare is used to capture the wire coming from the aorta across the PDA and into the LPA. Typically this requires multiple repositioning of the PA catheter. Once the wire is passed through the snare, the snare is tightened to capture the wire and the wire is brought back through the right heart chambers and out through the femoral vein sheath. This creates a "rail" from the femoral vein, through the right heart, through the LPA, across the PDA into the aorta, and down the aorta to the femoral artery and then out of the body. Exquisite attention is required to prevent wire trauma to the pulmonary valve, tricuspid valve and the subvalvular apparatus.

Once a wire position is established from the LPA across the PDA to the aorta, an appropriate catheter is advanced over the wire from the femoral vein through the right heart, through the PDA and into the descending aorta. The wire is withdrawn through the catheter and replaced with a stiff wire. Next a delivery sheath is advanced over the wire from the femoral vein through the right heart, through the LPA, across the PDA into the aorta, and down into the descending aorta. The sheath is flushed. An appropriate size occlude device is selected. A pigtail catheter is now advanced from the femoral artery up to the level of the PDA again and connected to a power injector. The occluder is advanced through the delivery sheath to near the distal end of the sheath. The sheath is withdrawn back to the aortic entrance to the PDA. The distal end of the occluder is extruded from the sheath and the sheath and occlude are pulled back to seat the device in the aortic entrance to the PDA. Biplane aortogram is performed to ensure the device is seated appropriately at the aortic end. The sheath is then withdrawn while holding tension on the occluder delivery cable to keep it in place. The device is thus deployed in the PDA back to its pulmonary end. Biplane aortogram is now performed to ensure the device is seated appropriately at both the

aortic and pulmonary ends. If the device is not appropriately seated or sized, the delivery sheath is advanced over the device to recapture the occluder. The occluder is removed and the same procedure is performed with a better sized device. Once the device is in proper position angiographically, the device is released by unscrewing its delivery cable from the occluder. At this point, the patient is monitored for device embolization under fluoroscopy.

The patient is then observed for a period of time to ensure the device does not move. Aortography is typically performed again to assess PDA closure and to ensure no aortic trauma. The pigtail is used to recross the aortic valve and remeasure left ventricular end diastolic pressure to ensure the left ventricle is tolerating the increased afterload. The occluder delivery sheath is removed over a wire and a pulmonary artery catheter is often used to repeat the right heart catheterization to assess hemodynamics using the same technique as described for the initial right heart catheterization.

The patient's arterial pressure, electrocardiogram, and oxygen saturation are constantly monitored through the procedure. All catheters are removed once angiography is completed. Images are reviewed to ensure no additional views are required before leaving the procedure suite. Angiography of the access site may be performed to assess for any complications and suitability for a percutaneous closure device. The catheters and sheaths are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision.

Description of Post-Service Work: Angiographic images and hemodynamics are reviewed and a formal report is generated. The patient family and the referring physician are notified of the results. When appropriate, a plan of management is developed and implemented and discussed with the patient and family. The patient is observed to ensure no bleeding from the access site prior to disposition. Post procedural vital signs and telemetry are monitored to ensure no immediate complication.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 93582 will be used to report transcatheter repair of patent ductus arteriosus (PDA closure). This service has previously been reported with codes 37204 and 75894. These two codes are used to report a wide array of cardiovascular

embolization procedures, and were identified as frequently reported together. ACC, ACR, SIR, and SVS referred the issue to CPT for creation of new bundled codes for relevant services. 93582 addresses only the transcatheter PDA closure service.

An email seeking survey volunteers was sent to the entire membership of the Society for Cardiovascular Angiography and Interventions (SCAI). Surveys were distributed to those who responded, a method previously accepted as random by the RUC. The survey was completed by physicians who have experience providing the service.

A RUC panel from ACC and SCAI reviewed the preservice time and selected package 4 for a difficult procedure on a difficult patient undergoing a procedure in a facility with adjustment to the time for scrub/dress/wait to reflect the survey.

The key reference service is 93580, Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant. Survey respondents indicated that 93582 takes less time and is less intense/complex to perform than 93580. The median survey RVU was 15.00.

We recommend a work RVU of 14.00, the survey 25<sup>th</sup> percentile. The RUC panel determined it is more appropriate than the median for this service. The resulting increase in intensity compared to the key reference code is reasonable since this rare procedure is performed by few cardiologists on infants.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) In 2010, code 37204 (reported with 75894) appeared on the RAW screen identifying codes reported together 75% or more with recommendation made by ACC, ACR, SIR and SVS to refer this service to CPT for the development of new bundled codes that will more accurately reflect the current clinical practice of these procedures. Codes 37204/75894 are currently used to report a very wide array of cardiovascular embolization procedures. This proposal seeks to create a bundled code specific for reporting transcatheter PDA closure. Additionally, commercial carriers' coding guidelines for PDA have not been consistent across the country with at least one carrier recommending use of an unlisted code for one type of transcatheter PDA closure. Using an unlisted code to report such a well-established, typically covered procedure creates an undue burden on practices performing these procedures and carriers claims processing systems.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology                      How often? Rarely

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 4800

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Without a specific code to report and track utilization for transcatheter PDA closure, we do not have precise utilization estimates. The preliminary number of U.S. births in 2010 was 4,000,279. (Source: [http://www.cdc.gov/nchs/data/nvsr/nvsr60/nvsr60\\_02.pdf](http://www.cdc.gov/nchs/data/nvsr/nvsr60/nvsr60_02.pdf); viewed 6/6/12). From available sources (<http://emedicine.medscape.com/article/891096-overview#a0156>), PDA occurs in 0.002 to 0.008%, supporting estimates of 2,000 to 32,000 babies born each year suffering from PDA. Depending on the physiology, PDA may be treated medically or surgically using either open or transcatheter-based techniques. Using the highest estimates of incidence, and assuming that 15% of these children eventually require treatment using the minimally invasive transcatheter techniques, approximately 4,800 patients could be treated each year with transcatheter PDA closure.

Specialty cardiology	Frequency less than 4800	Percentage 100.00 %
----------------------	--------------------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 0 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate.

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Specialty	Frequency	Percentage	%
-----------	-----------	------------	---

Do many physicians perform this service across the United States?

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 93580

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2013

### **Percutaneous Alcohol Ablation of Septum**

In October 2012, the CPT Editorial Panel created new code 93583 *Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed* to describe percutaneous transcatheter alcohol septal ablation, a procedure that reduces septal thickness to improve left ventricular outflow tract obstruction in patients with hypertrophic cardiomyopathy.

The specialty society indicated that this is a low volume service, with fewer than 60 physicians actively performing this service in the United States. However, the specialty societies gathered 29 responses with a median service performance rate of 5 in the last year. Given this, the RUC was confident that the survey respondents had adequate knowledge of the service and accurately valued the physician work required to perform this service at the survey 25<sup>th</sup> percentile (work RVU of 14.00).

The specialty societies indicated the pre-service work for this procedure necessitates a detailed analysis and review of all the echocardiographic measurements performed ahead of time, review the coronary angiogram, understanding exactly which tiny hair-like structures the physician will go to before starting the procedure and the physician must have a meticulous plan prior to entering the lab. The RUC determined that 58 minutes pre-time, 90 minutes intra-service time and 40 minutes immediate post-service time is appropriate to perform this service. The RUC compared the surveyed code to key reference service 93580 *Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant* (work RVU = 17.97 and 120 minutes intra-service time) and determined that 93580 requires 30 minutes more intra-service time to perform but requires less mental effort, technical skill and psychological stress than 93583, in which you are inducing a heart attack. The RUC also compared 93583 to 37229 *Revascularization, endovascular, open or percutaneous, tibial, peroneal artery, unilateral, initial vessel; with atherectomy, includes angioplasty within the same vessel, when performed* (work RVU = 14.05 and 120 minutes intra-service time) to support the recommended value. **The RUC recommends a work RVU of 14.00 for CPT code 93583.**

#### **New Technology**

This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

#### **Practice Expense**

This service is primarily performed in a facility and does not have direct practice expense inputs.

CPT Descriptor: Percutaneous transcatheter septal reduction therapy (eg, alcohol septal ablation) including temporary pacemaker insertion when performed

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A 56-year-old male has functional Class III exertional dyspnea and exercise intolerance (heart failure) attributed to hypertrophic cardiomyopathy despite optimal beta-blocker and calcium-channel blocker therapy. Echocardiography demonstrates a ventricular septal thickness of 1.6 cm, a septal to posterior wall ratio of > 1.3 cm with a left ventricular outflow tract gradient of 30 mmHg at rest rising to 60 mmHg during provocation, and systolic anterior motion of the mitral valve further worsening left ventricular outflow tract obstruction and mitral regurgitation.

Percentage of Survey Respondents who found Vignette to be Typical: 90%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? Yes

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 100%

Is moderate sedation inherent to this procedure in the office setting?

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The patient's history, records, laboratory and diagnostic tests are reviewed. This may include review of the echocardiographic or other imaging studies. Physical examination is conducted. A clinical note is generated summarizing the clinical information if a recent note is not available. The patient is prepared for the procedure with careful documentation of baseline clinical findings such as vital signs, arterial pulses, allergies, electrocardiographic findings, laboratory results, family contact information, and other data. Appropriate pharmacologic therapy important for patient safety is ensured. Additional pre-procedure functions include writing orders for adequate sedation and patient support, and a review of study arrangements and procedures with technical, nursing and other assisting personnel. Appropriate communication is conducted with the patient and family as well as other medical professionals as needed. The procedure is reviewed with the patient and family. The risks and benefits of the procedure are presented, as well as the alternatives. Informed consent is obtained. Necessary equipment, instruments and supplies for the procedure are confirmed to be available and operational. The patient is positioned on the procedural table, attached to cardiac electrodes and an oxygen saturation monitor. A sterile table is prepared. The potential access sites are scrubbed in sterile fashion. A sterile drape is placed over the patient. The injection manifold and hemodynamic monitoring tubes and cables are set up. The patient's information is loaded in the hemodynamic monitoring equipment and into the angiographic digital archive in order to retain the data from the upcoming study. A "Time Out" occurs during which confirmation of critical information is ensured, such as the patient's identity, planned procedure, access route, allergies, completion of the consent process, availability of proper equipment, and any unusual circumstances which might influence the procedure. Conscious sedation is administered for those patients who have not required general anesthesia

Description of Intra-Service Work: Percutaneous venous access is obtained, typically through the internal jugular or femoral vein. A thin-walled needle is inserted percutaneously into the vein through which a flexible guide wire is inserted into the vein. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and sidearm of the sheath is flushed to remove any clot or air. A bipolar temporary pacing electrode catheter is introduced into the vein and passed to the right atrium and then negotiated through the tricuspid valve and finally into the apex of the right ventricle where appropriate capture threshold is demonstrated. Typically this requires several repositionings of the pacing catheter to achieve adequate capture and sensing thresholds.

A thin-walled needle is inserted percutaneously into a peripheral artery, through which a flexible guide wire is inserted into the artery. The needle is removed over the wire, a sheath/dilator system is inserted over the guide wire, the dilator is removed, and the sidearm of the sheath is flushed to remove any clot or air. A second arterial access is obtained in the same manner. An appropriate catheter is inserted over a wire through one of the arterial sheaths under fluoroscopic guidance. The catheter is advanced retrograde through the arterial system to the ascending aorta. The wire is removed and the catheter is attached to the pressure manifold. Pressure is measured in the aortic root. The catheter is then used to cross the aortic valve retrograde into the left ventricle. Left ventricular pressure is measured. The catheter is then exchanged out over a wire for an endhole catheter, which is positioned in the apex of the left ventricle. The catheter is carefully positioned for optimal hemodynamic measurement, which typically requires several repositionings due to catheter induced ventricular ectopy. Pressure transducers are connected to both the endhole catheter and to the second arterial sheath. The transducers are all zeroed. Simultaneous left ventricular and arterial pressures are then measured to assess for the gradient. Next maneuvers are performed to assess for a dynamic component to the gradient. Typically this involves Valsalva maneuver to reduce left ventricular volume, which generally increases the gradient. In addition, the catheter is typically maneuvered to induced premature ventricular contractions. On a post premature ventricular contraction, the gradient is generally increased as well. The endhole catheter is carefully pulled back to just below the aortic valve to ensure that the gradient is eliminated in this location. This ensures that the gradient is truly intraventricular and not at the level of the aortic valve. Next the catheter is pulled back across the aortic valve to assess for any separate aortic valve gradient. Finally, the catheter(s) is used to recross the aortic valve and positioned in the left ventricle for monitoring during the procedure.

Following this, the left ventricular catheter remains in place while a separate left coronary guide catheter is advanced through the second arterial sheath over a wire to the ostium of the left coronary artery. Selective left anterior descending coronary artery angiography is performed to show the trajectory of the left anterior descending artery and all of its septal perforator arteries. The angiographic views best showing the septal perforator arteries and their origins is selected for roadmapping. Appropriate anticoagulation is administered to therapeutic levels. A coronary guide-wire is passed through the left anterior descending coronary artery and then negotiated into the appropriate septal perforator. Due to the sharp angulation of the septal takeoff, it is frequently difficult to maneuver the wire into the appropriate septal. This often requires removing, reshaping, and reintroducing the coronary guidewire. Next, an appropriately sized angioplasty balloon is passed over the guide wire and positioned it in the selected septal perforator, where it is inflated to occlude flow down the septal. Left coronary angiography is performed to document occlusion of the septal perforator artery and proper positioning of the balloon. The coronary guide wire is then removed from the balloon lumen. Injection of contrast is then performed through the balloon lumen to opacify the distal aspect of the septal artery. This is done to ascertain the exact vascular bed of the septal to be infarcted with ethanol and to ensure there is no spillage of contrast retrograde into the left anterior descending coronary or antegrade into the coronary venous system or distant myocardial sites remote from the targeted septal muscle. Once the septal is confirmed to be the appropriate one for the intervention, a mixture of saline and contrast is agitated and injected through the lumen of the balloon. A separate physician performs transthoracic echocardiography (separately reportable) to confirm these findings at this time. The separate echocardiographer ensures that the septal perfusion supplies the target tissue to be ablated and that the septal perfusion does not extend to myocardial sites separate from the septum, such as the papillary muscles or the right ventricle. Depending on the septal artery size, septal thickness and the area delineated, 1 to four ml of absolute ethanol is instilled through the lumen of the inflated balloon catheter at a rate of 1 to 1.5 ml per minute and left in place for 5-10 minutes. During this time, the electrocardiogram is monitored for signs of conduction block and ventricular dysrhythmias, blood pressure is monitored to ensure no hypotension, the gradient is monitored, and the electrocardiogram and the patient are monitored for any signs of acute coronary ischemia to suggest compromise of the left anterior descending artery. If the gradient is not reduced at least 50% from baseline peak values, another septal artery will be injected if available based on coronary anatomy and myocardial contrast echocardiogram guidance (separately reportable) using the same techniques. After the alcohol injection(s) are completed, the balloon lumen is aspirated to clear any residual alcohol, and the balloon and guide are carefully withdrawn as a unit from the coronary and then from the body. Again, the electrocardiogram and the patient are carefully monitored for any signs of ischemia to suggest alcohol spillage into the left anterior descending artery. A completion coronary arteriogram is carried out of the left coronary system to ensure no disruption and to confirm closure of the treated septal branch(es). The guide catheter is removed. At completion of the procedure, the left ventricular catheter

and the second arterial sheath are used to remeasure the final outflow tract gradient following ablation. The temporary pacemaker is sewn in place, where it will remain for at least 24-48 hours, or longer if needed to treat heart block. All catheters are removed once angiography is completed. Images are reviewed to ensure no additional views are required before leaving the procedure suite. Angiography of the access site may be performed to assess for any complications and suitability for a percutaneous closure device. The catheters and sheaths are removed and hemostasis is achieved by appropriate means by the physician or technician under the physician's supervision.

Description of Post-Service Work: Angiographic images and hemodynamics are reviewed and a formal report is generated. The patient family and the referring physician are notified of the results. When appropriate, a plan of management is developed and implemented and discussed with the patient and family. The patient is observed to ensure no bleeding from the access site prior to disposition. Post procedural vital signs and telemetry are monitored to ensure no immediate complication.

Median Subsequent Observation Care Time	0.0	0.00
<b>Median Total Time</b>	<b>188.00</b>	<b>210.00</b>
<b>Other time if appropriate</b>		

**INTENSITY/COMPLEXITY MEASURES (Mean)****(of those that selected Key Reference code)****Mental Effort and Judgment (Mean)**

The number of possible diagnosis and/or the number of management options that must be considered	4.30	3.90
The amount and/or complexity of medical records, diagnostic tests, and/or other information that must be reviewed and analyzed	4.40	4.00
Urgency of medical decision making	3.90	3.60

**Technical Skill/Physical Effort (Mean)**

Technical skill required	4.10	4.00
Physical effort required	3.90	3.60

**Psychological Stress (Mean)**

The risk of significant complications, morbidity and/or mortality	4.40	3.80
Outcome depends on the skill and judgment of physician	4.60	4.10
Estimated risk of malpractice suit with poor outcome	4.20	3.70

**INTENSITY/COMPLEXITY MEASURES****CPT Code****Reference Service 1****Time Segments (Mean)**

Pre-Service intensity/complexity	4.10	3.60
Intra-Service intensity/complexity	4.30	3.90
Post-Service intensity/complexity	4.10	3.50

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

Code 93583 will be used to report transcatheter alcohol septal ablation for the treatment of hypertrophic cardiomyopathy. This service has not been previously defined. It has been reported using unlisted code 93799.

Surveys were distributed to a short list of providers known to offer this service. The Research Subcommittee approved this method for this rarely performed service offered by few cardiologists.

A RUC panel from ACC and SCAI reviewed the preservice time and selected package 4 for a difficult procedure on a difficult patient undergoing a procedure in a facility with adjustment to the time for scrub/dress/wait to reflect the survey.

The key reference service is 93580, Percutaneous transcatheter closure of congenital interatrial communication (ie, Fontan fenestration, atrial septal defect) with implant. Survey respondents indicated that 93583 takes less time than 93580 and is more intense/complex to perform.

This value reflects a similar “active” procedural time and higher intensity/complexity. Reference code 93580 also includes time related to general anesthesia induction, endotracheal intubation with mechanical ventilation, and intraprocedural transesophageal echocardiogram, performed during the procedure by other physicians. In contrast, 93583 is typically performed under conscious sedation versus general anesthesia. It is also performed with angiography by the operator and includes no reduced intensity time for TEE performed by other physicians. Finally, a more complex/difficult patient population undergoes this rare procedure, which aligns with the survey response.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 93799

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty cardiology                      How often? Rarely

Specialty                                      How often?

Specialty                                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Double the Medicare estimate offered below.

Specialty cardiology	Frequency 2000	Percentage 100.00 %
----------------------	----------------	---------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Specialty	Frequency 0	Percentage 0.00 %
-----------	-------------	-------------------

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 1,000

If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The prevalence of hypertrophic obstructive cardiomyopathy (HOCM) is believed to be about 0.2% to 0.5% of the general population. HOCM patients may be asymptomatic and HOCM may go undetected. HOCM is a genetic disorder that can cause sudden death in otherwise healthy people. Without a specific code to track percutaneous transcatheter alcohol septal ablation, we do not have precise utilization estimates. We do know, for the past decade, there have been less than 1000 claims per year for the open alternative myectomy procedure (code 33416) reported under the Medicare program. This estimate also seems consistent with cardiology's utilization of roughly 1500 in 2011 for 93799.

Specialty cardiology	Frequency 1000	Percentage 100.00 %
----------------------	----------------	---------------------

Specialty	Frequency 0	Percentage %
-----------	-------------	--------------

Specialty	Frequency	Percentage %
-----------	-----------	--------------

Do many physicians perform this service across the United States? No

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 93580

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2013

### **Mechanical Chest Wall Oscillations-PE Only**

In February 2013 the CPT Editorial Panel created new CPT code 94669 *Mechanical chest wall oscillation to facilitate lung function per session*. In April 2013, the RUC reviewed the practice expense for the new code as well as the other codes in the family of services, CPT codes 94667 *Manipulation chest wall, such as cupping, percussing, and vibration to facilitate lung function; initial demonstration and/or evaluation* and 94668 *Manipulation chest wall, such as cupping, percussing, and vibration to facilitate lung function; subsequent*. This family of services does not include physician work. The PE Subcommittee reviewed the practice expense inputs and noted that the PE Summary of Recommendation states that, “typically, after 30 minutes the machine is powered off and the vest or chest wrap is removed from the patient’s chest.” Practice expense inputs were revised to align with the 30 minutes of therapist intra-service time typical for CPT code 94669. **The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.**

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<p><b>Category I Medicine Pulmonary Pulmonary Diagnostic Testing and Therapies</b></p> <p>Codes 94010- 94799 include laboratory procedure(s) and interpretation of test results. If a separate identifiable evaluation and management service is performed, the appropriate E/M service code including new or established patient office or other outpatient services ( 99201- 99215 ), office or other outpatient consultations ( 99241- 99245 ), emergency department services ( 99281- 99285 ), nursing facility services (99304- 99318 ), domiciliary, rest home, or custodial care services ( 99324- 99337 ), and home services (99341- 99350 ) may be reported in addition to 94010- 94799 .</p> <p>Spirometry (94010) measures expiratory airflow and volumes and forms the basis of most pulmonary function testing. When spirometry is performed before and after administration of a bronchodilator, report 94060. Measurement of vital capacity (94150) is a component of spirometry and is only reported when performed alone. The flow-volume loop (94375) is used to identify patterns of inspiratory and/or expiratory obstruction in central or peripheral airways. Spirometry (94010, 94060) includes maximal breathing capacity (94200) and flow-volume loop (94375), when performed.</p> <p>Measurement of lung volumes may be performed using plethysmography, helium dilution or nitrogen washout. Plethysmography (94726) is</p>				

utilized to determine total lung capacity, residual volume, functional residual capacity, and airway resistance. Nitrogen washout or helium dilution (94727) may be used to measure lung volumes, distribution of ventilation and closing volume. Impulse oscillometry (94728) assesses airway resistance and may be reported in addition to gas dilution techniques. Spirometry (94010, 94060) and bronchial provocation (94070) are not included in 94726 and 94727 and may be reported separately.

Diffusing capacity (94729) is most commonly performed in conjunction with lung volumes or spirometry and is an add-on code to 94726-94728, 94010, 94060, 94070, and 94375.

Pulmonary function tests (94011- 94013) are reported for measurements in infants and young children through 2 years of age.

Pulmonary function testing measurements are reported as actual values and as a percent of predicted values by age, gender, height, and race.

Chest Wall Manipulation for the mobilization of secretions and improvement in lung function can be performed using manual (94667, 94668) or mechanical (94669) methods. Manual techniques include cupping, percussing, and use of a hand-held vibration device. A mechanical technique is the application of an external vest or wrap that delivers mechanical oscillation.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

CPT Long Descriptor:

**94669 Mechanical chest wall oscillation to facilitate lung function; each session**

Global Period: XXX Meeting Date: April 2013

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee: **The ATS convened a consensus panel to develop recommendations for these Practice Expense only codes on March 8, 2013. The composition of this panel included private practice and academic pulmonologists in varying types of practices and locations. ACCP and AARC agreed with the inputs.**
2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale: **CPT 94667 Manipulation chest wall, such as cupping, percussing, and vibration to facilitate lung function; initial demonstration and/or evaluation is a similar code to 94669.**
3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time: **clinical standards are used.**
4. Please describe in detail the clinical activities of your staff:

**Pre-Service** Clinical Labor Activities:

- Prior to the procedure the respiratory therapist or nurse will do a patient assessment which includes a brief history of the patient's secretion clearance and pulmonary status.
- The breath sounds are auscultated and vital signs are taken and recorded.
- The therapist explains HFCWO to the patient.

**Intra-Service** Clinical Labor Activities:

- The chest wrap or vest is applied to the patient and the therapist will assess proper fit using manufacture's standards. A variety of sizes may be tried in order to get the right fit.
- The patient is instructed on how to fasten the wrap or vest in place.
- The hose from the machine is connected to the chest wrap or vest.
- The machine is turned on to the prescribed pressure level and vibrating frequency. Patient comfort is assessed and the therapist may modify the settings to optimize effectiveness.
- The patient is instructed to breathe normally while the vest is vibrating the chest. The patient is coached and encouraged throughout the treatment.
- At prescribed intervals of approximately 10 minutes the machine stops, and the patient is instructed in coughing. The vibration frequency is increased after each coughing session. During the treatment the patient is assessed for any adverse effects and tolerance.
- Typically, after 30 minutes the machine is powered off and the vest or chest wrap is removed from the patient's chest.

**Post-Service** Clinical Labor Activities:

**Tab 15 CPT Code: 94669**  
**Specialty Society('s)\_ATS/ACCP/AARC**

- The patient is instructed to cough and expectorate. Breath sounds are auscultated and vital signs are taken and recorded.
- The treatment results are documented in the medical record.

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

April 2013

### Ultrasonic Wound Assessment

In February 2013, the CPT Editorial Panel converted Category III code 0183T to a Category I code to report ultrasound wound assessment for low frequency, non-contact, non thermal ultrasound.

The American Podiatric Medical Association (APMA), American Physical Therapy Association (APTA) and American Society of General Surgeons (ASGS) conducted a RUC survey and received an inadequate number of survey responses. The specialty societies noted a wide variation in the survey intra-service time and determined that this was most likely the result of surveying a code and vignette that does not describe a typical wound size, thereby allowing survey respondents to consider whatever their personal typical patient would be. The specialty societies requested and the RUC agreed that this service be carrier priced for CPT 2014. The specialty societies will submit a coding proposal to describe two codes that differentiate the wound size and clearly indicate that the size reported is the total for all wounds treated.

**The RUC recommends that CPT code 97610 be carrier priced for CPT 2014 and refers this issue to the CPT Editorial Panel.**

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<b>Category I Medicine Physical Medicine and Rehabilitation Active Wound Care Management</b>				
●97610	DD1	Low frequency, non-contact, non-thermal ultrasound, including topical application(s), when performed, wound assessment, and instruction(s) for ongoing care, per day	XXX	Carrier Price and Refer to CPT

April 2, 2013

Barbara Levy, MD  
Chair, AMA/Specialty Society RVS Update Committee  
American Medical Association  
515 North State Street  
Chicago, Illinois 60654

Subject: Ultrasonic Wound Assessment (Tab 16)

Dear Dr. Levy,

At the February 2013 CPT meeting, the Editorial Panel approved conversion of Category III CPT Code 0183T Low frequency, non-contact, non-thermal ultrasound, including topical application(s), when performed, wound assessment, and instruction(s) for ongoing care, per day to a Category I CPT Code 976XX1 with the same code descriptor. The American Podiatric Medical Association, American Physical Therapy Association, and American Society of General Surgeons agreed to conduct a RUC survey for this new code. Based on the survey results, we have determined that we cannot make a work or practice expense recommendation for 976XX1. This letter provides background and the rationale for our decision.

#### CPT Background

*In February 2007*, representatives of the company that developed the device used in providing low frequency ultrasonic wound therapy presented a coding application for creation of two codes:

- 97xxx Low frequency, non-contact, non-thermal ultrasound, with or without topical application(s), wound assessment, and instruction(s) for ongoing care. Per session; total wound(s) surface area less than or equal to 50 square centimeters.
- 97xxx total wound(s) surface area greater than 50 square centimeters.

The Panel voted to accept Option B with modifications and establish a Category III code for 2008.

006XT Low frequency, non-contact, non-thermal ultrasound, ~~with or without~~ including topical application(s) when performed, wound assessment, and instruction(s) for ongoing care, per ~~session day; total wound(s) surface area less than or equal to 50 square centimeters~~

~~007XT- total wound(s) surface area greater than 50 square centimeters~~

*In October 2009*, a proposal was presented by the representatives for the device company to convert Category III code 0183T to a Category I code. The Panel rejected this proposal and maintained Category III status for the code.

*In February 2011*, a proposal was submitted by representatives of the device company and several Primary Investigators to convert Category III code 0183T to a Category I code. In a cover memo, the

presenters indicated that "establishing consistent payment has been challenging due to the lack of RVUs associated with the Category III CPT codes." The Panel postponed consideration of this request until time certain October 2011 in anticipation of new supporting literature.

*In February 2013, a proposal was submitted by several device company Primary Investigators, along with APMA, APTA, and ASGS to convert Category III code 0183T to a Category I code. Additional published literature was provided to support Category I status.*

#### RUC Survey Discussion

The APMA, APTA, and ASGS conducted a RUC survey and received 14 responses, three of which had no experience in the past 12 months. The key reference code chosen by 13 respondents was 97597 Debridement (eg, high pressure waterjet with/without suction, sharp selective debridement with scissors, scalpel and forceps), open wound, (eg, fibrin, devitalized epidermis and/or dermis, exudate, debris, biofilm), including topical application(s), wound assessment, use of a whirlpool, when performed and instruction(s) for ongoing care, per session, total wound(s) surface area; first 20 sq cm or less.

We reviewed the survey results and found a wide variation in intra-service time (range = 5-45 minutes) with a median of 20 minutes. This is most likely the result of surveying a code and vignette that does not describe a typical wound size, thereby allowing survey respondents to consider whatever their personal typical patient would be. We are unable to know what size wound the respondents considered for their time estimates. We also noted that code 97597 (first 20 sq cm), which we believe to be a bigger procedure, has an intra-service time of 14 minutes and that the device company brochure describes a typical "treatment" requiring an average time of 5 to 7 minutes (note that treatment is not defined by size).

#### Recommendation

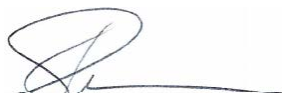

Given the low response rate, the wide variation in the survey intra-time time, and the lack of wound size specification in the code descriptors and vignette, we cannot recommend a work RVU or practice expense details for code 976XX1 at this time. It is clear that there would need to be (at least) two codes that differentiate wound size and clearly indicate that the size reported is the total for all wounds treated before we can recommend a work RVU. The Cat III code 0183T has been carrier priced since 2008. We recommend extending carrier pricing to the new Cat I code 976XX1.

Thank you for your consideration of this information. Our Advisors will be available at the upcoming meeting to answer any questions.

Sincerely,

Seth Rubenstein, DPM  
APMA RUC Advisor

Stephen Levine, PT, DPT  
APTA RUC Advisor

Jay Gregory, MD, FACS  
ASGS RUC Advisor

# AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2012

## Anogenital Exam Colposcopy-PE Only

In May 2012, this service was editorially revised by the CPT Editorial Panel to reflect change in practice due to new technology. The Practice Expense (PE) Subcommittee discussed the compelling evidence that the technique and knowledge/technology has changed significantly since the last review of this service. Best practice for this exam requires the use of highly trained support staff. The typical exam in an child advocacy center (nonfacility) now requires the expertise of clinical staff at the level of an RN and a specially trained Child Life Specialist (CLS). The PE Subcommittee determined that the specialty met compelling evidence and that the change and addition of clinical staff types are appropriate for this service. The RUC noted that Child Life Specialist is not recognized as a staff type in the CMS direct PE inputs clinical labor types list and is not listed as an occupation by the bureau of labor statistics. The specialty has included supporting documents regarding similar staff types in order to assist with appropriate pricing. **The RUC reviewed and approved the direct practice expense inputs with modifications as recommended by the Practice Expense Subcommittee.**

CPT Code	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
▲99170	A1	Anogenital examination, <del>with colposcopic magnification magnified</del> , in childhood for suspected trauma, <u>including image recording when performed</u> (For <del>conscious</del> <u>moderate</u> sedation, see 99143-99150)	000	1.75 (No change)

# SUMMARY OF THE 2008 CHILD LIFE PROFESSION COMPENSATION SURVEY RESULTS

---

## CHILD LIFE COMPENSATION SURVEY

In 2008, Child Life Council (CLC) sponsored a large-scale survey of practicing child life specialists to understand the positions held, how much is earned, and the types of benefits received.

CLC engaged Association Research, Inc., an independent research company to conduct a salary survey. More than 3,600 child life professionals in the U.S. and Canada were contacted to participate in the study. The response rate to the Web-based survey was excellent — 44.8% — based on 1,631 responses. Of this group, 94.4% worked in the U.S. and the balance in Canada. Eighty percent were in full-time positions. The confidential Web-based survey gathered individual and institutional demographic data along with the salary and benefits data as self-reported by the respondents.

Three distinct positions are reflected in the summary of survey results:

- Director/Manager/Leader of Child Life Program
- Child Life Specialist with Leadership Responsibilities
- Child Life Specialist

A profile of each position, with a summary of results, is presented on the following pages. As the vast majority of respondents to the survey were U.S.-based and full time, only individuals in those categories were used to create the detailed profiles. There is a separate summary table of full-time salaries in Canada.

### **Explanation of Terminology**

The Salary Table for each position uses statistical measures to describe the whole range of salaries. The mean and median values are the most familiar and commonly used benchmarks. The *mean* (average) is the total of all salaries divided by the number of individual entries reported. The disadvantage of the mean value is that it can be distorted by unusually high or low numbers, whereas the median (mid-point) figure is not influenced by extreme values. The *median* value is the salary right in the middle, after all salaries are arranged from the lowest to highest. Half of all the values are lower than the median and half are higher. In addition to mean and median values, salary quartiles are displayed. The first quartile, for example, is higher than 25% of all others reported, but lower than the remaining 75%. The third quartile is higher than 75% of the field, but lower than the remaining 25%.

Each Salary table also shows how salary levels vary by education, location, and experience. The crosstab for education displays the difference between individuals with a bachelor's degree and those with a master's degree. For location, U.S. Census Districts are used. A final table summarizing benefits offered by job position is included.

Detailed statistical tables and analysis are available in the *Executive Report on Child Life Salaries and Compensation*, published by CLC in July 2008. This inclusive report provides an analysis of salaries and benefits for part-time employees, and contains a separate section covering salaries and benefits for respondents working in Canada. The detailed Salary tables have additional breakouts for gender, credentials, community size, institution or organization type, number of pediatric beds, number of FTE professional staff in the department, as well as number of people supervised. Visit [www.childlife.org](http://www.childlife.org) for more information.

## DIRECTOR/MANAGER/LEADER OF CHILD LIFE PROGRAM

*Position Description: This individual should be a Certified Child Life Specialist with academic preparation at the master's degree level, including all expertise in the areas listed under child life specialist. Responsibilities may include:*

- *Managing the department budget, salaries, and staffing*
- *Evaluating staff, department needs, and overall contributions to organization*
- *Advocating for needs of department and organization*
- *Authorizing and encouraging fundraising and special events for the program and organization*

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

October 2012

### **Interprofessional Telephone Consultative Services**

In June 2010, the CPT Editorial Panel created the Telephone Consultative Services Workgroup to address a proposal to create codes describing telephone/internet consultative services. The workgroup was charged with the following: Clarify use by non-physicians; Review the appropriateness of time increments for physician to patient calls; Clarify the typical patient/service descriptions based upon literature supplied; Consider appropriate use of term “consultation”; and Consider time interval for non-reporting as being distinct from a patient call (ie, if a face to face service occurs the next week or if co-management is in progress and the patient is seen every month, but more than 7 days previously, is the service reported). In May 2012, the CPT Editorial Panel approved a new Evaluation and Management subsection, guidelines and four codes to describe and report telephone/internet consultative services.

An interprofessional telephone/internet consultation is an assessment and management service in which a patient’s treating (eg, attending or primary) physician or other qualified health care professional requests the opinion and/or treatment advice of a physician with specific specialty expertise (the consultant) to assist the treating physician/qualified health care professional in the diagnosis and/or management of the patient’s problem without the need for the patient’s face to face contact with the consulting physician.

These services are typically provided in complex and/or urgent situations where a timely face to face service with the consultant may not be feasible (eg, geographic distance). These codes should not be reported by a consultant who has agreed to accept transfer of care before the telephone/internet assessment, but are appropriate to report if the decision to accept transfer of care cannot be made until after the initial interprofessional telephone/Internet consultation.

The patient for whom the interprofessional telephone/internet consultation is requested may be either a new patient to the consulting physician or an established patient with a new problem or an exacerbation of an existing problem. However, the consultant should not have seen the patient in a face to face encounter within the last 14 days. When the telephone/internet consultation leads to an immediate transfer of care or other face-to-face service (eg, a surgery, hospital visit or a scheduled office evaluation of the patient) within the next 14 days or next available appointment date by the consultative physician, these codes are not reported.

**99446 Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 5-10 minutes of medical consultative discussion and review**

The RUC reviewed the survey results from 48 multi-specialty physicians and determined that the survey respondents overestimated physician work. The specialty societies proposed and the RUC accepted modifications to the survey times to more accurately reflect the CPT descriptor: 3 minutes for pre-service; 8 minutes for intra service; and 5 minutes for post service. The RUC reviewed key reference service, CPT code 99441 *Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 5-10 minutes of medical discussion* (work RVU=0.25) and agreed that 99446 is a more intense procedure. Typically, the patient is unknown to the consulting physician, the service is provided in a complex/urgent situation and the medical decision-making required is more intense than the key reference service. In order to maintain the proper rank order in relation to 99447 (described below), the RUC used magnitude estimation and determined that a work RVU between the survey 25<sup>th</sup> percentile (0.50) and the work RVU of 99441 (0.25) is appropriate. The RUC also compared 99446 to 99281 *Emergency department visit for the evaluation and management of a patient, which requires these 3 key components: A problem focused history; A problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor* (work RVU = 0.45) and determined that 99281 is a more intense service and should be valued higher. **The RUC recommends a work RVU of 0.35 for CPT code 99446.**

**99447 Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 11-20 minutes of medical consultative discussion and review**

The RUC reviewed the survey results from 31 multi-specialty physicians and determined that the survey respondents overestimated physician work. The specialty societies proposed and the RUC accepted modifications to the survey times to more accurately reflect the CPT descriptor: 3 minutes of pre-service; 15 minutes of intra service; and 5 minutes of post service. The RUC reviewed key reference service, 99442 *Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 11-20 minutes of medical discussion* (work RVU=0.50) and agreed that 99447 is a more intense procedure. Typically, the patient is unknown to the consulting physician, the service is provided in a complex/urgent situation and the medical decision-making required is more intense than the key reference service. In order to maintain the proper rank order within the family of services, the specialty society indicated and the RUC agreed that a work of 0.70, lower than the survey 25<sup>th</sup> percentile is appropriate. The 0.35 increment increase in work RVU is similar to that within the telephone evaluation and management services, 99441-99443. The RUC also reviewed CPT code 99241 *Office consultation for a new or established patient, which requires these 3 key components: A problem focused history; A problem focused examination; and*

*Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 15 minutes face-to-face with the patient and/or family (work RVU = 0.64 and 15 minutes of intra-service time) and agreed that 99447 should be valued higher since it is typically provided in a complex/urgent situation. The RUC recommends a work RVU of 0.70 for CPT code 99447.*

**99448 Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 21-30 minutes of medical consultative discussion and review**

The RUC reviewed the survey results from 31 multi-specialty physicians and determined that the survey respondents overestimated physician work. The specialty societies proposed and the RUC accepted modifications to the survey times to more accurately reflect the CPT descriptor: 5 minutes for pre-service; 25 minutes for intra service; and 5 minutes of post service. The RUC reviewed CPT code 99443 *Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 21-30 minutes of medical discussion* (work RVU=0.75) and agreed that 99448 is a more intense procedure. Typically, the patient is unknown to the consulting physician, the service is provided in a complex/urgent situation and the medical decision-making required is more intense than the key reference service. In order to maintain the proper rank order within this family of services, the RUC used magnitude estimation and determined that a work RVU of 1.05 is appropriate (99447 work RVU of 0.70 + 0.35 = 1.05). The RUC compared 99448 to 99374 *Physician supervision of a patient under care of home health agency (patient not present) in home, domiciliary or equivalent environment (eg, Alzheimer's facility) requiring complex and multidisciplinary care modalities involving regular physician development and/or revision of care plans, review of subsequent reports of patient status, review of related laboratory and other studies, communication (including telephone calls) for purposes of assessment or care decisions with health care professional(s), family member(s), surrogate decision maker* (work RVU = 1.10) and determined that 99374 is a more intense service and should be valued higher. **The RUC recommends a work RVU of 1.05 for CPT code 99448.**

**99449 Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 31 minutes or more of medical consultative discussion and review**

The RUC reviewed the survey results from 26 multi-specialty physicians and determined that the survey respondents overestimated physician work. The RUC noted that 99449 will typically be utilized by behavioral/mental health professionals as there is a perceived need with access to care. The specialty societies proposed and the RUC accepted modifications to the survey times to more accurately reflect the CPT descriptor: 9 minutes for pre-service; 31 minutes for intra service; and 10 minutes for post service. The RUC reviewed CPT codes 92014 *Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established*

patient, 1 or more visits (work RVU=1.42) and 99304 Initial nursing facility care, per day, for the evaluation and management of a patient, which requires these 3 key components: A detailed or comprehensive history; A detailed or comprehensive examination; and Medical decision making that is straightforward or of low complexity. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the problem(s) requiring admission are of low severity. Physicians typically spend 25 minutes at the bedside and on the patient's facility floor or unit. (work RVU=1.64) and agreed that both services require less intra-service time and are more intense than 99449. **The RUC recommends a work RVU of 1.40 for CPT code 99449.**

### New Technology

This service will be placed on the New Technology list and be re-reviewed by the RUC in three years to ensure correct valuation and utilization assumptions.

CPT Code (•New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
<p>An on-line electronic medical evaluation is a non-face-to-face evaluation and management (E/M) service by a physician to a patient using Internet resources in response to a patient's on-line inquiry. Reportable services involve the physician's personal timely response to the patient's inquiry and must involve permanent storage (electronic or hard copy) of the encounter. This service is reported only once for the same episode of care during a seven-day period, although multiple physicians could report their exchange with the same patient. If the on-line medical evaluation refers to an E/M service previously performed and reported by the physician within the previous seven days (either physician requested or unsolicited patient follow-up) or within the postoperative period of the previously completed procedure, then the service(s) are considered covered by the previous E/M service or procedure. A reportable service encompasses the sum of communication (eg, related telephone calls, prescription provision, laboratory orders) pertaining to the on-line patient encounter.</p> <p>(For an on-line medical evaluation provided by a qualified nonphysician health care professional, use 98969)</p>				

99444

Online evaluation and management service provided by a physician to an established patient, or guardian not originating from a related E/M service provided within the previous 7 days, using the Internet or similar electronic communications network

(Do not report 99444 when using 99339-99340, 99374-99380 for the same communication[s])

(Do not report 99444 for anticoagulation management when reporting 99363, 99364)

(Do not report 99444 with 99446-99449)

### **Interprofessional Telephone/Internet Consultations**

The consultant should use the following codes to report interprofessional telephone/internet consultations. An interprofessional telephone/internet consultation is an assessment and management service in which a patient's treating (eg, attending or primary) physician or other qualified health care professional requests the opinion and/or treatment advice of a physician with specific specialty expertise (the consultant) to assist the treating physician/qualified health care professional in the diagnosis and/or management of the patient's problem without the need for the patient's face to face contact with the consulting physician.

These services are typically provided in complex and/or urgent situations where a timely face to face service with the consultant may not be feasible (eg, geographic distance). These codes should not be reported by a consultant who has agreed to accept transfer of care before the telephone/internet assessment, but are appropriate to report if the decision to accept transfer of care cannot be made until after the initial interprofessional telephone/internet consultation.

The patient for whom the interprofessional telephone/internet consultation is requested may be either a new patient to the consulting physician or an established patient with a new problem or an exacerbation of an existing problem. However the consultant should not have seen the patient in a face to face encounter within the last 14 days. When the telephone/internet consultation leads to an immediate transfer of care or other face-to-face service (eg, a surgery, hospital visit or a scheduled office evaluation of the patient) within the next 14 days or next available appointment date by the consultative physician, these codes are not reported.

Review of pertinent medical records, laboratory studies, imaging studies, medication profile, pathology specimens, etc may be required and transmitted electronically, by fax or by mail immediately before the telephone/internet consultation or following the consultation.

The review of this data is included in the telephone/internet consultation service and should not be reported separately. The majority of the service time reported (greater than 50%) must be devoted to the medical consultative verbal/**Internet** discussion. This service should not be reported more than once within a seven day interval.

If more than one telephone/internet contact(s) is required to complete the consultation request (eg, discussion of test results), the entirety of the service and the cumulative discussion and information review time should be reported with a single code.

The written or verbal request for telephone/internet advice by the treating/requesting physician/qualified healthcare professional should be documented in the patient's medical record, including the reason for the request, and concludes with a verbal opinion report and written report from the consulting physician to the treating/requesting physician/qualified healthcare professional.

Telephone/internet consultations of less than 5 minutes should not be reported. Consultant communications with the patient and/or family may be reported using 99441-99444, 98966-98969) and the time related to these services is not used in reporting 99446-99449.

When the sole purpose of the telephone/internet communication is to arrange a transfer of care or other face-to-face service these codes are not reported.

The treating/requesting physician/qualified healthcare professional may report the prolonged service codes 99354-99357 for the time spent on the inter-professional telephone/internet discussion with the consulting (eg, specialist) physician if the time **exceeds 30 minutes** beyond the typical time of the appropriate E/M service performed and the patient is present (onsite) and accessible to the treating/requesting physician/qualified healthcare professional. If the interprofessional telephone/internet assessment and management service occurs when the patient is not present or on-site, and the discussion time exceeds 30 minutes beyond the typical time of the appropriate E/M service performed, then the non face-to-face prolonged service codes 99358-99359 may be reported by the treating/requesting physician/qualified healthcare professional.

(For telephone services provided by a physician to a patient, see 99441-99443)

(For telephone services provided by a qualified healthcare professional to a patient, see 98966-98968)

(For an on-line medical evaluation provided by a physician to a patient, use 99444)

(For an on-line assessment and management service provided by a qualified healthcare professional to a patient, use 98969)

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99446	Tracking Number E1	Original Specialty Recommended RVU: <b>0.50</b>
		Presented Recommended RVU: <b>0.35</b>
Global Period: XXX		RUC Recommended RVU: <b>0.35</b>

CPT Descriptor: Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 5-10 minutes of medical consultative discussion and review

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A two day old hospitalized newborn develops poor feeding and tachypnea and is diagnosed with group B streptococcal bacteremia. The patient's primary care physician telephones an infectious disease specialist located several hours away for treatment advice.

Percentage of Survey Respondents who found Vignette to be Typical: 65%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Confirms that patient, parent, or legal guardian has been informed in advance of the telephone consultation and has agreed. Decide on appropriate timing to fit call into existing daily schedule. Review any data or relevant information sent to consultant in advance of call.

Description of Intra-Service Work: Clarify from the requesting physician the nature of the patient's problem to be discussed. Obtain from the requesting physician all relevant history, physical examination, lab data, imaging. Present to requesting physician an analysis of the patient's problem, including likely diagnosis and suggested management. Provide to requesting physician alternative diagnoses and management approaches, including pluses and minuses of each. Respond to questions from the requesting physician to clarify diagnostic and treatment approach. Relay to requesting physician all relevant scientific background on the disease at issue needed to understand the consultant's recommendations or to respond to requesting physician's questions. Outline suggestions for long-term handling of the patient's problem.

Description of Post-Service Work: Review all relevant lab tests and other data not previously made available to consultant. Complete any literature review in response to issues raised during the phone call. Prepare a written response to the requesting physician.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
99212	XXX	0.48	RUC Time	18,400,000

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: A problem focused history; A problem focused examination; Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 10 minutes face-to-face with the patient and/or family.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
65205	000	0.71	RUC Time	28,100

CPT Descriptor 2 Removal of foreign body, external eye; conjunctival superficial

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99442	XXX	0.50	RUC Time

CPT Descriptor Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 11-20 minutes of medical discussion

**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Key Reference Code:** 15      **% of respondents:** 31.2 %

**TIME ESTIMATES (Median)**

	<b>CPT Code: 99446</b>	<b>Key Reference CPT Code: 99441</b>	<b>Source of Time RUC Time</b>
Median Pre-Service Time	3.00	1.00	
Median Intra-Service Time	8.00	8.00

------------------------------------	------	------

Post-Service intensity/complexity	2.67	2.60
-----------------------------------	------	------

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel was constituted from RUC advisors representing the surveying specialty societies. This expert panel reviewed the survey results in detail and conferred by telephone conference call on several occasions, together with specialty society staff members. As the four codes are linked and ordered by increasing time intervals for the duration of the telephone consultation, initial discussion focused on establishing 99446 as the anchor for the family. Based on survey results and comparison with other codes, the panel recommends the 25th percentile of the survey results (0.50 work RVUs) for 99446. Based on similar considerations, the panel recommends the 25th percentile of the survey results (0.75 work RVUs) for 99447.

The physician work survey results for 99448 were virtually identical to those of 99447, thus leading to a rank order anomaly if the 25th percentile were used. The panel recommends that the median physician work from the survey (1.00) should be used to avoid this rank order anomaly. In addition, this recommendation also maintains the same increment between 99446 and 99447 as between 99447 and 99448.

For 99449, the panel recommends a physician work value of 1.25, just slightly over the survey 25th percentile. This recommendation maintains the same interval between 99449 and 99448 as between 99448 and 99447 or between 99447 and 99446.

After comparison of the survey times with the times from various comparator codes, the panel recommends the median survey times for all four codes as there didn't appear to be substantial reason for modifying the survey results.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was not previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty Neurology/Endocrinology/Rheumatology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 112497

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 83081 Percentage 73.85 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 29416 Percentage 26.14 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

24,691 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 24691 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99462

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99447	Tracking Number E2	Original Specialty Recommended RVU: <b>0.75</b>
		Presented Recommended RVU: <b>0.70</b>
Global Period: XXX		RUC Recommended RVU: <b>0.70</b>

CPT Descriptor: Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 11-20 minutes of medical consultative discussion and review

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 66 year old male on levothyroxine and cortisone is admitted to an ICU for chest pain. The hospitalist contacts the patient's endocrinologist to obtain additional information regarding the illness(es) being treated, the dosage of the prescribed medications, any recent laboratory data and additional treatment and management options that should be considered during the hospitalization.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Confirms that patient, parent, or legal guardian has been informed in advance of the telephone consultation and has agreed. Decide on appropriate timing to fit call into existing daily schedule. Review any data or relevant information sent to consultant in advance of call.

Description of Intra-Service Work: Clarify from the requesting physician the nature of the patient's problem to be discussed. Obtain from the requesting physician all relevant history, physical examination, lab data, imaging. Present to requesting physician an analysis of the patient's problem, including likely diagnosis and suggested management. Provide to requesting physician alternative diagnoses and management approaches, including pluses and minuses of each. Respond to questions from the requesting physician to clarify diagnostic and treatment approach. Relay to requesting physician all relevant scientific background on the disease at issue needed to understand the consultant's recommendations or to respond to requesting physician's questions. Outline suggestions for long-term handling of the patient's problem.

Description of Post-Service Work: Review all relevant lab tests and other data not previously made available to consultant. Complete any literature review in response to issues raised during the phone call. Prepare a written response to the requesting physician.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99442	XXX	0.50	RUC Time

CPT Descriptor Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 11-20 minutes of medical discussion

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
99213	XXX	0.97	RUC Time	99,960,000

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
65205	000	0.71	RUC Time	28,100

CPT Descriptor 2 Removal of foreign body, external eye; conjunctival superficial

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99241	XXX	0.64	RUC Time

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: A problem focused history; A problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are self limited or minor. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Key Reference Code:** 9      **% of respondents:** 29.0 %

**TIME ESTIMATES (Median)**

	<b>CPT Code: 99447</b>	<b>Key Reference CPT Code: 99442</b>

Post-Service intensity/complexity	3.00	2.78
-----------------------------------	------	------

---

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel was constituted from RUC advisors representing the surveying specialty societies. This expert panel reviewed the survey results in detail and conferred by telephone conference call on several occasions, together with specialty society staff members. As the four codes are linked and ordered by increasing time intervals for the duration of the telephone consultation, initial discussion focused on establishing 99446 as the anchor for the family. Based on survey results and comparison with other codes, the panel recommends the 25th percentile of the survey results (0.50 work RVUs) for 99446. Based on similar considerations, the panel recommends the 25th percentile of the survey results (0.75 work RVUs) for 99447.

The physician work survey results for 99448 were virtually identical to those of 99447, thus leading to a rank order anomaly if the 25th percentile were used. The panel recommends that the median physician work from the survey (1.00) should be used to avoid this rank order anomaly. In addition, this recommendation also maintains the same increment between 99446 and 99447 as between 99447 and 99448.

For 99449, the panel recommends a physician work value of 1.25, just slightly over the survey 25th percentile. This recommendation maintains the same interval between 99449 and 99448 as between 99448 and 99447 or between 99447 and 99446.

After comparison of the survey times with the times from various comparator codes, the panel recommends the median survey times for all four codes as there didn't appear to be substantial reason for modifying the survey results.

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was not previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty Neurology/Endocrinology/Rheumatology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 99801

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 75133 Percentage 75.28 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 24668 Percentage 24.71 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

23,129 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty.

Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 23129 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99462

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99448	Tracking Number E3	Original Specialty Recommended RVU: <b>1.00</b>
		Presented Recommended RVU: <b>1.05</b>
Global Period: XXX		RUC Recommended RVU: <b>1.05</b>

CPT Descriptor: Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 21-30 minutes of medical consultative discussion and review

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 57 year old woman was sent for a CT exam by her primary care physician for recurrent severe headaches during which a thyroid nodule is incidentally identified. The primary care physician contacts an endocrinologist to discuss the appropriate diagnostic evaluation.

Percentage of Survey Respondents who found Vignette to be Typical: 74%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Confirms that patient, parent, or legal guardian has been informed in advance of the telephone consultation and has agreed. Decide on appropriate timing to fit call into existing daily schedule. Review any data or relevant information sent to consultant in advance of call.

Description of Intra-Service Work: Clarify from the requesting physician the nature of the patient's problem to be discussed. Obtain from the requesting physician all relevant history, physical examination, lab data, imaging. Present to requesting physician an analysis of the patient's problem, including likely diagnosis and suggested management. Provide to requesting physician alternative diagnoses and management approaches, including pluses and minuses of each. Respond to questions from the requesting physician to clarify diagnostic and treatment approach. Relay to requesting physician all relevant scientific background on the disease at issue needed to understand the consultant's recommendations or to respond to requesting physician's questions. Outline suggestions for long-term handling of the patient's problem.

Description of Post-Service Work: Review all relevant lab tests and other data not previously made available to consultant. Complete any literature review in response to issues raised during the phone call. Prepare a written response to the requesting physician.

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? Yes

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99443	XXX	0.75	RUC Time

CPT Descriptor Telephone evaluation and management service provided by a physician to an established patient, parent, or guardian not originating from a related E/M service provided within the previous 7 days nor leading to an E/M service or procedure within the next 24 hours or soonest available appointment; 21-30 minutes of medical discussion

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
99213	XXX	0.97	RUC Time	99,960,000

CPT Descriptor 1 Office or other outpatient visit for the evaluation and management of an established patient, which requires at least 2 of these 3 key components: An expanded problem focused history; An expanded problem focused examination; Medical decision making of low complexity. Counseling and coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low to moderate severity. Physicians typically spend 15 minutes face-to-face with the patient and/or family.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
-----------------------	---------------	-----------------	--------------------	---

CPT Descriptor 2

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
99242	XXX	1.34	RUC Time

CPT Descriptor Office consultation for a new or established patient, which requires these 3 key components: An expanded problem focused history; An expanded problem focused examination; and Straightforward medical decision making. Counseling and/or coordination of care with other providers or agencies are provided consistent with the nature of the problem(s) and the patient's and/or family's needs. Usually, the presenting problem(s) are of low severity. Physicians typically spend 30 minutes face-to-face with the patient and/or family.

**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Key Reference Code:** 11      **% of respondents:** 35.4 %

**TIME ESTIMATES (Median)**

	<b>CPT Code: 99448</b>	<b>Key Reference CPT Code: 99443</b>

### Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel was constituted from RUC advisors representing the surveying specialty societies. This expert panel reviewed the survey results in detail and conferred by telephone conference call on several occasions, together with specialty society staff members. As the four codes are linked and ordered by increasing time intervals for the duration of the telephone consultation, initial discussion focused on establishing 99446 as the anchor for the family. Based on survey results and comparison with other codes, the panel recommends the 25th percentile of the survey results (0.50 work RVUs) for 99446. Based on similar considerations, the panel recommends the 25th percentile of the survey results (0.75 work RVUs) for 99447.

The physician work survey results for 99448 were virtually identical to those of 99447, thus leading to a rank order anomaly if the 25th percentile were used. The panel recommends that the median physician work from the survey (1.00) should be used to avoid this rank order anomaly. In addition, this recommendation also maintains the same increment between 99446 and 99447 as between 99447 and 99448.

For 99449, the panel recommends a physician work value of 1.25, just slightly over the survey 25th percentile. This recommendation maintains the same interval between 99449 and 99448 as between 99448 and 99447 or between 99447 and 99446.

After comparison of the survey times with the times from various comparator codes, the panel recommends the median survey times for all four codes as there didn't appear to be substantial reason for modifying the survey results.

---

### SERVICES REPORTED WITH MULTIPLE CPT CODES

- Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

- Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

**FREQUENCY INFORMATION**

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was not previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty Neurology/Endocrinology/Rheumatology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 94626

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 72212 Percentage 76.31 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 22414 Percentage 23.68 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

21,464 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 21464 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

**Professional Liability Insurance Information (PLI)**

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99462

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 99449	Tracking Number E4	Original Specialty Recommended RVU: <b>1.25</b>
		Presented Recommended RVU: <b>1.40</b>
Global Period: XXX		RUC Recommended RVU: <b>1.40</b>

CPT Descriptor: Interprofessional telephone/internet assessment and management service provided by a consultative physician including a verbal and written report to the patient's treating/requesting physician/qualified healthcare professional; 31 minutes or more of medical consultative discussion and review

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A 10 year old boy with attention deficit disorder has become increasingly aggressive at home and school. The child's pediatrician arranges a telephone consultation with a child and adolescent psychiatrist and forwards historical records on the child prior to the telephone consultation.

Percentage of Survey Respondents who found Vignette to be Typical: 62%

#### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

#### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: Confirms that patient, parent, or legal guardian has been informed in advance of the telephone consultation and has agreed. Decide on appropriate timing to fit call into existing daily schedule. Review any data or relevant information sent to consultant in advance of call.

Description of Intra-Service Work: Clarify from the requesting physician the nature of the patient's problem to be discussed. Obtain from the requesting physician all relevant history, physical examination, lab data, imaging. Present to requesting physician an analysis of the patient's problem, including likely diagnosis and suggested management. Provide to requesting physician alternative diagnoses and management approaches, including pluses and minuses of each. Respond to questions from the requesting physician to clarify diagnostic and treatment approach. Relay to requesting physician all relevant scientific background on the disease at issue needed to understand the consultant's recommendations or to respond to requesting physician's questions. Outline suggestions for long-term handling of the patient's problem.

Description of Post-Service Work: Review all relevant lab tests and other data not previously made available to consultant. Complete any literature review in response to issues raised during the phone call. Prepare a written response to the requesting physician.

## Additional Rationale and Comments

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWPUR analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

An expert panel was constituted from RUC advisors representing the surveying specialty societies. This expert panel reviewed the survey results in detail and conferred by telephone conference call on several occasions, together with specialty society staff members. As the four codes are linked and ordered by increasing time intervals for the duration of the telephone consultation, initial discussion focused on establishing 99446 as the anchor for the family. Based on survey results and comparison with other codes, the panel recommends the 25th percentile of the survey results (0.50 work RVUs) for 99446. Based on similar considerations, the panel recommends the 25th percentile of the survey results (0.75 work RVUs) for 99447.

The physician work survey results for 99448 were virtually identical to those of 99447, thus leading to a rank order anomaly if the 25th percentile were used. The panel recommends that the median physician work from the survey (1.00) should be used to avoid this rank order anomaly. In addition, this recommendation also maintains the same increment between 99446 and 99447 as between 99447 and 99448.

For 99449, the panel recommends a physician work value of 1.25, just slightly over the survey 25th percentile. This recommendation maintains the same interval between 99449 and 99448 as between 99448 and 99447 or between 99447 and 99446.

After comparison of the survey times with the times from various comparator codes, the panel recommends the median survey times for all four codes as there didn't appear to be substantial reason for modifying the survey results.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: No

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) This service was not previously reported.

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Pediatrics How often? Commonly

Specialty Neurology/Endocrinology/Rheumatology How often? Commonly

Specialty How often?

Estimate the number of times this service might be provided nationally in a one-year period? 79666

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 60214 Percentage 75.58 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 17452 Percentage 21.90 %

Specialty Frequency 0 Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period?

18,694 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. Expert panel estimation

Specialty Pediatrics Frequency 0 Percentage 0.00 %

Specialty Neurology/Endocrinology/Rheumatology Frequency 18694 Percentage 100.00 %

Specialty Frequency 0 Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix. 99462

Re: Direct Practice Expense Inputs for Interprofessional Telephone/Internet Consultative Services (994XX1-994XX4; Tracking Codes E1-E4; Tab 14)

Dear Dr Levy:

Codes 994XX1-994XX4 (*Interprofessional telephone/internet assessment and management service provided by a consultative physician*) are among the codes being considered during the October 2012 RUC meeting.

The American Academy of Pediatrics (AAP), the American Academy of Neurology (AAN), the American College of Rheumatology (ACR), The Endocrine Society (TES), and the American Association of Clinical Endocrinologists (AACE) have conducted physician work surveys for codes 994XX1-994XX4 and developed work RVU recommendations based on the survey results.

However, we recommend no direct practice expense inputs for codes 994XX1-994XX4.

If you have any questions, please contact Linda Walsh, AAP staff, at 800/433-9016 ext 7931 or [lwalsh@aap.org](mailto:lwalsh@aap.org). Thank you.

Sincerely,

Alfonso Bello, MD

## AMA/Specialty Society RVS Update Committee Summary of Recommendations

January 2013

### **Total Body and Selective Head Hypothermia**

In October 2012, the CPT Editorial Panel created CPT codes 99481 and 99482 to replace CPT Category III codes, 0260T and 0261T, which describe services for hypothermia in a critically ill neonate per day. These services are no longer experimental and are part of the standard of care in neonatal intensive care units and as such are being valued in as CPT Category I codes.

CPT codes 99481 *Total body systemic hypothermia in a critically ill neonate per day (List separately in addition for code for primary procedure)* and 99482 *Selective head hypothermia in a critically ill neonate per day (List separately in addition for code for primary procedure)* were surveyed for the January 2013 RUC meeting. The RUC reviewed the survey results from 52 neonatologists and noted the low performance rate for this service with a median of 6 performed per year for 99481 and a median of 0 performed per year for 99482. The RUC was concerned that an add-on code that can be billed once per day rather than time based may overlap with other neonate critical care services. The RUC was also concerned with how the survey respondent arrived at 60 minutes of intra-service time for this service in the midst of the other services they are providing to a critically ill neonate throughout the day. The specialty explained that the Sarnat score, which measures six basic components of neurological function, must be taken every 4 hours, requiring 5-10 minutes for each evaluation. This, plus the assessment of continuous amplitude EEG monitoring, will result in at least 60 minutes of intra-service time.

The RUC determined that because of the low performance rate the survey data could not be considered reliable. Furthermore, there was concern that these services overlapped with the critical care services. For these reasons, the RUC decided that these codes should be carrier priced. The RUC recommends that the specialty work with the Research Subcommittee to determine an appropriate method to survey these services for the October 2013 RUC meeting. **The RUC recommends carrier pricing for CPT code 99481 and 99482.**

#### **Practice Expense:**

This service is primarily performed in a facility and does not have direct practice expense inputs associated with it.

CPT Code (●New)	Tracking Number	CPT Descriptor	Global Period	Work RVU Recommendation
D0260T		Total body systemic hypothermia, per day, in the neonate 28 days of age or younger	YYY	N/A
D0261T		Selective head hypothermia, per day, in the neonate 28 days of age or younger  (0260T, 0261T have been deleted. To report, see 99481, 99482)	YYY	N/A
<b>Category I</b> <b>Evaluation and Management</b> <b>Inpatient Neonatal Intensive Care Services and Pediatric and Neonatal Critical Care Services</b> <b>Pediatric Critical Care Patient Transport</b> <p>The following codes (99466, 99467) are used to report the physical attendance and direct face-to-face care by a physician during the interfacility transport of a critically ill or critically injured pediatric patient 24 months of age or younger. For the purpose of reporting codes 99466 and 99467, face-to-face care begins when the physician assumes primary responsibility of the pediatric patient at the referring hospital/facility, and ends when the receiving hospital/facility accepts responsibility for the pediatric patient's care. Only the time the physician spends in direct face-to-face contact with the patient during the transport should be reported. Pediatric patient transport services involving less than 30 minutes of face-to-face physician care should not be reported using codes 99466, 99467.</p>				

Procedure(s) or service(s) performed by other members of the transporting team may not be reported by the supervising physician.

For the definition of the critically injured pediatric patient, see the **Neonatal and Pediatric Critical Care Services** section.

The direction of emergency care to transporting staff by a physician located in a hospital or other facility by two-way communication is not considered direct face-to-face care and should not be reported with 99466, 99467. Physician-directed emergency care through outside voice communication to transporting staff personnel is reported with 99288.

Emergency department services (99281- 99285), initial hospital care (99221- 99223), critical care (99291, 99292), initial date neonatal intensive (99477) or critical care (99468) are only reported after the patient has been admitted to the emergency department, the inpatient floor, or the critical care unit of the receiving facility. If inpatient critical care services are reported in the referring facility prior to transfer to the receiving hospital, use the critical care codes (99291, 99292).

The following services are included when performed during the pediatric patient transport by the physician providing critical care and may not be reported separately: routine monitoring evaluations (eg, heart rate, respiratory rate, blood pressure, and pulse oximetry), the interpretation of cardiac output measurements (93562), chest X-rays (71010, 71015, 71020), pulse oximetry (94760, 94761, 94762), blood gases and information data stored in computers (eg, ECGs, blood pressures, hematologic data) ( 99090), gastric intubation (43752, 43753), temporary transcutaneous pacing (92953), ventilatory management (94002, 94003, 94660, 94662) and vascular access procedures (36000, 36400, 36405, 36406, 36415, 36591, 36600). Any services performed which are not listed above should be reported separately.

Code 99466 is used to report the first 30 to 74 minutes of direct face-to-face time with the transport pediatric patient and should be reported only once on a given date. Code 99467 is used to report each additional 30 minutes provided on a given date. Face-to-face services of less than 30 minutes should not be reported with these codes.

(For total body cooling of neonates, see 99481, 99482 ~~0260T, 0261T~~)

Re: Direct Practice Expense Inputs for Neonatal Hypothermia Services (99481-99482;  
Tracking Codes K1-K2; Tab 18)

Dear Dr Levy:

Codes 99481-99482 (*Total body systemic/selective head hypothermia in a critically ill neonate per day*) are among the codes being considered during the January 2013 RUC meeting.

The American Academy of Pediatrics (AAP) has conducted physician work surveys for codes 99481-99482 and developed work RVU recommendations based on the survey results.

However, we recommend no direct practice expense inputs for codes 99481-99482.

If you have any questions, please contact Linda Walsh, AAP staff, at 800/433-9016 ext 7931 or [lwalsh@aap.org](mailto:lwalsh@aap.org). Thank you.

Sincerely,

A handwritten signature in black ink, appearing to read "Steve Krug".

AAP RUC Advisor

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS High Expenditure Procedural Codes Screen*

April 2013

**Destruction of Premalignant Lesions**

CPT code 17004 was identified through the CMS High Expenditure Procedural Codes screen. The RUC recommended to survey for physician work and review practice expense for this family of services at the January 2013 RUC meeting. In January 2013, the RUC reviewed the survey results for these services and agreed with the specialty society that there may have been confusion among the survey respondents. Specifically, for CPT code 17004, the surveyed time may not have accurately reflected the physician work to treat the typical number of lesions (15 or more). The RUC recommended that the specialty society consider adding a question to the survey instrument to determine the typical number of lesions for this code. The specialty society submitted a request to withdraw the issue and resurvey for the April 2013 RUC meeting which was approved.

**17000, Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); first lesion**

The RUC reviewed survey results from 232 dermatologists and determined that a work RVU of 0.61, less than the survey 25<sup>th</sup> percentile appropriately accounts for the physician work to perform this service. The RUC noted that 17000 is reported with 17003, *Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); second through 14 lesions, each (List separately in addition to code for first lesion)* 72% of the time. Therefore, multiple lesions are typically treated. The RUC questioned whether or not an office visit was typically reported within the global period for this procedure. The specialty society noted that the survey instrument was revised to confirm whether or not an office visit was performed specifically in the 010-day global period. The survey respondents indicated that 70% of the time, an office visit is indeed performed. The specialty societies determined, and the RUC agreed, that the current work RVU of 0.65 overstated physician work, especially since this procedure is typically reported with an Evaluation and Management (E/M) service on the same date. In addition, the day of procedure time was reduced in this survey to 7 minutes from 9 minutes in the 2005 RUC survey. The specialty society appropriately reduced the work RVU to 0.61 to account for this difference using magnitude estimation. The RUC compared this service to similar service, 88302 *Level II - Surgical pathology, gross and microscopic examination Appendix, incidental Fallopian tube, sterilization Fingers/toes, amputation, traumatic Foreskin, newborn Hernia sac, any location Hydrocele sac Nerve Skin, plastic repair Sympathetic ganglion Testis, castration Vaginal mucosa, incidental Vas deferens, sterilization* (work RVU=0.13 and 11 minutes intra-service time) and 73140 *Radiologic examination, finger(s), minimum of 2 views* (work RVU=0.13 and 4 minutes intra-service time) and added the typical 99212 office visit (work RVU=0.48) that is included in the global period, which results in a work RVU of 0.61. For additional support, the RUC also reviewed service 95018 *Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intradermal), sequential and incremental, with drugs or biologicals, immediate type reaction, including test interpretation and report, specify number of tests*

(work RVU=0.14 and intra time=2 minutes,) and added a 99212 office visit (work RVU=0.48) resulting in a work RVU of 0.62. **Therefore, the RUC recommends a work RVU of 0.61 for CPT code 17000.**

**17003, Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); second through 14 lesions, each (List separately in addition to code for first lesion)**

The RUC reviewed survey results from 232 dermatologists and determined that a work RVU of 0.04, less than the survey 25<sup>th</sup> percentile appropriately accounts for the physician work for this procedure. The RUC noted that 17000 is reported with 17003 72% of the time. In addition, this service is typically reported with an Evaluation and Management (E/M) service. The RUC noted that the current intra-service time for this service is 2 minutes. The survey respondents indicated a median intra-service time of 1 minute. Since there was a 50% reduction in time, the RUC recommended reducing the work. Therefore, a 50% reduction in work RVU from current value of 0.07 equals 0.04. To further support this value, the RUC reviewed CPT code 95017 *Allergy testing, any combination of percutaneous (scratch, puncture, prick) and intracutaneous (intra-dermal), sequential and incremental, with venoms, immediate type reaction, including test interpretation and report, specify number of tests* (work RVU=0.07 and total time =1.86 minutes) which equates to 0.038 RVU per 1 minute. **The RUC recommends a work RVU of 0.04 for CPT code 17003.**

**17004, Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses), 15 or more lesions**

The RUC reviewed survey results from 232 dermatologists and determined that a work RVU of 1.37, a direct cross walk to CPT code 17270 *Destruction, malignant lesion (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), scalp, neck, hands, feet, genitalia; lesion diameter 0.5 cm or less* (work RVU=1.37) appropriately accounts for the physician work required to perform this service. Although, CPT code 17004 requires less pre service time compared to 17270, the RUC agreed this was acceptable since 17004 is typically reported with an Evaluation and Management (E/M) service. Additionally, the results of the survey from the specialty society suggested that the typical number of lesions treated is 20. Treating 20 lesions using the values for 17000 and 17003 would result in  $0.61 + (0.04 \times 19) = 1.37$ . The RUC also compared 17004 to key reference code 17282 *Destruction, malignant lesion (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 1.1 to 2.0 cm* (work RVU=2.09) and agreed that the treatment of malignant lesions is a more intense service requiring more physician work and therefore, should be valued higher. **The RUC recommends a work RVU of 1.37 for CPT code 17004.**

**Work Neutrality**

The RUC's recommendation for this family of codes will result in an overall work savings that should be redistributed back to the Medicare conversion factor.

**Practice Expense:**

The RUC confirmed that the use of a camera is typical in this procedure and reaffirmed the practice expense inputs reviewed at the January RUC meeting.

<b>CPT Code (•New)</b>	<b>CPT Descriptor</b>	<b>Global Period</b>	<b>Work RVU Recommendation</b>
17000	Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); first lesion	010	0.61

17004	Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses), 15 or more lesions	010	1.37

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 17000	Tracking Number	Original Specialty Recommended RVU: <b>0.61</b>
		Presented Recommended RVU: <b>0.61</b>
Global Period: 010		RUC Recommended RVU: <b>0.61</b>

CPT Descriptor: Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); first lesion

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman presents with a rough, scaly lesion on her face. The lesion is compatible with the diagnosis of an actinic keratosis.

Percentage of Survey Respondents who found Vignette to be Typical: 80%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

**Description of Pre-Service Work:**

The exact location of the lesion is measured and documented in the medical record and a photograph of the treatment site is taken for future assessment of response to treatment. The necessary materials are arranged. The patient is placed on the examination table and positioned for access.

**Description of Intra-Service Work:** The lesion is inspected and palpated for size and depth. Cryosurgery commences with the chosen modality until an ice ball with a 1 to 2 mm margin is achieved. The application of liquid nitrogen is timed (based on the thickness of the lesion) so that once the ice ball forms it has a thaw time of 20 to 40 seconds. After the lesion has completely thawed, cryosurgery is repeated until a second ice ball with a 1 to 2 mm margin is formed to achieve a second thaw time of 20 to 40 seconds.

Treatment can be administered either via directed spray from a Cry-Ac unit or via touch application of cotton tipped applicators. If cotton tipped applicators are used, liquid nitrogen is obtained from the central dispenser and poured into a disposable transfer cup. Small cotton tip applicators are used to apply the liquid nitrogen directly to the skin. Guidance via a neoprene cone or use of a protective shield may be required. Although cryodestruction is typical, for larger, keratotic lesions, other modalities such as electrosurgical destruction and curettage may be performed.

**Description of Post-Service Work:** Appropriate ointment and dressings are applied to the treatment site. The patient is instructed on wound care. A follow-up post-surgical visit is arranged. A procedure report is dictated and appropriate communication with family and referring physician is done.

**SURVEY DATA**

**Modifier -51 Exempt Status**

Is the recommended value for the new/revised procedure based on its modifier -51 exempt status? No

**New Technology/Service:**

Is this new/revised procedure considered to be a new technology or service? No

**KEY REFERENCE SERVICE:**

<u>Key CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
17260	010	0.96	RUC Time

CPT Descriptor Destruction, malignant lesion (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), trunk, arms or legs; lesion diameter 0.5 cm or less

**KEY MPC COMPARISON CODES:**

Compare the surveyed code to codes on the RUC's MPC List. Reference codes from the MPC list should be chosen, if appropriate that have relative values higher and lower than the requested relative values for the code under review.

<u>MPC CPT Code 1</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
	000		RUC Time	

CPT Descriptor 1 There are no MPC codes in the range with a 010 global.

<u>MPC CPT Code 2</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>	<u>Most Recent Medicare Utilization</u>
		0.00		

CPT Descriptor 2

<u>Other Reference CPT Code</u>	<u>Global</u>	<u>Work RVU</u>	<u>Time Source</u>
11200	010	0.82	RUC Time

CPT Descriptor Removal of skin tags, multiple fibrocutaneous tags, any area; up to and including 15 lesions

**RELATIONSHIP OF CODE BEING REVIEWED TO KEY REFERENCE SERVICE(S):**

Compare the pre-, intra-, and post-service time (by the median) and the intensity factors (by the mean) of the service you are rating to the key reference services listed above. **Make certain that you are including existing time data (RUC if available, Harvard if no RUC time available) for the reference code listed below.**

**Number of respondents who choose Key Reference Code:** 142 **% of respondents:** 61.2 %

**TIME ESTIMATES (Median)**

	<b>CPT Code: 17000</b>	<b>Key Reference CPT Code: 17260</b>	<b>Source of Time RUC Time</b>

------------------------------------	------	------

Post-Service intensity/complexity	2.72	2.88
-----------------------------------	------	------

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) surveyed Destruction of Premalignant Lesions codes 17000, 17003 and 17004. These codes were valued by the RUC in 2005, where the RUC determined cryotherapy was the typical modality. A year later, the definition of the codes changed from destruction of all lesions to destruction of pre-malignant lesions. The AAD surveyed the code for presentation at the January 2013 RUC meeting. The results of the survey and SOR were pre-facilitated. The pre-facilitation committee recommended and the RUC agreed that the AAD should re-survey the code family. The AAD expert panel has incorporated the results of the new survey and the recommendations of the pre-facilitation committee in the current SOR. These codes are typically done with an E&M service, and cryotherapy is the predominant treatment method although the CPT definitions describe other treatment modalities.

17000 is typically performed with an E&M service and with the ZZZ add on 17003.

#### Pre-service time:

Because these procedures are typically performed with an E&M service, and in keeping with the recent RUC directions, the expert panel has removed most of the pre-service time. The median survey pre service time is 7 minutes (5 minutes pre and 2 minutes positioning) and the selected pre-time package 5 is 7 minutes. The expert panel recommends reducing it by 5 minutes and is requesting 1 minute of pre-evaluation time and 1 minute of positioning time for this procedure.

As indicated in the 2011 Medicare 5% claims data, 72% of the time code 17000 is billed with varying numbers of the zzz add-on code 17003, hence multiple lesions are typically being treated. The expert panel believes that 1 minute of positioning is more appropriate than the survey median of 2 minutes. The total 2 minutes of pre-time the expert panel is requesting is less than the existing pre-time for code 17000, which is 4 minutes.

#### Intra-service time:

The expert panel recommends the median intra-service time of 3 minutes, which is the current time.

#### Post-Service time

The expert panel believes the survey median post-service time of 3 minutes is most likely accurate but suggests a 2 minute time. 2 minutes is the existing post service time.

#### Relative Value Units:

The expert panel recommends 0.61 RVUs for this procedure. The removal of the 2 minutes pre service time reduces the current 0.65 by 0.044 RVU for a recommended RVU of 0.61. This is below the 25% value of the survey. Since code 17000 has the lowest 010 global value, it is difficult to find comparator codes or crosswalks.

In summary, the expert panel recommends 0.61 RVUs, 2 minutes of pre-service time, 3 minutes for intra-service time and 2 minutes of post-time for code 17000.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.

- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☒ Other reason (please explain) Billed with Office E/M (code 99212) 76% of the time.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 17000

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)  
If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 14966508

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by code 17000 provided nationally in a one year period is estimated to be 14,966,508.

Specialty Dermatology                      Frequency 12209677                      Percentage 81.57 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 4,910,363 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. The 2012 Medicare Claims' data estimates that CPT code was billed approximately 5,000,000 times for Medicare patients nationally in one-year period.

Specialty Dermatology                      Frequency 3997526                      Percentage 81.40 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 17000

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 17003	Tracking Number	Original Specialty Recommended RVU: <b>0.05</b>
		Presented Recommended RVU: <b>0.04</b>
Global Period: ZZZ		RUC Recommended RVU: <b>0.04</b>

CPT Descriptor: Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); second through 14 lesions, each (List separately in addition to code for first lesion)

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: A woman presents with several scattered rough and scaly lesions located on her face. The lesions are compatible with the diagnoses of actinic keratoses.

Percentage of Survey Respondents who found Vignette to be Typical: 91%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: There is no pre service time as this is a ZZZ global period code.

Description of Intra-Service Work: The additional lesions are inspected and palpated for size and depth. Cryosurgery commences with the chosen modality until an ice ball with a 1 to 2 mm margin is achieved for each additional lesion. The application of liquid nitrogen is timed (based on the thickness of the lesion) so that once the ice ball forms it has a thaw time of 20-40 seconds. After each additional lesion has completely thawed, cryosurgery is repeated until a second ice ball with a 1 to 2 mm margin is formed to achieve a second thaw time of 20 to 40 seconds.

Treatment can be administered either via directed spray from a Cry-Ac unit or via touch application of cotton tipped applicators, with guidance via a neoprene cone or use of a protective shield when necessary. Although cryodestruction is typical, for larger, keratotic lesions, other modalities such as electrosurgical destruction and curettage may be performed.

Description of Post-Service Work: Appropriate ointment and dressings are applied to the treatment sites.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) surveyed Destruction of Premalignant Lesions codes 17000, 17003 and 17004. These codes were valued by the RUC in 2005, where the RUC determined cryotherapy was the typical modality. A year later, the definition of the codes changed from destruction of all lesions to destruction of pre-malignant lesions. The AAD surveyed the code for presentation at the January 2013 RUC meeting. The results of the survey and SOR were pre-facilitated. The pre-facilitation committee recommended and the RUC agreed that the AAD should re-survey the code family. The AAD expert panel has incorporated the results of the new survey and the recommendations of the pre-facilitation committee in the current SOR. These codes are typically done with an E&M service, and cryotherapy is the predominant treatment method although the CPT definitions describe other treatment modalities. Since 17003 is a zzz code there are multiple lesions that are being treated.

17003 is the lowest zzz in the RUC database. As such, it proved difficult for the surveyees to value. There is no appropriate crosswalk, and the suggested values are based on comparative explanations.

*Intra-service time:*

The expert panel recommends the median survey intra-service time of 1 minute. This figure takes into account the multitasking that occurs when multiple lesions are treated.

*Relative Value Units:*

The current RVU is 0.07. The 25% RVU in the survey was 0.20. The expert panel recommends 0.05 RVU for 17003. This recommendation is based on 2 arguments. First, 0.05 is the minimum RVU in our survey. That value is lower than the current RVU. In addition, the median time in the survey for 17004 is 13 minutes. On a purely proportional basis that is 65% of the current IS time for 17004, which is 20 minutes. And if applied as a time measurement to 17003 65% allows for 0.05 RVU.

Although this is not usual methodology, the multitasking involved in treating multiple lesions increases the intensity, and even though the time is halved, 0.05 takes into account the increased intensity, the time factor, and maintains rank order and intensity across the family. One minute is the lowest multiple in time, and 17003 is the lowest valued zzz code.

In summary, the expert panel recommends 0.05 RVUs and 1 minute for intra-service time for code 17003.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☒ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.
- ☐ Other reason (please explain)

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 17003

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 47055162

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by code 17003 provided nationally in a one year period is estimated to be 47,055,162.

Specialty Dermatology                      Frequency 40392151                      Percentage 85.83 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 15,449,279 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. According to Medicare Claims' data, code 17003 was reported 15,685,054 times nationally in one year for Medicare patients.

Specialty Dermatology                      Frequency 13261661                      Percentage 85.83 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

### Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 17003

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

## AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS SUMMARY OF RECOMMENDATION

CPT Code: 17004	Tracking Number	Original Specialty Recommended RVU: <b>1.43</b>
		Presented Recommended RVU: <b>1.37</b>
Global Period: 010		RUC Recommended RVU: <b>1.37</b>

CPT Descriptor: Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses), 15 or more lesions

### CLINICAL DESCRIPTION OF SERVICE:

Vignette Used in Survey: A man presents with 15 or more rough, scaly lesions scattered over the face, ears, upper torso, and extremities. The lesions are compatible with the diagnosis of multiple actinic keratoses.

Percentage of Survey Respondents who found Vignette to be Typical: 92%

### Site of Service (Complete for 010 and 090 Globals Only)

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

### Moderate Sedation

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 0%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 0%

Description of Pre-Service Work: The exact locations of the lesions are measured and documented in the medical record and photographs of the treatment sites are taken for future assessment of response to treatment. The necessary materials are arranged. The patient is placed on the examination table and positioned for access to all areas.

Description of Intra-Service Work: The lesions are inspected and palpated for size and depth. Cryosurgery commences with the chosen modality until an ice ball with a 1 to 2 mm margin is achieved for each lesion. The application of liquid nitrogen is timed (based on the thickness of the lesion) so that once the ice ball forms, it has a thaw time of 20 to 40 seconds. After each lesion has completely thawed, cryosurgery is repeated until a second ice ball with a 1 to 2 mm margin is formed to achieve a second thaw time of 20 to 40 seconds.

Treatment can be administered either via directed spray from a Cry-Ac unit or via touch application of cotton tipped applicators. If cotton tipped applicators are used, liquid nitrogen is obtained from the central dispenser and poured into a disposable transfer cup. Small cotton tip applicators are used to apply the liquid nitrogen directly to the skin. Guidance via a neoprene cone or use of a protective shield may be required. Although cryodestruction is typical, for larger, keratotic lesions, other modalities such as electrosurgical destruction and curettage may be performed.

Description of Post-Service Work: Appropriate ointment and dressings are applied to the treatment sites. The patient is instructed on wound care. A follow-up post-surgical visit is arranged. A procedure report is dictated and appropriate communication with family and referring physician is done.

**Additional Rationale and Comments**

Describe the process by which your specialty society reached your final recommendation. *If your society has used an IWP/UT analysis, please refer to the Instructions for Specialty Societies Developing Work Relative Value Recommendations for the appropriate formula and format.*

The American Academy of Dermatology (AAD) surveyed Destruction of Premalignant Lesions codes 17000, 17003 and 17004. These codes were valued by the RUC in 2005, where the RUC determined cryotherapy was the typical modality. A year later, the definition of the codes changed from destruction of all lesions to destruction of pre-malignant lesions. The AAD surveyed the code for presentation at the January 2013 RUC meeting. The results of the survey and SOR were pre-facilitated. The pre-facilitation committee recommended and the RUC agreed that the AAD should re-survey the code family. The AAD expert panel has incorporated the results of the new survey and the recommendations of the pre-facilitation committee in the current SOR. These codes are typically done with an E&M service, and cryotherapy is the predominant treatment method although the CPT definitions describe other treatment modalities. 17004 is treatment of 15 or more premalignant lesions, and the survey 25% and median numbers indicated that 20 lesions are typically treated at a time.

#### *Pre-Service time*

The survey median of total pre time is 10 minutes, and the appropriate pre-time package (5) has 7 minutes of pre-time. Because these procedures are typically performed with an E&M service, and in keeping with recent RUC direction, the expert panel has removed most of the pre-service time. We recommend 1 minute of pre-service evaluation time and 1 minute of positioning time, for a total of 2 minutes of pre-service time. Typically 20 lesions will involve multiple anatomic sites.

The total 2 minutes of pre-time requested is less than the current pre time for code 17004, which is 5 minutes.

#### *Intra-Service time*

Although the expert panel is concerned that the survey underestimates the time for 17004, it recommends the median survey intra time of 13 minutes. The 13 minutes indicated by our surveyees incorporates all possible economies of scale in performing multiple repetitive procedures, and assumes significant efficiencies including the presumption of working on 2 lesions at the same time. The current RUC database time is 20 minutes, and the expert panel believes that this time difference is a result of both the redefinition of this code and the assumption that the predominant treatment modality is cryotherapy. The survey shows that the typical number of lesions treated for 17004 is 20, both at the 25% and median. With the economies of scale of multitasking, we believe 13 minutes of intra-service time for 17004 is appropriate, and consistent with a 17000 intra-service time of 3 and multiple additives of 17003 intra-service times of 1 minute.

#### *Post-Service time*

The expert panel recommends the survey median post-service time of 4 minutes for 17004. That is 1 minute less than the current post service time of 5 minutes.

#### *Relative Value Units*

The expert panel recommends 1.43 RVUs for 17004. We offer this recommendation having taken into account the direction provided by the January 2013 pre-facilitation committee and the difficulty in establishing an appropriate value based upon crosswalk and magnitude estimation.

We are recommending removing 3 minutes of the existing 5 minutes of pre-time and are recommending a reduction from current post-service time from 5 minutes to 4 minutes for a total reduction of 4 minutes, resulting in a reduction of 0.09 RVU. As the existing RVU is 1.85, reducing it by 0.09 RVUs brings it to 1.76 RVUs. This RVU is less than the 25th percentile of the survey value (1.85). However, with the marked decrease in Intra-Service (IS) time for 17004 from 20 minutes to 13 minutes, an RVU of 1.76 is too high for 17004.

Looking at the intra-service (IS) time alone, after the adjustments made to pre and post times, if we back out the visit and pre and post time we arrive at  $1.76 - 0.48 - (6 \times .0224 = .13) = 1.15$  wRVU for IS time. Even though such an analogy is not RUC methodology, by pure time considerations alone (current IS 20 minutes, median survey IS 13 minutes), the 1.15 wRVU for IS time would translate into  $13/20 \times 1.15 = 0.75$ . This calculation does not take into account the increased intensity in performing 20 lesion destructions using multiple modalities in a shorter time interval. The above math would determine 17004 having an RVU of  $.75 + .48 + .13 = 1.36$

Using the recommended RVU of 0.05 for 17003, and a building block methodology,  $19 \times 0.05 = 0.95 + 17000 (0.61)$  plus 2 minutes extra in 17004 post time (0.044) would yield a value of 1.60. To ensure that there are no rank order issues, we looked at the additive value of 15 lesions  $17000 (0.61) + 14 \times 17003 (14 \times 0.05 = 0.70)$ , which gives 1.31.

The expert panel believes the value lies between 1.36 and 1.60. Using a lower number of lesions treated (e.g. 18 lesions) and building block, we arrive at a value of 1.51, preserve rank order and produce a proportional decrease in the value of the code of almost 20%. Adding back in the fact that 17004 has 2 minutes extra of pre and post time than 17000, this brings the value to between 1.51 and 1.55.

However, because of lack of a suitable crosswalk we need to rely on magnitude estimation and building block. For that reason, we chose 16 to 17 as the number of additional lesions ( $0.8 + 0.61 = 1.41$ ,  $0.85 + 0.61 = 1.46$ ) for an average of 1.43. This number does not include the 2 minutes extra of pre and post time in 17004 as compared to 17000, but we believe it is correct, given the difficulty with a crosswalk.

Although the techniques used to arrive at that number are not RUC sanctioned, we believe it is the correct RVU. This can be verified by crosswalk and magnitude estimation as the RUC did the last time these codes were valued, using 17111 (*Destruction of benign lesions other than skin tags or cutaneous vascular proliferative lesions; 15 or more lesions.*)

Below is the rationale that was used to value the code when reviewed in 2005.

“Due to the clarification of descriptors, description of intra-service time and adjusted intra-service work, the RUC felt that the specialty society recommended 1.80 work RVUs, half way between the 25th and median survey percentile for 17004, was appropriate. In addition, the RUC noted that the surveyed code 17004 requires greater mental effort and judgment, technical skill, intensity and time in comparison to the reference code 17111 (Work RVU=0.92) and felt that the value of 1.80 work RVUs appropriately values the surveyed code in relation to the reference code. Furthermore, the RUC agreed that 17004 indeed had slightly less work associated with it than 11750 Excision of nail and nail matrix, partial or complete, (eg, ingrown or deformed nail) for permanent removal; (Work RVU=1.86) with 10 minutes pre-service time, 15 minutes of intra-service time, 10 minutes of post service time and 2-99213 office visits. The RUC believed the median number of lesions for 17004 is 22 and the RUC recommends 1.80 work RVUs for 17004.” The current values for codes 17111 and 17004 have changed slightly since 2005 (current 17111, 0.97 and 17004, 1.85).

Utilizing the same crosswalks that the RUC used, taking into account the reduced IS and pre and post time, the comparisons to code 17111 are still valid, and using a new RVU of 1.43, we offer that crosswalk adjusted for time.

In comparison, the selected key reference code (17282 -*Destruction, malignant lesion, face, ears, eyelids, nose, lips, mucous membrane; lesion diameter 1.1 to 2.0cm*), has an RVU of 2.09, and the expert panel believes that it is not the most accurate comparator to the survey code. It has a higher RVU, and we acknowledge that the treatment of malignant lesions requires greater mental effort and judgment, technical skill, intensity and time (intra-service time for 17282 is 25 minutes, and 13 minutes for 17004). That is why we are comfortable altering the survey median value of 1.85.

In summary, the expert panel recommends 1.43 RVUs, 2 minutes of pre-service time, 13 minutes for intra-service time and 4 minutes of post-service time for code 17004.

## SERVICES REPORTED WITH MULTIPLE CPT CODES

1. Is this code typically reported on the same date with other CPT codes? If yes, please respond to the following questions: Yes

Why is the procedure reported using multiple codes instead of just one code? (Check all that apply.)

- ☐ The surveyed code is an add-on code or a base code expected to be reported with an add-on code.
- ☐ Different specialties work together to accomplish the procedure; each specialty codes its part of the physician work using different codes.
- ☐ Multiple codes allow flexibility to describe exactly what components the procedure included.
- ☐ Multiple codes are used to maintain consistency with similar codes.
- ☐ Historical precedents.

☒ Other reason (please explain) Code 17004 is billed with E/M (code 99212) 76% of the time.

2. Please provide a table listing the typical scenario where this code is reported with multiple codes. Include the CPT codes, global period, work RVUs, pre, intra, and post-time for each, summing all of these data and accounting for relevant multiple procedure reduction policies. If more than one physician is involved in the provision of the total service, please indicate which physician is performing and reporting each CPT code in your scenario.

## FREQUENCY INFORMATION

How was this service previously reported? (if unlisted code, please ensure that the Medicare frequency for this unlisted code is reviewed) 17004

How often do physicians in your specialty perform this service? (ie. commonly, sometimes, rarely)

If the recommendation is from multiple specialties, please provide information for each specialty.

Specialty Dermatology                      How often? Commonly

Specialty                      How often?

Specialty                      How often?

Estimate the number of times this service might be provided nationally in a one-year period? 2272000

If the recommendation is from multiple specialties, please provide the frequency and percentage for each specialty. Please explain the rationale for this estimate. The overall number of services described by code 17004 provided nationally in a one-year period is estimated to be 2,272,000.

Specialty Dermatology                      Frequency 1987772                      Percentage 87.48 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Estimate the number of times this service might be **provided to Medicare patients** nationally in a one-year period? 757,250 If this is a recommendation from multiple specialties please estimate frequency and percentage for each specialty. Please explain the rationale for this estimate. According to Medicare Claims' data, code 17004 was reported 757,250 times nationally in one year for Medicare patients.

Specialty Dermatology                      Frequency 662518                      Percentage 87.48 %

Specialty                      Frequency 0                      Percentage 0.00 %

Specialty                      Frequency 0                      Percentage 0.00 %

Do many physicians perform this service across the United States? Yes

## Professional Liability Insurance Information (PLI)

If the surveyed code is an existing code and the specialty believes the specialty utilization mix will not change, enter the surveyed existing CPT code number 17004

If this code is a new/revised code or an existing code in which the specialty utilization mix will change, please select another crosswalk based on a similar specialty mix.

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**CPT Long Descriptor: 17000 Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettage), premalignant lesions (eg, actinic keratoses); first lesion**

**Global Period: 010 Meeting Date: Jan 2013**

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

**The AAD RBRVS Committee assigned review of the current PE direct inputs to a Task Force which reviewed the values and compared them to current practice environments and have recommended a limited number of specific changes to reflect changes in equipment and supply requirements.**

2. You must provide reference code(s) for comparison on your spreadsheet. **If the code you are making recommendations on is a revised code you must use the current PE direct inputs for the code as your comparison.** You must provide an explanation for the selection of reference codes. Reference Code Rationale:

**AAD PE Task Force used the current PE direct inputs for 17000 as approved at the Jan 2002 PEAC meeting.**

3. If you are recommending more minutes than the PE Subcommittee standards you must provide evidence to justify the time:

**AAD PE Task Force is recommending less time for this code with values reduced to reflect current RUC Clinical labor time standards.**

4. Please describe in detail the clinical activities of your staff:

**Pre-Service Clinical Labor Activities:**

**There are no pre-service clinical labor activities.**

**Intra-Service Clinical Labor Activities:**

**Clinical staff prepares liquid nitrogen with transfer to appropriate delivery device (Cry-Ac unit or insulated container with cotton tipped applicator) from large storage unit. If hyperkeratotic lesions are to be treated with curettage or electrosurgery, the necessary equipment and materials are arranged. Staff assists patient onto the examination table and helps position for access. Staff assists physician with prep of local anesthesia and destruction modality equipment and related supplies.**

**Post-Service Clinical Labor Activities:**

**Assist with application of dressing. Assist with instruction on post-operative care and scheduling of follow-up care.**

**AMA/Specialty Society Update Process  
Practice Expense Summary of Recommendation  
Non Facility Direct Inputs**

**CPT Long Descriptor: 17003 Destruction (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), premalignant lesions (eg, actinic keratoses); second through 14 lesions; each**

**Global Period: ZZZ Meeting Date: Jan 2013**

1. Please provide a brief description of the process used to develop your recommendation and the composition of your Specialty Society Practice Expense Committee:

**The AAD RBRVS Committee assigned review of the current PE direct inputs to a Task Force which reviewed the values and compared them to current practice environments and have recommended a limited number of specific changes to reflect changes in equipment and supply requirements.**

AMA/Specialty Society RVS Update Committee Summary of Recommendations  
*CMS High Expenditure Procedural Codes Screen*

April 2013

**Mohs Surgery**

CPT codes 17311 and 17312 were identified through the CMS High Expenditure Procedural Codes screen. In January 2012, the RUC recommended the specialty society survey physician work and review practice expense for this family of services at the April 2013 RUC meeting.

The RUC reviewed the Mohs surgery CPT codes 17311-17315 survey results and noted that the survey 25<sup>th</sup> percentile work RVUs were all above the current work RVU. The specialty society indicated and the RUC agreed that there was not compelling evidence to increase these services at this time. Therefore, the RUC recommends maintaining the current work RVU for each code in this family of services.

The specialty society's presenters indicated that they typically see 2 to 4 Mohs patients per day. The survey respondents provided an annual service performance rate from 475 to 880 per year (which is the interquartile range of the survey responses). Given differing case mixes and practice patterns the case numbers will vary widely, with one patient coming in after another and staggering care. The physician time included in these services does not count the time a patient may be waiting for the physician or waiting for the histologic tissue processing.

**17311 Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), head, neck, hands, feet, genitalia, or any location with surgery directly involving muscle, cartilage, bone, tendon, major nerves, or vessels; first stage, up to 5 tissue blocks**

The RUC reviewed the survey results from 249 dermatologists (mohs surgeons) and determined that the current work RVU of 6.20 appropriately accounts for the physician work required to perform this service. The RUC noted that the survey intra-service time is the same as the current time. The RUC recommends maintaining the current physician time with a reallocation of the pre-time to 14 minutes pre-evaluation, 1 minute positioning and 5 minutes scrub/dress/wait pre-service time to align more to the pre-time packages. The RUC noted that in preparation of the reference service list, the specialty society was allowed to place 010 and 090-day global period codes adjusted with the post-operative visits removed in order to provide reference services with relative work RVUs for the survey respondents. Otherwise the 000-day and ZZZ global period codes would not provide adequate comparisons and would skew the survey results.

The RUC compared 17311 to key reference code 15260 *Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; 20 sq cm or less* (global adjusted work RVU = 6.79 and 100 minutes intra-service time) and similar service 11646 *Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter over 4.0 cm* (global adjusted work RVU= 5.29 and 65 minutes intra-service time) and determined that maintaining the current work RVU of 6.20 for 17311 maintains the appropriate relativity among other services. CPT code 15260 requires slightly less intra-service, 100 minutes versus 115 minutes, respectively, but is more intense and complex to perform. **The RUC recommends a work RVU of 6.20 for CPT code 17311.**

**17312 Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), head, neck, hands, feet, genitalia, or any location with surgery directly involving muscle, cartilage, bone, tendon, major nerves, or vessels; each additional stage after the first stage, up to 5 tissue blocks (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 249 dermatologists (mohs surgeons) and determined that the current work RVU of 3.30 appropriately accounts for the physician work required to perform this service. The RUC noted that the survey intra-service time is the same as the current time. The RUC recommends maintaining the current physician time with reallocation of the pre-time to 2 minutes pre-evaluation, 1 minute positioning and 5 minutes scrub/dress/wait pre-service time. The RUC confirmed the additional 8 minutes of pre-time is appropriate for this add-on service because the patient must go back and undress again, be re-gowned, prepped, draped, re-anesthetized and given the pathology results. Subsequently, there is additional direct practice expense time where the clinical staff must account for additional cleaning.

The RUC compared 17312 to key reference code 14302 *Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 3.73 and 40 minutes intra-service time) and determined that the key reference code requires 10 more minutes of physician work and is therefore appropriately valued higher. **The RUC recommends a work RVU 3.30 for CPT code 17312.**

**17313 Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), of the trunk, arms, or legs; first stage, up to 5 tissue blocks**

The RUC reviewed the survey results from 249 dermatologists (mohs surgeons) and determined that the current work RVU of 5.56 appropriately accounts for the physician work required to perform this service. The RUC noted that the survey intra-service time is the same as the current time. The RUC recommends maintaining the current physician time with a reallocation of the pre-time to 14 minutes pre-evaluation, 1 minute positioning and 5 minutes scrub/dress/wait pre-service time to align closer to the pre-time package

The RUC compared 17313 to key reference code 15260 *Full thickness graft, free, including direct closure of donor site, nose, ears, eyelids, and/or lips; 20 sq cm or less* (global adjusted work RVU = 6.79 and 100 minutes intra-service time) and similar service 11646 *Excision, malignant lesion including margins, face, ears, eyelids, nose, lips; excised diameter over 4.0 cm* (global adjusted work RVU= 5.29 and 65 minutes intra-service time) and determined that maintaining the current work RVU of 5.56 for 17313 maintains the appropriate relativity among other services. CPT code 15260 requires the same intra-service time of 100 minutes as the surveyed code, but is more intense and complex to perform. Additionally, the RUC noted that this mohs surgery service is appropriately less, relative to code 17311, mohs surgery to the face, which is a more intense service and requires slightly more time. **The RUC recommends a work RVU of 5.56 for CPT code 17313.**

**17314 Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), of the trunk, arms, or legs; each additional stage after the first stage, up to 5 tissue blocks (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 249 dermatologists (mohs surgeons) and determined that the current work RVU of 3.06 appropriately accounts for the physician work required to perform this service. The RUC noted that the survey intra-service time is the same as the current time. The RUC recommends maintaining the current physician time with reallocation of the pre-time to 2 minutes pre-evaluation, 1 minute positioning and 5 minutes scrub/dress/wait pre-service time. The RUC confirmed the additional 8 minutes of pre-time is appropriate for this add-on service because the patient must go back and undress again, be re-gowned, prepped, draped, re-anesthetized and given the pathology results. Subsequently, there is additional direct practice expense time where the clinical staff must account for additional cleaning.

The RUC compared 17314 to reference code 14302 *Adjacent tissue transfer or rearrangement, any area; each additional 30.0 sq cm, or part thereof (List separately in addition to code for primary procedure)* (work RVU = 3.73 and 40 minutes intra-service time) and determined that the key reference code requires 10 more minutes of physician work, and is therefore appropriately valued higher. The RUC also noted that this mohs surgery service is appropriately less, relative to code 17312, mohs surgery to the face, which is a more intense service and requires slightly more time. **The RUC recommends a work RVU 3.06 for CPT code 17314.**

**17315 Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), each additional block after the first 5 tissue blocks, any stage (List separately in addition to code for primary procedure)**

The RUC reviewed the survey results from 249 dermatologists (mohs surgeons) and determined that the current work RVU of 0.87 appropriately accounts for the physician work required to perform this service. The RUC noted that the survey intra-service time is the same as the current time. The RUC confirmed the intra-service time of 30 minutes is appropriate as the patient typically has a large lesion, requiring not only a pathology block, but also a surgical component. This service is rare, as 1 in 100 mohs surgery cases require it to be performed.

The RUC compared 17315 to key reference code 13102 *Repair, complex, trunk; each additional 5 cm or less (List separately in addition to code for primary procedure)* (work RVU = 1.24) and determined that these services require the same time, but 13102 is more intense and complex. Therefore, maintaining the current work RVU of 0.87 for 17315 appropriately places this service relative to other similar services. **The RUC recommends a work RVU of 0.87 for CPT code 17315.**

### Practice Expense

The RUC noted that there was an error in the prior direct practice expense inputs and therefore compelling evidence existed to increase the clinical staff time by 15 minutes in codes 17311-17314 and 2 minutes in code 17215 for the Histotechnologist (L037B) to clean (line 49). Additionally supply input *slide, microscope* (SL122) has been replaced with a new type of slide, *Slide, charged*, that currently is not listed as a 2013 CMS direct PE input. An invoice is included in this submission. The RUC recommends the direct practice expense inputs with modifications as approved by the Practice Expense Subcommittee.

CPT Code (•New)	CPT Descriptor	Global Period	Work RVU Recommendation
17311	Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), head, neck, hands, feet, genitalia, or any location with surgery directly involving muscle, cartilage, bone, tendon, major nerves, or vessels; first stage, up to 5 tissue blocks	000	6.20 (No Change)
17312	each additional stage after the first stage, up to 5 tissue blocks (List separately in addition to code for primary procedure)  (Use 17312 in conjunction with 17311)	ZZZ	3.30 (No Change)
17313	Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), of the trunk, arms, or legs; first stage, up to 5 tissue blocks	000	5.56 (No Change)

17314	each additional stage after the first stage, up to 5 tissue blocks (List separately in addition to code for primary procedure)  (Use 17314 in conjunction with 17313)	ZZZ	3.06  (No Change)
17315	Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), each additional block after the first 5 tissue blocks, any stage (List separately in addition to code for primary procedure)  (Use 17315 in conjunction with 17311- 17314 )	ZZZ	0.87  (No Change)

**AMA/SPECIALTY SOCIETY RVS UPDATE PROCESS  
SUMMARY OF RECOMMENDATION**

CPT Code: 17311      Tracking Number

Original Specialty Recommended RVU: **6.20**Presented Recommended RVU: **6.20**

Global Period: 000

RUC Recommended RVU: **6.20**

CPT Descriptor: Mohs micrographic technique, including removal of all gross tumor, surgical excision of tissue specimens, mapping, color coding of specimens, microscopic examination of specimens by the surgeon, and histopathologic preparation including routine stain(s) (eg, hematoxylin and eosin, toluidine blue), head, neck, hands, feet, genitalia, or any location with surgery directly involving muscle, cartilage, bone, tendon, major nerves, or vessels; first stage, up to 5 tissue blocks

**CLINICAL DESCRIPTION OF SERVICE:**

Vignette Used in Survey: An adult with extensive sun damage presents with a poorly defined infiltrative basal cell carcinoma of the right nose and cheek.

Percentage of Survey Respondents who found Vignette to be Typical: 98%

**Site of Service (Complete for 010 and 090 Globals Only)**

Percent of survey respondents who stated they perform the procedure; In the hospital 0% , In the ASC 0%, In the office 0%

Percent of survey respondents who stated they typically perform this procedure in the hospital, stated the patient is; Discharged the same day 0% , Overnight stay-less than 24 hours 0% , Overnight stay-more than 24 hours 0%

Percent of survey respondents who stated that if the patient is typically kept overnight also stated that they perform an E&M service later on the same day 0%

**Moderate Sedation**

Is moderate sedation inherent to this procedure in the Hospital/ASC setting? No

Percent of survey respondents who stated moderate sedation is typical in the Hospital/ASC setting? 2%

Is moderate sedation inherent to this procedure in the office setting? No

Percent of survey respondents who stated moderate sedation is typical in the office setting? 6%

Description of Pre-Service Work: The patient is taken to the surgical room, and gowned. The benefits, risks and alternatives to removal are explained. Sun exposure discussed. The procedure is explained, and the healing period with restrictions is reviewed. A fresh history of medications taken, including aspirin, vitamin E, and/or other blood thinners is reviewed along with a review of pertinent problems that may have arisen since the scheduling visit. The patient is placed on the surgical table and positioned for access. Under surgical lighting and magnification, the clinically obvious extent of the tumor is outlined. The area is cleansed with betadine, a sterile surgical marker is used to delineate the extent of the planned excision. Lidocaine is injected. The patient is re-prepped and draped, lights are positioned.

Description of Intra-Service Work: A scalpel is used to incise along the planned borders of the excision. The visible cancer is removed first (debulking) without attempting to remove a margin of normal tissue. Hemostasis is achieved with electrocoagulation. After the bulk of the tissue is removed, the first layer or stage is excised as a thin continuous wafer of tissue typically 1-3 mm thick around the sides and base of the wound. Prior to removing the specimen, hatch marks are then incised from the margin of the specimen into the surrounding adjacent normal skin to maintain orientation of the specimen to the defect. Hemostasis is achieved with electrocoagulation and the patient bandaged and discharged to the waiting room. This thin cup or saucer shaped wafer of tissue is flattened by cutting it into pieces (blocks) or making radial incisions to flatten the tissue. The smallest number of tissue blocks are created that will allow the performance of sectioning in the cryostat. The edges of the tissue are color coded with dyes that persist through histologic tissue processing. Once the wafer is cut into pieces and color-coded, a drawing or map of this tissue and its pieces is made so that

it corresponds to the surgical wound. These tissue pieces, disassembled like a puzzle, are processed by frozen section pathology. Each flattened piece (or tissue block) is mounted, frozen, sectioned horizontally and then stained. These frozen sections create an image of 100 percent of the peripheral and deep surgical margin including tissue dyes and hatch marks. Microscopic examination of this image allows the Mohs surgeon who also functions as the pathologist to identify the location(s) of any remaining tumor. The surgeon examines serial sections of the tissue to evaluate the status of the surgical margin. Residual tumor location(s) as seen through the microscope is marked on the map of the surgical wound. Following review of the pathology, the patient is returned to the operating room, and outcome of the review is discussed with the patient. After all required Mohs layers have been taken and a tumor free plane is reached the temporary dressing is removed. The wound is re-anesthetized and hemostasis is obtained as needed and the defect is evaluated for wound management. A final dressing is applied.

Description of Post-Service Work: Wound care is reviewed, as well as instructions for problems such as bleeding or pain, and restrictions on motion and activities. Prescriptions for pain and antibiotics, if needed, are given. Arrangements are made for postoperative follow-up.
